Instrument. This scale represents the first practical measuring instrument allowing the lucid projection practitioner to evaluate his/her own effort in each experiment, giving exact perspectives of the improvement of lucid projectability (LPB), or the goals for improvement of his/her extraphysical performance.

Psychology. As strange as it may seem, even the repressions and conditionings that comprise the psychological profile of each intraphysical consciousness influence the level of his/her lucidity when projected from the human body in the tropospheric extraphysical dimension.

Case study. For example: a very systematic person with deep-rooted habits, who is not accustomed to walking alone on deserted streets or in unfamiliar places for fear of being assaulted, can become traumatized in the very beginning, when outside the human body, in similar circumstances. For this reason, the projector is not able to achieve extraphysical lucidity, thereby remaining in a semilucid or nightmarish condition. His/her repressed *psychological* (intrapysicology) conditions do not permit him/her to attain healthy *parapsychic* (extraphysicology) conditions.

Bibliography: Baumann (93, p. 111), Vieira (1762, p. 143), Walker (1781, p. 24).

264. CONSCIENTIAL LUCIDITY AND PERCEIVED TIME

Definitions. Extraphysical sensation of time: the impression through which the intraphysical consciousness, while projected with lucidity, perceives the succession and duration of experiences outside the human body; the extrasensory process of the consciousness regarding the perception of the time factor.

Synonymy: para-perception of the fourth (temporal) dimension.

Premises. The following are 6 premises concerning the consciential lucidity-perceived time relationship:

1. **Conditionings.** Conditioned reflexes play the most important role in the consolidation of all manner of our habits and repressions. These even transcend the scope of manifestations of our personal psychology in the ordinary, physical waking state, and reach the manifestations of our *parapsychology*, when our consciousness is projected from the human body. In other words, when it is temporarily freed from the prison of the dense brain, the *black box* or transelectro-electronic machine which is only partially decipherable by our current intelligence. It is common knowledge that the continuous flow of time plays an important role precisely in the generation of these selfsame conditionings.

2. **Past.** One of the fundamental questions of scientific research is past time. All the factual information we have to work with refers to past events. In any scientific investigation, we have to make generalizations based upon this factual information, in order to know what to expect in the future and to sophisticate our research.

3. **Independence.** Strictly speaking, in the same way that the consciousness, which is insubstantial per se, does not need to depend upon the human body, the respiratory mechanism, natural sleep, physical forms, atmospheric pressure and gravitational laws in order to live and act freely, it also does not need to depend upon or suffer the consequences of the effects of the time factor, the chronological world or space-time coordinates.

4. **Cosmic.** Terrestrial humanity has thus far been living in an unnecessary condition of unconscious slavery to the internal and perceived time factor. In order to change this tyranny of time upon us, we need to create a new mental or consciential system according to the still immeasurable potentiality and vastness of our *total self*, until we arrive at a state of frequent cosmoconsciousness (cosmoconscientiology).

5. **Expansion.** Every act of expansion of the attributes of the human consciousness is, in some way, an escape from the condition of anthropomorphic physical restriction. It is therefore a specific type of nonlucid, semilucid or lucid consciential projection.

6. **Freedom.** The condition of expanded consciousness is the greatest possible realization of individual freedom – in this case, almost absolute – which can be enjoyed by the ego while humanized in a social, intraphysical or terrestrial manner (citizen). The expanded consciousness is an escape from time, or better still, the true freedom of the intraphysical consciousness from the *internal prison* of time, forged by the ego.

Cause. Given these 6 premises, it can be inferred that the influence of time, which – in theory – forms the fourth dimension, is one of the essential causes of greater alterations in the levels of extraphysical lucidity of the intraphysical consciousness while fully projected from the soma.

Pluri-awareness. When the time factor is not acting upon the consciousness, or even merely reducing the intensity of its action, when this selfsame consciousness finds itself free or expanded, the past, present and future occur together and coexist simultaneously within the consciousness. This comprises the condition of *atemporal pluri-awareness*.

Effects. The following are 6 effects generated by the condition of atemporal pluri-awareness:

1. **Alterations.** Lightning-fast alterations in or successions of consciential levels.
2. **Oneirism.** Chaotic oneiric images characterized by incongruity, incoherence, inconsistency and anachronism, which interfere in the lucidity of the projected intraphysical consciousness.
3. **Duplicity.** The condition of apparent double and multiple awarenesses.
4. **Semilucidity.** Semilucid consciential projections.
5. **Retrocognitions.** Retrocognitive consciential projections.
6. **Precognitions.** Precognitive consciential projections.

Anchoring. In order for the consciousness to induce full lucidity at a certain level or consciential dimension, it needs to somehow anchor itself in a stable manner at this level through the factor of perceived time – in a compact or frozen manner, in this case – in order to separate fantasies from real images, or *separate the wheat from the chaff* (extraphysical self-discernment).

Kaleidoscope. The consciousness – in reference to the manifestation of attributes which anchor its lucidity on a certain occasion – is always a living kaleidoscope: it is uninterruptedly mutable, unsleeping and almost unending.

Attributes. The consciousness allows time to influence its consciential world (consciential attributes) either positively or negatively. For example, within the scope of memory, time acts like a fixative, serving to preserve the clarity of recorded memories. More precisely, the consciousness allows time to operate as an imposed pause upon the uninterrupted flow of the inner images of its vibrantly alive inner experiences.

Elements. The following are examples of 6 time-fixative elements perceived by the consciousness:

1. **Light.** The chronological course of light or the day-night, sunrise-sunset rhythm.
2. **Seconds.** The passage of seconds of a clock.
3. **Vibrations.** The vibrations of any type of object: atom, radio station or pendulum.
4. **Seasons.** Distinction regarding the seasons of the year.
5. **Era.** The human clothing and customs of each era.
6. **Age.** The characterization of physical or biological age in the periods of infancy, youth, maturity and old age (from sixty-five years of age and over).

Brain. Physical and extraphysical phenomena converge in order to demonstrate that the consciousness is an active reality beyond the human brain.

Hemispheres. The 2 hemispheres operate like *restricting fields* of an enormous quantity of variables of the mentalsoma's manifestations, in order to allow activity in only one specific area, without dispersion to other areas.

Parabrain. Similarly, the parabrains (of the psychosoma) appears to be the seat of the mentalsoma which, in turn, is the seat of the consciousness.

Level. Each perceived period of time ends up creating – only apparently, simply by and for the consciousness – a level of consciential lucidity, a level of depth of reasoning and a different and specific range of perception according to a certain level of time.

Suspension. The provisory and interrupted elimination or suspension of time, as a consciential dimension, is one of the causes of instability in the projected consciousness' levels of lucidity.

Crises. Although being an extraordinary inner resource, or evidence of greater evolution, this suspension of time nevertheless ends up triggering evolutionary consciential growing crises.

Double. The condition of double awareness manifests itself on a scale of 3 levels:

1. **Coincidence.** The condition of *cerebral*, intraphysical or waking awareness.
2. **Discoincidence.** The intraphysical consciousness who is temporarily in the projected, *empty-brain* condition.

3. **Hyperacuity.** The situation of the *extraphysical* consciousness when in a state of extreme lucidity or hyperacuity.

Semilucidity. As long as there is no fixation of time by the consciousness, the condition of *atemporal pluri-awareness* predominates or, in other words, a state of inner entropy of the consciousness occurs due to the time factor. Thereby, ordinary semilucid consciencial projections arise due to ignorance regarding the parapsychology of the holosoma.

265. ILLUMINATION OF THE EXTRAPHYSICAL ENVIRONMENT

Definition. Illumination of the extraphysical environment: the perception, by the intraphysical consciousness projected in the extraphysical dimension, of light irradiating from a nonspecific origin and consequent brightening.

Synonymy: clarifying of the perceptions of the projected intraphysical consciousness; illumination of the extraphysical environment.

Unmani. The extraphysical period of the consciousness, or the state of the consciousness while outside the human body – namely the stage in which all intraphysical beings find themselves outside the dense body, e.g.: during certain phases of natural sleep, parapsychic trance and during lucid projection – is referred to as the state of *unmani* in the East. The condition of extraphysical illumination for the projected intraphysical consciousness is dependent upon this state of lucidity.

Night. There is no night outside dense matter for the projected consciousness.

Indirect. In the extraphysical tropospheric dimension, which appears to be a luminescent duplicate of the physical dimension, an indirect luminosity always arises for the consciousness. This luminosity does not emanate from any specific direction, but is diffuse, brilliant and intense. It neither disturbs nor obfuscates the shadowless extraphysical vision.

Near-death. It is worth observing that the intraphysical consciousness, after being lucidly projected from the human body, notably in near-death experiences (NDE), sometimes when describing extraphysical illumination does not speak in terms of light, but in terms of a *total absence of light* and *complete darkness*. The projector thinks – with these expressions – that he/she is not saying the same thing and is more correctly describing the real situation in the extraphysical dimension in certain intraconsciencial (internal or *subjective*) conditions and extraconsciencial (external or *objective*) circumstances.

Difference. In fact, illumination and an absence of darkness do not, strictly speaking, signify the same thing. This subtle but ponderable difference more clearly evidences the extraphysical reality of the intraphysical consciousness projected under certain conditions.

Self-awareness. The illumination of the extraphysical environment is one of the first ostensive and characteristic manifestations of the projector's self-awareness upon realizing that he/she is projected from the human body. Nevertheless, this is not a *sine qua non* condition for the intraphysical consciousness to be in the extraphysical dimension or to be absolutely self-aware of being outside the dense body. This is because that state can occur in the dark, namely without the consciousness seeing anything.

Vision. This phenomenon occurs due to the fact that vision is not everything to the consciousness nor does it express everything that you are, but only one of the consciousness' multiple *mentalsomatic attributes*, just like many others.

Characteristics. Among the characteristics of illumination in the extraphysical environment, at least the following 23 can be singled out:

1. **Perception.** The clear perception of extraphysical illumination by the projected consciousness.
2. **Moment.** The occasion or precise moment when extraphysical illumination arises.
3. **Speed.** The speed at which extraphysical illumination arises for the consciousness.
4. **Intensity.** The intensity of extraphysical illumination.

5. **Clarity.** The clarity of extraphysical illumination.
6. **Coloring.** The predominant color in the extraphysical illumination.
7. **Unicolor.** The unicolor condition, a bluish or yellowish color.
8. **Bicolor.** The bicolor condition, or black and white.
9. **Multicolor.** Multicolored extraphysical illumination.
10. **Grays.** Gray images.
11. **Silver.** Silvery images.
12. **Time.** Diurnal or nocturnal extraphysical illumination.
13. **Nature.** Natural or artificial extraphysical illumination.
14. **Uniformity.** The uniformity of extraphysical illumination.
15. **Increase.** A sudden increase in extraphysical illumination.
16. **Effects.** Phosphorescence, scintillations and stroboscopic effects.
17. **Blindness.** The consciential condition without vision.
18. **Neutrality.** Neutral vision of the projected consciousness, which is neither blind nor sighted.
19. **Desire.** The desire to see and extraphysical illumination.
20. **Explosions.** Explosions of light which are perceived extraphysically.
21. **Fog.** The condition of extraphysical fog.
22. **Darkness.** Extraphysical total darkness and semi-obscurity.
23. **Mentalsoma.** The environment without perceptible space-time (mentalsomatic dimension).

Movement. The relation between extraphysical illumination and movement of the projected consciousness shows that it can feel itself to be stationary somewhere, in the dark, translocate itself in the dark and volitate while apparently blind, often without any problem or harm occurring.

Amplification. The amplification of vision and extraphysical illumination reach a point that exceeds the physical dimension, making it difficult to visualize the details of forms in the human dimension. This fact engenders errors in the interpretation of events and mistakes in the description of forms, things and objects which are seen.

Case study. One day, a group of explorers encountered a little girl, no more than 2 years old, in an encampment abandoned by the indigenous Guayaquils. The child was retrieved by an ethnographer who entrusted her to his own mother. Thus raised and educated in a new mesology or intraphysical environment and in the *highly civilized* European culture, the little “savage one” became a modern adult woman who, speaking many languages, conducted profound studies in ethnology, collaborated with her adoptive father and eventually married him.

Paramesology. If the human environment (mesology) exercises such a profound influence upon the intraphysical consciousness, it is to be expected that the extraphysical environment (paramesology) also exercises a significant influence upon the projected intraphysical consciousness, beyond the little we understand on this subject thus far. This fact deserves our reflection.

Bibliography: Castaneda (258, p. 207), Greenhouse (636, p. 253), Kardec (824, p. 163), Monroe (1065, p. 131), Ring (1406, p. 48), Vieira (1762, p. 107).

266. VEHICLE OF MANIFESTATION IDENTIFICATION TECHNIQUE

Definition. Extraphysical self-examination: the observation made, through extraphysical perceptions (paraperceptions), of the qualities and circumstances in which the vehicle of manifestation of the intraphysical consciousness projected from the human body presents itself.

Synonymy: para-somatognosis; projective self-examination.

Identification. Your consciousness, as a projector – in view of the improvement of your extraphysical performance, upon seeing yourself temporarily free from the human body – should endeavor to recognize and identify the vehicle through which you are manifesting on that occasion. This may be either the psychosoma or the mentalsoma.

Psychosoma. With regard to the projection of your consciousness in the psychosoma, it can be entirely free or, in other words, connected to the fine and almost always imperceptible silver cord, although with little or no energy pertaining to the nuclei of the holochakra. The psychosoma can also be partially formed, with varying concentrations of the holochakra's energy.

Observation. There are many specific conditions that permit you to differentiate the psychosoma from the mentalsoma, especially the observation of some basic aspects of the extraphysical experiment.

Differential. The basic differences between the psychosoma and the mentalsoma have already been established in detail through descriptions and comparisons made in various preceding chapters. They can be summarized with the following 13 variables:

1. **Takeoff.** The type of takeoff.
2. **Hyperacuity.** The degree of extraphysical self-awareness.
3. **Departure.** A single or double departure.
4. **Dimension.** The precise condition of the dimension of manifestation.
5. **Form.** The form of the vehicle of manifestation.
6. **Connection.** The nature of the intervehicular connection.
7. **Sensations.** The sensations of weight, emotionality and the nuances of extraphysical parapsychism.
8. **Influence.** The occurrence of some extraphysical influence.
9. **Participation.** The nature of participation with the extraphysical environment.
10. **Communicology.** The process of consciencial communication.
11. **Energy.** The effects of energy currents.
12. **Recognition.** The possibility of the projected consciousness being seen by other beings.
13. **Repercussions.** Physical and extraphysical repercussions.

Bibliography: Vieira (1762, p. 107).

267. EXPANSION OF THE PROJECTED CONSCIOUSNESS TECHNIQUE

Awareness. After becoming aware of which vehicle you are manifesting in, either the psychosoma or the mentalsoma, it will be easier for your projected consciousness to maintain lucidity and then expand your attributes and perceptions outside the human body, amplifying your level of extraphysical self-critiquing and hetero-critiquing judgment.

Psychosoma. When in the psychosoma, your projected consciousness should endeavor to remain as serene as possible, discarding all emotionality, of any origin or cause. You need to concentrate on the delicate importance of the situation while free in the extraphysical dimension and take advantage of that period of lucid projection.

Input. At this point, you need to clearly define which of your modes of sensory input are operating the most: vision, audition, olfaction, touch, inspiration or another extraphysical parapsychic input, in order to then endeavor to expand along that line.

Impressions. Your *consciousness* or, in other words, that which refers to your soma (you are not your soma) especially needs to disengage from these 3 impressions that cause the process of exteriorization related to your soma:

1. **Position.** The position in which you find yourself after takeoff from the psychosoma.
2. **Soma.** The ordinary vision of your inactive human body (soma).
3. **Base.** The details of the environment of your physical base.

Target. All this should be done in order to immediately reach another mental target that is propitious to the development of your extraphysical experiences and lucid projection itself, without losing sight of the educational opportunity in the projective period.

Deconditioning. Lucid projection is capable of alleviating and expanding the intraphysical consciousness' profoundly conditioned perceptions through a number of extremely powerful *restrictive factors* with a variety of origins and natures, notably the following 13:

1. **Ecology.** Environmental or mesological (ecology).
2. **Art.** Artistic or psychosomatic (self-mimicries, existential miniprogram).
3. **Science.** Scientific or mentalsomatic (reason, logic, cons).
4. **Economy.** Economic or related to intraphysical survival (money).
5. **Karmic group.** Relatives or the first and second families (groupkarmality).
6. **Politics.** Philosophical, ideological, political or doctrinaire (positioning).
7. **Paragenetics.** Holokarmic or personal paragenetic.
8. **Culture.** Intellectual or cultural (habits or one's own *little world*).
9. **Profession.** Professional or corporative (nepotism, the condition of *entanglement*).
10. **Psychology.** Psychological or mental (referring to the 2 cerebral hemispheres).
11. **Education.** Religious or relating to pre-maternal and maternal education.
12. **Intraphysical society.** Social or relative to the repressions of the *abdominal brainwashing* of intraphysical society.
13. **Genetic.** Personal somatic or genetic (hereditariness predominately from the father or mother).

Mentalsoma. If you are manifesting through the mentalsoma, your consciousness should seek, through extraphysical reflection, the greatest ideas that you have always wanted to investigate. This should be done while bearing in mind your short extraphysical stay in the mentalsomatic dimension and the need for you to remember these important events upon returning to the intraphysical dimension shortly thereafter.

Bibliography: Vieira (1762, p. 66).

268. ORIENTATION OF THE PROJECTED CONSCIOUSNESS

Definition. Projective orientation: the act of becoming aware of the extraphysical location in which the consciousness finds itself when projected from the human body, and its situation in relation to the extraphysical environment.

Synonymy: extraphysical metatropism; extraphysical self-location; extraphysical spatial awareness; para-spatial orientation; projective self-direction.

Space. Personal orientation is found to be intimately connected with the notions of space and time.

Categories. There are two basic categories of personal orientation:

1. **Self-psychism.** *Self-psychic* orientation relative to the person him/herself, or the condition which allows the intraphysical consciousness to identify him/herself, to clearly perceive where he/she is, the day, month and year (Gregorian calendar) and the situation in relation to the environment (mesology).
2. **Allopsychism.** *Allopsychic* orientation or the notion of the consciousness itself, intraconscientially speaking, in relation to the outside world per se (cosmos).

Terrestrial. Certain environments close to the troposphere (the earth's crust) allow the projected intraphysical consciousness to pinpoint his/her extraphysical location, e.g.: when finding him/herself projected above the human body, on the ceiling of the bedroom, in an ordinary bedroom in his/her own home, in a familiar location in the city where he/she resides, or in the familiar residence of a friend or relative.

Intuition. However, extraphysical self-location is not always easy, even in the paratroposphere. Extraphysical intuition greatly assists the orientation of the projected intraphysical consciousness.

Extraphysical. In extraphysical environments per se – which are native, paratropospheric, underdeveloped or evolved, more distant from the terrestrial atmosphere – the projected intraphysical

consciousness generally does not have sufficiently secure means or indications for orienting him/herself, except when he/she returns to the same location where he/she had previously been or when visiting a familiar extraphysical consciousness.

Classification. Extraphysical environments visited by the projected intraphysical consciousness can be classified into those which are known and unknown to the projector.

1. **Known.** In known environments, at least the following 4 variables should be observed:

A. **Location.** The personal location.

B. **Self-determination.** Self-determination regarding one's own destiny (goal, target).

C. **Parachronology.** The sense of time.

D. **Warning.** An inner warning or extraphysical intuition regarding the environment or district.

2. **Unknown.** In unknown environments, one can look for the smallest indications regarding the location, such as the following 8 variables:

E. **Meteorology.** The meteorological conditions at that moment.

F. **Sun.** The position of the sun, when visible.

G. **Week.** The day of the week and its relation to the flow of events.

H. **Meridian.** The time zone and the possibility of being in another terrestrial meridian.

I. **Approach.** A direct extraphysical approach made to *any consciousness appearing before you*.

J. **Signs.** Signs written in large letters above the roofs of intraphysical buildings (while volitating).

K. **Monuments.** Isolated monuments, especially those in the middle of a public square.

L. **Advertisement.** A lighted advertisement, poster, signboard, placard, billboard, or tower clock.

Objects. The following is a list of 11 key objects that can be useful for you, as a projected intraphysical consciousness, in order to awaken recollections and enable you to identify your extraphysical location:

1. **Residences.** Types of houses or buildings.

2. **Vehicles.** Types of vehicles, cars, trucks or carts.

3. **License plate.** The license plates of cars or vehicles.

4. **Make.** The make and model of vehicles.

5. **Print media.** Journals, magazines and periodicals, their dates, titles, texts, names of persons, photos or illustrations.

6. **Screens.** Screens and pictures placed for public viewing.

7. **Identities.** Living beings or extraphysical consciousnesses, their possible identities, names or personal identifying evidence (documents).

8. **Addresses.** Address tags on luggage.

9. **Factories.** Offices, companies or factories.

10. **Signs.** Signs over doors (cultural or commercial).

11. **Signboards.** Gate signboards or street signs.

Erraticism. *Projective erraticism* is the temporary condition of the erratic consciential projector, namely that projected intraphysical consciousness who leaves the human body without orientation, in a lost manner, and is unable to locate him/herself. He/she is not able to reach his/her mental target when he/she has one and does not even arrive or reach a familiar extraphysical district, even after several attempts, only appearing at unfamiliar locations.

Panic. Regardless of the situation, extraphysical disorientation and the condition of projective erraticism usually neither cause substantial negative consequences nor should they scare the projected consciousness which, in every extraphysical situation, needs to avoid panic. Panic almost always signifies the abrupt, traumatic and undesirable ending of the consciential experience, and the sudden return of the consciousness to the human body accompanied by intraphysical repercussions.

Inertia. Obviously, neither the physical base, nor the human body – both temporarily abandoned – change location during the period of the consciousness' lucid consciential projection. This is a question of logic regarding the inertia of bodies.

Interiorization. Whenever necessary, the projected intraphysical consciousness needs only to think about his/her own human body, maintaining a firm desire to return to the physical base, resulting in his/her return, interiorization and physical awakening, without any major problems or obstacles.

Sense. The projected intraphysical consciousness, due to the operation of the silver cord in the *extraphysical dimension*, on the one hand, and the performance of the golden cord in the *mentalsomatic dimension*, on the other hand – whether consciously or unconsciously regarding these operations – enjoys a generally infallible sense of orientation in *extraphysical space* for returning to the isolated human body or to the coincident human body and psychosoma, which were left inactive in an intraphysical base.

Stereognosis. This occurs in the manner of *stereognosis*, in the common stereognostic sense, as with carrier pigeons and swallows, in regard to their movement in the *airspace* of the terrestrial troposphere and paratroposphere. This is also the case with dogs, cats or ants, in their dislocations on the *physical space* of the earth's surface.

Hypothesis. The 4 senses of orientation of these 4 types of subhuman animals, with manifest effects of dislocations in 4 very distinct *mesological conditions* may have a more intrinsic, profound and common cause to all 4. Which one? What? This research hypothesis is posed here in order to be tested.

Bibliography: Frost (560, p. 98), Kardec (824, p. 149), Monroe (1065, p. 60), Vieira (1762, p. 18).

269. EXTRAPHYSICAL ENVIRONMENTS

Definitions. Extraphysical environment: the location where the projected intraphysical consciousness locates him/herself outside the human body and the tridimensional geographic world; the sphere or dimension of life beyond the intraphysical, material or human dimension of existence.

Synonymy: alternant realities; alternative realities; alternative universe; astral domains; astral kingdoms; astral light; astral plane; astral reality; astral world; beyond the grave; beyond the tomb; circle of rescues; cryptocosmos; dimensions of existence; engaged universes; extraphysical district; extraphysical *habitat*; extraphysical plane; extraphysical state of the consciousness; extraphysical world; extrasensory world; fourth dimension; hyperspace; intertwined worlds; invisible space; invisible space-time; invisible world; kingdoms of existence; levels of reality; meta-etheric environment; meta-etheric planes of existence; meta-etheric worlds; parallel dimension; parallel universe; plastic interactive world; pluridimensions; polydimensional planes; second state; *second universe*; spiritual fields; spiritual world; spirituality; tachypsycholand; the beyond; transpersonal dimensions of the psyche; transpsychic reality; vibratory frequencies; world of immortality.

Principle. Any extraphysical district, above all, constitutes a state of consciousness and not a place. This is an essential principle of parageography (extraphysiology).

Schools. According to the Chinese researcher Solon Wang, the following are the 14 most important schools of knowledge on earth. Six of them are religions, 3 being Eastern, listed in decreasing number of adepts, namely Brahmanism or Hinduism, Buddhism and Zoroastrianism; and 3 being Western, listed in decreasing number of adepts, namely Christianity (Jesus of Nazareth), Islam (Mohammed) and Judaism (Moses). Six are philosophies, 3 being Eastern, namely Taoism, Confucianism and Yoga; and 3 being Western, namely Greek (Pythagoras and others), European Spiritualism (Descartes and others) and Materialism (Karl Marx: 1818-1883, and others). Two are sciences, natural or ancient science and new or psychic science.

Acceptance. Of these 14 schools of knowledge, 12 accept the existence of multiple dimensions in the cosmos and life and only two, ancient science and materialism, accept only the material or intraphysical dimension.

Tendency. Even in ordinary human life, every individual has his/her own personal conception of the world, possibly being born with a strong tendency to inhabit a certain type of universe to the detriment of the other.

Microuniverse. Every consciousness possesses its own personal microuniverse.

Intraconscientiality. The world is, above all, inside us.

Equality. We are not in a single world that is identical for all of us.

Acuities. The acuities of our physical senses (vision, audition and others) and parapsychic perceptions (lucid projection, clairvoyance and others) vary from adult to adult, from child to child, from animist to animist, from projector to projector, from sensitive to sensitive.

Serenissimus. *Serenissimus (Homo sapiens serenissimus)* lives simultaneously in various dimensions, with great equilibrium and self-awareness, wherever wishing to manifest.

Pre-serenissimus. Projectiology offers the intraphysical consciousness – or the *pre-serenissimus*, namely any one of us – the techniques for achieving, living and lucidly enjoying the fruits of the period of resoma with a new intraphysical life and the execution of the existential program.

Categories. Regarding the nature and the predominant quality of the energetic exchange between intraphysical consciousnesses per se, and between intraphysical consciousnesses and extraphysical consciousnesses, in relation to developed sensitives (whether aware or unaware of their abilities or potentialities), human environments can be classified into 3 categories:

1. **Absorbing:** slaughterhouses; nightclubs; gambling establishments; casinos; cemeteries; police stations; hospitals; institutions of social welfare; banking establishments; penitentiaries.
2. **Donating:** touristic spots with few visitors; jungles; tranquil parks; public squares with few transients; beaches with few beachgoers.
3. **Ambivalent:** sports clubs; open air performances; elevated artistic shows; motels; crowds; religious temples.

Sensitive. In order to live harmoniously, the intraphysical sensitive needs to know how to behave in each of the above-cited locations, without fearing or fleeing from any environment.

Projector. The same occurs with the projected intraphysical consciousness in the extraphysical dimension, in relation to the environment and the beings and extraphysical consciousnesses which he/she comes across. Nevertheless, there are extraphysical locations which should be wisely avoided.

Spaces. Lucid projection opens up new and broader spaces to the intraphysical consciousness, which are much more diversified than the entire immense physical universe (cosmos) that humankind knows and has partial access to.

Types. Extraphysical environments can be classified into 4 types or levels:

1. **Cord.** The reduced perimeter of the vigorous action of the silver cord; the perimeter of which extends 13 feet (4 meters) from the human brain.
2. **Paratroposphere.** The plane or dimension that is coincident with the physical universe; the crustal or paratropospheric dimension.
3. **Extraphysicality.** The extraphysical plane or dimension per se, beginning from the energetic dimension; the extraphysical spheres.
4. **Mentalsomatics.** The mentalsomatic dimension.

Districts. It would be more realistic to characterize the districts – the physical and the extraphysical – as having 3 basic consciential states:

1. **Deficiencyland.** In the physical dimension, or *deficiencyland*, things, creations or objects appear to be more well-defined and delineated for the individual.

Words. Here, words endeavor to express ideas which are also defined in their smallest detail regarding the consensual or objective *reality* (for us).

2. **Transitland.** The tropospheric extraphysical dimension, or *transitland*, is always in transition, its forms varying infinitely, at every moment, according to the perceptions of the consciousness which is manifesting there.

Morphothosenes. Morphothosenes dominate the multiple environments and the expression of ideas can be executed telepathically, either with or without words.

Illusions. This is the dimension of illusions (the *Maya* of the extraphysical side) more closely related to dreams, nightmares and hallucinations in general.

3. **Conscientioland.** The mentalsomatic dimension, conscientioland or idealand, is the dimension of the future, of pure ideas and *en bloc* ideas, that dispenses with articulated words, and where life also expresses itself telepathically.

Conscientese. The native language in the mentalsomatic dimension is *conscientese*.

Vehicles. The extraphysical environments constitute some of the most serious problems for the intraphysical consciousness, based on the principle that the vehicles of consciential manifestation are relative, and are especially employed here as didactic resources for research.

State. Above all, the inner, personal state of the consciousness always predominates.

Simultaneity. Your perceptions – as a lucid projector – do not remain limited to a single scenario of the environment. The simultaneous perception of multiple environments can occur during a lucid projection. This sometimes greatly complicates things and profoundly confuses the consciousness.

Discontinuity. Consciential states are often more important than the environments which are perceived or identified, since a permanent discontinuity of the levels of the consciousness occurs. In a single projection, the projector can reach various levels of consciousness or different extraphysical environments in succession, whether or not he/she is aware of it.

Perceptions. The disparity of the consciousness' perceptions in relation to the perceived realities is another powerful factor of interference and is difficult to resolve within the restricted scope of rudimentary research that so far exists on the subject.

Everydayness. The extraphysical experiences of the projected consciousness are similar to momentary sensations, but they do not have the same type of relationship with the external or physical world as do the common everyday sensations in the ordinary, physical waking state.

Description. From this arises the basic problem of the manner in which to describe such experiences. Extraphysical journeys, from the very start, are included by the novice projector among the mnemonic occurrences.

Conditions. Three facts prove the affirmation that extraphysical dimensions are a state of being, or a condition of the consciousness:

1. **Superimposition.** The planes or dimensions are not physically superimposed upon each other in the way we are accustomed to thinking in terrestrial or intraphysical life.

2. **Distinction.** The planes or dimensions do not have a clear spatial distinction.

3. **Differences.** The planes or dimensions do not present degrees of differentiation that allow easy characterization.

Psychiatry. According to modern psychiatry, the lower the social level of the population, the greater the incidence of mental disturbances. For example, human migrations and subhuman conditions, or social pressures, in the peripheries of the big urban centers (megacities, megametropolises, megalopolises) predispose an elevation in the index of psychiatric disturbances (neuroses). In general, 50% of cases occur within lower economic levels, 30% in the middle class and only 20% within more privileged classes. Psychiatric problems increase when the migrant does not work. If he/she has some type of activity, the index of psychiatric disturbances is equal to that of the local active population.

Reflexes. This human scenario precisely reflects, or is reflected, in its entirety, in extraphysical tropospheric environments that are populated by extraphysical consciousnesses (extraphysical migrations from the first desoma) which suffer from post-desomatic parapsychoses, or other consciential disturbances restricted to holosomatic parapatology, or the parapatology of the mentalsoma, psychosoma and holochakra.

Evolution. The extraphysical dimension, per se, as well as the mentalsomatic dimension, can be divided according to the evolutionary level of the consciousnesses which are encountered there – whether they are in transit or remain for longer periods of time – into 4 types of environment:

1. **Paratroposphere.** The *underdeveloped* extraphysical dimension (paratroposphere, ordinary *paraspeech*).

2. **Communities.** The evolved extraphysical dimension (communities of advanced extraphysical consciousnesses, telepathy).

3. **Cosmoconsciousness.** The *underdeveloped* mentalsomatic dimension (the phenomenon of cosmoconsciousness).

4. **FCs.** The evolved mentalsomatic dimension (free consciousnesses or FCs, conscientese).

Evolved. The majority of the considerations and analyses of this book – which endeavors to be practical and aims to avoid misunderstandings when referring, in theory, to the extraphysical dimension, per se – takes its evolutionary level into consideration. The same applies with regard to the mentalsomatic dimension. The observations in general made here refer to the evolved mentalsomatic dimension or, in other words, the one with well-defined characteristics.

Autochthons. The extraphysical consciousnesses or those consciousnesses belonging to extraphysical environments – namely the primitive inhabitants, aborigines, natives or autochthons of extraphysical districts – although periodically going through *resoma*, do not have races like those of human inhabitants.

Paragenetics. The essence of genetics is transmitted from one intraphysical consciousness to another. The essence of paragenetics *is not* transmitted from one consciousness (or extraphysical consciousness) to another.

Similarities. Extraphysical consciousnesses are similar with regard to the process of consciential evolution, but dissimilar with regard to the evolutionary levels of consciousnesses in general when considered individually.

Time. There are extraphysical environments that can be classified according to chronological time because they seem to better allow “journeys” of the consciousness backward, into the past or retrocognitive, and forward, in the future or precognitive. This is especially true with the gradations of the mentalsomatic dimension.

Cosmos. Other extraphysical environments are unarguably distant from the terrestrial crust, or troposphere, out in the cosmos or distant sidereal space (for us), where the consciousness docks itself through lucid consciential *exoprojections*.

Worlds. From a real perspective, or one relative to consciousnesses and their existence and evolution, not considering their vehicles of manifestation, there are at least 6 consciential worlds, according to the relative theory of World 3, proposed by Karl Raimund Popper (1902-1994) (*Objective Knowledge: An Evolutionary Approach*; London; Oxford University Press; 1972; p. 118; Eng., Port.) to wit:

1. **World 1:** the objective plane of material things; the physical universe; the world of material states.

2. **World 2:** the subjective world of minds or consciential principles that have gone through *resoma*; the mental universe, a specific place for human and animal minds, a mediator between World 1 and World 3.

3. **World 3:** objective ideas; public domain objective structures (microcosm), a product, which is not necessarily intentional, of the action of the consciousnesses of living beings (intrapysical beings) and which, once having arisen (produced by humankind), exists independent of these consciousnesses (houses, cities, machines, vehicles and others); human cultural inheritance.

4. **World 4:** the objective extraphysical dimension, the paratroposphere and the extraphysical dimension per se; the extraphysical universe (four-dimensional or tetra-dimensional); the world of extraphysical states.

5. **World 5:** the subjective mental (consciential) dimension of (cosmic consciential) cosmoconsciousness, utilized by intraphysical and extraphysical consciousnesses, without the charge of human passions, which is still extremely obscure for intraphysical consciousnesses.

6. **World 6:** objective structures (macrocosm), a product, which is not necessarily intentional, of the action of evolved extraphysical consciousnesses and which, once having arisen, exists independent of these consciousnesses (planets, solar systems, galaxies), including the abstract structures created by extraphysical consciousnesses (projectability, conscientese, code of extraphysical cosmoethics, universalism, extraphysical maturity, scale of the state of continuous self-awareness); *extraphysical cultural inheritance*.

Primothesene. Besides this new concept of *extraphysical cultural inheritance*, it is assumed that there was a primary cause, or primothesene, that created the *initial* World 1, and began the cycle of worlds that currently exist, are discernable and can be enjoyed by self-aware, self-critiquing and heterocritiquing consciousnesses. This implies the crude, physical Big Bang concept of conventional science.

270. TROPOSPHERIC EXTRAPHYSICAL DIMENSION

Definition. Tropospheric extraphysical dimension: the extraphysical environment that is a duplicate of the physical or human environment and coexists with it (see fig. 270, p. 1,138).

Synonymy: afterdeath world; anti-environment; astral side; astral world; astraline world; chimerical lights; crustal plane; crustal sphere; exterior darkness; hyperspace; immediate post-physical areas; inferior astral; invisible world, OBE world; low-astral; paratroposphere; pathological deposit; posthumous world; psi world; reflecting sphere; second world; the astral here and now; transitland; transpsychic reality; *umbral*; vestibule of learning; world of illusion; world of reflections; world of thoughts.

Existence. Extraphysical things, objects and forms inevitably exist prior to ourselves in our perceptions as intraphysical projectors, even when we are not aware of it. Extraphysical nature is prior to our organic nature, as temporary human beings.

Crust. In principle, geographically speaking, the dense, tropospheric (or paratropospheric) extraphysical dimension is very similar to the physical world (the natural world or *mythland*).

Term. The term *districts* is better adapted to the crustal (paratropospheric) dimension or that which is coincident with the objective, physical universe. This is because, in this case, there are areas – or districts, spheres, spaces, locations, places, planes, regions, subplanes or zones – that are less mutable to the perceptions of consciousnesses and are beyond the individual state of each consciousness, whether using expressions such as: *spiritual world*, used by spiritists; *astral* plane, according to the language of theosophists; or *astral* light, according to magicians.

Situation. Although the crustal or tropospheric extraphysical dimensions do not exist just because they are linked to the planetary crust, or the earth, many persons become disturbed upon thinking about where they are situated, located or are physically dependent.

Earth. It is worth bearing in mind that the planet earth is not just a simple, naked globe that ends in the clouds or the boundaries of the troposphere.

Layers. The earth is like a cosmic spaceship with outer walls composed of invisible atomic particles, which terrestrial magnetism (geomagnetism) has in 3 covers or layers:

1. **First.** The first Van-Allen layer (radiation belts), with a thickness of 3,000 mi (5,000 km).
2. **Second.** The second Van-Allen layer, with 12,000 mi (20,000 km).
3. **Magnetosphere.** The magnetosphere, which extends approximately 40,000 mi (65,000 km) into the physical universe.

Aura. In this *physical aura of earth* – which surrounds and accompanies it throughout the universe – the extraphysical crustal planes or dimensions progress and orbit it like *invisible extraphysical satellites*.

Parageography. In paratropospheric, crustal extraphysical environments, or those which coexist with human life, there is a real transcendent geography, or *parageography*, that still requires mapping. It is constituted and defined – beyond being a duplicate of physical objects and beings – through the

accidents generated by consistent and less transitory morphothosenes that have persisted over the human centuries. This is especially true regarding communities that have contact with terrestrial life, the *habitat* of extraphysical beings (extraphysical consciousnesses), areas of still very materialized transition. There is even that which can be called *extraphysical ecology (para-ecology)*, or the physical-extraphysical ecosystem.

Space. Parageographic space can be located, differentiated and varied. It is described as having a delimited portion of a paraterritory (para-subsoil, para-soil, para-air), which encompasses an extraphysical, parabiological or extra-human reality. From this arise the crustal, darkened and subcrustal extraphysical areas.

Paraterritory. Parageographic space, in general, is perceived as being a paraterritory that is akin to a human territory or a part of it (region, county, state, province, city, borough, neighborhood or district).

Parapopulations. In this parageographic space, extraphysical communities, para-animals and parapants are established, where paraspecies and (extra-human) parapopulations are found.

Organization. All this results in a *metastable extraphysical organization*.

Morphothosenes. The morphothosenes comprising the paratropospheric space allow a comprehensive understanding of its para-reality, in the practical study of the interior (paradecoration), or the set of the perceived volumes of the exterior (para-urbanism or urbanization and extraphysical reurbanization).

Deterioration. In sociology, the zone of deterioration or vice is already well-defined: a zone of the city characterized by the precarious state of edification and the high level of maladjustment of its inhabitants (slums).

Uncontrol. The individuals in that place endeavor to evade certain forms of social control and tend to get caught up in the confusion and variety of the behavior patterns of that area. In this place concentrations of the greatest variety of youth gangs, prostitution, delinquency, drug trafficking, violence, misery and vice (sociopathologies, sociopathies) are found.

Mold. This area of deterioration, as well as others, tends to mold its inhabitants.

Parody. The zone of human deterioration is nothing more than an imperfect and parodic copy of the shadowy paratropospheric areas visited by the consciencial projector when serving as an extraphysical assistant.

Resonance. These physical-extraphysical zones, or toxic-universes, resonate with each other and the consciousnesses there exchange ideas, emotions, attitudes and objectives.

Base. Obviously, the physical base in one of these zones is naturally predisposed to a permanent connection with the deteriorated crustal paratropospheric areas.

Extraphysical clinic. If someone works in one of these areas with the practice of penta, he/she will, after a while, have an ample and busy extraphysical clinic of interconsciencial assistance.

Assistential. In assistential projections, the projected intraphysical consciousness will inevitably travel to unevolved extraphysical districts that have received various names over time, such as the following 8:

1. Hades (Robert Crookall: 1890-1981).
2. Inferior Astral Plane (Theosophists).
3. Inferno (Dante Alighieri: 1265-1321).
4. *Kamaloka* (Hindus).
5. Locale II (Robert Allan Monroe: 1915-1995).
6. Purgatory.
7. Sheol.
8. *Umbral* (Spiritists).

Animals. The extraphysical beings (extraphysical consciousnesses at different evolutionary levels) found in the bowels of the planetary crust, in these shadowy or more backward zones, seem to undergo a phenomenon of evolutionary standstill or temporary degeneration, reminiscent of the conditions of sub-human and even human beings, such as the following 5 species:

1. **Endógeos.** *Endógeos*, which are constantly digging the soil (burrowers).
2. **Cavernicoles.** Troglóbionts or cavernicoles.
3. **Folióbios.** *Folióbios* or the inhabitants of caverns and mounds of earth.
4. **Topóbios.** *Topóbios* or those which remain under rocks or fissures in the soil.
5. **Troglodytes.** Troglodytes namely, cave-dwelling humans.

Extraphysical. Strictly speaking, the denser extraphysical world (or that with concrete forms, concretions, concretism and concreteness) has its beginning at the edge of the frequency of manifestation of the vehicles of manifestation of the consciousness beyond the holochakra or, in other words, excluding the human body and the holochakra – which can be detected by rudimentary human instruments – and beginning with the psychosoma, in the tropospheric extraphysical dimension, and spanning to the mentalsoma, in the mentalsomatic dimension.

Temperatures. It is important to note that the evidence gathered through various parapsychic phenomena suggests the continuous and predominant existence of extremely low temperatures (para-sensation) in the tropospheric extraphysical dimension, such as the temperatures of interstellar space.

Ectoplasmy. This explains the cooling that occurs in the human environment during parapsychic manifestations with physical effects, ectoplasmy, telekinesis, dematerialization and currents of cold air.

Population. In the tropospheric extraphysical dimension, the extraphysical consciousnesses which make up the crustal phantasm population are found. These extraphysical consciousnesses, in their own *habitat*, are so *solid* or firm and extremely objective, having real bodies which are so dense they can collide with your intraphysical consciousness – when you are projected in the psychosoma – which nevertheless also passes through all *physical* objects, moving human vehicles and even solid granite.

Novelism. In tropospheric extraphysical environments or those coexisting with human life, novel events occur, depending upon the location, such as the following 4:

1. **Movie.** Glide in front of a movie projector lens and the moviegoers, watching everything, without your presence being perceived.
2. **Electricity.** Pass through the thick electrical structures of fully functioning power plants.
3. **Ocean.** Plumb the depths of an oceanic abyss, visiting a strange and exotic world.
4. **Fire.** Pass through a wall of flames during a conflagration.

Comprisal. The tropospheric extraphysical dimension does not only refer to the earth, but to *all* planets in the universe, whether or not they are inhabited.

Patterns. There is only *one extraphysical dimension* in the universe, in spite of its different vibratory, frequency or existential patterns. Moreover, there is only one mentalsomatic dimension in the entire universe.

Gradations. Likewise, there is only one physical or material dimension, in spite of its different vibratory gradations – soil, water, air, solid state, liquid state, gaseous state, plasma, fields (such as electromagnetic, gravitational or nuclear) – with variable vibratory effects that are interconnected at each level. This constitutes the physical universe of the ordinary, physical waking state of the consciousness, on any planet at the same evolutionary level.

Parallel. These 3 dimensions – the physical, extraphysical and mental – comprise the so-called *basic parallel universes*.

Language. In common parlance: in the *tropospheric* or crustal extraphysical dimension it is futile to have the *para-demeanor* of saintliness, waste *para-breath*, walk on *para-eggs* or adorn yourself with peacock *para-feathers*. However, you should confront everything with *parahead* held high, without being asleep at the *para-switch* (physical base), being the captain of your own *para-ship*, aware that one *parahand* washes the other and that the extraphysical sun rises for all consciousnesses.

271. EXTRAPHYSICAL COMMUNITIES

Definition. Extraphysical community: the field of consciential energy – group energy, in this case – formed by the conglomerate of morphothosenes from groups of kindred extraphysical consciousnesses which are cohesive due to deep, complex and permanent links of self-interest.

Synonymy: community of extraphysical consciousnesses; consciential colony; extraphysical consciential conglomerate; pre-resomatic laboratory.

Consciousness. The world – regardless of which one – is a mere appearance outside the consciousness.

Abstraction. There is no abstract thought for the consciousness.

Knowledge. Knowledge is always subjective.

State. This is why we reaffirm that any physical or extraphysical district is, above all, a state of consciousness for the consciousness and not a place, or temporal-space reference.

Tropism. There is a presumption that the first extraphysical communities on a planet are formed in the manner of a spontaneous (energetic) tropism that occurs with the so-called *group-souls* of subhuman animals.

Pockets. The gathering of kindred consciousnesses creates energetic pockets. They are formed in an *instinctive*, spontaneous or completely unconscious manner or, in other words, are automatically determined by the predominant animal instincts that still remain in the average being or intraphysical consciousness which has undergone desoma.

Types. The most diverse types or categories of extraphysical communities exist. They can be formed by an overwhelming majority – which represents their *raison d'être* – of extraphysical consciousnesses with a masculine or feminine mentality, of extraphysical consciousnesses with a homosexual mentality, of former nationalist militants, of former artists in general, of former musicians, of former religious professionals, of former scientists and of other groups that were formed in human life.

Aims. Organized extraphysical communities – formed through the will of the consciousnesses mobilizing morphothosenes – aim, in principle, toward two basic or characteristic ends:

1. **Farewells.** Help those extraphysical consciousnesses which will go through resoma or, in other words: sponsor the *extraphysical send-offs* or farewells for those which will once again submit themselves to the restriction of their own consciousness through the *shock of resoma*.

2. **Reception.** Welcome those intraphysical consciousnesses which have left the period of intraphysical existence, those recent desomants or, more precisely: the *extraphysical reception* of those which have passed through the *first desoma*.

Transition. In both cases, the extraphysical communities serve as places of transition between one dimension of consciential life and another.

Parahospitals. Without a doubt, the extraphysical reception communities are the most numerous and problematic. They are true parahospitals or extraphysical assistance colonies because they welcome the veterans arriving from the frontline of human life. They are very different from extraphysical send-off colonies, which are involved with the resomatic preparation of the candidates to existence with a human body, an opportunity that is always full of hope, projects, existential programs and positive forecasts.

Paramentality. As a general rule, an extraphysical community will be more evolved proportionately to the average level of universalism of its extraphysical population's *paramentality*, or the predominant group materthosene in its holothosene.

Paratroposphere. In view of this, there is a much greater number of extraphysical communities of deceased ill intraphysical consciousnesses on the planetary crust (paratroposphere) – which are easier to encounter – than the number of evolved extraphysical conglomerates.

Groups. There are *parasocial* groups of extraphysical consciousnesses which are so withdrawn and suspicious that they do not even allow themselves to be observed by extraphysical or lucidly projected intraphysical participant-observers.

Assistants. Certain groups of extraphysical consciousnesses remain so impacted, introverted and inaccessible that they refuse to paracoexist with other neutral extraphysical consciousnesses or those more reliable observers or external assistants.

Hostility. Thus, at least the following 5 categories of extraphysical consciousnesses antagonize all those appearing in their communities:

1. **Interprisons.** Sectarians, factionalists, corporatists, fanatics, votaries, lobbyists or politicians who have passed through desoma and are already bound in groupkarmic interprisons.
2. **Paramafias.** Paramafias or gangs (*societas sceleris*) of deceased criminals.
3. **Anticosmoethical.** Extraphysical groups that plan some type of anticosmoethical strategy (mega-intruders).
4. **Defense.** Associations which retain knowledge that, according to their elements or components, must be aggressively maintained in secrecy for their common or evolutionarily wrong defense.
5. **Intimacy.** Extraphysical consciousnesses which live in great *parapromiscuity*, in a vulnerable condition of intimacy among themselves.

Visits. Sadly, the tropospheric and morbid extraphysical communities on this planet are still those which are most visited, night after night, by the great majority of the members of somnambulistic humanity (existential robotization). This occurs during natural sleep, when they leave their somas and intraphysical bases in nonlucid and semilucid consciential projections in all latitudes, continents, countries, metropolises, villages and rural zones.

Obstacles. These facts remain powerful obstacles to the consciential progress of everyone in the holothosene of intraterrestrial life. This is because they certainly show that the majority of human consciential projectors is made up of those who are still suffering from blatant intrusion, those suffering from partial intrusion or useful-innocents of intruders, satellites of intruders and extraphysical blind guides.

Approach. In general, the lucid projector senses that he/she is taken from the physical base, first volitating some yards (meters) above the ground, rising higher and higher and increasing his/her extraphysical speed upon getting farther from the human body, until arriving at the extraphysical community.

Buildings. Frequently, the para-buildings of extraphysical communities, when more closely related to human life, precisely reproduce the outside and interior decoration of the residences from the most recent intraphysical life of those deceased intraphysical consciousnesses which temporarily inhabit them in the intermissive period. This reality confuses projected intraphysical consciousnesses.

Reproductions. There are extraphysical reproductions which are true maquettes or living scenarios of entire neighborhoods of human cities.

Extraphysical consciousnesses. In a preliminary analysis which is independent of the evolutionary level and state of consciential health, the extraphysical consciousnesses encountered in extraphysical communities can be classified into 4 categories:

1. **Subcrustal.** Subcrustal or intraterrestrial, per se.
2. **Crustal.** Crustal or paratropospheric.
3. **Volitator.** Volitators or volitants.
4. **Mentalsomatic.** Mental or mentalsomatic.

Deintrusion. Major intraphysical consciousness-extraphysical consciousness intrusions are only removed when it is possible to directly extract the last vestiges which are firmly planted and fixed in a crustal or paratropospheric extraphysical community, which constitutes the extraphysical or presomatic origin (extraphysical hometown) of the intraphysical consciousness suffering from intrusion.

Evolutiologists. Hence the transcendent value of the extraphysical deintrusion task performed with the participation of intraphysical consciential projectors and the consequent service of the rebirth of these intrusive extraphysical consciousnesses realized by helpers, consciential epicenters, petifree consciousnesses and evolutiologists.

Dismantling. Consciential progress can only become consolidated on this planet after the total dismantling or reurbanization of thousands of these shadowy, morbid and tragic tropospheric or crustal extraphysical communities (parapathology).

Responsible. These communities are responsible for the great individual, group and collective intrusive processes between intraphysical and extraphysical beings. They are also responsible for the deliberate obstruction of the installation of a higher level of maturity and recuperation of cons (hyperacuity) among terrestrial (intraphysical and extraphysical) consciousnesses.

Extraterrestrials. Myriads of more evolved extraterrestrial extraphysical consciousnesses which have never had resomatic experiences on this planet are currently deeply extraphysically involved in the methodical and continuous extinction of multimillenary morbid extraphysical communities which *metastasize*, encyst and weigh upon human life and extraphysical terrestrial life.

Reurbanization. It is believed that this is the greatest effort toward collective deintrusion and extraphysical reurbanization that has ever been undertaken on this planet throughout its entire history of multimillenary multiexistential cycles (holoresomatics, holobiographies, holomemory) up until the present.

Pocket. Based on the fact that every bioenergetic field is situated in the still very obscure *three-and-a-half dimension* (energetic dimension) and that every extraphysical community constitutes a group energetic field, it can be concluded that every extraphysical community is also situated in the energetic dimension, forming an *interdimensional* and specific pocket of group consciential energy. This is inserted between the physical (human) dimension and the tropospheric extraphysical dimension, which is close and concomitant to the intraphysical (dense) dimension.

Dimension. The following are 7 characteristics of the energetic dimension:

1. **Deaths.** The space-time of the first and second desomas.
2. **Intermission.** At least a minimal portion of the intermissive or inter-resomatic period of the consciousness.
3. **Looseness.** The level of operation of the looseness of the holochakra (of the intraphysical consciousness).
4. **Bradycinesis.** The area of the totipotent operation of the silver cord or the so-called *condition of double awareness*, oneiric images (dreams) and extraphysical slow motion or bradycinesis.
5. **Discoincidence.** The specific environment of discoincidence of the vehicles of manifestation of the intraphysical consciousness.
6. **Gravitation.** The graduated gravitational field of the planet.
7. **Evolution.** The beginning of the interaction and acceleration of the consciential evolutionary rhythm.

Semimateriality. In view of the above, one can more rationally interpret the aspect, which is sometimes more difficult to understand, of the evident semimateriality of the extraphysical communities described in minute detail by lucid projectors and communicant extraphysical consciousnesses through various types of parapsychic manifestations in different times and locations.

Bibliography: Baker (69, p. 79), Borgia (171, p. 42), Monroe (1065, p. 73), Owen (1177, p. 261), Vieira (1762, p. 181), Xavier (1882, p. 263).

272. EXTRAPHYSICAL DIMENSION PER SE

Definition. Extraphysical dimension per se: the native, preexisting extraphysical environment in relation to the human dimension, with no direct, ostensive or easy connection with intraphysical life.

Synonymy: extraphysical *habitat*; higher astral; medium astral; pure spiritual dimension; pure spiritual plane; purely consciential sphere; ultraterrene stop.

Thought. All thoughts, wishes and acts are far more intense, quick and *corporifying* in the multidimensional, coexisting and interpenetrating circles of the extraphysical dimension.

Concomitance. There, thought is action or, in other words: thought and action manifest concomitantly. There is no time lag between them, as occurs in the physical dimension.

Waves. Radio and television waves are very real. They are solid and, in spite of this, mix and pass through each other without colliding, as long as each one of them remains in its frequency or “vibrations per second” range.

Analogy. This provides an analogy or a good example for picturing scenes, places and facts pertaining to the extraphysical dimension or, in other words, the environments which the intraphysical consciousness encounters when he/she projects him/herself and will also encounter after deactivation of the human body.

Solidity. Scenes, places and facts are, locally speaking, very solid things in our own habitual plane of human experience. There is no reason for us to presume that the scenes, places and facts we experience while projected from the human body are different in terms of their *local solidity*, in any dimension of existence aside from ordinary dense matter.

Extraphysical. In extraphysical environments per se – unmapped regions, the *habitat* of extraphysical beings – we encounter communities of extraphysical consciousnesses that are kindred in their harmonies and their imbalances. This gives rise, for example, to the following 5 categories:

1. **Agreeable.** Agreeable, healthy places which are still indescribable for us as intraphysical consciousnesses.
2. **Transitional.** All types of transitional places.
3. **Convalescence.** Regions of extraphysical convalescence which are adapted to the work of successive intraphysical lives.
4. **Bedroom.** *Extraphysical bedroom communities.*
5. **Subplanes.** Negative or ill extraphysical subplanes.

Bell tower. There are vertical, elevated extraphysical communities, created like groups of bell towers or bird houses, without floors, highways or streets, as we understand them. They are adapted to flying residents, their buildings having open air access in all directions.

Paraplants. Living plants that are long, luminous, colored, transparent and very tall in relation to the buildings are seen to sprout up around the fliers’ roadless housing complexes. It is not known whether these paraplants always grow to that size and if they reproduce in that dimension (parabotany).

Psychosoma. As previously explained, the psychosoma operates as a morphogenetic model for the human body, orienting its growth and its forms, in peaceful coexistence with the laws of genetics harmonized by the specific paragenetics of the resonant extraphysical consciousness.

Hypotheses. The following are two work hypotheses: Is it possible that something similar occurs in relation to the planets or the entire physical universe? What is the profound relationship between the native extraphysical dimension and the physical dimension?

Interpsychology. Interpsychology is the science that studies the psychological reactions which individuals of a collective induce in other individuals.

Assimilation. The intentional or unconscious interaction of individuals would trigger resistance, opposition or, conversely, an assimilation of one individual by others.

Inspirations. The highest degree of reactions pertaining to interpsychology – which in this case are also transcendent – occur individually among the inhabitants of the physical and extraphysical tropospheric consciential dimensions. Examples of this can be found in the phenomena of inspirations, intuitions and intrusions triggered by extraphysical consciousnesses.

Collective. Joint reactions already refer to collective parapsychology.

Bibliography: Monroe (1065, p. 73), Vieira (1762, p. 50), Xavier (1882, p. 17).

273. MENTALSOMATIC DIMENSION

Definition. Mentalsomatic dimension: the extraphysical environment that is characteristic to or native to the mentalsoma.

Synonymy: conscientioland; mental sphere; *habitat* of thoughts; *manasloka*; plane of omniscience; third astral plane; vestibule of wisdom; think tank.

Storehouse. Upon achieving cosmoconsciousness in mentalsomatic projections, the projector participates in the collective field of the consciousness, the storehouse of the universal consciousness or the mental plane, the domain of the so-called “*akashic register*”, the universal, eclectic and equalizing meeting place which is common to all consciousnesses, a free area for those capable of reaching it and enjoying it.

Global. Only the mentalsomatic dimension allows the consciousness to experience an expansion such that it achieves the global or universalized view of the entirety of *all things* in a single whole, establishing the lines of union between phenomena or universal events.

Types. The mentalsomatic dimension can be interpreted from 2 standpoints, or placed into 2 levels of classification, according to the manifestations which it affords: the underdeveloped mentalsomatic dimension and the evolved mentalsomatic dimension.

1. **Underdeveloped.** The first mentalsomatic dimension, which can be called corporeal, is still inferior in regard to consciential evolution, being mixed with energies of the psychosoma or the evolved extraphysical dimension per se. It allows the interdimensional dislocation of a ball of energy, a vital ovoid or energetic fulcrum, evolving to a point of consciousness or, in other words, *the punctiform consciousness*.

2. **Evolved.** The second mentalsomatic dimension, which can be called incorporeal, is more evolved and pure. It is the native environment of the consciousness itself, the *nec plus ultra* of consciential levels. It is an environment of non-space, non-time, non-form or, more precisely: an environment in which the consciousness controls these variables at will, making it absolutely incomprehensible to the more advanced reason of contemporary humans who are not projected in the mentalsoma.

Projections. There are mental projections of various types, ranging from the superficial, being mere copies of projections or simple free daydreams, to projections of the punctiform consciousness, all the way to the achievement of full consciential projection in the mentalsoma, which is indefinable, non-transferable, indescribable or understood only by those who have experienced it. It is worth stressing that the latter is in no way related to mysticism, fanaticism, emotionalism, moralism and other “isms.” Its manifestation transcends the parameters of human illusions (“*Maya*”) and all types of preconceptions.

Holochakrology. Energetic projections of a portion of the holochakra, sometimes assuming the individual’s humanoid form at a distance from his/her human body, should not be confused with consciential projections in the mentalsoma.

Vehicles. In summary, it is observed that projections of the intraphysical consciousness take place using 2 vehicles which allow the transportation of the consciousness: the psychosoma (emotional body, astral body or perispirit) in the crustal dimensions and the mentalsoma in the mentalsomatic dimension.

Conditions. This multidimensional reality presents 3 specific conditions:

1. **Extraphysiology.** Projections of the extraphysical consciousness also occur using the same 2 vehicles which allow the consciousness to be transported: the psychosoma, in the phenomena of ectoplasmy, making the consciousness temporarily dense in the intraphysical dimension (inverse direction); and the mentalsoma in the mental dimension.

2. **Resomatics.** When the extraphysical consciousness goes through a more long-lasting resoma (70 years of physical age), in the psychosoma (inverse direction), and when the extraphysical consciousness temporarily materializes, in the selfsame emotional body (inverse direction), the 2 processes are *similar*, although they are not identical.

3. Identification. When the intraphysical consciousness and the extraphysical consciousness project in the mentalsoma, in the mental plane, the 2 processes are extremely *similar*.

Meeting. Conclusion: the pure mental plane is the *meeting place* for all more lucid consciousnesses. Intraphysical consciousnesses in general and less evolved extraphysical consciousnesses achieve better conditions in both cases of projection in the mentalsoma in the pure mental dimension, even when temporary.

Flashes. Generally speaking, the consciousness is in a constant state of ebullience, experiencing incessant consciential flashes, illuminations and dislocations of its base of manifestation, which can take it to the pure mentalsomatic dimension or make it return to the crustal or tropospheric extraphysical dimension.

Other. It is presumed, as a working hypothesis, that there are other dimensions beyond, or more evolved than, the mentalsomatic dimension. However, we simply do not know about them, nor do we have resources for conceiving them in detail or rationally imagining them.

Intraphysiology. If we consider the physical universe to be infinite, there are even physical parts which we will never observe in the human condition.

Manifestations. The manifestation of the consciousness in the pure, evolved mental dimension is literally *breathhtaking* and, moreover, there is no longer a respiratory mechanism. This is because there is no body, as we are accustomed to it, nor are there objects, forms, time and other *objective* variables or realities characteristic of our human or physical world.

Astronomy. The numbers, conditions and research data of astronomy are reminiscent of the *objectivities* of the mentalsomatic dimension.

Hypotheses. The following are some working hypotheses: Is the mentalsomatic dimension immutable? What is the relationship between the mentalsomatic dimension and the so-called *cosmic engineers*? Can it be said that the basic consciential energies stem from the mentalsomatic dimension?

Responses. At our current stage of knowledge, we still cannot find adequate answers for these questions.

274. EXTRAPHYSICAL SPHERE OF ENERGY

Definition. Extraphysical sphere of energy: the extraphysical force field with a 13' (4 m) radius (or, by extension, a 26' (8 m) diameter) that envelops the human body of the projector.

Synonymy: area of alternative realities; area of discoincidence; area of double awareness; double of the physical base; essential *psi field*; extraphysical base of the intraphysical projector; extraphysical biomagnetic field; extraphysical decompression chamber; extraphysical energetic bubble; hypnagogic area; hypnopompic area; interplanar energetic field; living gravitational field; magnetic sluice gate of the psychosoma; parabiosphere; parapsychosphere; para-sphere; pluridimensional field of interaction; scenario of self-bilocation.

Characteristics. The extraphysical sphere of energy or parapsychosphere – in this case, a figure with 3 dimensions encompassing a pluridimensional space – presents 20 characteristic and defined factors:

1. **Prisons.** The human body is the *first* cellular prison of the psychosoma with the intraphysical consciousness inside it. The individual sphere of extraphysical energy is the immediately following *second* prison.

2. **Center.** The human head, notably the 2 cerebral hemispheres, operates as a central irradiator of energy. The pineal gland, medulla oblongata, coronachakra and frontochakra can be singled out here. The pineal gland represents the physical nucleus of the extraphysical sphere of energy. Strictly speaking, the mentalsoma is the central, essential irradiator of the extraphysical sphere of energy.

3. **Footage.** The diameter of the sphere of energy reaches an average of 26' (8 m), or a radius of 13' (4 m) from the human head or, more precisely, from the 2 cerebral hemispheres.

4. **Agent.** The silver cord, the crustal irradiating agent of this energetic center, is confused with the parapsychosphere, attributing it with greater quantities of volume and weight. Both are greater than the volume and weight of the projected psychosoma, in certain instances in the world of projectiology phenomena.

5. **Current.** The lengthwise direction of the human body, from head to feet (or from feet to head), when lying on its back, allows the conduction of a greater energetic current and influence in the takeoff of the psychosoma. The human body serves as a ground wire, just as a car does for its radio antenna. The dorsal position is ideal for predisposing the human body to lucid projection of the consciousness in the psychosoma.

6. **Hemisphere.** The upper hemisphere of the globe of energy is more important than the lower hemisphere in relation to the human head. This occurs due to the psychological influence of the intraphysical consciousness' deeply rooted habits with material forms, with the conditioning of the human body's position, the clothes, the bed linen, the bed itself and the bedroom floor in the physical base. The sphere of energy defines the environment of the projected consciousness, devoid of any useful need, and in favor of the retractive power of the silver cord.

7. **Space.** Ideally, there would be greater space behind the head of the lucid projection practitioner's inactive human body or, more precisely, more than 13' (4 m) without solid obstacles. This would eliminate the psychological and parapsychological influence of the unfounded concern of extraphysically *colliding* with physical bodies or objects.

8. **Operation.** The energy-filled sphere operates in almost all stages of the projection of the consciousness, but does so more strongly in tropospheric or crustal lucid projections.

9. **Weight.** The psychosoma tends to be *heavier* when inside the extraphysical sphere of energy. This weight is *perceived* by the projected intraphysical consciousness.

10. **Retention.** The extraphysical sphere of energy is the area of greater retention of the psychosoma, under the more vigorous action of the silver cord.

11. **Holochakra.** The energetic sphere permits a greater agility in the holochakra's performance or, more precisely, it represents a direct manifestation of the holochakra. On the other hand, depending upon its extension, the aura of the psychosoma of the intraphysical consciousness more intensely vitalizes and energizes his/her extraphysical sphere of energy.

12. **Slow motion.** The extraphysical actions of the projected consciousness frequently occur in slow motion inside the energetic sphere. This is due to the semiphysical environment, the greater *weight* of the vehicles of manifestation and the semilucid transition phase of extraphysical awakening.

13. **Uterus.** In the energetic sphere or the spheroid extraphysical force field – the *extraphysical uterus* – the floating of the psychosoma is similar to the sensation of the fetus in the amniotic fluid of the pregnant human woman. It is mentioned here as a good symbolic representation for individuals who study the themes of Sigmund Freud's works.

14. **Fields.** The extraphysical sphere of energy is closely related to all of life's electrodynamic fields: vital field (L-fields), thought or mental fields, biological fields, biogravitational fields and psi fields. Its relationship with artificial, electric and/or magnetic energetic fields is not yet known.

15. **Dimension.** The sphere of energy can be characterized as the field of interaction of the *three-and-a-half dimension* or, in other words, transition from the third dimension to the fourth dimension, or from a median frequency between the motor action of dense matter and the hyper-tachyonic action of free thought.

16. **Occurrences.** Various phenomena occur with greater intensity inside the extraphysical sphere of energy: the influence of terrestrial gravitation; hypnagogy; dis coincidence of the vehicles of manifestation of the consciousness; oscillations or instability of the psychosoma; extraphysical catalepsy; double awareness; extracorporeal sleep; consensual self-bilocation; extraphysical repercussions; hypnopompy.

17. **Isolation.** Obviously, the intraphysical consciousness projected in the psychosoma isolated inside a 13' (4 m) radius from the human head will be better, will suffer less restriction and will enjoy greater extraphysical agility than with an awake intraphysical consciousness or projected together with that individual. When the intraphysical consciousness projects, the sphere remains, but is modified. The human aura is directly related to the extraphysical sphere of energy and, under certain circumstances, can be visible to the clairvoyant and to projected intraphysical consciousnesses.

18. **Booth.** Actually, the parapsychic booth – which is closed with curtains and used in the session rooms of physical effect phenomena, or ectoplasm, for the purpose of condensing the psychic energy required for manifestations – is always recommended precisely because of the extraphysical sphere of energy.

19. **Faraday.** There is a supposition that a Faraday cage with a diameter of 26' (8 m) would intensify the energetic field of the extraphysical energy field and would negatively condition the environment and restrict the extraphysical movements of the projected consciousness. Could this be the case?

20. **Imponderability.** Is it possible that the effect of physical imponderability, or the absence of gravity upon the projector's human body (androsoma, gynosoma), would affect the extraphysical sphere of energy?

Xenophrenia. The quality and intensity of the extraphysical sphere of energy, in and of itself, generate conditions which predispose the installation of diverse altered states of the intraphysical consciousness.

Circumscribed. In the circumscribed lucid projection, the intraphysical consciousness remains within the range of the extraphysical sphere of energy or centered within the 26' (8 m) diameter perimeter around the human head.

Characterization. Two very evident realities can be characterized in this context:

1. **Exteriorization.** The projection of the consciousness within the area of this extraphysical sphere of energy, or within the perimeter of the action of the silver cord, as though it were an *exteriorization*.

2. **Excursion.** When the projected consciousness transfers its seat to more distant districts, beyond the extraphysical sphere of energy, characterizing the extraphysical *excursion*.

Snare. The intraphysical consciousness who only, or invariably, lucidly projects in the area around his/her own human body – within the 26' (8 m) perimeter of his/her extraphysical sphere of energy – without being able to control the connections of the silver cord, is not producing an ideal, not to mention *healthy*, experience. It is like a spider that gets caught up in its own web, not knowing how to get free from its own trap. Over 90% of the members of terrestrial humanity have been unconsciously living in this type of energetic snare during natural sleep for millennia.

Morphothosenes. It is known that consciential energy generates morphothosenes and that prolonged, continuous reflection upon the same subject can create a morphothosene of tremendous power. This form remains over time, with the appearance and behavior of an actual entity.

Cage. Most individuals go through life enclosed in their energetic snare, or mental cage naturally constructed by themselves, within their individual extraphysical sphere of energy, through morphothosenes generated by the energy of their habitual thoughts reacting upon them, which tend to reproduce themselves indefinitely.

Arteriosclerosis. Arteriosclerosis worsens this energetic cage scenario even further, and it continues even beyond the deactivation of the human body and senile psychoses (Alzheimer's disease).

Couplings. The extraphysical sphere of energy and its interrelation with the human aura act vigorously in the installation of auric couplings, as well as in relation to certain objects which are large but restricted to the individual, or even extremely individual physical environments, such as the following 5 examples:

1. **Chamber.** The intraphysical consciousness' bedroom (energetically shielded chamber).
2. **Office.** The personal office.
3. **Car.** The car of long-standing personal use.
4. **Boat.** The fisherman's small boat.
5. **Plane.** The private pilot's small plane.

Protection. In these cases, the extraphysical sphere of energy cooperates in the permanent installation of an intense and profound *human-machine relationship*, keeping and involving the object in a type of individual, energetic anti-disaster protection.

Extraphysical consciousness. The extraphysical sphere of energy analyzed here refers to the deceased intraphysical consciousness which has already passed through the first desoma (biological death, extraphysical consciousness), and which has not gone through the second desoma (deactivation of the holochakra). The extraphysical sphere of energy of the more lucid and free extraphysical consciousness is different, being more evolved.

275. HUMAN BRAIN

Definition. Human brain: the most organized material substance on the face of the earth, part of the central nervous system housed inside the human cranium, or beneath the protective osseous helmet, currently considered to be a large endocrine secreting gland.

Synonymy: biological computer; black box of thought; cerebral hemispheres; controller of the human body; encephalon; master organ of the soma; mediator of the consciousness; organ of thought; physical brain; straightjacket of the extraphysical consciousness; thinking apparatus; thinking machine.

Models: The decoding or study of the workings of the human brain has already used at least 7 models thus far: hydraulic, dioptric, phrenologic, geologic, embryological, mechanotechnological and computational.

Oxygen. Of all the organs of the body, the brain is the one which breathes more actively, consuming a greater quantity of oxygen in a given amount of time.

Object. Until now, research indicates the exceptional condition of the brain being a complex of physical-chemical material that represents only 2% of the human body's weight. It is the only known lucid object in the physical universe that directs and controls all the areas and organs of the human body through approximately ten billion neurons and one hundred trillion connections and intersections, 80% of its weight being water.

Use. All things aside, and although considered by many to be a luxury organ – whose owner has still not learned how to make good use of it, being developed beyond his/her needs – not every human brain is capable of handling all the mundane (material) and ultramundane (extraphysical) activities of the veteran, intraphysical lucid projector together at the same time.

Control. The brain, being the most complex apparatus in the universe, the most intriguing and unfathomable part of the human body, does not control thoughts, sentiments and the will, although it is controlled by these 3 elements.

Driver. The impulses of the mentalsoma cannot act directly upon the human body. The brain thus works like a driver, just like those used in electronics, amplifying and shaping the impulses.

Transistor. The synapse in the brain is similar to the diode or transistor in an electronic circuit. There are approximately one hundred trillion synapses in the brain.

Switchboard. The brain can be compared to a type of telephone switchboard or a computer.

Human. The human is an animal that laughs, has a language composed of coherent sounds that form a vocabulary and thinks with full self-awareness (of itself).

Genetics. Every cell of the human brain retains the memory of the millions of years of the age of humankind.

Cachalot. The brain of the cachalot (*Physeter macrocephalus*) is 6 times bigger than the human brain.

Awareness. On account of awareness, humans – despite being the final product of the entire evolution of life on this planet – are greater, more important and have more expression than the sum total of their parts and physical accessories, as complex, sophisticated, subtle and transcendent as the mechanisms of the cerebral cortex may in fact be.

Physiology. If the cortex could be stretched, its surface would cover approximately 1.68 yd.² (2 m²).

Continent. The brain is the continent, the consciousness is the content.

Paraphysiology. The empty brain condition of the consciousness, which is naturally generated by lucid projection and referred to here in many topics, should not appear odd to studious individuals because it is, in fact, physiological or, more precisely, paraphysiological. If not, it will be seen below.

Emptying. Everything related to the functions of the human body occurs through the filling and emptying of the organs or viscera, which are emptied of content in some manner, as in the following 8 examples:

1. **Lungs.** The lungs fill and empty themselves with air (oxygen).
2. **Heart.** The heart and blood vessels as well, with venous and arterial blood.
3. **Stomach.** The stomach, with ingested food.
4. **Intestines.** The intestines, with a bolus of food.
5. **Bladder.** The bladder, with the urine excreted by the kidneys.
6. **Gallbladder.** The gallbladder, with bile.
7. **Testicles.** The testicles, with sperm.
8. **Hemispheres.** The cerebral hemispheres, in turn and in their own way, fill and empty themselves with the consciousness.

Pattern. The physiological organs operate in this way, following the phenomenological pattern, with the intraphysical consciousness, whether in a lucid, conscious, or unconscious manner.

Evidence. In this particular case, we do not only encounter an analogous or homologous phenomenon, but a simple phenomenological pattern that is logical, rational and evident.

Operation. The human brain is similar in appearance to a big 3.3 lb. (1.5 kg) nut and, although being the most complex physical structure, as well as the most sensitive computer in existence, it does not directly operate in the extraphysical world when the consciousness finds itself projected outside the human body.

Egos. There are 2 cerebral hemispheres, the right and the left, each with its own specialized function. The hemispheres appear to be mirror images of each other. There are those who suppose that there are 2 egos, according to the manifestations of the consciousness, notably with regard to speech.

Fibers. The cerebral hemispheres transmit information to each other through the corpus callosum, which is made up of 200 million nerve fibers. One hemisphere is capable of assuming the intellectual and motor functions performed by the other, which evidently shows that the functioning of the brain, *with some exceptions*, does not depend upon any specific area of cerebral matter.

Neurophysiology. Let us take a succinct look at some neurophysiological data regarding the 2 cerebral hemispheres:

1. **Left.** The left hemisphere exercises control over logical and abstract thought; stores symbols of objects; speaks with ease, repeating the words it hears with rapidity and precision; it, however, does not reproduce a musical passage faithfully, preferring to mark the rhythm. It reproduces an object as it

knows it and not as it perceives it. When confronted with an irregular figure, it is unable to retain it in its memory as it cannot conceptualize it.

2. **Right.** The right hemisphere commands concrete thought and the formation of images; speaks little, communicating with isolated words, mimics or gestures; is capable of hearing a melody and reproducing the tones. It memorizes figures of (three-dimensional) forms that are strange to the human eye. The influences of the right cerebral hemisphere predominate in paranormal manifestations.

Drawing. The differences between the cerebral hemispheres has been successfully employed in the acceleration of learning to draw, in which the student is forced to use his or her right cerebral hemisphere. In this case, the student is led to correctly copy the negative (empty) space of a piece of furniture, such as a chair, instead of its form, thus exercising the right hemisphere of the brain, which has a global perception of the object.

Form. The student is also requested to copy objects upside down because the figure is otherwise rejected by the left hemisphere which cannot conceptualize it. The object's bizarre form is of greater interest to the right hemisphere that solves the drawing as a brainteaser, resulting in better resolved details.

Hypothesis. It is supposed that there must be a way to accelerate the production of lucid consciential projections through the compulsory use of the right cerebral hemisphere. This is a promising research hypothesis.

Illustrators. Incidentally, a high percentage of lucid projectors, among professionals, are creative illustrators. This is probably because they are obliged to create ideas, original forms and details. They also have to get out of themselves in search of the new, and reconstruct the world around them through their illustrations. Thus, they are more predisposed and motivated to produce spontaneous and even willfully provoked consciential projections, reaching extraphysical dimensions which are unexplored, new and enriching to their imaginative conceptions and personal experiences.

Polarity. Some researchers also consider the brain to have a front/back polarity, as well as a division of left and right hemispheres. The back portion, the *old* brain, is common to subhuman animals, whereas the *front* part, the *newer* circuits, are more human and tend toward greater self-awareness.

Implants. Recent neurophysiology research demonstrates that cerebral lesions are reversible through tissue implants. The damaged nervous system can regenerate its fibers and restore lost mental functions and even improve memory and learning capacity. This is performed by transplanting fetal cells, which are richer in regenerative factors and more easily adapt to the new environment, thereby creating new connections between the transplanted tissue and the remaining brain matter.

Growth. According to anthropological studies made on the detailed internal architecture of the skull, it is currently accepted that the capacity or volume of the human brain increases on the order of 10.8 mg per generation (every 5 lustrums) on average; with an approximate increase of 300,000 neurons; precisely in the frontal and parietal regions; predominately in the left hemisphere; in those regions of the brain responsible for the command and elaboration of language and rational operations. It is forecast that this slow rhythm of growth will double humankind's cerebral capacity within only 4 million years.

Minority. The animist-sensitive or, more precisely, the lucid projector, is currently in the minority. It is presumed that this is due to the need for the intraphysical consciousness to expand its right cerebral hemisphere and thus act against the current average pattern of cerebral evolution characterized by a predominance of the left cerebral hemisphere.

Mind. The brain is not the mind. The mind serves as the programmer of the cells that comprise the brain.

Evidence. There are two basic pieces of evidence which support the conclusion that the mind functions independently from the brain:

1. **Pathology.** The apparent persistence of *elevated cortical ability* despite irreparable damage to large areas of the brain in cases of tumors and other cortical diseases, in which a drastically large amount of the brain is removed, as with hemispherectomies in which half of the brain is surgically removed.

2. **Projectiology.** Lucid consciousness projections and normal thought processes, namely facts that survive after verified cases of clinical death.

Reference. The human brain of the consciencial projector, at the very center of the extraphysical sphere of energy – simultaneously being the entryway to the extraphysical dimension and the return doorway to the physical dimension – is, strictly speaking, the only physical reference point or, more precisely, the absolute and practical reference on earth, considered from a physical perspective, for the projected intraphysical being.

Interference. Contiguous physical objects or constructions, namely the bed, furniture, walls, building (even in a building with extra thick walls or with floors above and below, in an apartment complex) and even the city block and the city itself, need not – and for the sake of the projector’s freedom and extraphysical agility should not – interfere in the extraphysical events in which the consciousness participates or observes. All this must remain inexistent for this selfsame intraphysical consciousness, while temporarily free in a different plane of life or in a different consciencial dimension.

Conditioning. When the consciousness of the projector leaves the human body in the psychosoma, or emotional body, it becomes important to control the supervening emotions and, above all, the conditioned reflexes acquired in diuturnal human life which are intensely reflected in the manifestations of the ways in which we habitually coexist with material forms and structures. Hence the necessity and importance of the thoughtful and profound awareness of the consciencial projector in regard to the reality of the extraphysical sphere of energy, the extraphysical dimension, the nature of the psychosoma and many other correlated factors.

Weight. In order to begin this awareness, the projector should judiciously meditate upon the fact that the psychosoma has only one thousandth of the weight of the human body. This means that the 3.3 lb. (1.5 kg) brain of a human is reduced to an extraphysical *parabrain* weighing only 0.05 oz. (1.5 g).

Forces. The projector’s form also obeys the criterion of the will of the projected consciousness. For this reason, brute, physical force disappears entirely, giving way to the subtlety of mental, consciencial, psychic or parapsychic force.

Exercises. Those who are accustomed only to physical or muscular exercise, or to the violence of brute force, naturally find it more difficult to adapt to the extraphysical period of the projected consciousness in comparison to those who are accustomed to intellectual, psychic, parapsychic exercises or the cultivation of a determined genre of art.

Moderation. However, this does not mean that the projector should entirely eliminate physical exercise from his/her life. On the contrary, when applied in moderation as a complement to intellectual life, it can only contribute to the maintenance of physical health and the development of lucid projections.

Health. A healthy mind, in a healthy human body, sustains the physiological foundation of the processes of lucid projection produced in line with some type of methodology.

Empty. The empty brain condition – or the vegetative brain – only occurs when there is a temporary transfer of the seat of the consciousness outside the human body. For example, traveling clairvoyance does not present the empty brain condition, since the clairvoyant is even able to describe what he/she is experiencing at the very moment it is happening. In other words, in a major lucid projection, the ego (the extraphysical substratum of the human brain) is projected from the human body. In traveling clairvoyance, on the other hand, this is not so much the case. It is hard to affirm that the *empty brain* condition occurs in this case because the consciousness leaves and returns to the physical brain at such a high velocity that it is not even perceived.

Box. The brain, in the machine of the human body, upon being transformed into a cadaver, remains like a *black box*, *indecipherable* by humankind to date.

Computer. In 1986, it was estimated that it would cost 3 billion dollars in order to construct a computer with the same characteristics as the human brain, yours, for example. This is a number with a 3 and 9 zeros. Is it not therefore worth taking advantage of your invaluable asset of thought, creativity and ideas?

276. PARABRAIN

Definition. Parabrain: the extraphysical brain of the psychosoma, whether of the consciousness which has undergone desoma (extraphysical consciousness), resoma (intrapysical consciousness), or is temporarily projected (projector) in the psychosoma, with or without full extraphysical lucidity.

Synonymy: bioplasmic brain; brain of the psychosoma; controller of the psychosoma; emotionalizer; extraphysical brain; para-encephalon; second brain; self-transfigurer.

Para-anatomy. The parabrain can be considered an improved reflection of the cerebral hemispheres.

Paracerebellum. The paracerebellum, a duplicate of the cerebellum, being more restricted to the dynamic functions of the human body, does not operate extraphysically with an intensity equal to that of the extraphysical duplicates of the cerebral hemispheres.

Para-object. Of all known semi-physical forms, the human parabrain seems to be the para-object that is most sophisticated, most important and has the most transcendent and immediate consequences.

Weight. Based on the previously presented supposition that the psychosoma – a consciential, but still semiphysical, vehicle – weighs, on average, one thousandth of the weight of the human body (soma), an individual weighing 154 lb. (70 kg) with a brain of 3.3 lb. (1.5 kg), will have a psychosoma weighing 2.47 oz. (70 g) with a parabrain of 0.053 oz. (1.5 g). There is therefore a 1:1000 weight and density ratio between the brain and the parabrain.

Paraphysiology. Just as the human brain houses the parabrain, the parabrain, in turn, houses the mentalsoma. The parabrain operates as much in the coincidence of the vehicles of manifestation of the consciousness – with the human body, the holochakra, the psychosoma and the mentalsoma making up the holosoma (coexistence) – as in the discoincidence of these same vehicles, namely submersed in and dominated by the various paraphysiological characteristics, according to the consciential dimension (level) at which it finds itself.

Thosenes. Obviously, the thosenes of the consciousness, when in the discoincident state, cannot always be the same or at the same level when in the coincident state, as in the ordinary, physical waking state.

Properties. The parabrain, although, strictly speaking, being the matrix for the human brain, is very different from it because of its various properties, such as the following 7:

1. **Subtlety.** According to psychosomatics, the parabrain has a greater subtlety because it is light and quintessentialized, not having such dense matter in its free structure, as occurs with the brain, which is protected inside the osseous helmet of the human head.

2. **Mutability.** According to evolutiology, the parabrain differs fundamentally from the brain in regard to its mutability or, in other words: each brain arises, develops and disappears together with and for only 1 human body; the parabrain, which is less perishable, sustains the existential seriation mechanism of the consciousness in countless human bodies (*retrosomas*) or, in other words, in the succession of other countless brains (*retrobbrains*) which are more perishable and always ephemeral.

3. **Self-transfigurability.** The parabrains (self-transfigurers) are able to alter the extraphysical forms of the psychosoma according to the will of the consciousness, whether unconsciously or consciously.

4. **Expandability.** The parabrains allow the exit and free expansion of the mentalsoma in the mentalsomatic dimension, still the most obscure area researched on earth.

5. **Emotivity.** The parabrains (emotionalizers) are the basic fulcrum of all the types of emotions that stimulate the consciousness. This is why the psychosoma is called the “emotional body”. It is one of the properties of the parabrains that is more difficult to conveniently utilize.

6. **Force.** The parabrains present a parapsychic force, derived from the dynamic of the will, which is extraordinarily more potent in its subtlety than physical or brute, muscular, animal force.

7. **Memorization.** According to mnemosomatics, the quality of recall of the extraphysical events in which the consciousness of the human projector participates while projected in the psychosoma depends upon the transmission level of the recollections from the second brain (psychosoma) to the first brain (soma). The parapsychology of the parabrains shows that this para-organ of thought simultaneously holds, with relative ease, the memories of the consciousness’ experiences in two or more consciencial dimensions, or those resulting from experiences of the consciousness in various parallel worlds, something which does not occur with the dense brain.

Hemispheres. The facts lead one to think that the mentalsoma, as well as the parabrains (of the psychosoma) are made up of 2 hemispheres, just like the human brain, because each element of these is a reflection of the other more evolved version. However, the structures of these extraphysical components still remain very obscure for us intraphysical consciousnesses, when active in the pure mentalsomatic dimension.

Consequences. The consequences of the discovery regarding the identification of the properties and self-awareness relative to the parabrains are simply revolutionary and have a profound impact for the evolution of the consciousness (or hyperacuity) and the progress of the sciences in general.

Solution. The notion (and evaluation) of the parabrains is, in fact, the rational solution for the controversy regarding the mind-matter binomial, or the effective discovery of the ancient and mysterious interaction between the consciousness and the human body (soma).

Applications. Many researchers still consider the human brain a luxury organ, its owner still not having learned how to make good use of all its potentialities, which peak at only approximately 80%. The individual thereby has an instrument which is developed beyond the needs and applications of the parabrains by the contemporary intraphysical consciousness. It is worth noting that the brain cannot handle the more sophisticated, veteran, intraphysical, lucid projector’s *entire* range of material and extraphysical activities together and at the same time.

Utilization. Most intraphysical consciousnesses, even when they temporarily free themselves from a predominance of the operations of the dense brain – during their lucid consciencial projections – do not know how to use the possibilities and paraperceptions of the parabrains (the basic organ, in this case) with full awareness and efficiency. In other words: they continue to think, manifesting themselves through the parabrains, as though they were still inhibited and stuck in the dense brain, the secondary organ, and consequently in the physical restriction of the human body.

Desomatics. This can be stated another way according to desomatics: up to now, they have only learned to think with the restricted cellular brain in any situations or existential dimensions in which they find themselves. After undergoing desoma, the sad result of this is the installation of post-desomatic parapsychosis: for an extended period of time, recently-deceased consciousnesses in general do not suspect the radical changes in their surroundings and that the human body has died, and sometimes, depending on the case, has even disintegrated (decomposition) and completely disappeared.

Neurology. The greatest impactful power of recognizing the reality of the parabrains occurs in the areas of neurology and neurophysiology. This is because, in this case, it reaches the kernel of the research, still reflecting upon all consequences and structural recycling of observations and discoveries made by neurologists and neurophysiologists.

Mentalsoma. The most important relationships of the parabrains occur with the mentalsoma, which is the basic seat of manifestation of the consciousness when humanized, whether in an intraphysical condition or in the post-desoma condition, as long as it is, evolutionarily speaking, in a situation which is still tropospheric, crustal or terrestrial.

Zoology. Based upon the evolutionary development verified in embryology, it can rationally be concluded that subhuman animals also have a rudimentary parabrains corresponding to their evolutionary level.

Comparison. Without a doubt, the parabrains related to a simple brain, weighing a few grams, cannot be compared to that related to a complex brain, weighing 53 oz. (1,500 g), for example, regardless of which living being it commands.

277. GENERAL EXTRAPHYSICAL PERCEPTIONS

Definition. Extraphysical perception: the reception or registering of an extrasensory or parapsychophysiological impression in the consciential centers of the intraphysical consciousness projected from the human body.

Synonymy: extraphysical extrasensory perception; extraphysical impression; extraphysical perceptiveness.

Characteristics. Among the general extraphysical perceptions, at least the following 13, in line with the objectives of our research, can be listed:

1. **Psychosomatics.** Consciential perceptions by the psychosoma.
2. **Mentalsomatics.** Consciential perceptions by the mentalsoma.
3. **Extraphysiology.** Extraphysical vision.
4. **Omnivision.** Omnivision by the mentalsoma.
5. **Para-audition.** Extraphysical audition or para-audition.
6. **Omni-audition.** Omni-audition by the mentalsoma.
7. **Para-senses.** Extraphysical touch, smell and taste or para-senses.
8. **Para-acuity.** Acuity of the extraphysical senses or para-acuity.
9. **Sharpening.** Subtlety, semi-awareness and sharpening of extraphysical senses.
10. **Paratemperature.** An absence or presence of the extraphysical sensation of heat or cold (paratemperature) on the part of the projected intraphysical consciousness.
11. **Para-equilibrium.** The extraphysical sensation of equilibrium or para-equilibrium (parapronation).
12. **Radiations.** Mental radiations.
13. **Para-pain.** Extraphysical painful sensations or *para-pain* (para-algia, a process like many others referred to here of *parapsychology*, *parapsychism*, the extraphysical conditioning or *para-sensations* of the intraphysical consciousness who is still subordinated to instincts, vegetative life and intraphysical experiences).

Differences. According to experiments performed thus far, it can be verified that the extraphysical perceptions pertaining to the projected intraphysical consciousness differ in the two following manners:

1. **Physical.** First, physical perceptions, per se, which occur in the ordinary, physical waking state.
2. **Extrasensory.** Second, extrasensory perceptions (ESP), which somehow also occur stemming from the consciential state of ordinary, physical wakefulness.

Dissimilarities. Because of the scale of general observations of the projected intraphysical consciousness, 2 projectors, or even the partners of a harmonized and well-consolidated evolutionary duo, never report experiences that are entirely identical or show a completely equal development of their experiences outside the human body.

Processes. The intraphysical consciousness projected from the human body registers information through 3 basic, well-defined processes which are reaffirmed below:

1. **Paratelepathy.** Direct, common, mental acquisition or extraphysical telepathy (paratelepathy).
2. **Paraclairvoyance.** Acquisition in the form of perceiving images, scenarios, or extraphysical clairvoyance (paraclairvoyance).
3. **Para-intuition.** Acquisition, through thoughts or ideas that suddenly enter the consciousness, or extraphysical intuition (para-intuition).

Types. General impressions in the extraphysical dimension can be classified into 3 basic types: positive, negative and ambivalent.

1. **Positive.** Attainment of extraphysical illumination; cosmic superconsciousness; sense of absolute peace.
2. **Negative.** Regarding projectors in general: admonitory discomfort; the effects of extraphysical repercussion; sudden, imposed, premature or traumatic interiorization. Regarding the novice projector: fear of the unknown (neophobia); extraphysical insecurity; unfounded concern about not returning to the human body; pseudo-death; indecision; disorientation; depressive solitude; panic; sexual impulse.
3. **Ambivalent.** Euphoria; sense of omnipotence; sense of absolute freedom; immateriality; subtleness of extraphysical sensations.

Frontochakra. The parafrontochakra of the psychosoma allows the projected intraphysical consciousness to improve its tropospheric extraphysical perceptions, seeing and distinguishing the form and nature of extraphysical four-dimensional environments and objects with greater precision. All more advanced lucid projectors end up having a permanently pulsating developed frontochakra. This is because one condition stimulates the other and both, necessarily and inevitably, coexist.

Phobias. The following are 13 phobias that can be instantaneously generated by the novice projector during lucid projection:

1. **Intrusion.** Fear of encountering an old adversary that is already deceased (interconsciential intrusion).
2. **Basophobia.** Fear of floating and falling (basophobia) when volitating.
3. **Coma.** Fear of not awakening after reentering the human body.
4. **Diplychiphobia.** Fear of suffering a trauma or accident (diplychiphobia) with the head or the entire body.
5. **Eremophobia.** Fear of being alone (eremophobia, autophobia, monophobia) and getting lost in a deserted location.
6. **Phobophobia.** Fear of the individual's own fears in relation to unknown and as yet unexperienced situations.
7. **Hypnophobia.** Fear of sleeping, morbid fear of not returning to the human body or the intraphysical base during sleep.
8. **Interiorization.** Fear of not being able to reenter the human body or of interiorization.
9. **Neophobia.** Fear of confronting the unknown, the mysterious, the new world or the *incognito*.
10. **Nosophobia.** Fear of contracting an irreversible mental (psychopathy) disease (nosophobia).
11. **Possession.** Fear of encountering a stranger occupying the projector's own human body upon returning to the intraphysical base (interconsciential possession).
12. **Taphophobia.** Morbid fear of being buried alive (taphophobia) or with the lucid consciousness imprisoned within its own dense body (pathological catalepsy).
13. **Thanatophobia.** Fear of dying (deactivation of the soma) or thanatophobia – the mother of all phobias – in this case, without being prepared or prior to the appropriate time.

Penetration. A characteristic sensation stemming from lucid projection and one which is truly unique for the consciousness in the ordinary, physical waking state, is the sense of universal accessibility or penetrability into everything and everyone, with a certain awareness of a seemingly omnipotent penetration and full capacity for the invasion, investigation and study of places, more inhospitable environments and the lives of more inaccessible intraphysical beings.

Ancestrality. It becomes difficult to characterize precisely the sensation of invasion that has some connotation in regard to our subhuman ancestry.

Analogies. This invasion may be a glimpse of the ambivalent sensation that some individuals experience in the following 5 conditions:

1. **Assault.** The nocturnal assailant in action.
2. **Inmate.** The prison inmate upon being freed after many lustrums in captivity.
3. **Port.** The sailor who is back at port after months of confinement on a ship on the high seas.
4. **Power.** The personality who finds him/herself suddenly armed with immense decision making power with regard to human circumstances.
5. **Daydream.** The person who, in his/her almost always negative daydreams, imagines him/herself as an invisible violator of houses, bodies, intimacies and consciousnesses.

Albedo. The albedo, or the total reflective force of the earth and its atmosphere, generally appears greater to the perceptions of the lucid volitating consciousness, whether it is a healthy extraphysical consciousness or a lucid projected intraphysical consciousness. It can easily identify the energetic or luminous radiations from the surfaces of bodies situated in a landscape, such as bodies of water, trees, rock formations, monuments or others.

Violation. The extraphysical sensation of invasion can lead the novice and incautious projected projector to the negative impulse of extraphysical sexual violation.

Intuition. The projected consciousness, upon experiencing correct impressions at any level of lucidity, always has the corresponding intuitive sensation of whether it is proceeding correctly or incorrectly, in a cosmoethical or anticosmoethical manner.

Inventory. The sensorial experiences involved in the inner processes of lucid projection are not part of our normal inventory of sensory data, but overflow beyond the ideas that are routinely conceived. This is why these impressions or sensations become so difficult to translate into words.

Self-confidence. The projector should have self-confidence in his/her parapsychic abilities.

Censure. When projected, the projector should not worry or censure what he/she observes, regardless of how strange, fantastic or absurd it may appear during the lucid projection.

Analysis. Later, upon returning to the human body, in the ordinary, physical waking state, the projector should perform a detailed self-critical analysis of his/her extraphysical information and perceptions.

Robot. Rationalization and critical analysis should not be attempted while the consciousness is projected, otherwise the projector's preconceptions, which make him/her a robot with its solid system of beliefs and repressions, mechanically suffocate his/her intuitive abilities.

Mistakes. The conscientious projector should also not be concerned with the mistakes in his/her extraphysical research. It is better to practice lucid projection with perseverance and patience, sustaining the intention that he/she will succeed in his/her attempts, not only to project, but also to perform research outside the human body.

Pattern. Every time the projected intraphysical consciousness makes his/her human, physical environment the standard plane of reference for his/her extraphysical observations, he/she tends to increase the percentage of observational errors. It can thus be concluded that the standard plane of reference pertaining to the extraphysical world needs to be discovered, identified and applied with lucidity and reason by the lucid projector.

Echo. Some conditions of the projected intraphysical consciousness make his/her extraphysical environment into a veritable echo chamber, where he/she hears his/her own voice resonating.

Hyperacuity. There are reports of visual and auditory hyperacuity (hyperacusia) occurring during various phenomena such as interconsciential apparitions and lucid projections in which the percipient – whether a clairvoyant sensitive, clairaudient sensitive or lucid projector – enjoys an intensification of visual or auditory perceptions during parapsychic events.

Discomfort. In lucid projections produced through pure, natural or physiological processes, any disagreeable sensation that arises while the phenomena are occurring is too short-lived to be characterized as a true inner discomfort. However, in lucid projections produced through impure, forced or antiphysiological processes, the greatest variety of disagreeable sensations can occur, depending upon the interference and combination of a thousand and one physical and extraphysical factors.

278. EXTRAPHYSICAL VISION

Definition. Extraphysical vision: the visual perception of the intraphysical consciousness when projected from the human body.

Synonymy: astral vision; extraphysical clarity; paravision; vision in the fourth dimension.

Vehicles. None of the extraphysical senses are, necessarily, located or restricted to any part of the psychosoma or mentalsoma. The projected consciousness manifests itself in these vehicles through the set of its extraphysical constituents while the consciential senses, in this condition, are active in all parts of these vehicles. Hence the possibility of the occurrence – even through a minor discoincidence of the consciential vehicles – of clairvoyance or global visions forward, backward, above, below or to both sides, as well as skin sight, the phenomena of transposition of senses, and others.

Characteristics. Among the characteristics and types of extraphysical vision, at least the following 23 can be singled out:

1. Ordinary monocular vision.
2. Stereoscopic or binocular vision.
3. Uniform, well-focalized vision.
4. Unstable vision.
5. Out of focus vision.
6. Unidirectional vision.
7. Retrovision.
8. Circular vision.
9. Global or 360° vision.
10. Vision lacking deformation that eliminates perspective.
11. Vision on well-defined planes.
12. Omnidirectional vision.
13. Generalized omnivision or omni-sight, characteristic of the mentalsoma.
14. *En bloc* vision.
15. Deep endoscopic or X-ray vision.
16. Magnifying or telescopic vision.
17. Microscopic vision.
18. Chromatic vision.
19. Vision in the dark.
20. The range of vision and influence of willpower in extraphysical vision.

21. Close-up vision.
22. Zoom and extraphysical vision.
23. Panoramic vision.

Application. Strictly speaking, blinding lights and impenetrable darkness do not exist for the projected intraphysical consciousness. It all depends on his/her personal potential, application of the will and extraphysical performance in order to enable him/her to see, discern, witness or participate in extraphysical events.

Coadjutant. Extraphysical vision is a powerful coadjutant factor for the awareness of the consciousness upon projecting, as well as the extraphysical awakening of projectors in general, especially myopic and daltonic intraphysical consciousnesses in the ordinary, physical waking state.

Distance. According to the processes of dissimulation, masking and simulation used in camouflage techniques, it is known that objects do not appear the same when seen from the ground as opposed to being seen from an airplane (distance).

Observation. Besides, observations made in intraphysicality suffer limitations imposed by fog, rain or smoke.

Subtle. If our coarse physical senses suffer from these situations while in the ordinary waking state, what would the projected projector experience with his/her subtle paraperceptions while in the much more sophisticated extraphysical dimensions?

Aspects. By virtue of the transference of the processes of extraphysical vision, when the consciousness goes from one body (the human body) and from one dimension (that of the ordinary, physical waking state) to another body (generally the psychosoma) and to another dimension (generally the tropospheric or crustal extraphysical dimension), even the most familiar objects in certain circumstances can appear unknown to the projected intraphysical consciousness, taking on chaotic, surrealist and strange aspects.

Invisible. Extraphysical vision can also perceive forms which, although physical, are completely invisible to retinal, physical or ordinary sight. Included in this case are the particles that make up the atmosphere and the emanations from living beings.

Global. The generalized extraphysical global, circular, panoramic vision or omnivision, characteristic of the mentalsoma, allows one to simultaneously see in all directions in the light or in the dark and see objects from all sides at the same time.

Particle. In this case, each particle located inside a solid is as visible as that which is found on the surface. Also, hearing is replaced by the tachypsychic and automatic perception of thoughts.

Speed. In the tachypsychism of the projected and expanded intraphysical consciousness, the speed of mental elaboration seems to be higher than the maximum speed of the interactions of the phenomena or that of the speed of light.

Dissolution. When the projected projector has more consciential energy, extraphysical vision sometimes seems to penetrate the molecules of solid objects such as walls and rocks as though dense matter dissolved on contact with the thought emitted by the projector's consciousness. This is the sensation of *extraphysical dissolution*.

Blind. *Blind projection*, or that taking place in *extraphysical darkness*, is that in which the intraphysical consciousness clearly perceives he/she is projected outside the human body, although not seeing anything in the period prior to obtaining extraphysical vision. Note: the consciousness is quite aware that he/she is projected from the human body, sees absolutely nothing and can even vibrate in complete darkness without seeing anything.

Distinction. The projected consciousness needs to learn to distinguish extraphysical environments by overcoming undefined extraphysical vision, no visibility, as when in a penumbra, which often occurs due to a lack of consciential energy.

Difficulties. Letters and numbers are the most difficult items for the projected consciousness to see, distinguish or read. Visual images, or vivid figures, are more accessible to extraphysical

vision. These observations have already been verified under laboratory conditions, but their cause is still unknown.

Self-energizations. One of the resources that the author has used while projected in order to obtain or intensify extraphysical vision is the application of self-energizations made directly from the extraphysical dimension to the head of his own psychosoma (parahead). These resources seem to balance the energies, *rinsing* or *cleansing* the dense energetic excess of the holochakra or the extraphysical environment that is *attached* to the psychosoma, thereby clearing up the process of direct vision.

Distortions. The extraphysical vision of the projected intraphysical consciousness varies greatly in terms of focus, clarity and coordination. It is dependent upon the extraphysical environment in focus and, more than anything, the qualities of the extraphysical perceptions of the consciousness, according to the vehicle of manifestation being used on that occasion, which can alter or distort the actual visions, owing to countless factors.

Case study. The following are 2 examples of distorted extraphysical vision:

1. **Soma.** Seeing one's own human body (soma) lying on the bed without a head, or with a dark mass in the place of a head, or with a plane (two-dimensional) perspective, as though it were a sheet of paper (flatman).
2. **Environment.** Seeing the environment of the bedroom in an altered fashion, with nonexistent curtains, different decoration, a bigger space, higher ceiling and different colors.

Bibliography: Andreas (36, p. 54), Blackmore (139, p. 4), Bozzano (186, p. 166), Coxhead (312, p. 119), Currie (354, p. 148), Denning (391, p. 48), Grosso (650, p. 186), Krishnan (869, p. 21), Mitchell (1059, p. 4), Monroe (1065, p. 183), Salley (1496, p. 159), Sculthorp (1531, p. 94), Sherman (1551, p. 185), Vieira (1762, p. 116), Yogananda (1894, p. 205).

279. EXTRAPHYSICAL ATTENTION

Definition. Extraphysical attention: assiduity of the projected consciousness to some idea, object or *thing*.

Synonymy: fixation of observation; para-attention.

Types. Extraphysical attention can be classified into 2 basic types:

1. **Focused.** Focused or applied attention.
2. **Distracted.** Wandering or distracted attention.

Control. The control of fixation of attention is the irreplaceable foundation for the improvement of extraphysical perceptions and the improvement of the quality of the experiments of the intraphysical consciousness during excursions outside the human body.

Distraction. Any distraction of extraphysical attention can mean a sometimes radical change in the mental target predetermined by the projected intraphysical consciousness.

Thosenization. In this case, extraphysical attention spearheads or leverages 3 factors (trinomial) that can be summarized in a single thosenization practically at the same time: will, thought and action.

Holochakrology. The absence of fixation of observation on the part of the projected intraphysical consciousness wholly absorbed in what he/she sees outside the human body results in a great number of projectors never seeing the silver cord and thereby believing it does not exist.

Psychosomatics. Other projectors do not even distinguish their own psychosoma, parahands and even their extraphysical clothing.

Bibliography: Baumann (93, p. 44), Vieira (1762, p. 83).

280. SCALE OF OBSERVATION OF THE PROJECTED CONSCIOUSNESS

Definition. Scale of observation: the reference system chosen by the consciousness in order to face and analyze the phenomena of daily life.

Synonymy: analytic angle; didactic viewpoint; process of observation; reference system; scientific perspective.

Versions. Depending upon the moment and the circumstances of its perception, the consciousness examines its probable version of the universe.

Reality. Wherever there is a consciousness, different types of reality exist according to the different types and levels of evolution of the consciousness, or particular aspects of experience.

Universe. The universe, as well as the consciencial dimensions, above all constitute a purely parapsychic structure that is consonant with the manner of being, the pattern of perception, the scale of actualization or the approximation of the reality perceived by the consciousness, individually, as a separate unit, *per se*.

Perception. The objective existence of things primarily depends upon subjective perception.

Inseparability. Strictly speaking, existence and perception, subject and object are inseparable concepts.

Psychosoma. The emotional body – the psychosoma – creates its own emotional field or emotional world (holothosene having a materthosene with an emphasized *sen*) and this influences the understanding of reality as seen by the consciousness.

Intercommunications. The experiences are intercommunicable in the cosmic *here and now*.

Manifestations. Our consciousness, having unstable manifestations, acts incessantly, or thosenizes through diverse levels of subjectivity.

Physics. Even the data of our knowledge of physics are impregnated with subjectivity. It is impossible for two persons to observe the same phenomenon, except in an incomplete and approximate sense.

Chalk. A piece of chalk used to write on the blackboard will be seen by the common person, according to the *scale of normal* human observation, as being a small solid object.

Case study. The following are 3 examples of the analysis of 1 piece of chalk according to the scale of observation of 3 different professionals:

1. **Geologist.** The geologist, following the *microscopic scale*, will see the geological components, the process of rock formation, its age, hardness, the calcium carbonate or calcium sulfate of the chalk.

2. **Chemist.** The chemist, restricted to the *chemical scale*, will analyze the chemical composition of the chalk, its pH, speculating on the chains of chemical elements derived from the carbon that composes the piece of chalk.

3. **Physicist.** The physicist, in accordance with the level of the *subatomic scale*, will distinguish the electrons, protons, nuclei and fields in perpetual movement that form the chalk.

Vision. In the case of the chalk, each of these 4 intraphysical consciousnesses – the common person, the geologist, the chemist and the physicist – saw the same object, apparently as though examining 4 *objects* that are different from each other.

Electrons. The natural, basic phenomenon, in this case, is a singular one: the movement of electrons.

Phenomena. None of the 4 *observers* made a mistake, nor did they modify the object, although 4 distinct *phenomena* were detected.

Systems. The fact occurred due to the use of 4 different *reference systems*.

Scale. For the individual – or the consciousness – the scale of observation creates the phenomenon.

Discovery. The consciousness that changes the scale of observation encounters or discovers new phenomena for itself and other consciousnesses.

Change. Any change in the scale of observation will engender different phenomena in relation to the same observing consciousness.

Analysis. In the case under analysis, only 1 observer could have seen 4 different phenomena where there is only the natural phenomenon of the movement of the electrons and atomic particles that make up the chalk.

Telepathy. Another example where the importance of the scale of observation can be observed is the problem in telepathic transmission, which is still considered to be performed through images and not words, thereby dispensing with the problem of linguistic diversity.

Bucket. If someone were to telepathically transmit the idea of 1 *bucket* to a group of persons, it could be received in the most diverse ways. Some will think the transmission was a cup of water, others will see a glue stick, others a wastebasket, others a pencil, a mug or even an actual bucket and all will be correct, although with different ideas.

Greek. If the thought were to be transmitted today to a Greek, from Ancient Greece, that “An airplane crashed into an apartment building and destroyed a television tower.” or the idea of “a late model car”, for example, he would limit all this thoughts to his/her own ideas and would certainly see another phenomenon. This is because these events or objects would still not pertain to the scope of his/her thoughts – consensual microuniverse – or he/she would simply say that he/she understood nothing.

Microuniverse. The intraphysical consciousness is a complex microuniverse that does not allow correct simplistic or hasty analyses. Each person has his/her own perspective in the examination of reality or experiences, things, objects, locations, phenomena and facts.

Sofa. Personal perspective alters the significance of things. A large sofa, for example, signifies different things for the following 4 categories of human beings: an upholsterer; a couple of lovers; an elderly person (old age) who is exhausted after walking; and a furniture mover.

Errors. Personal perspective can generate errors in interpretation.

Interpretation. The following is a classic example of the mechanism of errors in interpretation. Four persons simultaneously sit around a small square card table. Then, an uppercase “M” is placed at the center of the table. Depending upon where each person is seated, 4 different objects will be seen:

1. An “M”.
2. An “E”.
3. A “W”.
4. An angular “3”.

Expectations. It can thus be seen that these persons may also be mentally or psychologically *set in their ways*, a condition that interferes in their repressions, conditionings, brainwashings, sacralizations and expectations in the analysis of the context.

Deductions. It becomes easy to deduce that the analysis of the scale of observation permits the achievement of 4 distinct objectives:

1. **Understanding.** An increased understanding of things (personalities, realities and objects) from a scientific point of view.
2. **Hits.** The avoidance of serious mistakes in rational perspectives and analyses, generally coming from the human brain.
3. **Differences.** The identification of great differences generated by erroneous observations.
4. **Paradoxes.** The logical explanation of countless paradoxes, apparent contradictions and tautologies.

Rashomon. The analysis of the scale of observation, in the area of projectiology, avoids a situation similar to the one portrayed in “Rashomon,” a film made in 1950 by Akira Kurosawa, with Toshiro Mifune, which won the top award at the 1951 Venice Film Festival. In the story, which takes place in medieval Japan, each protagonist, observer or narrator reports the events from his/her point of view in his/her own personal style.

Extraphysiology. If the intraphysical consciousness, in the ordinary, physical waking state, in the dimension of dense matter, using the distortional mirror of the human senses, can err so greatly regarding the everyday phenomena of physical reality to which he/she is habituated in diuturnal life, what will happen when this same consciousness projects – still with the same lucidity – from the human body in the subtle, unhabituated, immense, undefined and unexplored extraphysical dimension?

Ambiguity. While the intraphysical consciousness is projected in the extraphysical dimension, whether in the psychosoma or the mentalsoma, the process through which he/she receives information differs from the 5 or more basic senses of the human body that breathes in the intraphysical dimension. To start with, the lucid projector is, above all, simultaneously the observed object and the observer of the projective experience.

Human. Physical vision is routinely stable, continuous and immutable. When the intraphysical consciousness sees and analyzes a physical object, the possibilities of his/her vision are predictable. He/she is aware of the extent of the investigative resources that he/she can count on in order to accurately examine the object.

Instruments. In many cases, the intraphysical consciousness, unconcerned about time, uses more accurate instruments in order to maximally correct his/her physical deficiencies and improve detailed examination: lenses, glasses, magnifying glasses, microscopes and telescopes.

Projected. The extraphysical vision of the projected intraphysical consciousness is unstable, unpredictable and tends to work extremely rapidly. There are also no possibilities for using instruments while in the projected state outside the human body.

Lucidity. The only intelligent solution will be the intensification of extraphysical lucidity, improving the perceptions of the projected consciousness, which encompasses parameters that are much more ample than the amplitude of the consciousness in the condition of restriction of the human body, when in the ordinary, physical waking state.

Conditions. Bearing in mind the scale of observation of the projected human consciousness, we can thereby understand the causes of disparities in the projector's extraphysical perceptions that stem from the following 6 projective conditions, among others:

1. **Projectability.** The type or nature of lucid consciential projection.
2. **Vehicles.** The vehicle of manifestation of the consciousness.
3. **Density.** The density of this vehicle of manifestation.
4. **Self-lucidity.** The degree of self-lucidity of the projected consciousness.
5. **Frequency.** The vibratory frequency of the extraphysical dimension in which the consciousness is manifesting.
6. **Competence.** The extraphysical skill, experience and agility or projective competence of the projected consciousness.

Synchronicity. It evidently becomes very difficult for two intraphysical consciousnesses to be projected with the following 4 identical or synchronous manifestations:

1. **Moment.** Projected at the same time.
2. **Dimension.** Projected in the same dimension.
3. **Identity.** Both being in the same 6 previously mentioned projective conditions.
4. **Events.** All this occurring in order to observe or participate in the same extraphysical events or experiences.

Disparities. From these logical facts, disparities arise in the reports due to the diversity of the extraphysical acquisition of the projected consciousnesses' experiences.

Supposition. For example, suppose that 4 intraphysical projectors endeavor to extraphysically visit an ill target-person in a distant city:

1. **Common.** The consciousness of the *first* projector leaves the inactive human body in the psychosoma, which is in a *light* condition, with full lucidity, locates the target-person and later reports

having transmitted, apparently alone, a flow of consciential energy in the gastrointestinal area (umbilicochakra) of the assisted intraphysical consciousness.

2. **Assisted.** The consciousness of the *second* projector, leaving the inactive human body in the psychosoma, which is in a *dense* condition, laden with the energies of the holochakra, in a semilucid condition, assisted by a helper, goes to the target-person who receives the energies of both – the projected intraphysical consciousness and the helper – reporting nothing about the details of the extraphysical experiment because he/she does not remember it.

3. **Clairvoyance.** The consciousness of the *third* projector, with no loss in lucidity or psychomotor control of the human body, leaves instantaneously through traveling clairvoyance, goes to the target-person and reports seeing the interior of his/her organism through extraphysical heteroscopy, identifies a gastric ulcer and, finally, mentions having transmitted consciential energies to the patient's entire affected organic area.

4. **Mentalsoma.** The consciousness of the *fourth* projector leaves the inactive human body together with the holochakra and psychosoma and, in the condition of a punctiform consciousness, extraphysically *enters* the brain of the target-patient and, after returning, affirms having energetically helped the patient, who has a gastric ulcer, through an improvement of his/her thosenes.

Experiences. The 4 projectors had 4 different experiences, satisfactorily reached the mental target and fulfilled the purpose of the lucid consciential projection, each in his/her own way.

Angles. The 4 projectors, however, differ in regard to the scale of observation employed according to the projected consciousness, which made each one report events with the *same object* – the target-patient – but from *different angles*.

Misunderstandings. Countless misunderstandings and apparent contradictions can obviously arise from this upon making an accurate comparative analysis of the 4 experiences.

Repetitions. It is even possible for the *same* projector, in the *same* extraphysical district and in two different projections to observe aspects or angles of the *same* beings, objects and occurrences in an entirely *different* manner due to his/her extraphysical perceptions being altered in a specific manner during each projective occasion.

Personal. The author has extraphysically returned to the same extraphysical location up to 3 or 4 times at different periods in order to begin to truly understand it. On the other hand, this resource improves the personal reference system in the scale of extraphysical observation.

Sensitive. In the same way, it should be remembered that the scale of observation of the clairvoyant sensitive is very different from the frame of reference of the common person who lacks advanced parapsychic sensitivity with regard to the possibility of detecting and identifying the projected projector or, in another words: cooperating and establishing confirmations subsequent to projection of the consciousness.

Bibliography: Vieira (1762, p. 40).

281. PERFORMANCE OF THE PROJECTED CONSCIOUSNESS

Definition. Performance of the projected consciousness: the actuation of the intraphysical projector according to his/her projective possibilities while free in the extraphysical dimension.

Synonymy: projective actuation; projective competence; projective performance.

Scale. The performance of the projected consciousness extends over a wide range of actuations, from the common and familiar everyday attitudes characteristic of human life to the more surprising and exotic manifestations relative to conventional existence.

Periods. The actions of the projected consciousness permit the evaluation of its basic evolution and they also have an influence upon 4 existential periods:

1. **Existence.** The remainder of the individual's human life (lifetime).
2. **Desoma.** The final projection or the upcoming and inevitable desoma.

3. **Intermission.** The interval between two immediate intraphysical lives or the post-desomatic intermissive period.

4. **Cycle.** The characteristics of the upcoming human life, within the personal and multi-existential cycle of intraphysical and successive existences that dominate us all at our current evolutionary level (holoresomatics).

Categories. Among the existing categories of the performance of the intraphysical consciousness projected in the psychosoma, at least the following 26 can be singled out:

1. **Respiration.** Lack of a need for respiration (annulment of the condition of the *human bellows*).
2. **Pain.** Absence of physical pain.
3. **Lightness.** Lightness in personal manifestations.
4. **Weight.** Absence of one's own body weight.
5. **Insubstantiality.** Experience of insubstantiality regarding oneself.
6. **Intangibility.** The condition of intangibility to human beings.
7. **Invulnerability.** The condition of invulnerability to physical agents.
8. **Paraphotonics.** Personal, extraphysical photonic irradiation.
9. **Energies.** More evident irradiation of one's own consciential energies.
10. **Morphothosenes.** Creation of morphothosenes or thought-forms.
11. **Paraclothing.** Mental texture of the extraphysical clothing (paraclothing) that shapes the visual appearance of the psychosoma in which the projector manifests.
12. **Self-luminosity.** The condition of personal extraphysical self-luminosity.
13. **Rejuvenation.** Rejuvenation of the extraphysical esthetic appearance (para-appearance).
14. **Transparency.** Personal verification of the transparency of human things and objects.
15. **Double.** Observation of the double of human things and objects.
16. **Self-permeability.** The condition of extraphysical self-permeability.
17. **Psycholocotion.** Use of psycholocotion or extraphysical dislocation through the impulses of the will.
18. **Paraphenomenology.** Triggering of extraphysical parapsychic phenomena.
19. **Stroboscopy.** Generation of extraphysical stroboscopic effects.
20. **Parapsychism.** Use of parapsychism without the direct use of the human body, when far from the physical base, using the psychosoma and mentalsoma.
21. **Paravisitation.** Performing fraternal paravisits or spontaneous extraphysical invasions – with no anticosmoethical intention – into the privacy of an intraphysical or extraphysical consciousness that has the appearance of a man or a woman and is not encapsulated.
22. **Apparition.** Personal tangible apparition to intraphysical beings.
23. **Bilocation.** Promotion and experience of the phenomenon of physical bilocation.
24. **Mnemosomatics.** Experience of the phenomena of mnemosomatics: extraphysical precognition and retrocognition.
25. **Conscientiality.** Enjoyment of a temporary consciential life, although lacking conventional human form and time.
26. **Self-awareness.** Enjoyment of the condition of continuous self-awareness.

Implication. The intangibility of the projected consciousness in relation to human beings ordinarily directly implies the fact that the psychosoma, as well as the holochakra, when *inside* the human body, do not exist for the consciousness. It is as though they were simply created as morphothosenes at the moment of projection, because they would otherwise present direct resistance as substances which are analogous to those of the projector.

Facts. The facts, however, remain: the human body, holochakra and psychosoma are extremely *real* when the consciousness manifests itself adequately, according to the existential dimension. They also do not seem to be morphothosenes or thought-forms, nor do they show resistance to each other in their manifestations relative to the circumstances.

Substances. The *substances* of these consciential vehicles, therefore, exist with vibratory frequencies in their energies or different *insubstantialities*.

Compound. *Compound extraphysical actions* – or, in other words, the simultaneous attitudes that demand, firstly, the division of attention and, secondly, the division of the channeling of the transmission of consciential energy to various targets by the consciousness projected with lucidity from the human body in a tropospheric extraphysical environment – are evidently among the more difficult and evolved.

Attention. Good examples of *tripartite* (or multipartite) *attention* are found in the compound manifestations that require conditions such as the following 7:

1. **Assistance.** The assistential act of continued volitation, or hovering in midair, in a heavier or denser tropospheric extraphysical environment.
2. **Exteriorization.** Perform a specific application of one's own consciential energies.
3. **Psychosoma.** Exteriorize energies simultaneously from the parahands and para-arms of the psychosoma to an ill extraphysical consciousness that is off to one side.
4. **Extraphysical consciousness.** Also exteriorize energies to another extraphysical consciousness that is off to the other side.
5. **Balance.** Maintain stability of the peaceful course of the lucid projection, as well as inner consciential balance.
6. **Emotionality.** Avoid negative, impassioned, emotional involvements.
7. **Patience.** Avoid losing patience and fraternal comprehension.

Concentration. In order to achieve all positive objectives, in a complex situation such as this, the projected intraphysical consciousness should minimize the disturbances of the patients, restricting what they say, shout, *telepathize* or nervously gesticulate, beyond the central focus of the projector's attention, concentrating on the maintenance of the balance of his/her strategic position and in the execution of intense transmissions of consciential energies.

Bibliography: Vieira (1762, p. 159).

282. INABILITIES OF THE PROJECTED CONSCIOUSNESS

Definition. Inability of the projected consciousness: *lack of* experience, practice, agility and competence in experimentation with lucid projection in the extraphysical dimension.

Synonymy: extraphysical inability; extraphysical incapacity; paratropospheric inability; projective incompetence; projective ineptitude.

Habits. The mental habits and patterns deriving from human activities in the ordinary, physical waking state strongly influence the reactions and behavior of the projected intraphysical consciousness in the extraphysical condition, thereby engendering many of the projected projector's inabilities.

Genius. With regard to intraphysical beings in general, in theory, no one is entirely incapable outside the human body. By the same token, however, no one is entirely capable in this same condition. For example, the author has not yet encountered an intraphysical *pre-serenissimus* projector who could be considered a projective genius. Does anyone know of one?

Categories. The inabilities of the projected intraphysical consciousness can be placed into two categories:

1. **Generalization.** Universal (groupkarmic) inabilities.
2. **Personal.** Individual (egokarmic) inabilities.

Universal. The following are 3 examples of universal inabilities of the projected intraphysical consciousness:

1. **Contacts.** Difficulty in contacting intraphysical beings.
2. **Intraphysiology.** Inability to affect physical objects.
3. **Reading.** Difficulty in performing various types of reading.

Individual. The following are 8 examples of individual inabilities of the projected intraphysical consciousness:

1. **Compulsion.** Ridiculous or infantile compulsive reactions.
2. **Repression.** Lack of monitoring of one's own instincts, chronic bad habits, human repressions and conditionings (self-weak-traits).
3. **Emotionalism.** Difficulty in performing a critical reduction of emotionalism (psychosomatics) in the paratropospheric dimension.
4. **Lack.** Difficulty in controlling the sexual impulse and its extraphysical repercussions.
5. **Traumas.** Extemporaneous and misplaced personal passivity when faced with disagreeable surprises and extraphysical traumas.
6. **Phobias.** Phobias or fears that are unfounded and sometimes even indistinct or of unknown origin.
7. **Initiative.** Weak initiative on the part of the projected intraphysical consciousness.
8. **Inhibition.** Extraphysical inhibition of the projected intraphysical consciousness which restricts the environment and facilitates the retraction of the silver cord.

Overcome. Universal inabilities that affect all projected intraphysical consciousnesses are overcome with the evolution of the practitioner's lucid projectability. This is only obtained after the intraphysical being is able to overcome his/her individual inabilities through theoretical study and disciplined, continued and successive projections.

Techniques. From this arises the reason for and importance of projective techniques.

Contributions. Certainly the improvement of these individual conditions, according to cosmoethics, personal behavior, mental concentration, acclimation to discoveries and new things (neophilia), while in the ordinary, physical waking state, all contribute equally to overcoming the projected intraphysical consciousness' inabilities.

Bibliography: Greene (635, p. 56), Monroe (1065, p. 182), Schiff (1515, p. 116), Vieira (1762, p. 163).

283. EXTRAPHYSICAL IMPOSSIBILITIES

Definition. Extraphysical impossibility: everything which, in fact, cannot be realized by the intraphysical consciousness while projected from the human body.

Synonymy: extraphysical impracticability; extraphysical incapacity; extraphysical infeasibility; extraphysical unfeasibility.

Discernment. The projector should always be aware of his/her actual extraphysical impossibilities, which will allow him/her to have greater discernment outside the human body, to rationally identify oneiric interference in extraphysical events, to be aware of the extent of his/her morphothosenes and the deepening of his/her self-critiquing and heterocritiquing judgment.

Types. Obviously excluding fantasy states and simulacra of actions, there are 3 basic types of extraphysical impossibilities for the projector: physiological, psychological and psychophysical.

1. **Physiological:** ejaculation; ovulation; fertilization; gestation (or generation of new children); abortion; ordinary nutrition.
2. **Psychological:** suicide; biological death or desoma.
3. **Psychophysical:** the fact that the projected intraphysical consciousness cannot take anything with him/her from the intraphysical dimension to the extraphysical dimension during a lucid projection and the consequences of this particular condition.

Extraphysical consciousnesses. It is important to remember that there are legions of conscientially undeveloped extraphysical consciousnesses which still live in their illusory consciential worlds. They use the dense psychosoma to fulfill all the physiological needs of an ordinary person, which they still consider themselves to have and to be. For those consciousnesses, these needs are real, critical, indispensable and, more precisely, *parapathological*.

Intraphysical consciousness. The projected intraphysical consciousness obviously should not imitate the abovementioned parapathological conditions of ill extraphysical consciousnesses.

Bibliography: Carrington (245, p. 281), Rampa (1357, p. 109), Vieira (1762, p. 162).

284. IMMANENT ENERGY

Definition. Immanent energy (Greek: *energeia*, active): primary, vibratory, invisible, essential and multiform *inergia* which is totally impersonal, dispersed in all objects or physical realities, interpenetrating the entire universe, therefore being universally diffused, or omnipresent, still untamed by the human consciousness, and too subtle to be identified by modern equipment.

Synonymy: *acasa* (Hindu); *alcaeste*; anamorphosis (Ludwig von Bertalanffy); *andrimanitra* (Malaysia, Philippines); *ani* (Ponape, Pacific); *anima mundi* (Avicenna: 980-1037); animal magnetism (Franz Anton Mesmer); anthropoflux (Farny); *anut* (Kusaie, Pacific); *aôr* (Hebrews); *arqueo* (Paracelsus); *arunquiltha* (aborigines, Australia); astral energy; astral force; astral light (H. P. H. F. de Blavatsky: 1831-1891); *atna* (Maoris, New Zealand); *ayik* (Elgonyi, Africa); azote (alchemists); *badi* (Malaysia); *baraka* (Sufis); biodynamic force (Enrico Morselli: 1852-1929); bioenergy; bio-flux (Paul Joire); bioflux; *biolicté* (Vladimir Pravdine); biomagnetism (George de la Warr: 1904-1969); bioplasm (V. S. Grischenko); bioplasmic energy (Soviet scientists); biopsychic energy; bio-radiant energy (Francesco Racanelli); biotic energy; *cause formativa* (Aristotle); *chi* (acupuncturists, China); churinga (Aborigines, Australia); cohesion of the universe; cosmic energy; cosmic force; crystalline force; curative energy; dielectric biocosmic energy (Oscar Brumler); ectenic force (Marc Thury: 1822-1905); ectoplasm (Charles Robert Richet: 1850-1935); efflorescences (Albert Freiherr von Schrenk-Notzing: 1862-1929); effluvia (Hippolyte Baraduc: 1850-1902); *élan vital* (Henri Louis Bergson: 1859-1941); electronic force; elima (Congolese); *eloptic* energy (Thomas Galen Hieronymus); entelechy (Hans Driesch: 1867-1941); etheric force (radiesthesists); etheric formative force (Rudolf Steiner: 1861-1925); *etherium* (J. S. Grimes); extramaterial force; factor X (Bernard Grad); *facultas formatrix* (Galeno: 130-200); fakirian fluid; field information; fifth force; formative energy (Paul Kammerer); fundamental cosmic fluid; *gestaltung* (Johann Wolfgang von Goethe); *glama* (Persia); *han* (Ponape, Pacific); Holy Spirit (Christian tradition); *hormic* energy (William Mc Dougall: 1871-1938); *huaca* (Peruvians); innate (D. D. Palmer); integral energy; integrative tendency (Arthur Koestler: 1905-1983); invisible energy; irradiant cerebral force (Cesare Lombroso: 1836-1909); *it* (Georg Groddeck: 1886-1934); *kalit* (Palan, Pacific); *kasinge* (Palan, Pacific); *ki* (Chinese and Japanese Acupuncture); *kriptus*; *kundalini*; *labuni* (Gelaria, New Guinea); libido (Sigmund Freud: 1856-1939); life-force (Luigi Galvani: 1739-1798); *magnale magnum* (Jan Baptista van Helmont: 1577-1644); magnetic energy; magnetic fluid (Franz Anton Mesmer); magnetoelectricity (William T. Tiller); magnetism (A. Wendler); *mahashakti*; mana (Polynesians and Hawaiian kahunas); *manitu* (Algonquian Indians); *megbe* (Ituri Pygmies); mesmeric fluid; metapsychic energy; motor force (John Ernst Worrel Keely); *mulungu* (Yaos, Central Africa); *mungo* (Sudanese); munis (Paracelsus); mythogenetic radiation (Alexander Gurwitch); negative entropy (Erwin Schrödinger); neo-energy; nervaura (Joseph Rodés Buchanan); *nervengeist* (Frederika Hauffe: 1801-1829); nervous force (Charles Bray); neuric energy (E. Baret); neuricity (E. Baret); neuric-radiant force (A. Baret); *ngai* (Masai, Africa); *njom* (Ekoi, Africa); Nobel Prize winner in medicine in 1913); noetic energy (Charles Musès); *nous* (Plato); *od* (Karl Louis von Reichenbach); OD rays; odic force (Karl Louis von Reichenbach, 1788-1869); odic radiation; *odile*; *oki* (Iroquois Indians); onana; *oni* (Nazareno Tourinho); *orenda* (Iroquois Indians); orgone

(Wilhelm Reich: 1897-1957); orgonic energy; para-electricity (Ambrose Alexander Worrall: 1899-1972); para-energy; perispiritual fluid; physiological radiation; physionuclear energy; *pneuma* (Erasistratus: 300 B.C.); *prakriti* or *mulaprakriti* (Hindus); prana (yogis, India); pre-physical energy (George de la Warr); primal energy; primary human force field; primary perception (Cleve Backster); primary universal force; primordial energy; psi capacity (Joseph Banks Rhine: 1895-1980); psi plasma (Andrija Karl Puharich); psi-energy; psychic fluid; psychic force (William Edward Cox: ?-1879); psychic lever (William Jackson Crawford: ?-1930); *psychode* (Marc Thury); psychonuclear energy; psychosomatic energy; psychosomatic force; psychosomatic phenomenon (modern medicine); psychotronic energy (Robert Pavlitta); psychotronic force; quantic connection; quasi-electrostatic field (Henry Margenau); rays of light (Robert Fludd: 1574-1637); rigid rays (Julian Ochorowicz: 1850-1918); *rlum* (Bushmen, Kalahari); root fluid; *ruach* (Hebrews); *sa* (Egyptians); serpentine fire; serpentine wisdom (Cabalists); sidereal light (Paracelsus); *sila* (Eskimos); somatonuclear energy; soul of the universe (Gustav Benjamin Stromberg); *spiral*; *spiricity* (Adin Ballou); *spiritus* (Robert Fludd); sustaining energy; synchronicity (Carl Gustav Jung: 1875-1961); synergy (Abraham Maslow: 1908-1970); *tao*; telergic energy; telesma (Hermes Mercúrio Trimegistus); tellergy; telluric force; the great arcane (practical magic); third force (Robert Allan Monroe); time (Nikolai Kozyrev); *tondi* (Bataks, Pacific); undefined force (Albert De Rochas: 1837-1914); unified concept; unified field (Albert Einstein: 1879-1955, Nobel Prize winner); unitary principle of nature (L. L. White); universal energy; universal fluid; *universion* (Georges Lakhovsky); virtue (Jesus of Nazareth); *vis formativa*; *vis medicatrix naturae* (Hippocrates); vital electricity; vital energy (ancient Chinese); vital fluid (Allan Kardec); vital force (Christian Friedrich Samuel Hahnemann: 1755-1843); vital magnetism (Charles Littlefield); vital principle (vitalists); *vril* (Henry Bulwer-Lytton); *wakan* (Sioux indians); *wakonda* (Sioux indians); *wodan* (Germans); *wong* (Africans, Gold Coast); X-energy (John White); X-force (L. E. Eeman); *yaris* (Tobi, Pacific); *yesod* (Cabalists); YX-rays; *zoéter* (Hippolyte Baraduc); *zogo* (tribes, Torres Strait, Australia).

Multimodal. As can be observed in this extensive and still incomplete synonymy of names and terms for immanent energy – which are not exactly synonyms in all cases but are equivalent in their convergent objectives, namely to represent different names for the same type of concept – humanity is anxious to recognize, understand and control this energy that permeates the cosmos. It is apparently omnipresent, multimodal and was verified 30 centuries before the current era of the Gregorian calendar.

Forms. Modern day physics researchers have established the existence of 4 basic forms of physical energy or energetic interactions, listed here in decreasing order:

1. **Strong.** *Strong* interaction that acts at the subatomic level of elementary particles, equally causing the union of the atomic nucleus.
2. **Electromagnetic.** *Electromagnetic* interaction, where the greater part of modern or everyday physics is to be found.
3. **Weak.** *Weak* interaction that is also observed at the subatomic level of elementary particles and radioactivity.
4. **Gravitational.** *Gravitational* interaction that humans feel as gravitational force.

Cosmos. It is generally accepted that all matter is energy. It is impossible to imagine the cosmos without energy, one of the last remaining ordinary things about which we know nothing, because we merely observe its manifestations.

Terminology. The terms “immanent energy” and “consciential energy” are used here to characterize these non-physical energies. They require a universal consensus, which should arise someday, of a suitable term, when an expression will be coined for this objective. This will serve to ratify this still controversial hypothesis which, moreover, has logical roots since ancient time, as seen in the studies of modern researchers.

Transference. In fact, immanent energy cannot be created or destroyed, but only evaluated, concentrated, blocked, dispersed, transferred, acquired, transformed, modulated, emitted and projected by the subconscious structures forming the *psi potentiality*, influencing parapsychic phenomena and the projectability of human beings from the soma, as well as all of their thosenizations.

Universal. This energy has been identified in different times, locations and civilizations since ancient esoteric and pre-scientific traditions, as a universal phenomenon.

Matter. All existing matter is energy.

Indestructibility. Matter-energy has the properties of increativity and indestructibility.

Explanations. Immanent energy constitutes an essential factor for the satisfactory explanation of countless occurrences, such as: acupressure; acupuncture; aura; *ballonnement* (French term); bending metal at will; chakras; *congressus subtilis* (Latin expression); consciential energy; dematerializations; ectoplasm; exteriorization of curative energies; exteriorization of motricity; extraphysical paraprogenesis; extraphysical rain, currents and fire; extraphysical self-defenses; extraphysical sphere of energy; homeopathy; interdicted extraphysical locations; *kundalini* (Hindu term, sexochakra); morphothosenes; orgonology; parasurgery; post-projective energetic shower; projective poltergeist (German term); projective raps (English term); radiesthesia (radionics); rematerializations; self-curative projection; self-desoma; self-luminosity; spontaneous self-combustion; teleportation; trace of light of the psychosoma; vibrational state; voluntary self-cardiac arrest; voluntary self-combustion.

Application. Consciencial energy, derived from immanent energy, is indivisible, inoffensive in and of itself and is applied by each individual according to his/her intention and level of cosmoethics. Some do so with sex appeal, others projecting with lucidity, still others researching and so on.

Analysis. If the reader wishes to delve deeper into the ever-relevant subject of consciencial energies, he/she should analyze the dozens of chapters in this book that address this theme in a comprehensive manner.

285. CONSCIENCIAL POWERS

Definition. Consciencial power: the consciousness' capacity for self-determination regarding its own life and destiny.

Synonymy: capacity of the consciousness; consciencial action; consciencial control; energetic radiance; energy of will; force of animus; parapsychic power; personal power; power of consciencial energy; right of the consciousness; self-aware free will; *siddhis*.

Source. Immanent energy is the source of energy that is common to all consciousnesses.

Personal. Consciencial energy is the source of personal power.

Maturity. Power grows along with the maturity of the social being.

Maintenance. Consciencial maturity predisposes the storage or maintenance of personal power.

Fundamentals. Strictly speaking, the consciousness presents 3 intraconsciencial or fundamental intrinsic powers that should not be omitted here. They are listed in order of development, whereas each one depends upon the previous one or the others:

1. **Volition.** Personal will or the potency of volition.
2. **Intentionality.** Intentionality or the cosmoethical quality of the intention of the consciousness.
3. **Self-organization.** Self-organization or personal discipline regarding personal interrupted thosenization.

Penta. According to consciology, the fourth fundamental power of the intraphysical consciousness is the adequate practice of the daily, conscial energetic task or penta, with highly evolutionary results.

Facets. The decisive power to accept something, to have conviction about something or maintain a relative certainty can be analyzed according to 3 logical facets:

1. **Concentration.** The state in which the consciousness inwardly concentrates conscial energy upon that which it accepts.

2. **Categories.** This consciousness can be a child, adult or an extraphysical consciousness.

3. **That.** That which is accepted can be an idea, behavior, object or an intraphysical or extraphysical environment.

Principle. Based upon this principle of energetic concentration, anyone can better understand the manifestations and uses – including those which are spontaneous, instinctive or unconscious – of conscial energy by the members of humanity throughout history.

Energy. When immanent energy is transformed and applied as conscial energy (bioenergy), it leads the human personality, whether conscious or unconscious of the facts, to acquire powers and rights, influencing the existential environment or conscial dimension with its self-determination.

Types. In practice, the conscial powers discovered and identified by the sensitivity of the interested person can be classified into 4 basic types: word, gesture, object and place.

1. **Word.** The word of power can be mental (self-thosene, intrathosene) or spoken. The following are some examples: discourses; prayers; evocations; mantras; hymns and canticles in the dead or exotic languages of Catholics, evangelists, umbandists and followers of other religions.

2. **Gesture.** The gesture of power is that act or gestural manifestation which concentrates, potentiates and directs conscial energy to reach a target. Examples: raise an arm in evocation; move the right hand in order to send positive energy to someone (energization); the dance; the procession; the gesture of blessing; ritualistic acts and objects; the drawing of crosses and stars; and many others.

Personalities. Diverse personalities, such as leaders, communicators, teachers, lawyers, public prosecutors, orators in general and artists of all categories use specific gestures of power (conscial acts) anywhere, broadly and sometimes even abusively, on a frequent and daily basis wherever they wish to manifest themselves.

3. **Object.** The object of power is a material object that has form and occupies space, including the human body, used as an instrument for potentiating bioenergy. The following are some examples: the objects of an altar; the image and the bier of a saint; the monstrance of the priest; a pyramid; the sword used in magic; an object of personal use for establishing *rapport*; the hands of a healer; the (insured) legs or breasts of a star; and others.

Others. Objects are the most commonly found type of conscial power, as can be observed in the following examples: any type of symbol; the incense of an Eastern monk; the plant of power (drugs); the bible of the evangelical pastor; the amulet; the rabbit's foot; clenched fist amulet; the necklace; the bracelet; the earring; the queen's crown; the king's throne; the leader's scepter; the skull with a candle; crystals; jaguar's teeth; the conch shell; the whale bones of the voodoo priest, or *hougan*; shells; the coins of the Umbandist *pai-de-santo* (priest); sacred garments; scapular; the images and pictures of the crucifixion; the lighting effects and shining objects of altars; the Eucharist; the aspergillum; the sacred chorus; the candles and other various liturgical vestments of the catholic priest; the human body of the prostitute; the deck of playing cards; tarot cards; the crystal ball; dowsing rods; pendulums; the object scanned by the psychometrist; the pen used for signing government decrees; the communicator's microphone; and many others.

4. **Place.** The most common place of power is that environment where the energies flow more strongly, without intersections or negative or harmful interferences, and which allow the full manifestation or thosenization of the consciousness. The following are some examples: a nook in the garden; a bench, a corner of an interior wall; a well-positioned chair in a living room; a stable; and many others. *Feng shui* is worth mentioning in this context.

Radiesthesia. Places of power are especially researched by radiesthesia or radionics, for the purpose of prophylaxis and therapy. These include: the bed in an apartment bedroom; the secretary's desk in an office; the corner of the table in a meeting room; the orator's rostrum; the priest's pulpit; the director's chair in a meeting room; the artist's stage.

Hair. As can be seen, certain talismans, and even certain apparently incomprehensible uses or habits, have their *raison d'être* and actually work in energetic terms. For example, Samson's famous hair that, according to legend, was cut by Delilah, making him lose his incredible strength, could have actually had an effective application. The hair of the scalp (the root and shaft) is directly and intimately related to the coronochakra, the lotus of 1,000 petals, the most influential of all the holochakra's force centers, or nuclei of the consciential energy of the human personality (holosoma, unified body).

Chakras. Besides the relationship between the hair on the head and the coronochakra, a man balances his laryngochakra more effectively when he has a long, full beard. A woman effectively balances the cardiochakra (psychosoma) when she is able to maintain her breasts (prolactin, lactogenic hormone) proportional to her physical constitution. In these last 2 cases, there is an evident increase in consciential powers through physical or organic factors.

Pathology. On the other hand, from a pathological point of view, it can be observed that an obese person or one with a large abdomen, has his/her umbilicochakra (solar plexus) unbalanced or blocked, being constantly overworked, thereby impairing the nearby chakras. In this case, there is a reduction in consciential powers due to an organic disturbance.

Transformations. It is interesting to note that certain objects used in order to compensate for physical deficiencies (a lack or an absence of power), such as a cane, an artificial arm and others, can become efficient objects (self-sufficiency or the presence of power).

Priorities. When using the powers of consciential energy, the interested individual, whether young or old, should remember that what is most important or of greatest interest is establishing rational and cosmoethical priorities in the application of parapsychic resources in accordance with his/her personal development.

Losses. The failure to establish priorities in his/her manifestations makes the consciousness lose a great deal of intraconsciential energy, time and space, repeating unnecessary actions (dispensable self-mimicry), enslaved by dispensable ceremonies and rituals, mired in the dispersiveness of its acts, at a sublevel of evolutionary consciential performance.

Objectives. All types of consciential power should be meticulously and rigorously studied by the lucid consciential projection practitioner in order to achieve 3 well-defined objectives in his/her intraphysical and extraphysical life:

1. **Application.** The application of these powers when it is truly suitable or cosmoethically constructive for the individual or others on an everyday basis in intraphysical life or in the extraphysical dimension.

2. **Self-defense.** The act of defending oneself against the powers of balanced or imbalanced intraphysical or extraphysical consciousnesses, when necessary, either in the ordinary, physical waking state or while lucidly projected outside the body.

3. **Freedom.** The act of freeing oneself from submission to the conscious or unconscious use of consciential powers that are entirely dispensable for the individual, or are not in favor of other beings (consciential maturity).

Crutches. All psychological rituals and crutches are temporary, infantile and infantilizing.

Consciousness. The most important *object* is the consciousness, signifying the potent thought or ironclad will (self-motivation) of the personality of the intraphysical or extraphysical being.

Will. All known objects are ephemeral and gradually come down to the *consciousness*. Only the will of the consciousness itself remains as the irreplaceable and eternal resource of power or the *primopower* (first power).

Bibliography: Andrade (32, p. 59), Castaneda (257, p. 152).

286. CONSCIENTIAL ENERGY

Definition. Consciential energy: that immanent energy which the consciousness uses in its general manifestations or thosenizations.

Synonymy: animic energy; animic force; biological PK (biological psychokinesis); energetic microwaves; inner energy; ovarian power; personal magnetism; projective energy; self-energy; sperm power; the energy of will; volitative energy.

Attributes. Regardless of the name that this immanent energy which is transformed into consciential energy someday receives, it currently appears to be responsible for the attributes or qualities of the human personality, referred to by the following 13 expressions, among others:

1. Allure.
2. Charisma, a condition derived from paragenetics.
3. Charm.
4. Emotional magic.
5. Fascination.
6. Glamour.
7. It.
8. Personal enchantment.
9. Personal magnetism.
10. Physical attraction.
11. Seductive power.
12. Sex appeal.
13. Sympathy.

Broad. There are those who also use the term *energy* to broadly denote (umbrella term) any synonym of: attraction; audience participation; *axé*; charge; climate; disposition; enthusiasm; fluid; health; peak; power; vibration; vigor; vitality; and willpower.

Presence. Consciential energy stands out more ostensively in the person who has a *magnetic presence*, latent force, exuberant potentiality, is *photogenic*, liberating involving energy and *exuding power*.

Leadership. Consciential energy is, among other things, responsible for stratification of the defined presence of the human personality in the terrestrial scenario and sustains the phenomenon of leadership when someone from the group with a greater energetic capacity imposes the dominant thought, the group mentality, the vision of life or the “collective” will.

Flock. Thus, the *human flock* is led by an individual or a small group, based upon a clan, family, congregation, oligopoly, institution, society, nation or continent.

Research. Consciential energy instigates countless research projects regarding its nature, peculiar properties, sources, particles, liberation, transference, isolation, storage, fields, biological compatibility and catalysis, sensitivity to intelligence, relationship to time and space, the laws that govern it, its most efficient use and other consequences. All this may seem quite abstract but does not, however, preclude its existence.

Facts. Those who think they can easily discard the theory of consciential energy, derived from immanent energy, as being too illogical or irrational to explain countless phenomena throughout the universe, should bear in mind the following 4 facts, for example, relative to our personal electromagnetic aura:

1. **Thermic.** The human body emits magnetic energy and thermic energy.
2. **Bioelectric.** Countless techniques of modern conventional medicine are based precisely upon biological concepts of some form of bioelectric energy, or psycho-electric waves generated by thoughts and the consciousness.
3. **Electroencephalograph.** The electroencephalograph registers and records forms of electromagnetic energy that pulsate continually in the 2 cerebral hemispheres of humans and subhuman animals, from which recordings many customarily make diagnoses.
4. **Bioelectronics.** The electrocardiogram, electromyogram, chronaximetry and other bioelectronic processes are also partial registers of organic energies.

Influx. The hypothesis of consciential energy is as valid or acceptable as nervous influx, which is still hypothetical. Has any neurophysiologist (or even you) ever personally witnessed *neural influx*, this all-powerful hypothetical agent that is considered to circulate along the nerve fibers of the human body?

Energization. What is the nature of the relationship between neural influx and consciential energy and to what degree does it act? It is good to bear in mind that there is an accepted distinction between 2 types of energization: magnetic (organic, neurological, pure human, material, physiological, somatic) and consciential per se (extraphysical, extra-organic, compound, paraphysiological, holosomatic).

Relations. At least the following 8 areas of human knowledge have a direct relation to and interest in the applications of consciential energy:

1. **Medicine.** All of modern or contemporary medicine.
2. **Holochakrality.** The Hindus' ancient concepts regarding the chakras.
3. **Acupuncture.** The nadis, the invisible points and network of energy conductors known as the meridians of acupuncture or of Chinese medicine.
4. **Acupressure.** The techniques of do-in or acupressure, currently popular in various countries.
5. **Homeopathy.** Unicist homeopathy, which is based upon the remission of illnesses by harmonizing the individual's energy.
6. **Meditation.** Yoga and transcendental meditation.
7. **Anti-gymnastics.** Anti-gymnastics.
8. **Bioenergetic.** Bioenergetic therapy in all of its forms.

MRI. It is incidentally worth remarking upon a recent conquest of medical technology – a veritable revolution in the diagnosis of infirmities – the construction of the magnetic resonance imaging (MRI) camera, which allows the extremely detailed imaging of diseased organs or tissues, thereby allowing diagnoses that are much more accurate and precise, including those in the exploration of the brain and the nervous system. There has already been mention of the first *photography of thought* (*O Globo*; newspaper; daily; Rio de Janeiro, RJ, Brazil; June 16, 1998).

Signals. MRI does not use X-rays. It uses magnetic signals emitted by the nuclei of hydrogen atoms, an element present in the entire organism (*O Globo*; newspaper; daily; Year LIX; N. 18,449; Rio de Janeiro, RJ, Brazil; May 18, 1984; p. 29).

Diagnostic. MRI creates an artificial magnetic field 500 to 40,000 times greater than the earth's magnetic field. This field is so strong that it orients the electrons of the organism's atoms. To this is added another energy that is equal to that of a radio-frequency which, through resonance, changes the position of the lines of force of the electrons' movements. In this way, a special system of electrical transmission, functioning at approximately minus 868°F (-200°C), is captured and computerized in

order to form an image. This apparatus allows spectrography, quantifying the chemical elements of the molecules, precisely indicating the concentration of substances such as phosphorus, sugar, sodium or oxygen in the organism (*O Globo*; newspaper; daily; Year LXIV; N. 20,103; Rio de Janeiro, RJ, Brazil; December 6, 1988; p. 16).

Ectoplasm. When consciential energy condenses in order to manifest in a compound condition in the substance called *ectoplasm*, it gives the sensation of coagulating, appearing to gather into globs inside the ectoplasmic sensitive's human body, congregating organic or biological components.

Sources. According to somatics, the human personality has 5 basic sources of vital energy, presented here in order of increasing importance:

1. **Ingestion.** Ingestion of solids and liquids.
2. **Respiration.** Respiration or organic oxygenation.
3. **Absorption.** Absorption of energy in the ordinary, physical waking state from plants, animals, persons, the soil and the sun, through primary, secondary and tertiary chakras.
4. **Sleep.** Sleep or cellular detoxification with a minor dis coincidence of the vehicles of manifestation of the consciousness (personal number of hours of sleep).
5. **Projectability.** Projection of the consciousness in the psychosoma or direct absorption of cosmic energy (consciential projectability).

Production. The developed human transmitter of consciential energies – a charged holochakral battery or a source of supplementary force – feels that consciential energy, in certain circumstances, can produce heat, cold and a *prickling* sensation (para-esthesia) mainly in the hands. The individuals that he/she treats can come to him/her in a state of energetic imbalance, like *drained batteries* (imbalance of consciential energies).

Action. The action of consciential energy shows itself to be intimately associated with homeostatic mechanisms or, in other words, appears to maintain the human organism in a state of *optimal* operation, or full health.

Heat. Consciential energy provokes an alteration in molecular movement. This is why it produces heat during therapeutic transmissions between intraphysical consciousnesses, affecting the self-regulatory processes that maintain order in biological systems and, in this case, intensifying the capacity of the human organism to neutralize entropy, despite the fact that heat increases entropy. These chemical reactions are very powerful.

Matter. Through his/her emunctories, the human being constantly rids him/herself of various types of waste material, whether intestinal, vesical, pulmonary, vaginal, auditory or epidermal. It also continuously excretes mental paramatter, or the morphothosenes that populate the psychosphere of the individual's consciential microuniverse. Like many houses, the consciential microuniverse never completely cleans out its internal trash, which is generated on a continuous basis. The greater the person's physical weight and biological age, the greater his/her amount of waste matter may be. These excreted materials, when excessive, present low amounts of consciential energies that often influence the creation of the bioenergetic imbalances and blocks of the intraphysical consciousness.

Transmission. It is theorized that consciential energy is not conducted directly through the nervous system, but electrolytically, through the conjunctive tissue, transmitting information and signals in the surroundings of the surface of the human body.

Oxygen. On the other hand, it is generally accepted that immanent energy is intrinsic to the oxygen molecule (prana).

Motor. Consciential energy can manifest through the psychosoma as a motor force, still leaving many fundamental aspects to be researched, such as: intensity; potency; takeoff; extraphysical translocation; the action of the silver cord; telekinetic effects; interconsciential communication; and the interpretation of the nature of energy.

Therapeutic. Consciential energy also manifests as a therapeutic resource when used as a curative method that regards the human organism more as energy than as mass, still leaving the various related manifestations to be researched, such as: therapeutic exteriorization; *external* energy; the parapsychic channel; extraphysical energizations; magnetic self-defense; the influence of affinity or extraphysical empathy.

Antiquity. Treatment through the laying on of hands or direct energizations (*Reiki*) has been used by the Greeks, Egyptians, Hindus and Chinese since antiquity.

Insistence. Mechanist scientists still insist on placing consciential energy at the same level of fantasies such as phlogiston, ether, N-Rays, caloric, canals on Mars, *lysenkoism*, a perpetual motion machine, squaring a circle and others. Every paradigm change is very slow.

Evidence. Two facts that prove the existence of consciential energy, which can be transferred from a donor to a human receiver, have been demonstrated in the laboratory:

1. **Water.** Water treated with consciential energy changes the color of the solution of the crystal, giving a visual indication of the presence of energy.

2. **Tension.** The same water, when treated with consciential energy, shows a change in its surface tension, hydrogen bonds and the electrical properties of the water.

Modeling. The objective modeling of morphothosenes and moving waves can be distinguished in the shaping of forms through consciential energy. There are no 2 individuals alike, in terms of the qualities or characteristics of personal consciential energy (volume of manifestation, frequency, duration, accumulation, velocity, recomposition, dissipation, direction and other variables).

Characterization. Each human being can be classified by the essential characteristic or trace of the specific energies of his/her consciential microuniverse. This is the core of his/her individualizing holothosene.

Organ. When meeting a person, you can really define the type of consciential energies according to the predominant organ or system of that individual.

Parapsychism. These characteristics are undisguisable to the parapsychic acuity or sensitivity of the observer with bioenergetic self-control, although operating on an unconscious level in most individuals, whether victim-seducer or victim-seduced.

Case study. The following are 7 examples of these facts:

1. **Drainer.** The human drainer: the bioenergetically ill person; the woman in lack of affection.
2. **Psychomotricity.** A set of muscles: the fanatic athlete; the weightlifter (cerebellum).
3. **Palmochakras.** A pair of hands: the virtuoso; the specialized artisan.
4. **Sexochakra.** A sexual organ: the addicted sexaholic (sex-maniac); nymphomaniac.
5. **Umbilicochakra.** A stomach: the gourmet; the overweight female gourmand.
6. **Cardiochakra.** A heart: the religious consoler (consolation task); the tearful artist (infantilism).
7. **Coronochakra.** A brain: the self-aware erudite; the mature social being.

Fetus. The interfacing of consciential energies coming from the auric coupling of the state of gestation, between the pregnant woman and the consciousness of the fetus, probably somehow profoundly affects the resomatic directives or conditions of the recent-resomant extraphysical consciousness.

Prematurity. It can thus be asked: “What are the real energetic consequences for the resomant extraphysical consciousness that passes through *fetal infancy* or, in other words, through the period between birth as a premature infant (from sixteen weeks on) and the date on which it would otherwise be born as a full-term baby (forty weeks)?”

Hypothesis. The best research hypothesis, in this case, is a survey of the levels of awareness and chakral operation of adults who were born prematurely and those who were full-term babies. This research has still not been performed. Might prematurely born individuals be more susceptible to bioenergetic imbalance?

Systems. Today, in various countries, acupuncture, moxibustion and acupressure, as readily accepted scientific norms, use knowledge of the physical-extraphysical bioenergetic system, based upon the *holistic theory* and the structure of the bioplasmic body as a fourth organic system equivalent to the 3 other systems: the nervous system, the circulatory system and the lymphatic system. Its techniques make use of the acupuncture points, the system of meridians, the system of ducts or circuits of low resistance, which are directly related to the endocrine system.

Therapies. Therefore, consciential energy is already involved in various fields of medicine and in controversial alternative therapies. Only those who do not wish to see this fact do not perceive it.

Future. It is rational to forecast that in the future all children, just as they are currently obliged by law to have vaccines and compulsory basic education, will legally be obligated to become familiar with and control the procedures of energetic reception, transmission and self-defense through the self-aware mobilization of bioenergy (VS).

Anomalies. To what degree is the consciential energy of the experimenter (unknown source of error) responsible for the surprising and inexplicable apparent (or occult) effects in the laboratory that can be reproduced for a while (anomalous results or simple synchronistic, isolated *coincidences*) and finally disappear without trace? These facts are related to the sheep-goat effects and experimenter effects.

Bibliography: Alverga (18, p. 81), Baraduc (76, p. 93), Bedford (103, p. 171), Gibier (587, p. 114), Meek (1028, p. 165), Scott (1529, p. 62), Walker (1781, p. 15), Wang (1794, p. 151), White (1831, p. 443), Yogananda (1894, p. 235).

287. MOBILIZATION OF CONSCIENTIAL ENERGIES

Definition. Mobilization of consciential energy: the act of will whereby the intraphysical consciousness sponsors the circulation of consciential energies inside and outside his/her human body, redirecting and normalizing their flows (see fig. 287, p. 1,139).

Synonymy: circulation of consciential energy; energetic normalization; energization.

Scale. Intraphysical consciousnesses can be placed into 4 categories, in an ascending scale of excellence with regard to their relationship with consciential energy:

1. **Ignorant.** The intraphysical consciousness who is completely unaware of the subject of consciential energies.
2. **Theoretician.** The intraphysical consciousness who is theoretically familiar with consciential energy but has not had any self-aware experience with his/her transcendent reality.
3. **Superficial.** The intraphysical consciousness who, as well as having a theoretical understanding of the subject, has already had some experimental, practical, superficial or occasional contact with consciential energy in a self-aware manner.
4. **Technique.** The intraphysical consciousness who has a theoretical and practical (theoretical) understanding of consciential energy and technically applies it, through the impulsion of his/her will, consciously controlling the operation of the chakras.

Greatnesses. Strictly speaking, this ascending scale of excellence, aside from measuring the degree of theoretical experience of intraphysical consciousnesses with consciential energy – the *touchstone* of all basic phenomena of life on this planet – indisputably shows 3 other greatnesses of the human personality:

1. **Phenomena.** The precise level of the intraphysical consciousness' awareness regarding parapsychic phenomena in general (evolutiology).
2. **Projectability.** The intraphysical consciousness' level of projective excellence (consciential states).
3. **Parapsychism.** The intraphysical consciousness' level of parapsychic development (multidimensional exchanges).

Reservoirs. Consciential energy, being as subtle as it is powerful, penetrates human bodies and the bodies of subhuman animals. We all have a certain amount of it throughout the body, but mainly in certain reservoirs such as the cerebrospinal axis and sympathetic plexuses, like the solar plexus, or in the abdominal brain (umbilicochakra).

Types. In mobilization of consciential energy, any intraphysical consciousness can, on his/her own, execute 3 types of simpler, basic procedures, or the basic mobilization of energies (BME):

1. **Circulation.** The circulation of consciential energies in a closed circuit.
2. **Reception.** The reception or absorption of consciential energies.
3. **Release.** The exteriorization or release of consciential energies.

Will. The execution of any of these 3 basic procedures has to start from the practitioner's will.

Key. Ironclad, granitic or steely will is the key that unlocks the ample performance of consciential energetic procedures, turning the psychosoma and holochakra together into an energy mobilization center.

Mobilization. The mobilization of consciential energies predisposes the animist practitioner to serve as a sensitive for extraphysical consciousnesses which are technicians in all energetic operations in favor of intraphysical or extraphysical beings.

Perceptions. The natural development of sensitivity in the application or mobilization of energies allows the animist-sensitive, with time and repeated experiences, to perceive energetic manifestations within him/herself when alone, extending the energetic pathways within his/her vehicles of consciential manifestation, or in the energetic current formed by the group of receptor and donor individuals, and extraphysical consciousnesses, when gathered in a collective experiment of bioenergetic exteriorization or irradiation.

Points. There are 3 points of access that can be used in order to approach the energetic psychosphere of an intraphysical consciousness in a practical, para-anatomical, paraphysiological and paratherapeutic manner:

1. **Hands.** Through one's own hands or fingers (palmochakras) – without making physical contact (between yourself and the other person) – pointing them directly at the forehead (coronochakra and frontochakra) of the child or adult at a distance of 1 3/8" (3 cm).
2. **Middle.** Pointing the middle finger of one of the hands, or the middle fingers of both hands, for example – at a distance of 1 3/8" (3 cm), without making physical contact – toward the middle finger of one of the hands of the person under analysis (palmochakras, cardiochakra and laryngochakra).
3. **Hallux.** Performing the same procedure (middle fingers of the hand) at a distance of 1 3/8" (3 cm) – without making physical contact – toward the big toe or hallux of one of the person's (bare) feet (sexochakra).

Procedures. Five different conscientiotherapy practices can be performed through these probings or procedures.

1. **Affinity.** Establish direct auric coupling with someone.
2. **Holochakra.** Therapeutically balance the person's holochakra through bioenergetic unblocking and balancing.
3. **Evaluation.** Assess or evaluate the bioenergetic potentialities of an individual or evolutient.
4. **Paradiagnosis.** Establish deep sympathetic assimilation with an evolutient with the specific objective of paradiagnosis or even a prolonged therapy with more long-lasting results (self-remission).
5. **Self-discrimination.** Allow the person to discriminate his/her sensations regarding exteriorized consciential energies and thereby perform a candid analysis of the level of awareness of his/her own holochakra or of specific chakras.

Performance. The practitioner will notice that his/her energetic performance varies from one day to another, being vanquished or victorious from the endeavor, according to his/her prior

preparation, goodwill, disposition, donation, passivation, optimization, *self-maintenance in good shape* or efficiency in cooperating with assistential energetic services, such as during the daily practices of penta.

Procedures. Thus, if the practitioner wishes to perform research by extending him/herself throughout the environment, he/she will perceive the following 39 very distinct occurrences or technical procedures within holochakrology and thosenology, listed here in alphabetical order:

1. **Absorption.** The acquisition or interiorization of immanent and consciential energies to him/herself.

2. **Accumulation.** The localization, accumulation or storage of masses of condensed energies generated by the intraphysical consciousness him/herself and by all those intraphysical and extraphysical consciousnesses present.

3. **Assimilations.** Sympathetic assimilations (synchronism) and sympathetic deassimilations performed by the decided and more potent will.

4. **Asynchronies.** Divergences or asynchronies of energetic flow, or *breaking the chain* with internal and *external* agents (xenothosenes).

5. **Balances.** Various instances of energetic balancing or unblocking that pertain to that person and others (groupthosene).

6. **Blocking.** The blocking and unblocking (balancing and detoxification) of the energetic flows of others when unhealthy or intrusive to the microuniverse of that person or to the energy current already installed and consolidated through affinity.

7. **Category.** The category of energies that are generally present.

8. **Chakra.** The (personal) chakra, the manifestations of which predominate in the energy current.

9. **Continuity.** Verification of the dynamic of the rare continuous flow of consciential energies in certain assistential, emergency and critical situations.

10. **Coupling.** Auric coupling and uncoupling established between intraphysical and extraphysical consciousnesses by the decided will.

11. **Direction.** The direction, orientation, course and destination intentionally applied to assistential energetic flows.

12. **Discrimination.** The clear identification and specification of consciential energies all the time.

13. **Dissipation.** The location and identification of the spreading, dispersion or dissipation of consciential energies.

14. **Donors.** Participants who are (more “connected”) self-aware maintainers and donors or sustainers of the current of consciential energies.

15. **Draining.** The rupture or draining of the energetic current.

16. **Duration.** The duration, permanence or predominance of a specific dynamic of energetic flows.

17. **Empathy.** The strong or weak energetically associated affinities of those persons present (empathy, homothosenes, orthothosenes).

18. **Encapsulations.** The energetic “cysts” of intraphysical and extraphysical consciousnesses which have no affinity with the environment (holothosene) and are encapsulated or dependent upon extraphysical intruders (*satellites of intruders*).

19. **Exteriorization.** The release, exteriorization or self-aware transference of consciential energies from one intraphysical consciousness to another, from one object to another and from one environment to another.

20. **Homogenization.** The homogeneity of bioenergetic discharge or the uniformity of the intense flow of consciential energies of continuous action.

21. **Increase.** An increase or decrease in the volume (impulsion) of energetic flow.

22. **Increases.** Increases in *external* energies (heterothosenes) that may be healthy or unhealthy.

23. **Intensity.** The intensity of flow or of energy “pulsations” that pass by.
24. **Intermittence.** The identification of the energetic flow occurring through *streams of discharge* of consciential energies.
25. **Loss.** The apparent temporary loss (transference) of energies during assistential works.
26. **Pathothosene.** The identification of the type of pathothosene of the person who is distracted or parapsychically absent (encapsulated) from similar manifestations (“disconnected”) within the chain of assistential energies.
27. **Paths.** The paths of the circulation of energies both inside and outside the environment or, in other words: the continuous dynamic or the self-aware mobilization of personal and group energies (materthosene or group thosene).
28. **Recomposition.** The normalization of *immanent* energy assimilation and the recomposition of personal levels of *consciential* energies of the holochakra (energetic homeostasis).
29. **Reduction.** A reduction in the volume of energetic flow generated by personal willpower.
30. **Reinforcement.** The lucid reception of additions or *showers* of reinforcing and unexpected consciential energies that envelop intraphysical consciences.
31. **Reunification.** The energetic supply made in favor of homogenization of the frequencies of energies or of thosenes, when energetic surpluses bridge the gaps and discontinuity in the flows, restoring the vital current.
32. **Rhythm.** The frequency, rhythmic pulsation or precise, average or predominant rhythm of the personal energetic flow.
33. **Specification.** The specification of energetic flows that are *in streams* or are continuous.
34. **Synchronizations.** Synchronizations with intraphysical and extraphysical external agents.
35. **Temperature.** The sensation of a predominantly hot or cold temperature in manifestations (somatic biothermia), with somatic heating or cooling occurring through consciential energies.
36. **Tentacles.** The involving energetic *tentacles* that can be intercepted and annulled through the determination of the will.
37. **Vacillations.** The mental or *xenothosenic* vacillations of those persons present.
38. **Velocity.** The willful force of the impulsion of the energetic flow or the velocity of the energetic discharge generated by the will stemming from the materthosene and *median* will of the group performing assistential services.
39. **VS.** The installation of a prophylactic vibrational state (VS) at the beginning and end of interconsciential energetic assistance.

Fields. The fields of consciential energies installed in the Extension Course in Projectiology and Conscienciology 2 (ECP2), of the International Institute of Projectiology and Conscienciology, were conceived and developed in order to allow practical observation and detailed testing with all of the energetic procedures listed herein.

Bibliography: Alverga (18, p. 81), Gibier (587, p. 135).

288. CLOSED CIRCULATION OF ENERGIES TECHNIQUE

Definition. Closed circulation of energies: conscious control of energetic movements inside yourself, from your head to your feet and hands, and back to your head.

Synonymy: closed energization; dynamization of the vibrational state; energies in closed circuit; internal energetic circulation.

Will. The dimension, intensity, velocity and duration of the closed circulation of consciential energies vary according to your active will (see fig. 288, p. 1,139).

Uses. Among the uses of the control of the closed circulation of energies by your intraphysical consciousness inside your own human organism and your other coincident vehicles, at least the following 6 can be singled out:

1. **VS.** Installation of the vibrational state (VS), a condition that predisposes even a lucid takeoff of your consciousness projected in the psychosoma.

2. **Self-confidence.** Intense motivation, providing you self-confidence to use your own consensual energies and allowing you to distinguish external energies that you receive.

3. **Digestion.** Acceleration of your digestion in appropriate occasions of interconsensual assistance.

4. **Self-cure.** Heal organic disturbances, mini-illnesses and minor-indispositions.

5. **Prophylaxis.** Obtain one thousand and one positive and prophylactic consensual resources that are easily understood by you or anyone else (consolation task, clarification task, penta).

6. **Self-defenses.** Completely block the entrance of undesirable energies to your inner world, thereby augmenting your energetic self-defenses (self-encapsulation).

Practice. Circulation of energy, without exteriorizing, from the head to the feet and from the feet back to the head, can be performed many times. Soon thereafter, the process will be changed to the condition of an extremely intense vibrational state throughout all vehicles of manifestation of the consciousness. This practice sterilizes the environment in a vibratory manner, provides a great sense of well-being, a positive disposition and self-confidence to the intraphysical consciousness.

Procedures. The closed-circuit energetic self-defense technique can be structured around 6 basic procedures:

1. **Feet.** Remain erect, with feet astride. Close the eyelids. Let the arms drop alongside the body. Direct the flow (or influx) of your energies, through the impulsion of the will, from the head to the hands and feet. Do not worry if you do not know what bioenergy is. Continued practice will show you the entire energetic reality. If you feel nothing during the first attempts, do not be concerned. Persist and you will end up feeling something. This is inevitable because it is part of the paraphysiological development of us all.

2. **Head.** Return the flow of the energies, through the impulsion of your decided will, from the feet to the head. At this point, you will already be able to identify the direction of the energetic flow upwards, contrary to the previous flow.

3. **Discrimination.** Repeat the same procedure 10 times, perceiving and discriminating the flow of energies sweeping the various parts and organs of your human body. At this point, the unblocking, balancing and potentiation of your energies in your energetic centers and points begins.

4. **Speed.** Continue the same procedures, now gradually increasing the speed (or rhythm) of the impulsion of the flow of energies.

5. **Intensity.** Continue with the same procedures, now maximally increasing the intensity (rhythm or volume) of the flow of energies. This flow will comprise progressively larger and more potent circuits, which you will perceive.

6. **Vibrational.** Finally, install the vibrational state. The flow and the closed circuit disappears and your entire psychosphere becomes completely “lit up”, “dazzling”, or “incandescent” with the vibrating energies.

Repetitions. Endeavor to repeat the entire process many times a day to start with, in different conditions, situations and circumstances, always remaining erect (standing up) if possible. The following are examples: in the bathroom nude; wearing informal attire; wearing social attire; holding packages; in the sun; in the rain; and in other various conditions.

Alert. It is necessary to perform the circulation of energies in the most diverse existential circumstances and situations because we never know when we will need more energetic defenses. Diurnal life always presents many surprises and not all of them are welcome or agreeable. We should be energetically ready and alert 24 hours a day, all year, our whole life.

Note. We should never use any parapsychophysical artifices or crutches, regardless of their nature or pretext, with the intention of optimizing or “enriching” the process of installation and operation of the vibrational state, because this will drastically impede the development of self-confidence in our

own consciential energies and their applications. The following 2 examples are to be avoided, in this case: imagination as a *psychological crutch*; the vibrating chair as a *physical crutch*.

Crutch. It is always wise to bear in mind that, in our consciential condition while in the projected state, or even while in the extraphysical state, in the post-desomatic intermissive period, after the decomposition of our human body, neither the author nor you will have any physical object at hand to serve as a parapsychophysical crutch in our energetic self-defense when faced with interconsciential attacks from ill extraphysical consciousnesses.

Immaturity. When you use any artifice or crutch, except for the impulsion of your unbreakable will, you erroneously and lazily endeavor to transfer the effort you need in order to develop your energies through your dynamized will and improve your notably emotional self-control to the “providential” crutch. This is, therefore, an attitude that is infantile, conscientially immature and intraconscientially regressive, as well as being repressive and escapist. It is also an indefensible harmful postponement of something that we all have to confront either now or later, here or elsewhere.

Bibliography: Vieira (1762, p. 19).

289. RECEPTION OF CONSCIENTIAL ENERGIES TECHNIQUE

Definition. Reception of energies: conscious or unconscious absorption and interiorization of forces assimilated from intraphysical and extraphysical consciousnesses, as well as from natural sources (plants, water and others) that are in the surroundings of the intraphysical consciousness.

Synonymy: conscious energetic absorption; conscious energy assimilation; conscious extraction of external energy.

Neutrality. In the physical and extraphysical consciential encounters of human life, rarely does someone always remain neutral regarding the bioenergetic aspect or the energies of consciential principles or immanent energies in general.

Balance. Generally speaking, you either give or absorb energies from others almost constantly, through the chakras (force centers) and energetic points (meridians) of the holochakra (vital body), keeping yourself energetically balanced (healthy) or unbalanced (ill).

Types. There are many types of reception of energies, such as the following 4:

1. **Reception.** Received (magnetic) energization, whether perceptible or imperceptible.
2. **Hydromagnetic.** The hydromagnetic shower.
3. **Aeromagnetic.** Aeromagnetic refrigeration.
4. **Post-projective.** The post-projective energetic shower.

Receiver. The receiver of consciential energies is also known as a *centripetal person*. The opposite, the donor of consciential energies, is the *centrifugal person*.

Coupling. In auric coupling, absorption as well as exteriorization of energies can occur on the part of one or another consciousness which consciously or unconsciously allows a temporary energetic union or, in other words, the homogenization of the energies of both.

Pathological. The pathological absorption of energies is energetic vampirization. It can also be intentional or unconscious on the part of the receiver or, in the case of an ill person, one who suffers from constant imbalance in the circulation of his/her physical-extraphysical energies.

Contraband. The intentional acquisition of energies from others, plants and objects, should never get to the point of vampirism or the frank parasitism of draining the individual, animal or plant in *energetic contraband*. This is similar, for example, to the concise system of the tapper Hestreo – a true vampire technician – who drains the seringa tree to the point where he removes all the sap and leaves it completely dehydrated or dry.

Bibliography: Vieira (1762, p. 51).

290. ABSORPTION OF EXTRAPHYSICAL ENERGIES TECHNIQUE

Definition. Absorption of energies from the extraphysical or cosmic dimension: the act wherein your consciousness projected in the psychosoma absorbs energy like an extraphysical accumulator.

Synonymy: absorption of immanent energy; acquisition of cosmic energy; extraphysical assimilation of prana; process of extraphysical nutrition.

Sources. The absorption of cosmic energies – or direct immanent energy transformed into indirect consciential energy – through projection in the psychosoma, is the human personality's fifth basic source of vital energy, after alimentation, respiration, energetic absorption during the ordinary waking state and the state of natural sleep (see fig. 290, p. 1,140).

Sleep. Sleep permits two categories of basic absorption of energies:

1. **Minor.** The minor absorption of prana or cosmic energies through the miniprojection of your psychosoma near your human body, in the intraphysical base or energetically shielded chamber.
2. **Major.** The major absorption of cosmic energy through the maxiprojection of your psychosoma some distance from your intraphysical base.

Influences. The splenochakra of the holochakra-psychosoma set is attributed with the function of absorption of cosmic energies by the projected intraphysical consciousness, when its psychosoma is affected by 3 basic influences, listed below in order of decreasing importance:

1. **Locations.** Extraphysical locations which are natural reservoirs of prana, e.g.: the ocean, rivers, vegetation and others.
2. **Distance.** The physical distance between the projected psychosoma and the human body, by virtue of extraphysical freedom, volitation and greater absorption.
3. **Time.** The duration of the consciential projection, which has a minor influence because the time factor gradually disappears when the consciousness is extraphysically (conscientially) more *distant* from the human body that was left inactive at the intraphysical base.

Law. The capacity to absorb cosmic energies increases in direct proportion to the physical distance between your projected psychosoma (a semiphysical body) and your human, physical and inactive body.

Uses. Within the uses of absorption of cosmic energies, at least the following 3 can be singled out:

1. **Health.** Recuperation of physical and mental health.
2. **Sleep.** Recuperation from a sleepless night (correction of one's personal sleep schedule).
3. **LPB.** Increased possibilities for improving projective performance or your lucid projectability (LPB).

Regeneration. During the natural sleep state, which allows extracorporeal sleep, and during the consciential projection condition, whether nonlucid, semilucid or lucid, the psychosoma, now detached from the human body, has more opportunity and possibility to work toward the regeneration and recuperation of this same human body through absorption of cosmic energies. It thereby intensifies the potentialities of the holochakra (energetic parabody) as well as more rapidly curing fractures and luxations, detoxifying the organs and renewing the physiology of the organic systems.

Analogy. The absorption of cosmic energies by the projected psychosoma is somewhat analogous to the absorption of luminous energy, or photons, by a plastic switch or commutator. This is a wall mounted device that can interrupt or reestablish continuity in an electrical circuit and, after being exposed to the light of an electric lamp, creates a temporary weak luminosity in the typical darkness of the closed bedroom.

Commutator. The luminous commutator is, due to the phenomenon of phosphorescence, frequently used nowadays in order to provide orientation in dark, closed environments. This is because it illuminates and maintains visual reference points, so that persons do not lose their sense of direction upon moving about in a penumbra or in darkness.

Hypotheses. The absorption of cosmic energies raises various questions or hypotheses for research, such as the following two:

1. **Light.** Does the absorption of cosmic energies also constitute an absorption of luminous energy by the psychosoma?
2. **Psychosomatics.** Is the psychosoma of the intraphysical consciousness which projects very frequently more luminous than the psychosoma of average human beings?

Force. An increase in personal force, physical and psychic disposition of the intraphysical consciousness who projects in the psychosoma far from the physical base is a fact that is observed by veteran consciential projectors. On the other hand, it is not known to what degree this sensation of force and disposition stems from the positive parapsychic conditions of the intraphysical projector.

Proof. There is still no known scientific process that can prove the conjectures and questions of this chapter. However, it is possible to obtain individual and definitive evidence through projective practices. Skeptics and interested individuals are therefore urged to perform research and seek out proof by producing some prolonged lucid projections at a distance in the psychosoma.

CHSC. Major research with consciential energies can be performed in the many independent and isolated laboratories at the Center for Higher Studies of the Consciousness (CHSC), in Iguassu Falls, PR, Brazil, which are specially constructed for this purpose.

Transmission. The silver cord or, more precisely, the holochakra transmits the absorbed energies directly through the projected psychosoma to the cells of the human body.

Volitation. Extraphysical volitation, obviously with the consequent absorption of cosmic energies and the reinvigoration of the parapsychology and physiology in general, in certain conditions, increases the manifestations of the sexochakra and intensifies the sexual excitation (libido) of the lucid projector in the ordinary, physical waking state.

Aphrodisiac. In this case, consciential projection works like an infallible aphrodisiac. The veteran projector should be cautious with regard to intrusions, self-intrusions and self-corruptions in view of cosmoethics. This is like walking a razor's edge. The monogamous human being who is sexually mature and settled into a harmonized and stable affectionate relationship – being a partner of an evolutionary duo – is the one who is better off in this process. It is important to note that the physical age of the intraphysical consciousness has little influence in these occurrences.

Bibliography: Andrade (27, p. 159), Andreas (36, p. 52), Muldoon (1105, p. 142).

291. EXTERIORIZATION OF CONSCIENTIAL ENERGIES

Definition. Exteriorization of consciential energies: the act wherein the consciousness emits, through one or more of its vehicles of manifestation, consciential energies that are temporarily accumulated inside it or are passing through it (see fig. 291, p. 1,140).

Synonymy: biotherapy; donation of energies; energetic emission; extravasation of *od*; looseness of the holochakra technique; self-aware bioenergetic projection.

Types. Among the types of exteriorization of consciential energies of the intraphysical consciousness, at least the following 6 can be singled out:

1. **Self-lucidity.** Conscious or unconscious energetic exteriorization.
2. **Dimension.** Energetic exteriorization produced in the ordinary, physical waking state or in the extraphysical dimension.
3. **Penta.** The energizations that are apparently emitted into the void during the daily, regular and technical practices of penta.
4. **Individuality.** The energizations that are performed solitarily, alone or only with the projector as an intraphysical being.

5. **Groupality.** The energizations that are performed in a group (chains) of intraphysical beings (intraphysical consciousnesses and subhuman animals).

6. **Assisted.** The energetic transmission emitted to assisted intraphysical beings as well as to energivorous and parapsychotic post-desomatic extraphysical consciousnesses.

Donor. The donor of consciential energies is also known as a *centrifugal person*.

Uses. Among the basic uses of exteriorization of consciential energies, at least the following 8 can be singled out:

1. **Holochakra.** Improvement in the aura of health (holochakra) in the lucid projector's psychosphere (holothosene).

2. **Base.** Extraphysical cleansing of the lucid projector's intraphysical base (energetically shielded chamber).

3. **Projections.** A parapsychic coadjutant to lucid projections, especially those that are assisted, programmed or sponsored by extraphysical helpers.

4. **Assistance.** A complement to extraphysical assistential tasks performed during periods of lucid projection.

5. **Deintrusions.** Cooperation in the tasks of extraphysical rescue, extraphysical deintrusion and the act of assistentially serving as *interconsciencial bait*.

6. **Psychosomatics.** The positive rarefaction of the psychosoma, thereby better predisposing one to projections with continuous self-awareness.

7. **Blocking.** The blocking or neutralization of certain intrusive parapsychic manifestations from other beings in relation to oneself, such as in the performance of the clairvoyance of a clairvoyant sensitive.

8. **Encounters.** Self-defense encounters or energetic confrontations with ill extraphysical consciousnesses and with intraphysical beings who are either in the waking state or projected, on certain occasions.

Detection. Over the decades, the author has observed 4 apparently diverse occurrences that nevertheless present characteristics which are common to the intensification of consciential energies that are exteriorized, or psychophysiological, active and detectable:

1. **Burn.** The patient who was recently burned in the open air and was an inpatient at a specialized clinic, after being saved from a violent electric discharge of lightning that originated from a cloud and terminated in the ground (thunderbolt, flash of lightning). This fleeting intensification of consciential energies generally disappears shortly after leaving the clinic.

2. **Abducted.** The burn victim who affirmed having been "abducted by an unidentified flying object", having experienced the so-called contact of the third kind of UFOlogy, manifesting a period of hours of total amnesia that are only recoverable through hypnotic mnemonic regression. Some abductees are energetically active, in this state, 4 years after the event.

3. **Sexochakra.** The person ("recent extraphysical burn victim") who recently suffered an abrupt awakening of the kundalini (sexochakra), the release of the so-called *serpentine fire* of the sexochakra, with or without awareness of his/her state, which can disappear after a short while or may last for decades.

4. **Sensitive.** The experienced sensitive who is able, at any moment, through the impulsion of his/her own will, to perceive and trigger the reception as well as the exteriorization of energies from and to living beings, objects and human environments, whether they are active sensitives of the parapsychism of physical effects, energy transmitters, psychic parasurgeons, telekineticists or veteran lucid projectors. This state generally lasts longer than the others.

Transformations. These 4 personality types are listed here in ascending order of their energetic possibilities, although any of the first 3 can become a developed sensitive over time. These experiences provoke the *healthy looseness of the holochakra* for a considerably prolonged period.

Potenkinetic. The author proposes the term *potenkinetic* to characterize the condition of the vehicles of manifestation of the intraphysical consciousness, which determines his/her capacity for transmitting and receiving consciential energy, more popularly known as bioenergy.

Bibliography: Gibier (587, p. 136), Machado (968, p. 37), Pisani (1248, p. 285), Schutel (1525, p. 25), Targ (1651, p. 253), Vieira (1762, p. 51), White (1831, p. 94).

292. EXTERIORIZATION OF CONSCIENTIAL ENERGIES TECHNIQUE

Isolation. The exteriorization of energies, as a physical-extraphysical self-hygiene technique and a coadjutant in the development of lucid consciential projections, can be produced by you whenever needed, although it is preferable to do so in an environment that allows physical isolation.

Locations. You can practice the exteriorization of energies: at an ill person's bedside; at an assistential institution through the application of public energizations; through energizations apparently into the distance, in the privacy of your home, in the practices of penta.

Omni-interaction. Energetic omni-interaction can be sought by the individual using mental force through evocation or mental irradiation in an effort to bring together all living beings, ranging from viruses, fish, insects, larger animals, humans and extraphysical consciousnesses, all the way to those consciousnesses in the pure mentalsomatic dimension, for a single universalistic objective of perfect harmony: "May the best occur for everyone."

Therapeutic. The following are 5 factors that play fundamental roles in the exteriorization of therapeutic energies:

1. **Volition.** Your will.
2. **Hands.** The imposition of your hands.
3. **Movement.** Energetic movement with your arms and hands, in certain cases.
4. **Visualization.** The intentional visualization of the desired therapeutic effect.
5. **Receptor.** The will of the recipient consciousness.

Law. The facts show a basic law of projectiology that is quite edifying: those who are able to exteriorize (project) their consciential energies, with lucidity, only using the impulsion of the will, are also able to project (exteriorize) their own consciousness, with lucidity, from the human body, using only the impulsion of the will. One needs only to desire and be sufficiently motivated toward this objective.

Lungs. In the beginning of the practice of mobilization of consciential energy – sponsored by one's own will, or even when aided by a helper – the act of exteriorization is generally accompanied by *expiration* or exhalation and the act of reception of energies is accompanied by, or synchronized with, *inspiration* or inhalation (lungs).

Sensations. The following are 5 of the most common primary sensations experienced in the exteriorization of consciential energies:

1. **Electricity.** A type of *internal electricity*.
2. **Numbness.** Localized physical numbness (torpidity).
3. **Prickling.** A *prickling* sensation on the hands, fingers, arms and cheeks (para-esthesia).
4. **Myology.** Muscular contractions, as in the hands, arms, neck and around the head (encephalon).
5. **Heterocommand.** Imperious impulses that are *external* or commanded by another intangible or extraphysical consciousness, from outside oneself (heterocommand).

Pulsation. "Energetic cerebral pulsation" or neuronal pulsation is the classic sensation of mobilization of consciential energies experienced by the animist intraphysical consciousness or, in

other words, provoked by the intraphysical consciousness him/herself without anyone's interference, either from a sensitive, assistance from an extraphysical consciousness, or even from a projected intraphysical consciousness.

Occurrences. Inoffensive and agreeable energetic cerebral pulsation may be accompanied by various organic occurrences, such as the following 10:

1. **Energization.** Powerful cerebral energization.
2. **Contractions.** Muscular contractions throughout the head.
3. **Sounds.** Intracranial sounds.
4. **Vibrations.** Tympanic vibrations.
5. **Respiration.** Sounds of the energetic transmissions that may or may not be synchronized with the respiration or heartbeat.
6. **Force.** A sensation of vigorous force, "electricity in the arms, hands and fingers."
7. **Goose bumps.** Generalized goose bumps.
8. **Temperature.** Changes in body temperature.
9. **Rhythm.** Changes in the rhythm and intensity of energetic transmission.
10. **Location.** The precise sensation of the location of the energetic current in the human body.

Four-hands. During energetic exteriorizations, such as when performing penta, at a set time, in moments of very intense discharges, while you are semi-possessed by an extraphysical helper, the 4-hands phenomenon sometimes occurs, namely, two other hands seem to work together with your hands in perfect synchrony. This happens due to the departure of your extraphysical hands (parahands) from the state of coincidence of the vehicles of manifestation (fragmented projection).

Limitation. The exteriorization of energies should not reach the point of draining or *physically* weakening the practitioner. Thus, it is not necessary for the novice, for example, to perform more than 11 major therapeutic transmissions everyday, in order to preserve his/her health and well-being. The energies are inexhaustible, but the inactive muscle fibers can be affected.

Transmissions. The number 11 does not have any mystical connotation here. In fact, there are only 10 transmissions, because the first one almost always corresponds to a preparation or simple energetic reception by the transmitter (recovery or warm-up).

Psychomotricity. It is pointless for you to help others to cure themselves and become sick yourself, thereby cutting off the energetic source. For this reason, it should be dosed only with regard to psychomotricity or lack of ability or physical exercises (sedentariness, inactivity) when one is beginning the assistential energetic practices.

Factors. Within this context, one principle should be borne in mind: consciential energies are, above all, inexhaustible because immanent energies are endless and, strictly speaking, are independent from the element of time or space.

Last. It should be stressed that the eleventh energetic transmission, namely the last one, generally pertains to direct extraphysical assistance performed inside the actual area of the physical base, also serving to leave the practitioner's environment extraphysically sanitized (energetically shielded chamber, healthy personal holothosene).

Bibliography: Gibier (587, p. 136), Reis (1384, p. 73).

293. PENTA TECHNIQUE

Definition. Penta: the *personal energetic task* or energetic transmission from the intraphysical consciousness – commanded by an extraphysical helper while the practitioner is in the ordinary waking state – directly to extraphysical consciousnesses or projected intraphysical consciousnesses, all of which are intangible and invisible to ordinary human vision (see fig. 293, p. 1,141).

Synonymy: assistential session of “me alone”; energization of the “unknown patient” (victim or persecutor); individual animic-parapsychic session; parapsychic self-experiment; service of energetic balancing; solitary passivity; solitary psychogroup; the practice of energization to the void.

Preparation. In the daily penta practice, you, as a solitary sensitive, make yourself comfortable on a bed, preferably in the dark, relax, meditate and become mentally and muscularly passive to the extraphysical helper. Incorporation or semi-incorporation transpires in order for the transmission of assistential consciencial energies to take place while the practitioner is seated or standing (erect).

Assistance. The anonymous extraphysical assistance performed through the practices of penta, realized within the *period of human anguish* – between 6:00 PM and 10:00 PM – must be performed daily, including weekends, which bring the *Sunday neurosis* to individuals in lack of affection who, while removed from the daily routine, are forced to confront the shallowness and emptiness of their lives.

Period. It should be stressed that, according to available statistics, 6:00 PM is the time at which the greatest number of intraphysical beings undergo desoma throughout the world.

Occurrences. After the incontestable action of another intelligence upon your vehicles of manifestation – the human body, the holochakra and the psychosoma – you may experience at least the following 8 events:

1. Lucid projection.
2. Various clairvoyant episodes.
3. Psychophonic monologue.
4. Changes in the position of the soma.
5. Numbness of the lips and face.
6. Sensation of cold air, most often in the hands.
7. Energetic cerebral pulsations.
8. Sensation of dematerialization of the fingers and even the hands.

Flame. The energy exteriorizations can often give the impression that your human body has become an enormous flame, a 9’ 10” (3 m) long tongue of fire that is extremely hot at the perimeter and ice cold at the center, whipping forward and upward and reverberating as if it were a focus of light expanding and contracting in powerful, intelligent and controlled alternating outward and inward movements.

Sounds. The sounds of the vibrations pass through your head and appear to leave through your arms and hands like drums being beaten intelligently or the cadence of a one-word mantra which is not spoken, but is repeatedly heard with greater or lesser acceleration.

Movements. The synchronous, frenetic, spasmodic distributing movements made with the arms and hands during benign semi-possession are aimed toward the assistance of intraphysical and extraphysical consciencenesses through 3 distinct operations which are almost always interconnected:

1. **Exteriorization.** Exteriorization of immanent-consciencial energies.
2. **Dematerialization.** Temporary fleeting dematerialization of parts of the animist-sensitive’s human body.
3. **Ectoplasm.** The extraction of your human ectoplasm, exclusively for therapeutic purposes.

Distributors. The para-arms and para-hands of the psychosoma of the practitioner are the real distributors of energy, under the actual command of a helper, the basic energetic transmitter.

Environment. An ambient temperature below 68°F (20°C) facilitates the practicing or intensification of the exteriorizations of assistential energies.

Concepts. In order to maintain syntony, balance, and intensify the operations while in the vibrational state during major exteriorizations of energy, the helper instills intuition that leads the animist-sensitive, when more aware, to inevitably reflect upon concepts which, while being disparate at first sight, are related by their unquestionably logical connections to each other and to the service-by-3, similar to the

following: the uncreated creator; self-gestation; the phoenix; eternity; the infinity of the past; the infinity of the future; omnipotence; implosion; potential to the nth degree; perpetual motion machine; black hole; bottomless sack.

Development. It seems that the more evolved a consciousness is, the more intensity its energetic potential has and the less consciential effort and time is required in order to complete its energetic replenishment and sympathetic deassimilation.

Time. At the beginning of the exercises, the energetic irradiations take up to an hour. With time, a daily development occurs allowing the 11 discharges to be completed in an individual session of only 25 to 45 minutes.

Transmissions. Each *series* of energetic discharges corresponds to at least 50 transmission-contractions. Thus, 550 to 750 transmissions will be performed by the end of each daily session.

Evolution. At a more advanced stage, the helpers transform the projector's physical base into an extraphysical medical clinic or, in other words, a multidimensional clinic for helping the intraphysical and extraphysical needy, unaided or dispossessed.

Observations. The following are 20 practical observations on the practice of penta:

1. **Warning.** The penta technique is not recommended for those who have never experienced impactful, ostensive parapsychic manifestations or to novices in terms of paraperceptiology, who are not yet parapsychically developed and who are not able to sufficiently control the processes of multidimensional interconsciential exchange.

2. **Parapsychism.** Only fairly developed sensitives – without serious problems of interconsciential intrusion, entirely confident in what they do, aware of the closed circulation of energies, reception of energies and transmission of consciential energies – should practice the daily exteriorization of energies at a set time.

3. **Recess.** The assistential exteriorization of energies at a daily pre-set time is the best means by which the veteran lucid projector can avoid a prolonged recess in the production of his/her lucid projections.

4. **Waves.** The energetic transmissions are emitted in well-defined waves of energy that are perceived by the projector-sensitive as being generally intermittent (discontinuous).

5. **Holochakra.** During the exteriorization of energies, the human body sometimes seems smaller or of lesser volume. This is due to the expansion of the exteriorized holochakra and characterizes the non-pathological phenomenon of *self-microscopy*.

6. **Machine.** Frequently, during the energetic transmissions, the practitioner seems to hear the pulsing of an immense machine, as though having a unified body or, in other words, as if all of his/her consciential vehicles were coupled to an extremely powerful invisible dynamo, serving as a sensitive for the intangible extraphysical machine.

7. **Flame-throwers.** During benign semi-possession, the holochakra of the arms and hands seem like flame-throwers spraying the energies forward with apparent violence through the accelerated and continued rhythmic discharges. The hands may also seem to be periodic energetic sprayers. At this time, images of force arise, inspired by the helpers, e.g.: the incandescent creation of the solar system; a sea of hot lava pouring from an erupting volcano; hot steel pouring from ovens in a steel-works. This entire process is reminiscent of the workings of an interdimensional-energetic-consciential-centrifuge.

8. **Interface.** The first energetic discharge – which is more receptive for the extraphysical sensitive-transmitter than donative for the recipient consciousness – establishes the parapsychic interface.

9. **Eighth.** In general, one energetic discharge among the 11 – e.g.: the eighth – can be notably more intense or more potent than the others.

10. **Quality.** Duration is not an important factor in the energetic discharges. The quality and potentiality of the energies transmitted is far more important.

11. **Intervals.** The brief interval of time between one energetic transmission and another serves to physiologically replenish the intraphysical transmitter, to readjust the intraphysical consciousness-extraphysical consciousness interface as well as to substitute the proximate or distant recipient consciousness when necessary. In this period, the helper generally does not lose parapsychic-mental-energetic control of the process. The intense sensations felt by the practitioner may disappear in the intervals between one energetic discharge and another, thus remaining controlled by the extraphysical consciousness during the transmissions and benignly semi-possessed during the intervals.

12. **Synchronizations.** The sounds of the rhythmic vibrations in the head during the energetic discharges are synchronous with the distributing movements of the arms and hands.

13. **Asynchronies.** The interference of ephemeral asynchronies between the sounds and energetic distributions is due to the difficulty of the engagement or, in other words, the disengagement between the mind of the sensitive and the extraphysical transmitter consciousness.

14. **Transmitters.** The extraphysical energetic transmitters – extraphysical consciousnesses having a male or female appearance – can take turns during a single session and the sensitive-projector will perceive the alternation and changes in techniques which are characteristically individualistic and unmistakable.

15. **Intensity.** The more intense the energetic transmissions are, the greater will be the well-being of the practitioner in the period following the transmissions.

16. **Rhythms.** Often, the intense and sometimes varied rhythm of the energetic discharges, physical movements and muscular contractions has almost no effect on the practitioner's heart rate. This fact, in and of itself, constitutes a separate subjective and concomitant phenomenon. Strictly speaking, the ever-perceivable frequency of the practitioner's energetic transmissions is not subordinated to his/her will, heart rate, or even his/her cardiorespiratory frequency, as well as the passage of time of an ordinary watch, or any other source except for the parapsychic or motor commands of the basic extraphysical transmitter. Nevertheless, the entire transmission often seems to be connected to powerful extraphysical and intangible apparatuses. There can be 4 to 5 rhythms of energetic transmission that are quite different from each other in a single session of 10 basic transmissions.

17. **Calibration.** The daily practice of penta allows the practitioner to calibrate his/her energetic condition or health of that day, week or current period of terrestrial existence.

18. **Protection.** The practice of penta maintains a positive extraphysical protection over the lucid projector's human life.

19. **Ideas.** The state or period of the transmissions in penta show themselves to be highly propitious for the assimilation of new ideas by the attentive practitioner.

20. **Consciousness.** The psychophysical state of the sensitive or lucid projector during the practice of penta can be compared to the condition of cosmoconsciousness that is characteristic of the ordinary, physical waking state or maximum assistential pangraphy.

Collectivity. It is common knowledge that any human undertaking with a positive, group, collective energy or one born from a homogenous and cohesive group of individuals with a strong sense of union and affinity when gathered, is stronger, more intense, vigorous and curative, benefiting a greater number of assisted consciousnesses than individual, isolated energy or that energy derived from just one consciousness.

Professionals. The artist on the stage, the orator on the rostrum, the lawyer in court, the professor at a presentation and the sensitive in trance are all familiar with the energy emanated from a live audience. From this arose the practice of the parapsychic session.

Syntony. The "parapsychic and assistential session of *me* alone" is apparently contrary to or runs counter to the abovementioned energy in group precept. Nevertheless, it should be borne in mind that the penta practitioner *is never alone*. This is because he/she always acts in profound syntony with the extraphysical helpers and even, in exceptional cases, with projected intraphysical consciousnesses

and those consciousnesses that are assisted, when serving as a therapist to needy, energivorous extraphysical consciousnesses or ill extraphysical parapsychotics. The fact that it is a parapsychic task involving only one intraphysical consciousness makes inspection and vibratory defenses more efficient and, above all, generally easier for the helpers to maintain.

Union. With a syntony of the consciousnesses, a harmonizing of elevated sentiments (empathy) and cohesion in their objectives, the percentage of intraphysicals relative to extraphysicals is not important. What does matter is the union that creates mental or, more precisely, consciential force, which represents the intensity of mobilized energies with a positive intention.

Umbilical. At a more advanced stage, the practice of penta can be extraphysically oriented toward physical (ectoplasmic) effects, e.g.: with the following 9 characteristics of manifestation:

1. **Position.** Use of the dorsal position.
2. **Temperature.** A drop in corporal and ambient temperature.
3. **Phenomena.** Mild physical effect phenomena.
4. **Trunk.** More energetic exteriorizations coming from the trunk and head, and less from the arms and hands.
5. **Frequency.** A change in respiratory frequency during the energetic transmissions.
6. **Umbilicochakra.** A marked predominance of activity of the umbilicochakra in the energetic transmissions.
7. **Abdomen.** An upward pulling sensation in the abdomen with each energetic exteriorization.
8. **Musculature.** A strengthening of the abdominal musculature.
9. **Arms.** Cessation of muscular hypertrophy in the arms and shoulders.

Duration. Energetic transmissions performed while the animist-sensitive is seated and predominantly using the head, arms and hands – or with a predominance of the coronochakra, frontochakra and laryngochakra – are made with physical movements that are broader, faster, and the assistential session is shorter. Energetic transmissions performed while the animist-sensitive is lying down, predominantly using the head, thorax and abdomen or, in other words, with all 7 basic chakras active, are made with physical movements that are less intense, slower, and the energetic session is longer with a greater number of ectoplasmic effects.

Practical. The performance of penta is extremely practical with regard to human life. Even the person who, due to personal, human commitments cannot exercise parapsychism even twice a week in specialized study groups, can practice penta every day. This can be done alone and in secret, without excessive self-censure, before or after business hours, in the privacy of their home, without the problems of commuting and traffic, or the demands of conventions, rituals and social principles of human existence in intraphysical society, independent from the presence and judgment of other intraphysical beings.

Prisoners. The practice of penta, as well as lucid projections, are especially indicated for prisoners in general who wish to change their destiny for the better (existential recycling), while incapable of physically removing themselves because of the human circumstances imposed by their forced isolation.

Myology. A warning to interested individuals: those who practice the assistential exercises of penta on a daily basis, making themselves passive to the helper, will end up having arm, shoulder, thorax, pectoral and other muscles that are larger and firmer. Their body weight will also increase due to these exercises after a while due to the increased amount of physical, motor and muscular movement performed habitually and regularly.

Itching. One of the first indications of the manifestation of physical effect phenomena, or the indisputable exteriorization of ectoplasm, is the uncommon itching of the nasal mucosae or interior of the nose (nasal cavities). This occurs during the assistential practices of energy transmission during penta. It is probably due to the initial emission of ectoplasm through the nasal mucosae.

Nudity. Based on the fact that the practice of penta occurs while the practitioner is alone and isolated – as long as he/she observes the absence of local air currents, a suitable ambient temperature and a correct use of air conditioning so as to avoid catching a cold – he/she can make him/herself parapsychically passive to the helpers while entirely nude and do so with naturality because they, being of evolved mentalities, do not place importance upon this fact. This can, however, affect the reactions of the extraphysical consciousnesses that extraphysically awaken due to the exercises of assistential energetic transmissions, as their consciential microuniverses are still deeply influenced by human conditioning (post-desomatic parapsychotics).

Chakras. The energetic transmissions are constantly improved. After a number of years, the daily exercises – which are not considered a chore, but awaited daily with personal joy – make the energizer perceive the chakras, especially the following 4, simultaneously while in the ordinary, physical waking state:

1. **Sexochakra.** The sexochakra, pulsating as though the practitioner were seated on a ball of fire.
2. **Umbilicochakra.** The umbilicochakra or the entire abdomen energized toward the front.
3. **Frontochakra.** The frontochakra, which appears to be a small but powerful apparatus encrusted in the forehead.
4. **Coronochakra.** The coronochakra with the impressive sensation of the dissolving of the head.

Approaches. The helpers also bring ill extraphysical consciousnesses which are more disturbed and in lack (energivorous) in order to approach the practitioner directly while he/she is in the ordinary, physical waking state or while projected.

Results. At this point, the physical-extraphysical *rapport* (affinity, interaction, empathy) is intensified and the results of the assistential energetic irradiations improve.

Extras. When the penta practitioner arrives at a higher level of affinity with the *main* extraphysical transmitter, extra or emergency energetic exteriorizations can occur either before (usually) or after the daily period of transmissions at unexpected moments or circumstances.

Health. This all occurs without psychically or physically forcing the practitioner but, instead, in an agreeable, enriching and healthful manner – which will never bring any intrusive or harmful connotation – aiming toward the treatment of ill extraphysical consciousnesses in an emergency situation.

Absorption. The absorption or sympathetic assimilation of illnesses, disturbances or ailments of certain person-patients or ill extraphysical consciousnesses, through affinity, good intention and energetic ascendancy, can occur during the assistential transmissions of penta, whether they be conscious or unconscious on the part of both, the energizer-absorber and the patient-absorbed.

Remission. The definitive remission of the patient's symptoms, after transmissions spanning over a period of hours, days, or even weeks, is what in many cases reveals the occurrence of sympathetic absorption. Whenever this occurs, it is always triggered by the extraphysical benefactors, according to the animist-sensitive transmitter's greater capacity to discard the disturbances through energetic strengthening. The practitioner, nevertheless, may or may not identify the absorption, as soon as it is installed, depending upon the level of his/her technical self-lucidity within these assistential processes.

Case study. A typical example of the sympathetic absorption of pathological conditions of the human body-holochakra-psychosoma of an ill individual is that of someone suffering alterations in a member, whether it is a leg that has been exhibiting pain, edema, locomotive difficulties and other disturbances for a long time and for which all conventional examinations, diagnoses and treatments, as well as alternative treatments, have proven ineffective. These disturbances disappear when treated with energetic transmissions, often only with transmissions at a distance and in secret.

Bait. Sympathetic absorption among consciousnesses is the most advanced effect of the condition of animic-parapsychic bait. It is established upon the state of *rapport*, the existence of consciential energies and the phenomenon of auric coupling. This should not be interpreted as an intrusive episode, as pathological, interconsciencial intrusion is understood.

Therapeutic. Sympathetic absorption is, above all, therapeutic and non-pathological, although it stems from cases of intrusion or chronic possession, negative magic, the syncretic practices of many sects, physical-extraphysical couplings with ill consciousnesses and other primitive and anticosmoethical manifestations of the same type, such as the use of *prescriptions* and the practices of *Mandingos* used in candomblé and *quimbanda in order to kill persons* (note, for example, the specialized technical works of Pierre Verger).

Responsories. Many practices, which are popularly called “responses” and “responsories,” are positively or healthily performed through sympathetic absorption.

Continuum. The assistential habits of energy exteriorization can lead the intraphysical consciousness to a centering or *fundamentation* of the ego, the most elevated state of equilibrium that a human being can attain. At this point, the coupling of his/her mentalsoma with the mentalsoma of an experienced extraphysical consciousness – a helper – almost always occurs, in the serene condition of the interface of the awareness *continuum*.

Maturity. One of the uses of the practice of penta is to help heal the disturbances within the scope of the parapatology of the psychosoma. Among them are the sequels of physical restriction of the intraphysical consciousness that recently became an extraphysical consciousness. For example: the faster recuperation of extraphysical maturity for those consciousnesses that underwent desoma at a tender age or during adolescence or, in other words, the extraphysical children that merit or need to return to consciencial adulthood more quickly. In these cases, the paratropospheric energies of the human sensitive operate in a positive and effective manner, with the possibility of greater *rapport* in the unblocking and balancing of the remaining quite animal, human, related energies that are still connected to the extraphysical consciousness.

Tasks. Among the more elevated objectives of the practice of penta, the increasing predominance of the clarification task over the consolation task can surely be included. It can thus be seen that there are penta practices of higher or lower quality, not only in terms of the practitioner, in different stages of his/her life, but also in terms of the interdimensional results of different practitioners.

Groups. Penta study groups have been developed at the offices of the International Institute of Projectiology and Conscienciology (IIPC) by veteran penta practitioners.

Bibliography: Vieira (1762, p. 165). A recent work by the author specifically on this theme: *Penta Manual: Personal Energetic Task*.

294. THEORY OF ENERGETIC SYMPATHETIC ASSIMILATION

Definition. Energetic sympathetic assimilation: the quality and act of a consciousness simultaneously absorbing the consciencial energies and analyzing the holosomatic, paraphysiological and parapatological conditions of another.

Synonymy: bioenergetic catheterization; consented energetic reception; empathic communication; energetic assimilation through affinity; energetic involvement; *enkinesia* (shamanic medicine); interconsciencial assimilation; investigative energetic projection; symbiotic paranormality; sympathetic absorption; therapist-patient resonance.

Technique. The parapsychic technique of sympathetic assimilation is only performed through the impulsion of the decided will, a working tool of the animist-parapsychic, after deep *auric coupling* has been established. Sympathetic assimilation is of overall interest within the practices of projectiology.

Physical. In theory, no direct physical *contact* is necessary in order to establish energetic sympathetic assimilation, except the laying on of hands, if needed. There is also no need for the use of any physical *instrument*, or merely human artifices such as prayer, mantras or counting.

Transcendence. Consciential energy transcends the *physical world* in any gradation of its conditions of manifestation, whether having imperceptible, minor, moderate or great *intensity*; or having slow, active, constant, rapid or strong *impulses*.

Space. Sympathetic assimilation can be established regardless of physical *distance*, in terms of space. It can be sent to another person, even from one continent to another.

Time. Sympathetic assimilation can be established instantaneously. In a split second, the emitter of consciential energy can invade the psychosphere of someone who senses the *energetic intrusion* at that same moment.

Circuit. Energetic sympathetic assimilation is simultaneously an exteriorization (projection) of energy (energetic probe), upon *departure*, and absorption of energy (retaking), upon *return*. The energizer thus closes a circuit of energy and investigative sensitivity with someone.

Factors. There are 3 essential or causal factors in the development of the phenomena of interconsciential, sympathetic energetic assimilation:

1. **Lucidity.** The level of lucidity, balance and wakefulness of the energizer makes the energizer *aware* or *unaware* of 3 agents: his/her willpower, personal consciential energies and sensitivity regarding the *correct* or *incorrect* holosomatic investigation of another. This factor stems exclusively from the degree of holochakral self-awareness.

2. **Nature.** The nature, quality or excellence of the stable consciential energy used in the process of sympathetic assimilation enables *healthy* (sound) practices, or *unhealthy* (pathological) actions, in the probing of the inner, harmonious or entropic conditions of the personal holosoma.

3. **Intensity.** The intensity, volume, quantity or condensation of consciential energy employed in the process of sympathetic assimilation allows *weaker* or *stronger* energetic operations, and more superficial or intrusive and deep holosomatic probings. This factor depends upon the level of personal experience, agility and energetic training. It is wise to bear in mind that basic immanent energy is inexhaustible.

Classification. Interconsciential energetic sympathetic assimilation can be classified into 5 basic types:

1. **Paraphysiological.** Simple and ephemeral energetic harmonization, exclusively at the levels of the holosomatic functions of the consciousness. Examples: auric coupling generated through the instinctive and unconscious, but visceral, impulses of the passionate emanations of two persons in love; conscious auric coupling, when intentionally promoted between two or more human psychospheres. Auric coupling is a common fact during human sexual relations.

2. **Parapathology.** Unconscious energetic *acceptance*, by the intraphysical consciousness, of the *intrusion* and holosomatic intrusion – whether unconscious or even when conscious – of an ill extraphysical consciousness. Examples: the transference, energetic repercussion or somatization of signs, sensations and symptoms, or even the installation of disease (tuberculosis, dermatosis) that is parapsychically maintained from the unconscious extraphysical intruder (post-desomatic parapsychotic), to the intraphysical consciousness suffering from intrusion; the so-called *contact high* of the director of the psychedelic session (drugs, LSD).

3. **Paradiagnosis.** Energetic involvement – up to a level capable of reflecting the symptomatology of disturbances in the emitting being (involver) through ephemeral and inoffensive somatization – that may or may not be perceived by the involved intraphysical consciousness. Example: energetic assimilation aiming to provide a *paradiagnosis* of a patient.

4. **Paratherapy.** Energetic receptivity with curative aims on the part of the intraphysical sensitive who becomes passive in order to receive the manifestation from the deceased ill consciousness. At this point, the illness is transported out of the patient's body. Examples: psychophonic trances performed

in classic deintrusion sessions that not only awaken the ill extraphysical consciousnesses, but also improve the sensitive over time; the absorber-energy emitter and the absorbed-patient in the therapeutic practices of penta; the passage of the illness from the patient to the shamanic healer; the practices of *benzedoiras*.

5. Paraprophylaxis. Energetic symbiosis of two consciousnesses aiming to test the self-defensive or prophylactic energetic resources of both. Examples: energetic and spontaneous projective holosomatic or, in other words, holosoma to holosoma confrontation; the modern athletic challenge intended to celebrate the *bioenergetic champion* within a group of likeminded persons.

Contagion. Unfortunately, the contagion of disease through the transmission of bioenergy actually occurs in persons who lack vibratory self-defense or are bioenergetically vulnerable and do not follow recommendations for physical, mental and consensual hygiene.

Difference. It can be concluded that the qualitative difference between diagnostic sympathetic assimilation and parapatological sympathetic assimilation is merely in the fact that, in the first, the assimilator temporarily absorbs only the sensations of the blockages and *symptoms* of the patient. In the second, not only are the deep symptoms or strata absorbed and installed, but also the components of the actual *disturbances* of the patient being assisted (contagion via bioenergy).

Para-asepsis. The triggering of the *vibrational state*, when necessary, applied as a resource of para-asepsis after paradiagnosis, or even in all practices of sympathetic assimilation, eliminates any possibility of permanent absorption or contagion of the bioenergetic imbalances and blockages of the patient.

Forecast. The author has been using this efficient and practical technique for over 4 decades without contracting any illness merely through bioenergetic contacts and exchanges. It is easy to forecast that in the future this method will prevail over all diagnosis techniques. At that point, universities of medicine, psychology, odontology, nursing and psychotherapy (specialization) will probably teach *Practical Discrimination of Bioenergy*, a discipline suitable for the first year of university.

Serenissimus. Energetic sympathetic assimilation performed extraphysically with a *Homo sapiens serenissimus*, or *serenissimus*, is a process that is difficult in practice but ideal for the energetic self-analysis of the pre-*serenissimus* or, in other words: ourselves, ordinary intraphysical consciousnesses in evolution on earth.

295. ABUSES IN THE USE OF CONSCIENTIAL ENERGIES

Definition. Discernment: the ability of the consciousness to judge things or phenomena in a clear and sensible manner.

Synonymy: ability to discern; discerning analysis; norm of judgment; strict criterion.

Vehicles. The interactive agent between the vehicles of the consciousness is the consensual energy that is commanded by the conscious or even unconscious will.

Use. The abusive use of a consensual vehicle can cause damage to another vehicle of manifestation. Thus, the intraphysical consciousness (materialist) who lives only for his/her human body (instincts or the sexochakra) does not develop the resources of the psychosoma or emotional body (cardiochakra).

Psychosomatics. On the other hand, the individual who lives only for emotions (psychosomatics), without reflecting upon his/her existence to a greater degree, is not able to improve the elevated sentiments or rationalized emotions (coronochakra) pertaining to the mentalsoma.

Biology. The directives of human biology are quite strict and do not allow excesses in any direction, not even regarding the abusive application of consensual energy when they transcend biological limits and attain parabiology.

Soma. It is common knowledge that consciential energy is unlimited and inexhaustible because it comes from immanent energy, which exists throughout the universe and the consciential dimensions. Nevertheless, upon performing excessive mechanical movements and processes or other abuses the human body (soma) can present disturbances stemming from the application of consciential energy in diverse forms through it.

Disturbances. The following are 5 occurrences that can be identified as disturbances or damage subsequent to the incorrect use of consciential energy (bioenergy) by an intraphysical being.

1. **Microlesions.** In theory, the lucid projector, or the animist-parapsychic, can exteriorize consciential energy all day, every day. Nevertheless, if the intraphysical consciousness' muscles are not accustomed to the intensity of the physical exercises performed, he/she can later suffer the effects of microlesions of the muscle fibers and its uncomfortable aftereffects: muscle pain and physical indisposition.

2. **Hypertrophy.** The simple acts of exteriorization of consciential energy on the part the intraphysical consciousness (magnetic exteriorization), or even the energies composed by extraphysical consciousnesses or helpers (extraphysical exteriorization) – through physical exercises pertaining to prolonged, assiduous, intensive practices, such as those of daily penta – can develop the evident hypertrophy (greater volume) of the muscles of the forearms, biceps, shoulders and thorax, depending upon the energy exteriorization techniques used. This obviously increases the individual's body weight and makes him/her appear more robust and firm.

3. **Decalcification.** The installation of a dense bioenergy field, with a substantial reduction in the ectoplast's basal metabolic rate and hypothermia of the extremities during the parapsychic trance, when repeated intensively, can predispose the appearance of peripheral decalcifications in the toenails, for example, if there is any organic predisposition in this sense: physical constitution; age; peripheral circulation; calcium metabolism.

4. **Transference.** In theory, *bioenergy* is the same as any *medication*, which can cure as well as kill. It is always necessary to keep a discerning eye on the variables that interfere in the movements and practices of energetic processes. The technique of sympathetic assimilation, for example, performed through the auric coupling of the sensitive to the assisted individual can, in some cases when the sympathetic assimilation becomes very intense and continuous, transfer or absorb certain unhealthy predispositions or install disturbances that will generate the patient's symptoms in the bioenergetic donor. This happens when he/she lacks adequate techniques and environment for the maintenance of the extraphysical para-asepsis of his/her psychosphere (deassimilations) and personal organic replenishment. This can occur not only with the ordinary energy emitter, but also with any type of physician, psychologist, nurse and even with the social worker or human health professional.

5. **Resistance.** In the correct maintenance of the parahygiene of the consciential energy donor, the relationship between his/her organic state and the extent or depth of his/her work should always be borne in mind. When the person lacking a balanced diet and a high natural organic resistance dedicates him/herself excessively to bioenergy donation, he/she can become predisposed to after work fatigue, minidisturbances in his/her weak points and frequent colds.

Hangovers. Correct practices with consciential energies never generate *energetic hangovers*.

Others. The best medication can become poison, depending upon its abusive use. Other disturbances and inconveniences will easily be identified by the interested individual upon developing his/her control and application of consciential energies based on the examples offered here.

Actions. It can be seen from these objective and rational examples that the consciousness needs to guard against error and damaging excess in everything that it does. Positive intentions and goodwill help greatly but can generate blatant senselessness when applied alone. Active discernment of the consciousness is always indispensable in order that productive actions in one sector of manifestation develop without generating harm in other sectors.

Theorice. That is why the ideal union of theory and practice (theorice), namely the simultaneous use of diligent study (intellectuality) as well as parapsychophysical experience, should always be recommended to everyone, whether it is the occasional ordinary practitioner or the active researcher.

Age. Youth, of course, provides greater resistance than mature physical age. Nevertheless, youths can be more predisposed to organic mindisturbances in work involving the application of consciential energies. This is due to dispersiveness of efforts, lack of method, indiscipline in everyday life, *disassociation of ideas*, an unbalanced diet and an irregular eating schedule.

Code. Middle-aged or mature individuals can come out better in these cases. Although not having the defenses of the youths' age group, adults already have a *behavior pattern* that is *methodical* and stricter for themselves in terms of physical, mental and consciential hygiene, with healthy habits.

Exteriorization. The simple existence of the possibility of malefactions ensuing from the exteriorization of consciential energies does not imply that one should avoid them, inhibit oneself in regard to its use or fear its continued use and applications.

Discernment. Consciential energy is the foundation, the instrument, the touchstone of renovation of the consciousness in its evolutionary development. However, as with everything that exists, it demands discernment in order to be used wisely, competently and efficiently.

Decision. The intraphysical consciousness needs to always have decisiveness, courage and motivation in the lasting, evolutionary and multidimensional consciential realizations that he/she intends to pursue.

296. THEORICE OF MORPHOTHOSENES

Definition. Morphothosenes: mental formations shaped and organized by the energy and the dynamism of thought (thosenes), guided by the will and enriched by the imagination of the consciousness, whether intraphysical or extraphysical.

Synonymy: astral clichés; astral creations; astromental images; consensual forms; extraphysical visual creations; floating thoughts; forms that are thought; form-thoughts; human simulacra; ideofoms; ideomorphs; ideoplastic forms; ideoplastic projections; mental effects; mental models; mental pararealizations; mental projections; objective mental formations; psycho-effects; psychones; thought-forms; tulpas; tulpoids.

Effects. The *thosene* is constituted of three indissoluble components: thought (*tho*), sentiment (*sen*) and consciential energy (*e*). Every defined thought produces 2 immediate effects:

1. **Vibration.** First effect: a radiant vibration.
2. **Form.** Second effect: a floating thought-form, all this through the consciential energies or the *e*, the third element of the thosene.

Creation. Morphothosenes are created by the consciousness at every fraction of a second of its existence.

Procedures. Thought, a most powerful creation, can be manifested through at least 7 basic procedures:

1. **Focalization.** Sustained, focalized, concentrated and projected by the force of imagination, or through reflection, prayer, meditation, suggestion, ritual or evocation.
2. **Telepathy.** Transmitted at a distance, as in telepathy.
3. **Bending.** Employed to bend metal, as in the Geller effect.
4. **Anticosmoethics.** Used anticosmoethically to kill birds in flight, as done by certain primitive animists or witches.
5. **Fly-killer.** Applied to kill flies, as in the manner of a prisoner-projector in England (Will Howell, *The Way to Why*).

6. **Existence.** Used to create morphothosenes or thought-forms that are imbued with a temporary independent existence.

7. **Holothosenes.** Besides the above, it can gather in group thoughts and collective thoughts, and create personal and group holothosenes.

Paratroposphere. That which is called the crustal or *paratropospheric dimension* – the extraphysical sphere that coexists with human life – constitutes a fluid, plastic, non-physical and apparently omnipresent environment. Although formless per se, this dimension has the property of taking on or reflecting whatever form is mentally impressed upon it.

Water. The shapeless extraphysical substances that constitute thought-forms or morphothosenes are similar to water in a glass. Even though the liquid is formless, it adapts itself exactly to the shape of the glass into which it is poured.

Imagination. As a product of imagination, the morphothosene does not have life of its own, although, even so, it acts, moved by the thought of the consciousness, its creator.

Manifestations. Morphothosenes can be of the most diverse categories according to their properties and manifestations, such as these 11:

1. **Conscientiality.** Conscious or unconscious in relation to the consciousness.
2. **Consolidation.** Stable (consolidated) or unstable (immature).
3. **Health.** Positive, healthy and cosmoethical or negative, sick and anticosmoethical.
4. **Consistency.** Evanescent or consistent.
5. **Duration.** Ephemeral (fleeting) or quasi-permanent (holothosenic) which, in certain cases, even require extraphysical reurbanization lasting for hundreds of years.
6. **Creativity.** In the rough or of the pre-*serenissimus*, or refined of the *serenissimi*.
7. **Expression.** Small (such as phytothosenes) or grandiose (such as from free consciousnesses).
8. **Structure.** Opaque or transparent.
9. **Irradiation.** Dull or luminous (irradiant).
10. **Temporality.** New (recently created) or gravitating residues (multimillenary).
11. **Thosenity.** Self-morphothosenes or heteromorphothosenes.

Identification. Identical types of morphothosenes mutually attract each other.

Effects. It can logically be deduced that the vibrations of only one thought produce effects such as: shape, color, light and sound, including musical chords in the extraphysical dimension.

Transformations. The action of fantasies, impulses, desires, appetites, passions and emotions can transform *things* or the surrounding reality in the dimension where we manifest ourselves.

Harmonization. The unconscious morphothosenes coalesce and harmonize with the creations of preexisting thoughts or, to the contrary, battle openly against the thosenic realities previously created by other consciousnesses.

Habits. The morphothosenes of the consciousness act upon it, thereby creating the habits, uses, customs and routines of personal thought, sentiment and action.

Groupality. Individual ideoplastic formations are different from those of a group.

Potency. Individual will, although producing specific uniform results, is weaker than group or collective will (union increases strength).

Caliber. The power of the influence of the fixed (*extraphysical*) parapopulation's average mental caliber characterizes, edifies and maintains the extraphysical environment (districts, communities). That is why there are parallel, individual and collective mental *worlds*, as well as others in incessant transition.

Self-transfigurations. Acting upon the psychosoma, the consciousness can both generate and cure organic illnesses and forge self-transfigurations. For example, it is possible to create a third leg (supernumerary member), or rejuvenate the appearance through the power of thought, or the consciential energies.

Paraclothing. Extraphysical clothes (paraclothing) are morphothosenes, which have generally been created in an unconscious, para-instinctive, *automatic* way or through tactism.

Ephemerality. There is evidence for the existence of ephemeral and quasi-permanent morphothosenes, however, the facts and logic suggest that eternal morphothosenes do not exist.

Duels. Outright extraphysical duels between wills or combats with morphothosenes occur. This is why there are residual or gravitating negative thought-forms in many places.

Communicology. Telepathy and the means of mass communication (media) in general (interconsciential communicology) are directly related to the creation of morphothosenes in human environments.

Pollution. The essential pollution of planet earth (ecology, para-ecology, *planetary trash*) is, above all, a *thosenic pollution* or one generated and maintained by anticosmoethical or sick holothosenes.

Imagistic. Many images which are mentally evoked and sustained by the intraphysical consciousness through his/her passions become consistent morphothosenes that act upon the thought world of intraphysical and extraphysical consciousnesses. This even creates cumulative group-thoughts, which still require research and investigation by sensitives, projectors, penta practitioners, conscientiologists and conscientiotherapists, in order to be more clearly understood and better avoided by the unwary.

Reality. Thoughts are real things.

Psychopathology. Morphothosenes comprise many of the hallucinations of all types of psychopaths or the mentally ill of both sexes and of all intraphysical ages.

Extraphysical. The reader should not conclude that only his/her morphothosenes exist in the dimensions where his/her intraphysical consciousness (you) projects. In fact, there are other independent extraphysical shapes which are consistent and real apart from the physical, human and dense shapes of this paratropospheric dimension, outside the intraphysical base and beyond the morphothosenes generated by the consciousness.

Vision. The projected consciousness sees the extraphysical shapes because they are there, although these forms are generally not his/her creations.

Artifacts. Those who nurture doubts regarding the possible existence of concrete morphothosenes – well-constituted and incredibly solid extraphysical artifacts – should ponder the existence of the silver cord. This non-material or semi-material appendix or object is extremely tangible, active and vigorous in many ways. All intraphysical beings have it – including plants and bacteria – and nothing similar in shape, structure and function is to be found among all existing objects and bodies in the entire physical universe. It is important to bear in mind that the *umbilical cord* does not have the same nature or functions as the *silver cord*.

Primothosene. In truth, the entire universe is the assemblage of the thosenes from all the consciousnesses that exist within it. Nonetheless, this does not exclude the existence of an “uncreated cause” or a *primothosene*, a principle that is still beyond our comprehension.

Consensus. The extraphysical dimensions are consensual realities, that is, the result of the interaction of two or more consciousnesses on an empty space, acting through morphothosenes or individual and general thosenization.

Average. The average blocks of morphothosenes in a certain area make up the extraphysical environment or, more precisely, even the intraphysical environment which is always derived from it.

Distortion. The general reality is often perceived in a distorted manner by the intraphysical consciousness individually, as a result of (infantile) egocentrism, (adult) egoism, consensual restriction, loss of cons, immaturity, pathothosenes, repression and abdominal brainwashing.

Complexity. Extraphysical self-awareness and morphothosenes present deeply complex aspects.

Detection. The projected intraphysical consciousness can simultaneously see and detect what are presumed to be parts of his/her psychosoma, paralegs, para-arms or parahands; the holochakra or the extended and brilliant silver cord; and even the paraphysiognomy of an extraphysical consciousness in front of him/her. All of this disappears in an instant, without any reason which is apparent or identifiable at that moment.

Mentalsomatics. This can occur due to the creation of one's morphothosenes. Even so, the consciousness still remains projected only in the mentalsoma.

Mistakes. When projected in this manner only once, this intraphysical consciousness will think that the silver cord and the extraphysical consciousnesses are mere mental creations derived from its human conditioning, from reading, habitual imaginative acquisitions and nothing more. This shows reason and even a fair degree of coherence and good mnemotechnique, but also a serious error in evaluation, stemming from the inexperience of the intraphysical consciousness that is projected in the complex isolated mentalsoma.

Disappointment. On the other hand, the intraphysical consciousness that projects many times in different ways and under various extraphysical conditions will inevitably conclude that the silver cord exists. In certain extraphysical circumstances, he/she will even be deeply disappointed by the actions of this appendix, which reduces his/her manifestations outside the human body.

Inexperience. In the same manner, the projected intraphysical consciousness can come across extraphysical consciousnesses – as happened with the author – and try to exteriorize thoughts and energies with the objective of undoing what are considered to be mental shapes of personalities before him/her. These, being real, roar with laughter, make fun of and ridicule this obviously futile attempt. They immediately establish an open thosenic and energetic extraphysical confrontation. The inexperience of the consciousness – projected in the psychosoma this time – will lead him/her to commit another primary error in evaluation.

Force. Every morphothosene sent from one consciousness to another is a real transference of a certain quantity of force and matter from the emitter to the receiver, about whom he/she thinks and with whom he/she syntonzes with greater or lesser empathy.

Discharge. The passivity of the receiving consciousness and the harmonious character of the thoughts of both – the emitter and the receiver – make it such that the morphothosene is discharged onto the receiver to varying degrees according to the structure of the emitter's intentionality.

Thought. Everything that can be done, imagined or invented by the thoughts of the intraphysical consciousness, when in the ordinary, physical waking state in this tropospheric dimension, can be accomplished much more easily by the same intraphysical consciousness when lucidly projected outside his/her human body.

Categories. The intraphysical consciousness, when projected and lucid, can sometimes perfectly detect 3 basic categories of his/her morphothosenes: detached, pursuing and projected morphothosenes.

1. **Detached.** Detached morphothosenes are those that are incessantly left behind the consciousness and comprise its mental trace or the *basic thosenic signature*. They should not be confused with the previously mentioned trace of light.

2. **Pursuing.** Pursuing morphothosenes are those that hover over and pursue the personality or, in other words, his/her repetitive thoughts and more common tempting self-thosenes, which are energetically highly charged and self-reproducible. Such morphothosenes can have an extremely negative or pathological influence over their creator because he/she is generally unaware of his/her own unhappy mental creations and is often even unaware of his/her positive and healthy mental creations.

3. **Projected.** Projected morphothosenes are those which are flung far away by the consciousness to specific targets: beings, objects and places. Such projection of morphothosenes can be: positive, negative or neutral; created consciously or unconsciously; pure or elaborate; and alone or in good or bad company.

Bibliography: Babajiananda (65, p. 39), Bennett (117, p. 25), Blackmore (139, p. 232), Blavatsky (153, p. 187), Bozzano (186, p. 157), Brennan (199, p. 66), Cavendish (266, p. 254), Chaplin (273, p. 158), Coquet (301, p. 65), Crookall (338, p. 219), Day (376, p. 138), Fodor (528, p. 383), Frost (560, p. 206), Gaynor (577, p. 186), Greene (635, p. 65), Hodson (729, p. 105), Leadbeater (901, p. 280), Lee (908, p. 189), Monroe (1065, p. 75), Muldoon (1102, p. 118), Osborn (1155, p. 165), Powell (1279, p. 45), Rogo (1453, p. 248), Schatz (1514, p. 201), Sculthorp (1531, p. 115), Shepard (1548, p. 933), Steiger (1607, p. 245), Talbot (1642, p. 144), Vieira (1762, p. 20), Walker (1782, p. 414), Wang (1794, p. 215), Xavier (1891, p. 49), Yram (1897, p. 148), Zain (1898, p. 40).

297. COMPARISONS BETWEEN LUCID PROJECTION AND MORPHOTHOSENES

Differential. There are clearly defined differences between the self-projection of morphothosenes created by the projected consciousness and the real images of lucid projection that already exist and are perceived by the same projected consciousness in the extraphysical dimension, as can be verified in the following 7 technical comparisons:

1. **Origins.** When they are formed by the projector's consciousness, self-projections of morphothosenes do not present any uniqueness or novelty, because they stem from personal and obviously familiar experiences. The real images of lucid projection do not originate from the projected consciousness, but are already created by other intelligences that are generally unknown.

2. **Location.** Most self-projections of morphothosenes occur more frequently inside the individual extraphysical sphere of energy (psychosphere) that envelops the consciousness when inside or outside but physically close to the human body. Lucid projection occurs both inside and outside the extraphysical sphere of energy, in any extraphysical environment or district.

3. **Unpredictability.** Self-projections of morphothosenes almost always present the inescapable characteristic of predictability or prior knowledge of that which will be seen, because they are images generated within the scope of the manifestations of the projector's consciousness. Lucid projection surpasses the parameters of knowledge of the intraphysical consciousness projector and, being unpredictable, springs inconceivable surprises on the experimenter.

4. **Vitality.** Self-projections of morphothosenes do not show signs of life because they are inevitably only forged with apparent artificial life, whether conscious or unconscious in nature. Lucid projections present lively experiences and sensations having the unmistakable charm of authenticity, vitality and unique magnitude, sometimes being much more vibrant than the common reality of human existence in the ordinary, physical waking state.

5. **Durability.** Self-projections of morphothosenes spontaneously tend to be ephemeral and lack the power of survival. The images of lucid projection tend to be long-lasting, independent and indifferent, according to the extraphysical environment where the projected consciousness manifests itself.

6. **Resistance.** Self-projections of morphothosenes are generally easily and rapidly dissolved by the projector's will because they are created and arise ephemerally restricted to the will, intentionality and imagination. The real images of lucid projections are resistant to the projected projector's will and do not easily disappear. They almost always exist prior to and remain after the lucid projection, as they exist in the extraphysical dimension.

7. **Takeoff.** Self-projections of morphothosenes clearly do not have the experience of the lucid takeoff and interiorization of the consciousness projected in the psychosoma, or the experience of leaving and reentering the human body. These experiences are specific to the phenomena of lucid projections.

Bibliography: Fodor (528, p. 382), Vieira (1758, p. 3), Yram (1897, p. 148).

298. MORPHOTHOSENE CREATION TECHNIQUE

Foretokens. Self-projections of the human mind during deep meditation (introspection), daydreams and the effort of the mentalist represent the foretokens of the formation of morphothosenes in the extraphysical dimension.

Details. The details of mental creation require extraphysical energy while using the deep power of singular thought or, thought directed toward a single objective.

Raw material. Thought – a type of mental raw material, or ductile extraphysical substance – together with the will and the attention that is fixated with clarity on the smallest details of the desired object in an environment that is adequate for self-thosenization of the consciousness, instantaneously shapes morphothosenes.

Technique. The basic mental shape which maintains a morphothosene until arriving at the predominant materthosene and, consequently, the peculiar and characteristic personal holothosene, is conceived and constructed by the consciousness through the simultaneous union of 4 consciential attributes:

1. **Concentration.** The effort of the concentration of attention (fixation).
2. **Imagination.** Visualization through imagination (imagistic processes).
3. **Emotionality.** Vitalization through emotions (psychosomatics).
4. **Will.** Maintenance through the will that created it (intentionality).

Imagistic. The imaginary visual field is very restricted in consciousnesses with a weak imagination regarding visualization. It is likewise very ample in those with a fertile imagination.

Holochakrology. The qualities of mental images – specifically of visual images, the clarity and precision of outlines – depend upon intrinsic personal conditions, as well as the intensity and quantity (volume) of the consciential energies (holochakrology) they are imbued with.

Capacity. The capacity for abstraction can increase the efficiency of one's imagination.

Rationality. Paradoxically, rational ideas reduce the normal capacity for producing visual images.

Thinkers. Incidentally, scientists and thinkers have little capacity (underendowed) for visual imagination, a strong trait which is very developed in women and youths of both sexes.

Simple. In the morphothosene creation technique, thought which is spontaneous and lacks the effort of will conceives only formless sketches of the image. Simple thought obtains simple creations.

Duration. The less important a mental creation is, the more ephemeral it will be.

Law. The lower the evolutionary level of the environment or an extraphysical community, the denser and fuller it is with confused, disturbed and ephemeral mental forms.

Relief. In the creation of morphothosenes and extraphysical forms, the objects are not only imagined with their form and outline, but are also raised with a certain degree of relief.

Attention. The objects in which greater attention is focused stand out as being more colored and somewhat salient over the imagined or created background.

Recreation. Those extraphysical objects of little importance can easily be modified and recreated by any consciousness.

Complexity. The greater and more complex mental assemblies, the collective environment, gigantic scenarios and large objects, are only altered by the creative force of the assemblage of thoughts of the *inhabitants*, the autochthons of that dimension, or the powerful and more evolved consciousnesses (*serenissimi*, free consciousnesses).

Repetition. Repeated modeling exercises clearly improve the performance of the consciousness in the creation of morphothosenes.

Hypothesis. The following is a research hypothesis: What is the relationship between human morphothosenes and the earth's gravitational force?

Addition. If the projected intraphysical consciousness thinks of a detail that is missing in the object, upon coming across it, even if it is a physical or an ordinary one, the projector can unconsciously and instantly add it. This gives the object an extraordinary sense of realism that can fool the extraphysical perceptions in a very self-convincing manner. It is thus always important for the intraphysical consciousness, when projected, to maintain alert self-critical judgment and improve his/her own capacity to differentiate the extraphysical images down to the smallest detail.

Openness. On the other hand, the intraphysical lucid projector, when projecting, needs to maintain an open mind without excessively narrow-minded prejudgments, apriorisms or human conditioning.

Fossilization. The projector will otherwise *inadvertently* only see what he/she wishes to. In other words, he/she will only see his/her very familiar pattern-morphothosenes, reexperiencing his/her own lucubrations in an endless vicious circle (fossilization). The projector will thus not participate in the realities of the extraphysical dimension, which are independent from him/her as a consciousness. These realities have always existed on their own or were generated and have been maintained by other consciousnesses over a long period of time.

Uses. When the consciousness manifests lucidly in the psychosoma, its ideoplastic projections facilitate the elaboration of logical, clear and sensible thought, thereby improving its images, concepts, judgments and capacities for paying attention, concentrating, making comparisons and deciding with a view toward the evolution of the mentalsoma.

Maturity. The creation of morphothosenes dynamizes the level of maturity of the consciousness, acting as a propelling agent for its passage from projection in the psychosoma (which is easier) to superlucid projection in the isolated mentalsoma (which is far more difficult).

Work. The act of creating and recreating *concrete* extraphysical forms is an objective and healthy form of extraphysical *paraleisure* for those extraphysical consciousnesses which are close to and in the planetary troposphere. This dynamizes the parapsychophysiology of their consciential faculties or attributes, on the way toward the state of continuous self-awareness.

Bibliography: Bennett (117, p. 26), Blavatsky (153, p. 222), Brennan (199, p. 66), Buckland (219, p. 153), Carrington (251, p. 242), Cavendish (266, p. 254), Gomes (612, p. 118), Leadbeater (901, p. 280), Powell (1279, p. 50), Vieira (1758, p. 3).

299. SEXUAL FACTORS FAVORABLE TO LUCID PROJECTION

Classification. Sexual factors favorable to lucid projection can be classified as physiological, psychological and parapsychic:

1. **Physiological:** an active and balanced sexlife; marriage or the condition of an evolutionary duo without problems; personal hygiene in the phase preparatory to projection.

2. **Psychological:** elimination of taboos regarding sexuality; a precise notion of the functions and the constructive force of sexochakral energies (libido); an understanding of cosmoethics in relation to human morality.

3. **Parapsychic:** a harmonious coexistence between active sex and consciential projections in series, deintrusive projection and projection in the mentalsoma; an understanding of the unproductiveness of extraphysical sex; the technique of projecting immediately after the sex act.

Projector. The dorsal position – with legs spread apart, loose clothing and the body relaxed on the bed – favors the male projector because it avoids a predisposition toward inopportune penile erection, which negatively interferes in the projective process, in some cases, only because an erection occurs during sleep, regardless of the physical position of the sexual organ. This position is not favorable for some women.

Sexosomatic. As the intensive practice of lucid projection becomes popular and generalized with evolution and time, it will allow healthy women and men to control their sexosomatic manifestations.

Sports. Just as the sex act is currently the most popular sport on earth, there are other evolved planets where lucid projection is the favorite sport of the intraphysical inhabitants.

Superiority. Multidimensional facts show that neither men nor women are superior to each other in regard to the factors restricted to the intraphysical consciousness, given that masculinity and femininity are mere episodic manifestations within the evolutionary way of all.

Diversifications. It is obvious that there are, nevertheless, functional diversifications, notably in light of the connecting of different human bodies, or the patterns of sexual roles. These operational diversifications are reflected in parapsychic areas. Two examples are to be found in the poltergeist and the phenomenon of cosmoconsciousness.

Poltergeist. It is currently accepted that the epicenter of the basic poltergeist phenomenon – one of the most primary parapsychic phenomena – is an adolescent intraphysical consciousness (puberty), and that the sexual processes play an important role in the phenomenon.

Young women. Occurrences indicate a considerable preponderance of activity related to young women (95%) compared to the proportion of young men (5%) in cases involving adolescents (Bayless, p. 214).

Sexochakra. The poltergeist is an assemblage of phenomena with physical effects and is related to the *kundalini* or consciencial energies stemming from the sexochakra and, finally, from the psychosoma.

Cosmoconsciousness. The evolved phenomenon of cosmoconsciousness – the most illuminating of all phenomena pertaining to the intraphysical consciousness – occurs while the consciousness is in the mentalsoma, which is headquartered in the parabrains of the psychosoma, in the mentalsomatic dimension. Some researchers note that the cosmoconsciousness condition occurs in a clear and much more frequent manner with men than with women (Bucke; Steiger).

Hypothesis. In light of these observations, the following question can be posed: Does the conquest of self-awareness – in terms of the evolved androgenesis, by the consciousness which, strictly speaking, *has no gender* – begin in an evolutionary extreme, from the woman, using the gynosoma, the key element of animal reproduction, through the genesic chakra and the psychosoma, and consolidate, at another evolved extreme, with the man using the androsoma, the less important element in animal reproduction, through the condition of cosmoconsciousness? Does this hypothesis, without any depreciative intention, seem logical?

Bibliography: Baker (69, p. 90), Moore (1082, p. 230), Richards (1394, p. 38), Steiger (1608, p. 3).

300. SEXUAL FACTORS UNFAVORABLE TO LUCID PROJECTION

Classification. The sexual factors unfavorable to lucid projections can be classified as physiological, psychological and parapsychic.

1. **Physiological:** sanguineous stasis generated by the sleep position or vesical repletion in the inactive physical body, which provokes an erection before or during exteriorization of the projector; projection in the dorsal position with the female projector's legs spread apart on the bed; use of sensory deprivation of the sexual impulse as a projection generation factor; an inactive or disorganized sexlife; lack of sex; excessive sexual freedom and permissiveness; period of sexual *fermentation* (promiscuity).

2. **Psychological:** intranquil *mental* sex; sexual self-guilt; overestimation of the libido (sexaholic); lack of defense against mental or interconsciencial approaches.

3. **Parapsychic:** the condition of the conscious or unconscious extraphysical sexual predator-projector, or violator-projector, and its prey; the interflow of extraphysical forces with ill or energivorous extraphysical consciousnesses; the extraphysical kiss; reflections of the unrestrained sexual impulse in the projected consciousness; lack of defense against extraphysical attacks; the passive condition of a victim of extraphysical vampirization, having a sexual origin, by ill extraphysical consciousnesses or projected intraphysical consciousnesses; sexual evocation of intraphysical and extraphysical consciousnesses; promiscuous invisible unions; *congressus subtilis* with the wrong consciousness

(partner); the vampire-partner; creation of morphothosenes having a sexual origin; consciential projections solely through the psychosoma or the body of desires.

Self-guilt. Sexually deprived persons, or those who repress their natural emotions and nurture constant anxieties, ideas and sentiments of guilt regarding affectionate relationships – whether because of marital infidelity, “living in sin”, maintaining “illicit relationships”, receiving accusations and criticism about their sexual conduct, or attempting to “sublimate” their own healthy physiological impulses – act in a negative manner in terms of lucid consciential projection. This is because projection, in order to develop, requires a constantly worry-free condition and a mind that is open – without inculcations – to renewal and new knowledge (neophilia).

Camouflage. The intraphysical consciousness who is projected in an extraphysical dimension is not able to camouflage his/her emotions or emotional lacks if he/she does not control them on a diuturnal basis in the ordinary, physical waking state.

Morphothosenes. In many cases, the unconscious modeling of morphothosenes makes it such that the male consciential projector molds mental forms of a woman and the female consciential projector molds mental forms of a man which, for them, present all the characteristics and vital signs of their extraphysical sexual fantasies. This occurs in the same manner with persons who nurture homosexual fantasies.

Bibliography: Frost (560, p. 62), Monroe (1065, p. 190), Muldoon (1105, p. 181), Prado (1284, p. 42), Richards (1394, p. 38), Vieira (1762, p. 45).

301. EXTRAPHYSICAL ROMANCES

Definition. Extraphysical romance: all of the acts through which the intraphysical consciousness dates or has a positive affair while projected out of his/her human body.

Synonymy: astral love; astral sex; extraphysical affair; extraphysical dating; paratropospheric sex; projected romance.

Adventures. Lucid projection allows intraphysical projectors to actually have two distinct types of romantic adventures in the extraphysical dimension:

1. **Primitive.** Those still involving the characteristically primitive sensations of physical sex and tropospheric results, or *congressus subtilis*.

2. **Evolved.** Those having emotions elevated to levels of ample expansion of the consciousness and indescribable results of sublimation, in an ecstasy that is supreme and therefore evolved.

Intentionality. Each of these experiences is dependent upon the quality of the consciousness’ intentionality (true intentions), the company it seeks and those with which it has an affinity (empathy, because likes attract).

Marriage. Extraphysical and positive romances or honeymoons frequently prepare an upcoming human union or the constitution of an evolutionary duo between two projected intraphysical projectors. These are sometimes facilitated by helpers, which serve as cupids in this case. There are those who have asked their intraphysical girlfriend’s hand in marriage, while outside the human body, before doing so officially in the ordinary, physical waking state.

Widowers. Many widowers and widows of various ages who are still intraphysical, solitary and longing, continue their affectionate experiences – generally maintained in secret – in elevated levels of sublimation, with the companions who preceded them in biological death (desoma or final projection).

Differences. The differences in the level of lucidity of extraphysically projected intraphysical consciousnesses and the degree of recall of the experiences of lucid projections involved 2 intraphysical partners in an extraphysical romance make it such that only 1 of them, the more predisposed party, has complete recollection of his/her experiences in another consciential dimension.

Bibliography: Denning (391, p. 203), Fox (544, p. 61), Frost (560, p. 66), Greenhouse (636, p. 115), Monroe (1065, p. 198), Morrell (1088, p. 369), Muldoon (1105, p. 256), Norvell (1139, p. 157), Prado (1284, p. 114), Schiff (1515, p. 115), Sculthorp (1531, p. 62), Shirley (1553, p. 105), Vieira (1762, p. 46), Walker (1781, p. 145), Yram (1897, p. 205).

302. CONGRESSUS SUBTILIS

Definition. *Congressus subtilis*: invisible parasexual union with an extraphysical consciousness or even, very rarely, a projected intraphysical consciousness, while the intraphysical consciousness is physically resting.

Synonymy: divine coitus; extraphysical coitus; extraphysical erotic encounter; extraphysical sex act; incubism; intangible parasexual union; invisible intercourse; invisible union; mystical sexual relations; sexual visit in a dream; sidereal rape; succubism.

Notion. The notion that sexual relations can occur between mortals and *supernatural beings, gods, angels and demons*, is one of humanity's most widespread beliefs, according to the *affirmations* of anthropology researchers.

Concepts. The following are 9 concepts that should be understood by those who wish to have a deeper understanding of the more pathological or less healthy occurrences of *congressus subtilis*:

1. **Thosenology.** The negative morphothosenes stemming from erotothosenes (mental adultery).
2. **Sexosomatics.** The physical aspects of ordinary human sexual relations.
3. **Holochakrology.** The manifestations of the energies of the sexochakra (*kundalini*).
4. **Folklore.** The ancient *love potions*.
5. **Grimoires.** The ritual prescriptions of grimoires.
6. **Tonics.** So-called aphrodisiac tonics, drugs and cocktails.
7. **Partners.** The *astral* partner.
8. **Lovers.** Angelic lovers.
9. **Predators.** The specifically sexosomatic extraphysical visits made by sexual predators upon sexually deprived intraphysical consciousnesses.

Types. It was accepted for centuries, in various human regions and cultures, that the incubus, an extraphysical entity with the form of a male human, angel or demon, sought invisible union with female intraphysical consciousnesses, and the succubus, an extraphysical entity with the form of a female human, angel or demon, sought invisible union with male intraphysical consciousnesses.

Appearances. However, projections of the consciousness show that invisible unions occur with both intraphysical and extraphysical consciousnesses having a predominantly masculine or feminine mentality or tendency, regardless of their human or extraphysical visual appearance.

Psychosomatics. The extraphysical consciousness and the extraphysically projected intraphysical consciousness can change the form of their sexual appearance at will, according to the properties of the psychosoma or emotional parabody.

Factors. Various factors explain the occurrence of *congressus subtilis*, such as the following 7:

1. **Thosenization.** The power of thought or self-thosenization.
2. **Evocations.** The power of conscious and unconscious evocation.
3. **Empathy.** The natural attraction (empathy) of likeminded consciousnesses.
4. **Monothosenes.** Fixed ideas, monoideisms, mental echoes or monothosenes.
5. **Sport.** The popularity of sex – the favorite human sport – which, above all, originates in the mind (“between the ears and not between the thighs”).
6. **Extraphysiology.** The existence of extraphysical consciousnesses of all types and multimillenary experiences, nurturing all kinds of intentions and sometimes fixed upon a single anticosmoethical objective in the paratropospheric dimensions.

7. Instincts. The silent and mental sexual instincts and appeals that stem from the affective and sexual deprivation of persons who are unconcerned and unprepared with regard to the extraphysical dimensions.

Film. *The Entity* is a film that impressively and realistically addresses the incubism phenomenon experienced by a North American woman who suffers from intrusion and is possessed by an extraphysical consciousness with masculine characteristics. This film is based on a true story that had its beginning in 1976.

Proximity. Invisible unions between intraphysical consciousnesses, or between intraphysical and extraphysical consciousnesses, can occur with the consciousness of a partner – man or woman – who is in the physical body (the human host) or with both consciousnesses of the projected partners. The closer they are to each other, physically speaking, the easier it will be to obtain extraphysical sexual company.

Energies. With invisible unions involving affectionate embraces (“bear hugs”) and contact that is intimate although neither displaying characteristics common to the sex act, nor with orgasm identical to that of humans, there is an exchange or interflow of energies between the partners. This can be a simple peaceful mental advance, when there is a reciprocal revitalization, or an open and direct extraphysical attack, in this case signifying vampirization or blatant energetic plundering, with the revitalization of only one of the partners.

Varieties. Invisible unions occur with 2 partners, or even among various somewhat likeminded partners, between the two basic dimensions of existence: the human, intraphysical or tropospheric and the extraphysical or paratropospheric.

Prophylaxis. The establishment of an evolutionary duo or the normalization of the man and woman’s sexlife is the ideal prophylaxis, or the natural and physiological solution for the projective couple to avoid vampirizing *congressus subtilis* and calmly seek projective development through maturity, the clarification task, *consciential gestations* and polykarmality.

Effects. Besides the above-cited effects, *congressus subtilis* can provoke dreams, nightmares, recollections, daydreams, physical repercussions and temporary or permanent interconsciential intrusions.

Will. The will prevails in invisible sexual intercourse. If the intraphysical being, and even the extraphysical consciousness, do not wish the invisible union, it does not occur, regardless of the human circumstances or interdimensional situations.

Shared. One of the most common types of *congressus subtilis* is the shared orgasm in which the intraphysical being finds him/herself unprotected, or passive to the plundering of his/her physical sensations by an extraphysical consciousness of any sexual preference, but having some affinity with the victim.

Case study. This occurs, for example, when one partner commits suicide due to the termination of a neurotic, tempestuous romance and returns, or remains in this human dimension, in order to reestablish the romantic relationship. This even occurs during the sex act of human partners who are influenced by one or more ill, energivorous extraphysical consciousness.

Frustrating. The shared orgasm, frustrated orgasm, semi-orgasm, pseudo-orgasm, generally happens with only one single real orgasm occurring at a time on the part of the intraphysical partner (man or woman), whether it be penile, vaginal, clitoral or anal. This is shared between 2 partners, the intraphysical and extraphysical consciousness, regardless of whether both partners have the same or a different *mental sex*.

Mini-intrusion. The extraphysical influence can manifest in the manner of interconsciential mini-intrusion or ephemeral intrusion. This can last minutes or a few hours, only until achieving reciprocal relief, whether soon after a dream, nightmare, sexothosene, pathothosene or even in a sophisticated act of solitary and silent self-masturbation, in complete physical isolation, in the ordinary, physical waking state.

Emission. Innocent involuntary nocturnal emissions of sperm can attract so-called *succubi* extraphysical consciousnesses (female para-appearance).

Bait. A positive aspect of *congressus subtilis* that challenges human comprehension should be added here. In order to assist intraphysical and extraphysical consciousnesses – reciprocal agents or victims of shared orgasm – the helpers sometimes take advantage of the post-orgasmic period of

mutual relief to intervene and guide the one or more ill extraphysical consciousnesses to another extraphysical location. They almost always definitively detach from the intraphysical being who, in this case, served as psychophysical bait, usually unconsciously.

Therapeutic. This shows that, as incredible as it may seem at first, these extraphysical consciousnesses known as *succubi* and *incubi*, act while in a semiconscious condition, albeit in a positive and therapeutic manner.

Comprehension. The affirmations of the previous topic, evidenced by the extraphysical experiences of veteran projectors, can only be understood by the lucid and unbiased intraphysical consciousness, with reference to the following 4 aspects:

1. **Moral.** The sometimes shocking disparities between cosmoethics and conventional human morality. Examples: invisible energetic reunions which lack malice or bad intention; an ordinary human couple can have an invisible union beyond the usual physical union.

2. **Nonproductiveness.** The differences between extraphysical sex – which is natural and malice-free, although nonproductive in terms of human gestation or, in other words, lacks reproductive results and their physical consequences – and physical sex, with its immediate results.

3. **Rapport.** The need to establish deep consciencial *rapport* (empathy) between the one who assists and the one who should be extraphysically assisted, in certain cases of assistance provided to post-desomatic parapsychotics (*former intraphysical consciousnesses*).

4. **Universalism.** The universalistic understanding, without preconceptions or taboos, of the needs of consciousnesses that are still parapsychically attached to human instincts. In this case, there are obviously no concessions made to the excesses of the permissivenesses of habits and liberalities regarding the promiscuities and sexual contaminations between men and women.

Awareness. Sadly, the earth will revolve many times, with the appearance of countless human generations and an equal number of consciencial lifetimes on this planet, before even half of terrestrial humanity becomes aware of these and other phenomena of equal significance, priority and relevance, in order to enact a prophylaxis of the parasitism and vampirization of interconsciencial energies. This takes into consideration the fact that the average human being still erroneously overvalues sexuality among his/her existential resources, tasks, sports and pastimes.

Bibliography: Blavatsky (153, p. 278), Cavendish (266, p. 125), Chaplin (273, p. 88), Day (376, p. 63), Denning (391, p. 203), Digest (401, p. 361), Fortune (540, p. 144), Gaynor (577, p. 85), Gooch (616, p. 29), Lewis (923, p. 66), Martin (1003, p. 70), Pensamento (1224, p. 55), Planeta (1249, p. 168), Richards (1392, p. 139), Shepard (1548, p. 461), Spence (1588, p. 223), Tondriau (1690, p. 241), Vieira (1762, p. 46), Walker (1782, p. 94), Wedeck (1807, p. 186), Zaniah (1899, p. 241).

303. EXTRAPHYSICAL SELF-LUMINOSITY

Definition. Extraphysical self-luminosity: the quality by which the projected intraphysical consciousness and many extraphysical consciousnesses close to the earth irradiate light through their vehicles of consciencial manifestation (see fig. 303, p. 1,142).

Synonymy: extraphysical aura; extraphysical luminescent aureole.

Cause. Self-luminosity is the basic effect caused by the consciousness' own field of energy, which becomes visible to the perceptions of lucid consciousnesses in the extraphysical dimension.

Effects. Among the characteristics of the effects of extraphysical self-luminosity, at least the following 12 should be singled out:

1. The degree of intensity (decrease, increase).
2. Luster.
3. The predominant color.
4. Glimmering, scintillation or sparkling.
5. Luminous trail.

6. Fluxes.
7. Uniformity.
8. The effects of the will.
9. The extension of the luminous projection.
10. The relationship with the extraphysical district, environment or community.
11. Translucence.
12. Monochrome.

Energy. Extraphysical self-luminosity is closely related to the exteriorization of consciential energy.

Types. There are 3 types of extraphysical self-luminosity according to the vehicle of manifestation of the projected consciousness:

1. **Psychosomatics.** Only in the psychosoma.
2. **Holochakrology.** In the psychosoma with the holochakra.
3. **Mentalsomatics.** In the mentalsoma.

Sensitives. Extraphysical luminosity helps overall in certain cases of *inter vivos* apparitions and the apparitions of extraphysical consciousnesses. This is because it is easier for the clairvoyant sensitive to perceive extraphysical lights and reverberations than well-constituted forms.

Self-awareness. The consciousness projected in the psychosoma does not always realize that it emits its own light.

Identification. Sometimes, on certain occasions, without identifying the source, the projector thinks the light is external, from a helper, for example, whereas the light actually emanates from the projector him/herself.

Extinguishment. Other times, the projector only notices that he/she has some luminosity when this extinguishes as a result of passing from a rarefied extraphysical environment to another denser environment (group holothosene).

Opacity. Many intraphysical projectors, when projected, as well as countless extraphysical consciousnesses, appear to be opaque or without luminosity. This can be due to various causes, such as the following 4:

1. **Parapathology.** Disturbances of the consciousness itself.
2. **Evolutiology.** Pathological personal evolutionary period.
3. **Extraphysiology.** The influence of the extraphysical environment (para-ecology) upon the consciousness.
4. **Volition.** Intentional opacity provoked by the will (volition) of the consciousness during the service of extraphysical interconsciential assistance.

Extraphysical consciousnesses. Evidently, extraphysical beings and consciousnesses also present the quality of self-luminosity, although they do not always make use of it. This depends upon the conditions and performance of the more or less alert consciousness.

Disadvantages. Self-luminosity becomes disadvantageous in dull or evolutionarily underdeveloped extraphysical communities or environments because it attracts the attention of the resident native beings (autochthons), whether the visitor is a projected intraphysical consciousness or a lucid extraphysical consciousness that has to *turn off* or become opaque in order to avoid problems by looking like the others. The *outsider's disguise* allows blending into the realities of the district.

Note. The following 3 different realities should not be confused with each other:

1. **Self-luminosity.** The human aura with extraphysical self-luminosity.
2. **Paraluminosity.** The human aura with the still more subtle extraphysical aura.
3. **Bioluminescence.** Bioluminescence (pyrophorous), the biological or natural quality of certain evolutionarily inferior (firefly, glowworm, noctiluca, jellyfish, starfish, scarab beetle or *zarlippus*) living beings (biophotogenesis or physioluminescence).

Bibliography: Bozzano (188, p. 74), Castaneda (258, p. 118), Durville (436, p. 197), Greenhouse (636, p. 284), Kardec (825, p. 149), Vieira (1762, p. 65).

304. EXTRAPHYSICAL SELF-PERMEABILITY

Definition. Extraphysical self-permeability: the quality of the psychosoma whereby the consciousness, when projected in this vehicle, and many extraphysical consciousnesses contiguous with intraphysical life on earth, pass through solid objects, including dense, tropospheric physical forms, as well as certain formations native to the extraphysical environment (see fig. 304, p. 1,143).

Synonymy: extraphysical self-penetrability; interdimensional self-penetration.

Mechanism. The mechanism of self-permeability is explained by the different vibratory frequency of the vehicles of manifestation of the consciousness or, in other words, the occurrence of interpenetrability of the existential dimensions.

Effects. Well-defined vibratory barriers or extraphysical resistance sometimes arise for the projected lucid projector, that considers his/her psychosoma to be solid, due to various factors, such as the following 5:

1. Unknown densities.
2. Unknown *substances*.
3. *Surface tension*.
4. Unknown impermeability of encountered formations.
5. Clear sensations of passing through, penetrating and perforating.

Types. There are 4 basic types of extraphysical self-permeability:

1. **Structures.** Interpenetration of field 1, passing through material structures.
2. **Intraphysiology.** Interpenetration of field 2, passing through the bodies of intraphysical beings, humans and subhuman animals.
3. **Extraphysiology.** Interpenetration of field 3, passing through the bodies (vehicles) of extraphysical consciousnesses (projected extraphysical human beings and extraphysical animals).
4. **Mentalsomatics.** Interpenetration of field 4, the isolated mentalsoma of the projected consciousness acting directly in the mentalsomatic dimension, passing through any physical-extraphysical structure.

Case study. The following are 3 examples of extraphysical interpenetration:

1. **Parafingers.** Pass the parafingers through a cup or glass.
2. **Psychosomatics.** Pass the parabody (psychosoma) through a table, furniture, door, wall, fence and vehicles, from one end to the other.
3. **Parabodies.** Extraphysically pass through the bodies of awake persons and animals, without their perceiving it.

Sensation. In many cases of lucid projection with the compound double – when the psychosoma is denser or laden with the holochakra – the projected intraphysical consciousness, upon passing through a wall, fence or closed door, has the sensation of passing through fog.

Reverse. The extraphysical sensations frequently give the reverse impression that the physical doors and walls pass through the psychosoma, the psychosoma not seeming to actually pass through the objects.

Limitations. Extraphysical self-permeability is neither infinite nor totipotent, as it presents evident limitations that are insurmountable for us, such as the following 3:

1. **Ballast.** The psychosoma, when very dense or excessively laden with holochakral ballast, has difficulty in passing through certain solid bodies, because it may contain an elevated amount of matter, beyond the average amount that is useful for its extraphysical permeability.
2. **Parapsychism.** The aspect of parapsychic inhibition or the psychological reactions of the projected intraphysical consciousness also have an influence. If the intraphysical consciousness projected in the psychosoma is hesitant or harbors the erroneous idea that he/she will not pass through a certain formation, he/she will in fact not succeed. This is explained through autosuggestion and the mechanism of morphothosene modeling.

3. **Extraphysicals.** The psychosoma is not able to penetrate certain extraphysical formations which were shaped by certain extraphysical consciousnesses. Although excessively dense, most of them were created like that on purpose. This is also caused by morphothosene modeling.

Consciousness. The projected consciousness does not always perceive the self-permeability of the psychosoma. It therefore continues to be inhibited when faced with physical objects, whether opening a door's double, avoiding intraphysical vehicles and subhuman animals in the waking state that move toward the projector.

Self-reluctivity. Reluctivity is the opposite of permeability. In cases of blockages in the operation of the self-permeability of the psychosoma or, in other words, the *self-reluctivity of the psychosoma*, some projectors endeavor to reduce the density of the vehicle through their own will or they try to open a door, for example, using ordinary processes, lifting the (extraphysical) hand to the knob or even entering the door backward (paraback). These means somehow alter the *parapsychology* of the consciousness, the extraphysical conditions and/or density of the psychosoma.

Rearguard. Another means for overcoming the self-reluctivity of the psychosoma is entering via the back entrance when possible, for example, instead of using the front door.

Polarity. The act of the consciousness projected in the psychosoma circling around the human construction seems to alter the magnetic polarity of this vehicle relative to the extraphysical environment, one polarity acting in opposition to the other. This ends up eliminating the resistance that is encountered.

Energy. Is it possible in this case that the front door, which is ostensive, more visible, seen, focused upon, dense or impregnated with the energy of the thoughts of intraphysical consciousnesses – just like the images of cults, monuments, tombstones and other objects – hampers the self-permeability of the psychosoma of the projected intraphysical consciousness?

Attraction. It is presumed that the consciousness's vehicle of manifestation maintains its magnetic polarity as well as the extraphysical environment or, more precisely, semi-physical environment. However, upon turning around, the psychosoma may come into magnetic consonance with the environment it wishes to enter. This is like 2 magnetic poles that repel when facing each other but, when one is turned around, they attract each other through the inversion of one of them (magnet).

Shadows. For the intraphysical consciousness projected from the human body, tables, chairs, walls, vehicles and persons' bodies often seem to be as insubstantial as the ordinary shadows of objects and things when in the ordinary, physical waking state. The psychosoma, on the other hand, is simultaneously perceived to be extremely solid and unarguably real.

Tangibility. When the projected consciousness becomes denser he/she achieves full extraphysical reluctivity. He/she is then no longer invisible and is tangibly perceived by 3 categories of percipients, in the following order of occurrence:

1. **Clairvoyants.** By human beings, but firstly, obviously, by clairvoyants.
2. **Subhumans.** Secondly, by subhuman pets, especially dogs.
3. **Intraphysical consciousnesses.** Next, by human beings or intraphysical consciousnesses in general. This produces the phenomena of *inter vivos* apparition, physical bilocation and extraphysical parateleportation.

Mentalsoma. The action of the *isolated mentalsoma* should not be confused with the operation of the *isolated psychosoma*. The mentalsoma operates in the universal and infinite mentalsomatic dimension with less influence from space, form and time.

Freedom. Incidentally, it is neither easy nor common for the intraphysical consciousness to act with greater freedom in the isolated mentalsoma without any influence or ballast of the psychosoma.

Ballast. It should be borne in mind that just as the *holochakra* can serve as ballast for the psychosoma during a lucid projection, the *psychosoma* can serve as ballast for the mentalsoma in another lucid projection.

Movements. In extraphysical reality, the consciousness manifesting in the psychosoma can enter the time-space structure whenever it wishes and leave it to go to a fifth or higher axis, for

example, and move about within it, ignoring the space-time structure. It can enter this space-time structure when it wishes, maintaining its position in the other axes constant. It can also travel through time, maintaining space as a constant, or it can travel through space while keeping time constant, or a combination of these, traveling forward and back in space and time.

Axes. Time and space do not cease to exist for the mentalsoma of the consciousness, but this vehicle can maintain its position indifferently in these space-time axes and move about in another which it finds more interesting and is unknown to us. This works in the same way that we walk in a direction along the x-axis and maintain our positions and directions constant on the y-axis and z-axis. When we need to move upward (z-axis) or to the side (y-axis) we can do this also, because space and time do not cease to exist.

Interval. If a spatial interval is greater than, less than or equal to zero, we cannot affirm that it does not exist. The same occurs in relation to a time interval, since these 2 physical aspects are clarified by Einstein's theory of relativity, which establishes that they are not absolute, as classical physics had proclaimed. What is absolute, however, is the velocity of light in a vacuum over any (referential) spatial interval (since velocity = spatial interval / time interval). These 2 aspects are relative when the reference system is changed and can, depending upon the system, be greater than, less than or equal to zero.

Bibliography: Brittain (206, p. 50), Currie (354, p. 100), Delanne (381, p. 209), Farrar (496, p. 196), Greene (635, p. 58), Greenhouse (636, p. 56), Kardec (825, p. 137), Larsen (888, p. 13), Richards (1392, p. 45), Sherman (1551, p. 191), Stokes (1625, p. 24), Vieira (1762, p. 207).

305. EXTRAPHYSICAL ELASTICITY

Definition: Extraphysical elasticity: the property which the psychosoma (of human beings, in this case) presents when submitted to the action of the will of the intraphysical consciousness, projected in this vehicle, of becoming deformed as an instrument of manifestation and later returning to its original, generally humanoid form (see fig. 305, p. 1,144).

Synonymy: elastic property of the psychosoma; extraphysical plasticity.

Extraphysical consciousnesses. Many extraphysical consciousnesses which are in the terrestrial troposphere obviously also have this property – the extraphysical elasticity of the psychosoma – to a more advanced or evolved degree than we do, as intraphysical beings, when we lucidly project from the human body.

Limit. There is no known limit to the elasticity of the psychosoma, beyond which its transfiguration will result in permanent deformation.

Hypothesis. Is it possible that intraphysical consciousnesses are still not able to perform maximal demands that are close to or beyond the elastic limit of the psychosoma? The evolution of projectiology research will answer this question.

Phenomena. The extraphysical elasticity of the intraphysical consciousness' psychosoma allows the occurrence of a variety of other phenomena which are analyzed in this book, such as the following 5:

1. **Self-transfiguration.** Extraphysical self-transfiguration in the psychosoma.
2. **Elongation.** Extraphysical elongation in the psychosoma.
3. **Mimicry.** Extraphysical mimicry.
4. **Clothing.** The appearance of the extraphysical clothing with which extraphysical consciousnesses and projected intraphysical consciousnesses dress their psychosomas.
5. **Zoanthropy.** Zoanthropy.

Bibliography: Vieira (1762, p. 107).

306. EXTRAPHYSICAL IMPONDERABILITY

Definition. Extraphysical imponderability: the quality through which the projected intraphysical consciousness and many extraphysical consciousnesses in the earth's troposphere cannot be weighed because they do not present a weight that can be evaluated, not specifically manifesting in the psychosoma, but in the mentalsoma.

Synonymy: antigravitational condition; antigravitational quality.

Cause. The cause of extraphysical imponderability is in the absence of matter, as we understand it, in the mentalsoma.

Mentalsomatics. Strictly speaking, *absolute imponderability* only exists when the consciousness manifests in the mentalsoma.

Psychosomatics. On the other hand, in the case of *extraphysical ponderability*, as well as volitation, consciential energies serve to sustain and propel the psychosoma.

Ponderability. The psychosoma is ponderable or, in other words, contains mass or energy. It thus necessarily suffers gravitational attraction. However, due to its reduced weight, this attraction can easily be eliminated by an opposing force, implemented by the consciousness through the movement of nearby energies which are impelled by the will.

Thousandth. It is presumed, as a hypothesis, that the weight of the psychosoma is approximately 2.47 oz (70 g) or, in other words, one thousandth of the average human body weight. All indications are that, up to this weight, the intraphysical consciousness projected in the psychosoma is capable of moving more easily against terrestrial gravity. Above this weight, however, the psychosoma presents an increased ponderability and reaches a point where it begins to be influenced by the earth's gravitational force.

Holochakra. The holochakra plays a particularly important role in the density of the projected psychosoma and, thereby, in the gradation of extraphysical ponderability. The psychosoma, when without the holochakra, is less ponderable than when laden with it.

Consciousness. The projected consciousness can immediately perceive the reduced ponderability of the psychosoma relative to the human body because it feels lighter and *free as a bird*.

Imponderability. Any type of matter or energy has mass and therefore necessarily suffers gravitational attraction.

Deflection. This is the case, for example, with the experiment performed in 1919, which demonstrated Albert Einstein's (1916) assertion that light rays were deflected upon passing close to the sun's mass.

Absence. Only the total absence of energy is imponderable.

Mentalsoma. In the same manner, any matter or energy cannot, in theory, exceed the speed of light. It is therefore accepted that, in order to reach faster-than-light speeds, or penetrate into spacelike, the consciousness must be manifesting only in the mentalsoma (devoid of energy through the action of the will, in this case?), thereby being able to travel through time at will. The realities of the mentalsoma are still very obscure to our megathosenes.

Evolution. The more evolved an extraphysical consciousness is, the less ponderable it will be.

Scale. The projected projector therefore encounters, on an ascending scale, extraphysical consciousnesses similar to humans, which are dense and *heavy*, subject to the law of gravity, at one extreme, and beings which are totally imponderable, when manifesting in the so-called "mentalsomatic dimension," at the other extreme.

Holograms. Generally speaking, the extraphysical consciousnesses which are seen by the projector (projected intraphysical consciousness) seem to them, in principle, to be veritable *living holograms* or *virtual realities*.

Bibliography: Andreas (36, p. 55), Bozzano (184, p. 131), Delanne (381, p. 209).

307. EXTRAPHYSICAL INAUDIBILITY

Definition. Extraphysical inaudibility: the quality through which projected intraphysical consciousnesses and many extraphysical consciousnesses in the earth's troposphere cannot be heard by intraphysical beings in the ordinary waking state, whether they are projected in the psychosoma or the mentalsoma.

Synonymy: unhearability.

Cause. Extraphysical inaudibility is the effect caused by a change in the existential dimension of the projected consciousness that passes from the physical dimension to the extraphysical dimension using another vehicle of manifestation adequate for the plane in which it is manifesting.

Consciousness. Because it hears its own voice, the inexperienced projected consciousness has the habit of speaking to human beings and thinks it is being clearly heard, even receiving apparent responses and holding conversations which actually do not exist as they are forged solely by its own morphothosenes.

Contact. Verbal contact between a projector and an intraphysical consciousness becomes very problematic, especially if the individual is not a developed clairaudient sensitive.

Reversion. When the projected consciousness overcomes its inaudibility, which is habitual on the part of human beings, and is able to produce sounds (reversion), the following 2 phenomena occur:

1. Projective pneumatophony.
2. Sonorous projection.

Voice. When the extraphysical consciousness is able to speak to intraphysical beings, the extraphysical-physical phenomenon of direct voice occurs.

Clairaudients. Hearing or clairaudient sensitives are able to receive telepathic messages which are sometimes sonorous for them. The messages are sent by extraphysical consciousnesses and projected intraphysical consciousnesses. In this case, extraphysical inaudibility does not need to be overcome on the part of the transmitting agent.

Mentalsoma. When the projected consciousness is manifesting solely in the isolated mentalsoma, it is presumed that it does not have the means to produce sound although it communicates directly with the mentalsoma of other extraphysical consciousnesses or even intraphysical consciousnesses.

Bibliography: Currie (354, p. 147), Monroe (1065, p. 47).

308. EXTRAPHYSICAL INVISIBILITY

Definition. Extraphysical invisibility: the quality through which the projected intraphysical consciousness and many extraphysical consciousnesses in the earth's troposphere can ordinarily not be seen by intraphysical beings when manifesting directly in the psychosoma or mentalsoma.

Synonymy: extraphysical insubstantiality; mental invisibility; self-invisibility.

Types. The quality of extraphysical invisibility gives the psychosoma one of its many names, the invisible body. Nevertheless, the least relative mental invisibility is that of the isolated mentalsoma, without the psychosoma.

Patterns. It is feasible to suppose that there are patterns of visibility which may be perceived in different ways and not within or with currently known patterns.

Causes. Invisibility is based on the vibratory frequency of the vehicle of manifestation of the consciousness. For this reason, the projected projector, depending upon extraphysical circumstances, can be invisible to intraphysical consciousnesses as well as to unevolved and even evolved extraphysical consciousnesses.

Case study. Example: when manifesting in the mentalsoma, the intraphysical consciousness will not be seen by extraphysical helpers which are manifesting in the psychosoma on that occasion.

Vehicle. Strictly speaking, total or absolute invisibility does not exist. If the consciousness is not seen or perceived in one dimension at a given moment it will be perceived in another or other dimensions. This always depends upon the consensual vehicle of manifestation used on that occasion.

Manifestation. The temporary invisibility of the projected lucid projector to persons in the ordinary, physical waking state, in their daily routines, constitutes one of the most grandiose manifestations of projective experiences. It can be included among the initial manifestations of human parateleportation, wherein a temporary invisibility of even the human body occurs.

Utopia. The invisibility of the projected intraphysical projector somehow concretizes the utopia of the legendary *invisible man*, who goes wherever he wishes without anyone perceiving his invasive or intrusive presence, as though everyone is unaware of the reality he experiences.

Predator. This sometimes negatively transforms the lucid projector who is unprepared, inexperienced and ignorant of the laws of cosmoethics into a veritable extraphysical predator, from a sexual standpoint, or a frank violator of consciousnesses and environments, when he/she actually takes on the profile of an advanced type of ghost-human, vampire-human or operative intraphysical intruder.

Fiction. Incidentally, Herbert George Wells (1866-1946), the famous English writer, wrote a science fiction novel entitled *The Invisible Man*, which was made into a movie with the same title by Universal Pictures Corporation.

Self-permeability. The abovementioned work recounts the disastrous adventure of a character named Griffin – “the most genial of all physicists” – the first malicious invisible man who suffered hunger, thirst, cold and uttered sounds, but did not have the attribute of physical self-permeability (*O Homem Invisível (The Invisible Man)*; trans. Monteiro Lobato; 252 p.; 18.5 cm.; br; 2nd ed.; Companhia Editora Nacional; São Paulo; Brazil; 1934).

Self-invisibility. When projected in the mentalsoma, the consciousness becomes invisible even to him/herself or, in other words, the phenomenon of self-invisibility arises in which the projected projector is neither seen nor sees him/herself, thereby leading him/her to believe that he/she has no vehicle of manifestation and to feel like a mobile point of awareness or merely a vital center of consensual energies.

Visibility. In order for extraphysical visibility to occur on the part of an intraphysical consciousness, the projected intraphysical consciousness needs to have a psychosoma that is denser or laden with the holochakra. In this case, an actual physical visibility occurs or the phenomenon of materialization of the psychosoma of the projected intraphysical consciousness.

Consciousness. The projected projector is not always aware that he/she is invisible to human beings. He/she thus attempts to communicate and even gets angry with intraphysical beings who are indifferent to his/her extraphysical presence.

Bibliography: Bardon (80, p. 385), Blasco (151, p. 193), Carrington (245, p. 230), Carton (252, p. 362), Currie (354, p. 99), Hammond (674, p. 192), Kardec (825, p. 155), Richards (1392, p. 1), Walker (1781, p. 151).

309. EXTRAPHYSICAL INVULNERABILITY

Definition. Extraphysical invulnerability: the quality of the psychosoma whereby the projected intraphysical consciousness and many extraphysical consciousnesses in the earth’s troposphere cannot be affected or wounded from attacks by humans or physical objects.

Synonymy: extraphysical noncombustibility; extraphysical unattackability; physical-extraphysical immunity.

Lesion. Given that the psychosoma is a semiphysical vehicle, it cannot, in fact, be wounded with weapons or sharp pointed objects, or burned, as happens with the structure of the human body (self-combustion), or killed, deactivated (desoma) through one’s own will or the will of another. It also cannot decompose, as occurs with the soma, if the intraphysical consciousness is still a *pre-serenissimus*.

Serenissimus. This occurs only at the third desoma, when the *serenissimus* moves to the evolved state of free consciousness (FC).

Repercussion. There are exceptional cases which are intentionally triggered by the extraphysical helpers, wherein an extraphysical touch made to the projected human sensitive's psychosoma provokes a repercussion in his/her inactive soma in the intraphysical base, thereby giving rise to a more complex phenomenon involving the interference of other extraphysical consciousnesses.

Total. According to logical precedents, the quality of invulnerability does not confer total, absolute or indirect immunity to the psychosoma, as can be seen, in summary, with the following 4 aspects of extraphysical occurrences:

1. **Emotional.** As the psychosoma is characteristically the emotional parabody, it can be attacked from the standpoint of vulgar emotions, making the consciousness susceptible to feel, for example, an attack of energetic extraphysical darts in the form of weapons or objects created by morphothosenes with a high density and an elevated energetic level.

2. **Transfiguration.** Although always remaining unwounded, intact and undamaged from conventional physical attacks, the psychosoma, due to its complex structure, permits the ability of self-transfiguration. This gives the psychosoma an appearance of very relative integrity because the consciousness changes its extraphysical form at will, whether consciously or unconsciously, through self-determination or hetero-hypnosis. This is a *healthy* occurrence during extraphysical assistential tasks and *pathological* in the disfigurations of the phenomena of extraphysical lycanthropy.

3. **Sensitivity.** The phenomenon of exteriorization of sensitivity demonstrates that, although not being permanently wounded per se, the psychosoma transfers the *physical lesion* inflicted upon it, as occurs in cases of pinpricks and small cuts made to the human body, in a typical phenomenon of physical repercussion.

4. **Ectoplasmy.** Just as in the phenomenon of exteriorization of sensitivity, another typical physical repercussion of the materialized form occurs to the human body of the materialization ectoplast or sensitive during ectoplasmy experiments.

Vulnerability. Extraphysical repercussions upon the projected psychosoma having physical causes likewise demonstrate the relativity of the attribute of invulnerability of this vehicle or, more precisely, its real vulnerability as a semiphysical creation.

Awareness. The projected consciousness only becomes aware of his/her extraphysical invulnerability after some experience, or when he/she acquires greater lucidity outside the human body through the accumulation of projective experience. Until that point, the projector usually makes one mistake after another due to his/her preconceptions, repressions and deep-rooted social habits, such as: trying to run away from assailants, fearing all types of unfamiliar extraphysical consciousness that appears and needlessly enduring traumas.

Discoincidence. In fact, the condition of discoincidence of the vehicles of manifestation of the consciousness – whether in a voluntary or provoked lucid projection, or even in an involuntary or spontaneous consensual projection – is at the root of all cases of invulnerability, noncombustibility, para-anesthesia, human dematerialization and many other phenomena, due to the invulnerability of the psychosoma.

Mentalsoma. The projected consciousness only enjoys absolute extraphysical invulnerability when he/she manifests in the isolated mentalsoma, an occasion in which he/she even remains immune to the ordinary phenomena of interconsensual intrusion having an extraphysical origin.

Self-affirmations. The extraphysical invulnerability of the psychosoma allows the projected intraphysical consciousness certain freeing, self-realizing or self-affirming attitudes which would normally be avoided in the ordinary, physical waking state, such as the following 10:

1. **Parawalk.** Walk or perform parawalking (like a *tourist*) or volitate over rocky places that are full of weeds, debris, trash or scrap heaps, without worrying about hurting your feet.

2. **Fire.** Go into a large-scale fire without appropriate protective clothing (such as those used by *firemen*), without fearing the flames and toxic gases.

3. **Jungles.** Examine dense jungles, inhospitable fields and groups of suspicious bushes at close range, without clothes, boots and other protective gear, without worrying about poisonous snakes and other potentially dangerous subhuman animals.

4. **Jaguar.** Pet a live, awake jaguar in the open air inside a dense jungle.

5. **Lion.** Enter the cage of a live, awake lion and embrace it without fear.

6. **Alligator.** Extraphysically cross a swamp filled with alligators.

7. **River.** Extraphysically enter a river full of piranhas.

8. **Airplane.** Sit on the wing of an airplane in flight and enjoy the view from above.

9. **Scaling.** Climb or scale steep places without any protective *mountain climbing* or radical sport gear (borderline suicide), without worrying about falling and getting hurt.

10. **Caves.** Fearlessly enter the darkness of abysses, precipices, abyssal areas, caves and caverns of all types, like a *speleologist*.

Bibliography: Carton (252, p. 365), Frost (560, p. 62), Larcher (887, p. 192), Walker (1781, p. 152).

310. EXTRAPHYSICAL MULTIPLICITY

Definition. Extraphysical multiplicity: the quality through which the projected intraphysical consciousness and many extraphysical consciousnesses in the earth's troposphere multiply the form of the psychosoma, the simulacra of which can simultaneously appear in various locations.

Synonymy: all-presence of extraphysical form; multilocation of extraphysical forms; omnipresence of the extraphysical form; ubiquity of the extraphysical form.

Multilocation. The quality of multiplicity, derived from the creation of morphothosenes which are almost always unconscious, allow the development of the phenomenon of multilocation of forms or the creation of simulacra of the individual, which are clearly perceptible.

Autoscopy. The multiplicity of extraphysical forms is involved in certain phenomena of external autoscopy in an unconscious manner. In this case, it appears to be closely related to conscial energies and parapsychological functions of the holochakra.

Relation. In order to minimize the difficulty in understanding the quality of multiplicity of the psychosoma, it is important to observe that it is related to or can better clarify the following *6 occurrences*:

1. **Hologram.** The hologram, or the holographic plate, is a modern paradox with regard to the content-content binomial, or a *part of a whole that contains the whole which contains it*. The holographic plate allows the projection of a three-dimensional object in space. If the hologram is cut into many pieces, each fragment reproduces the entire object. This non-vital, optical (physics) occurrence of the hologram clearly demonstrates its similarity with the quality of multiplicity of the psychosoma.

2. **Clone.** The clone is the *assemblage of individuals* of the same genetic constitution derived from the asexual reproduction of a single original individual (continuous fission, continuous formation of sprouts, and propagation through cuttings). This vital, biological occurrence of the clone also demonstrates deep similarities with the quality of multiplicity of the psychosoma.

3. **Psychosomatics.** The quality of multiplicity of the psychosoma, derived from the creation of morphothosenes which are almost always unconscious, allows the development of the phenomenon of multilocation of forms, or the creation of clearly perceived *simulacra* of the individual.

4. **Ectoplasmy.** The quality of multiplicity of the psychosoma allows the occurrence of so-called simultaneous or *multiple materializations* during ectoplasmy experiments (in this case: triplasy, tetraplasmy, pentaplasmy). In these cases, two or more extraphysical consciousnesses are made tangible at the expense of the conscial energies which are densified by the cellular elements of the soma,

specifically those of a single intraphysical consciousness, the main ectoplasmic sensitive, from whom all manifest formations are derived and to whom they temporarily remain connected.

5. **Holochakra.** The quality of multiplicity of the psychosoma is involved in certain phenomena of *external autoscopy*, in an unconscious manner. In this case, it appears to be closely related to consciential energies and the functions of the holochakra.

6. **Clairvoyance.** The quality of multiplicity of the psychosoma can explain the cases of the simultaneous presence of an *extraphysical consciousness* detected by clairvoyant sensitives in various groups of parapsychic practices in human locations which are distant from each other.

Seven. The author has encountered a lucid projector who affirms that the consciousness has 7 bodies or vehicles of manifestation. This individual sought to confirm certain occultist affirmations because he saw 6 of his bodies on one occasion, while the seat of his consciousness temporarily remained in only 1 other vehicle.

Simulacra. However, depending upon the efficiency of the performance of the consciousness, the projector can consciously form not only 6 but “n” duplicates, or countless simulacra of his/her vehicles of manifestation, like a *paracloning* (extraphysical cloning) derived from consciential self-determination.

Note. Multiplicity of the vehicles of the consciousness should not be confused with the following 3 phenomena:

1. **Bilocation.** The phenomenon of physical bilocation.
2. **Trilocation.** The phenomenon of *physical-extraphysical* trilocation or double consciential projection.
3. **Multilocation.** The phenomenon of physical multilocation or *physical* trilocation.

Distinction. These 3 occurrences are indicative of a quality and 3 phenomena that are perfectly distinct from each other.

Bibliography: ADGMT (03, p. 282), Butler (228, p. 115), Crouzet (344, p. 204), Delanne (382, p. 175), Digest (401, p. 381), Morel (1086, p. 177), Paula (1208, p. 166), Pensamento (1224, p. 97), Sculthorp (1531, p. 135), Zaniah (1899, p. 462).

311. EXTRAPHYSICAL TRANSLOCATION

Definition. Extraphysical translocation: locomotion of the intraphysical consciousness in general when projected from the human body.

Synonymy: extraphysical self-kinesis; extraphysical transit; instantaneous transference; psycholocomotion.

Types. General extraphysical translocation can be executed by employing countless modes (variables) of the manifestations of the extraphysical consciousness or the projected intraphysical consciousness, such as the following 16:

1. **Company.** Individual or in group.
2. **Hyperacuity.** Conscious or unconscious.
3. **Illumination.** In a light or dark environment.
4. **Performance.** Easy or difficult.
5. **Dimension.** In an instantaneous transference from a consciential location or dimension.
6. **Parawalking.** Through parawalking (like ordinary walking).
7. **Gliding.** Through gliding.
8. **Floating.** Through floating.
9. **Volitation.** Through levitation or volitation.

10. **Mentalsomatics.** Like a ball of energy (mentalsoma).
11. **Paramovement.** By “moving without walking” (paramovement).
12. **Tunnel.** Through a *tunnel*.
13. **Currents.** By way of currents of force.
14. **Empathy.** Through extraphysical translocation *via human television (rapport or empathy)*.
15. **Aviation.** Through *extraphysical aviation*.
16. **Continuity.** By consecutive translocations (continuity) through extraphysical environments of different densities.

Hitchhike. Extraphysical translocation in group sometimes makes two categories of personalities arise:

1. The *extraphysical hitchhiker*.
2. The satellite-volitor.

Distance. Strictly speaking, problems of distance do not exist for the lucid projected consciousness. Evidence of this can be found in spatial lucid projections or exoprojections, with target-places beyond our *solar system*.

Location. In order to cross these considerable distances, the projected consciousness does not need to worry about the location of the star or the direction in which one should go in order to reach the destination. What the practitioner does need is to intensely wish to be there, and he/she will be there almost immediately through a projection in the mentalsoma.

Route. In the mentalsomatic dimension, the extraphysical route is irrelevant. The mental target is the factor which is more important in this context.

Segmented. Extraphysical translocation can also occur in a segmented manner, in parts, as if the consciousness projected in the psychosoma performed large successive leaps in order to reach its target-place, or were obliged to stop at 3 or 4 intermediate points, without being able to go direct, non-stop, from the physical base to the target-place. This generally occurs when there is a greater energetic density in the structure of the psychosoma which, in this case, is laden with the energies of the holochakra.

Dimensions. There are 2 basic modes of translocation regarding conscial dimensions:

1. **Unidimensional.** From one extraphysical district to another, in the same dimension.
2. **Bidimensional.** From one district in one dimension to another district in another dimension.

There is an effective change of dimension in this case.

Improvement. The processes and movements of the consciousness projected in the psychosoma are improved with the repetition of experiences. In other words, the volitation technique evolves and should be gradually learned and refined through continuous exercises which manifest in 3 stages:

1. **Freedom.** In the beginning, volitation gives the sensation of emptiness or being free in outer space, not always in a tranquil environment.
2. **Confidence.** Confidence later arises. The consciousness learns to use its new conscial abilities or resources and from this comes the agreeable enjoyment of extraphysical translocation.
3. **Habit.** Later, the veteran projector becomes accustomed (creates the habit) to and delights in free volitation, getting to the point of missing it and regretting the periods of the ordinary, physical waking state, in which it cannot be enjoyed.

Tonic. The excitement and involvement of volitation act like an extraphysical tonic, pacifying the consciousness or establishing true prophylaxis against melancholy of an imprecise origin and an effective extraphysical vaccination against irritability during the ordinary, physical waking state. This clearly signifies a condition of tranquility on the way toward understanding and experiencing serenism.

Sensations. Sometimes the projected consciousness seems to swim in midair. On other occasions, it has no sensation of movement while moving outside the human body.

Witches. Some individuals believe that extraphysical translocation, namely the volitation of projected intraphysical projectors, inspired the story of witches that fly on broomsticks, elaborated during the Middle Ages and the Inquisition, when thousands of supposed witches or sensitives were sacrificed, some even being burned at the stake.

Cord. It is often easier for the projected consciousness to visit someone in a distant city approximately 30 minutes away, for example, than to approach a nearby bedroom in the physical base and stay there for a few moments. This is due to the retraction of the silver cord that is close to the human body, which imposes abrupt interiorizations of the projected intraphysical consciousness.

Control. The more the projected intraphysical consciousness lucidly controls his/her conscial attributes, the better he/she will be able to operate in the extraphysical dimensions. For example: it is sometimes easier to *pass over* a physical wall than to *pass through* this same wall. In other words: depending upon the density of the vehicle of manifestation, it may be more convenient for the intraphysical consciousness to translocate through extraphysical volitation than to use self-permeability of his/her psychosoma.

Mentalsoma. When the projected intraphysical consciousness or an extraphysical consciousness manifests in the mentalsoma, extraphysical translocation is accomplished in a lightning fast manner. For the one using the mentalsoma, the distance to be crossed is unimportant. This is because all points of the universe will be separated from each other by the same time period or, in other words, in an instantaneous, atemporal manner (non-time).

Equilibrium. Although many dreams of flying are actually semilucid projections, one should not confuse them with extraphysical volitation, that unquestionably occurs in a manner that is self-persuasive for the projector at a distance from the human body with the common physiological sensations of floating, flying and spinning, as described in 8% of the reports of ordinary dreams, according to statistics on human conscial projections.

Theories. In line with current theories, the common sensations of floating occur because the brain is receiving disparate signals from the ventricular activation or balance mechanisms. The images of floating, or of other experiences which do not occur in ordinary waking life, can be influenced by the mechanisms of the areas that regulate the position and the equilibrium of the head and neck.

Bibliography: Currie (354, p. 102), Delanne (381, p. 209), Farrar (496, p. 191), Frost (560, p. 59), Greene (635, p. 108), Greenhouse (636, p. 109), Huson (768, p. 116), Sculthorp (1532, p. 24), Shay (1546, p. 97), Vieira (1762, p. 185), Walker (1781, p. 73), Yram (1897, p. 80).

312. MECHANISMS OF EXTRAPHYSICAL TRANSLOCATION

Transit. There is a great similarity between the mechanisms of conscial projection and the mechanisms of the transit of the projected consciousness. This is explained by a change in the vibrational frequency of the vehicle through which the consciousness is manifesting on any specific occasion.

Sensations. Most of the *sensations* of extraphysical translocation, including volitation and force currents, during the rapid unfolding of events when nothing is perceived of the *scenarios* or details of the succession of images, result from a simple change in the vibratory frequency of the vehicle of manifestation of the consciousness leaving one extraphysical energetic environment, plane or field and going to another. This is the case whether a shift is being made from the terrestrial troposphere to an extraphysical district per se, or from this extraphysical district to more evolved extraphysical communities or districts.

Underdeveloped. In underdeveloped conscial environments, the psychosoma generally operates together with the holochakra.

Time. Translocation through time, or that in which *time is stopped* is, above all, of a conscial nature.

Bibliography: Baumann (93, p. 21).

313. SPEED OF THE PROJECTED PROJECTOR

Definition. Extraphysical speed is the relationship between the distance traveled and elapsed time relative to the trajectory of the psychosoma of the projected projector in the paratropospheric extraphysical dimension.

Synonymy: speed of extraphysical dislocation.

Speed. Above all, it is important to clarify that the consciousness projected without physical or energetic ballast can, in theory, travel faster than the speed of light.

Will. Para-ecological environmental or local differences influence the speed of the projected consciousness' dislocation. It can be easy and rapid or difficult and slow, depending upon the experimenter's will and the density of the environment. There are extraphysical districts which are extremely dense and more difficult for consciential translocation than the planetary crust or paratroposphere itself.

Types. The speed of the projected projector can be classified into 4 basic types:

1. **Slow.** In *slow motion*, sluggish and arduous.
2. **Normal.** Normal or the speed of natural ordinary walking, when the projector is free to move about in the extraphysical environment like a healthy human being.
3. **Intermediate.** Intermediate, or the speed at which the projector moves effortlessly, faster than normal speed, without hindering extraphysical perceptions. At this speed, the projector is able to observe the passing of the images in the environments where he/she travels.
4. **Supranormal.** Supranormal speed, beyond human understanding, does not allow the projector to distinguish the extremely rapidly passing surrounding scenery or visions. A semilucid state frequently occurs. This type of speed is that of the current of force, which is often characterized by high speed wherein the projected consciousness does not always feel capable of stopping when it wishes.

Vision. It is worth mentioning that, when traveling close to the speed of light, it is possible to circle the earth 7 times in only 1 second, wherein it would not be possible to see anything.

Mentalsoma. Here we are only referring to the extraphysical speed of the consciousness when it manifests extraphysically in the psychosoma. In the mentalsomatic dimension, time and space are relative and speed, which is faster than tachyonic speed – because it is in spacelike – is mental, or travels at the speed of thought, without the consciousness losing lucidity.

Friction. Friction seems to occur between the vehicle of the consciousness and the local vibratory level in certain environments, as when the psychosoma is laden with the holochakra. This is reminiscent of the trace of light or the energetic escape of the psychosoma.

Bibliography: Crookall (343, p. 93), Greene (635, p. 6), Muldoon (1105, p. 59), Vieira (1762, p. 55), Yram (1897, p. 62).

314. LUCID VOLITATION TECHNIQUE

Definition. Volitation: the most common process of locomotion of the consciousness when projected from the human body.

Synonymy: extraphysical flight; extraphysical gliding.

Types. Among the types of extraphysical volitation, at least the following 10 can be singled out:

1. **Self-volitation.** Individual dislocation or self-volitation.
2. **Group.** Group dislocation or team volitation.
3. **Assisted.** Flight assisted by visible or intangible intelligences or heterovolitation.

4. **Hitchhike.** The *extraphysical hitchhike*.
5. **Infantile.** The *infantile extraphysical hitchhike*.
6. **Hyperacuity.** Lucid, semilucid or nonlucid dislocation.
7. **Slow.** Slow dislocation.
8. **Rapid.** Rapid dislocation.
9. **Antigravity.** Upward or antigravitational volitation.
10. **Takeoff.** The takeoff of volitation.

Movements. The psychosoma of the projected consciousness can move in various manners, such as the following 7:

1. **Circles.** Move in circles in the air.
2. **Zigzag.** Whirl around or move in a zigzag.
3. **Exercises.** Perform an *extraphysical dance*, *extraphysical swimming* and *extraphysical skating*.
4. **Directions.** Perform dislocations in various directions, whether upward, downward, to the side or at an angle.
5. **Stop.** Stop in midair.
6. **Landing.** Land the psychosoma or perform an *extraphysical landing*.
7. **Tree.** Volitation allows you to leave the branches of a high tree, circling around the trunk, as though descending a spiral staircase, for example.

Effects. Among the effects stemming from volitation, the following 9 can be singled out:

1. **Position.** The position of the psychosoma standing up, upside down, lying down, at an angle, reclining, with extended arms, open arms or cross-legged.
2. **Observation.** Looking straight ahead.
3. **Energies.** The degree of intensity of propulsive consciencial energies.
4. **Environment.** The density of the environment.
5. **Conditioning.** Conditioned human reflexes and their extraphysical consequences.
6. **Paralegs.** The para-arms and paralegs of the psychosoma.
7. **Gravitation.** Consciencial conditioning to gravitation.
8. **Transport.** The transporting of another consciousness or extraphysical hitchhiking: extraphysical consciousness or projected intraphysical consciousness.
9. **Mnemosomatics.** Improvement of the projector's recall through lucid volitation.

Help. In certain circumstances, the movement of the arms and legs of the psychosoma, as though the consciousness were swimming in midair or performing rhythmic dancing movements, parapsychically helps the volitation of the projected intraphysical consciousness.

Impulsion. The idea of impelling oneself forward also helps in extraphysical dislocation.

Imposition. During the dislocation of extraphysical volitation, the projected intraphysical consciousness, even with all of his/her lucidity, is not always able to stop at will. Sometimes his/her desire to stop allows him/her to merely reduce the speed of extraphysical dislocation, which continues to a destination that is almost always unknown to the consciousness on that occasion.

Elevation. In some extraphysical areas, even paratropospheric ones, due to the environment and/or the personal conditions of the projected intraphysical consciousness, high altitude extraphysical volitation, namely the voluntary and rapid propulsion of the psychosoma upward, in space, greatly helps in the discernment and identification of the overall physical-extraphysical district being visited.

Concentration. Extraphysical volitation requires considerable concentration of the thoughts of the consciousness or the concentrated attention.

Oligophrenics. Incidentally, extraphysical oligophrenics are generally not able to volitate due to the deficiency of their consciential development, difficulty in mental concentration and lack of coordination of critical judgment. Their mentality promotes insecurity and a loss of maintenance of the psychosoma, and apparent falling while volitating.

Agent. In extraphysical crustal or paratropospheric environments, unimpeded volitation realistically serves as the agent that allows discrimination of consciousnesses' level of awareness and extraphysical performance.

Case study. Thus, for example, an intraphysical consciousness projected with full lucidity in the tranquil early morning hours, freely cuts through space at a height equivalent to the sixth floor of buildings in the dense atmosphere of the big city streets (megacity, megalopolis). Meanwhile, a familiar ill extraphysical consciousness (*clinging* extraphysical consciousness) tries to follow him/her, without any intrusive intention, only desiring his/her company, by moving with some rapidity following the same route down on the street.

Assistential. Unimpeded lucid volitation can be useful as an effective assistential resource in certain paratropospheric environments. One or another ill, energivorous or intrusive extraphysical consciousness that is still very materialized, instantly changes its extraphysical reactions – turning from a *lion into a lamb* – if it is suddenly taken on a flight through midair by the projected intraphysical projector.

Mechanism. Besides the element of surprise, pusillanimity and sometimes the extraphysical consciousness' inability to volitate due to post-desomatic *para*conditioning – that is deeply rooted in its parapsychic reactions or consciential micro-universe – have an influence here, creating cowardice and the stark fear of falling from heights (basophobia).

Antigravity. Extraphysical volitation generally works against gravity or is performed under an antigravity condition.

Leadership. The volitative group commonly volitates in a closed formation in which the consciousnesses – extraphysical consciousnesses and projected intraphysical consciousnesses – dislocate beside the leader of the formation.

Competition. The author extraphysically witnessed a competition in rapid self-volitation between paratropospheric extraphysical consciousnesses in a street (swimming pool) in a district of Rio de Janeiro, Brazil. Each extraphysical consciousness (like a swimmer) threw itself (diving) from the roof of a three-story building (edge of the swimming pool), grazing the asphalt of the middle of the road (bottom of the pool) as quickly as possible, rose from there (antigravity volitation) up to the roof of the three-story building across the street (other side of the pool), where it landed, rose up and returned, erect, to the street.

Densities. This strange competition had its *raison d'être*, as extraphysical flight is not easy in certain paratropospheric districts, due to the density of the psychosoma and its relationship with the density of the *heavy* environment.

Longing. After the human lucid projector intensifies personal experiences of volitation outside the physical body, he/she will begin to understand the fearlessness and ideal of those consciousnesses confined to the physical restriction of terrestrial existence, but personalities who intuitively long for unimpeded extraphysical volitation, such as pilots in general, acrobatic pilots, astronauts and pilot-authors. These include some well known personalities: Charles Augustus Lindbergh (1902-1974), Antoine de Saint-Exupéry (1900-1944), Richard Bach, Edgar D. Mitchell, pioneers of greater aerial exploration of the physical space of the universe beyond earth. It can thus be seen that there is actually an inter-resomatic, intermissive or *parapsychic longing*.

Bibliography: Andreas (36, p. 55), Castaneda (255, p. 122), Leaf (905, p. 144), Mesquita (1037, p. 224), Muldoon (1105, p. 59), Sabom (1486, p. 54), Shay (1546, p. 99), Swedenborg (1639, p. 100), Vieira (1762, p. 201), Xavier (1890, p. 173).

315. EXTRAPHYSICAL ENERGY CURRENTS

Definition. Extraphysical energy currents: the extraphysical flow of energies existing in the paratropospheric dimensions and in extraphysical dimensions (extraphysiology) without dependence on or direct contact with the physical world (intrapysiology).

Synonymy: astral vortex; current of force; energetic corridor; energetic runway; errant current of energy; extraphysical energy current; extraphysical magnetic current; extraphysical wind; invisible tide; paratropospheric corridor.

Connection. We live in a condition of permanent cosmic connection or immanent interdependency with the entire universe.

Cosmoconsciousness. This fact is more intensely verified by the consciousness in the state of cosmoconsciousness. It is expressed through the smallest occurrences, such as the following 6:

1. **Wave.** A reflection from our consciousness makes waves throughout the universe.
2. **Thosene.** The *smallest* phytothosene counts within the *greatest* holothosene.
3. **Drop.** A drop of water is important in the depths of the ocean.
4. **Virus.** A virus has its specific place in the terrestrial atmosphere.
5. **Hair.** A strand of hair counts in a head of hair.
6. **Atom.** Each small atom has its personal register in the inventory of the entire cosmos.

Earth. The earth, just like the other inhabited planets in the physical universe – according to the correspondences between the microcosm and the macrocosm – has chakras, an aura, a psychosphere, meridians or networks of energy conductors and nadis or energetic points.

Realities. This same earth receives macro-acupuncture through the implantation of needles (menhirs, megaliths, dolmens); has interdimensional energetic doors; has circulating nervous flows; is crisscrossed by telluric currents (geoenergies) which are related to the traditional routes of the self-aware individual.

Effects. The state of universal interdependence and the characteristics of earth produce multiple effects that, for example, affect the following 8 occurrences:

1. **Conscientese.** Conscientese within the mentalsomatic universe.
2. **Hyperacuity.** The achievement of the state of continuous self-awareness.
3. **Universalism.** The concepts of universalism.
4. **Extraphysiology.** Extraphysical environments or communities.
5. **Bioenergetics.** The techniques of exteriorization of consciential energies.
6. **Naphology.** The complex studies and research of *naphology*.
7. **Somatics.** The physical position prior to the experience of lucid consciential projection.
8. **Conscientiality.** Countless other phenomena and procedures of the intraphysical consciousness in the ordinary, physical waking state and of the projected consciousness when outside the human body.

Objectives. Among the objectives of the extraphysical currents, at least the following 6 can be singled out:

1. **Vehicle.** An extraphysical means for rapid, general and continued translocation.
2. **Prophylaxis.** A prophylactic vibratory process of the mental world, defense of the physical and/or extraphysical environment.
3. **Antipollution.** Extraphysical antipollution.
4. **Commemorations.** Preparation or optimization of collective commemorations.
5. **Assistentiality.** An assistential resource in human catastrophes and calamities.
6. **Holosomatic.** Exclusive or direct influence upon the holochakra and psychosoma.

Characteristics. Among the characteristics that specify extraphysical currents, at least the following 24 can be singled out:

1. Field of energy.
2. Flow of energy.
3. Whirlwind.
4. Vibratory cloud.
5. Lightning.
6. *Extraphysical gust of wind.*
7. *Extraphysical hurricane.*
8. *Full sweep.*
9. Single current.
10. Multiple currents.
11. Interconnected currents.
12. Individual currents.
13. Collective currents.
14. Occasional currents.
15. Periodic currents.
16. Continuous currents.
17. Luminosity.
18. Penumbra.
19. Lapse of darkness.
20. Lapse of awareness.
21. Scintillations.
22. Colorations.
23. Sounds.
24. Melodies.

Movements. Extraphysical currents present intelligent effects and do not always allow voluntary movements to be made by the consciousness that is being translocated.

Agents. However, the currents can be reached with mentalsomatic triggering agents (e.g.: *a branch of an extraphysical tree*).

Direction. With regard to direction, extraphysical currents can be categorized into at least 4 types:

1. One-way.
2. Two-way.
3. Intersecting.
4. *Centrifugal* flow.

Trajectory. With regard to trajectory, extraphysical currents can be categorized into at least 5 types:

1. Straight.
2. Oblique.
3. Curved.
4. Horizontal.
5. Vertical.

Irresistibility. Extraphysical currents present the characteristic of irresistibility. The transported consciousness, whether an intraphysical consciousness or an extraphysical consciousness, almost always has to allow itself to be passively guided by the intensity of the current's force, often being swept along.

Peculiarities. They also show the following 5 peculiarities:

1. **Suction.** The existence of the effect of suction.
2. **Entrance.** The point of entrance.
3. **Impulsion.** The initial impulsion.
4. **Exit.** The exit of the current of energies.
5. **Expulsion.** The abrupt expulsion of the transported consciousness, on certain occasions.

Relationships. Extraphysical currents also present at least the following 12 relationships with the projected consciousness:

1. **Participants.** An individual or group experience.
2. **Psychosomatic.** Simple or odd positions of the psychosoma.
3. **Position.** Influence of the consciousness in the position of translocation.
4. **Changes.** Changes in posture while in transit.
5. **Scene.** Awareness of the transit and the *scene of extraphysical origin*.
6. **Sensations.** Vivid sensations that the phenomenon communicates.
7. **Emotionality.** Euphoria (extraphysical euphoria), fear (phobia) or surprise.
8. **Action.** The current of force can act upon the projected consciousness from takeoff or only during a specific extraphysical period of the consensual projection.
9. **Transit.** The departure and return in a single extraphysical experience or transit.
10. **Coexistence.** The effects of personal resistance and passivity to the current.
11. **Support.** The almost always futile attempt to anchor oneself with surrounding objects.
12. **Projectability.** The relationship of the experience of lucid projection in a whirlwind manner with the current of force.

Tunnel. Extraphysical currents of energy should not be confused with the *tunnel effect*.

Research. No one knows up to what point the intriguing extraphysical currents of energy are natural or artificial in the paratropospheric environments, thus demanding countless research projects by lucid consensual projectors.

Bibliography: Butler (228, p. 141), Castaneda (258, p. 234), Greenhouse (636, p. 263), Monroe (1065, p. 83), Muldoon (1102, p. 70), Schiff (1515, p. 177), Shirley (1553, p. 108), Steiger (1601, p. 112), Swedenborg (1639, p. 101), Vieira (1762, p. 201), Yram (1897, p. 60).

316. EXTRAPHYSICAL RAIN

Definition. Extraphysical rain: the torrent of positive energetic resources that sometimes flow in the paratropospheric extraphysical dimension.

Synonymy: extraphysical devastation; hydromagnetic tempest.

Causes. The main cause of extraphysical energetic rain lies in the formation of cysts or excrescences of negative or pathological morphothosenes that weigh upon the mentalsomatic economy of the extraphysical environment as well as the human environment.

Hypothesis. Extraphysical energetic rain seems to be generated by as yet inscrutable extraphysical intelligences. Might they be the direct and somehow more collective effects of free consciousnesses?

Effects. The main effects of extraphysical energetic rain are, at least, the following 3:

1. **Para-asepsis.** The cleansing or para-asepsis of chronic morphothosenes in the paratropospheric dimension.
2. **Parareurbanization.** Basic *reurbanization* and cleansing of the extraphysical environment.
3. **Cleansing.** Improvement and cleansing of the psychospheres of extraphysical patients in circumscribed atmospheres.

Types. Extraphysical energetic rain can manifest as ordinary rain or together (at the same time) with storms and other terrestrial meteorological disasters, including the following 5 types:

1. **Earthquakes.** Earthquakes or seaquakes.
2. **Volcanoes.** Volcanic eruptions.
3. **Tornados.** Hurricanes or tornados.
4. **Fires.** Large-scale fires.
5. **Floods.** Widespread floods.

Interrelationships. However, extraphysical energetic rain is not always related to meteorological phenomena.

Psychosoma. The projected consciousness only experiences or witnesses extraphysical energetic rain when manifesting in the psychosoma when it is free of or laden with the holochakra, and not when projected in the isolated mentalsoma in the mentalsomatic dimension.

Bibliography: Vieira (1762, p. 75), Xavier (1883, p. 157), Yram (1897, p. 109), Zoppi (1903, p. 98).

317. EXTRAPHYSICAL FIRE

Definition. Extraphysical fire: a mass of extraphysical flames that arises in certain paratropospheric extraphysical, or even native, environments or districts, with the objective of purifying the environment by cleansing residual, old, negative and dense morphothosenes.

Synonymy: mass of (extraphysical) paraflames; purifying bonfire; purifying fire.

Characteristics. Among the characteristics of extraphysical fires, at least the following 9 can be singled out:

1. **Intelligence.** Intelligence: the consciousness observes that it is neither an effect created by its emotions nor the fruit of its imagination.
2. **Luminosity.** Powerful light that illuminates the entire para-environment.
3. **Intensity.** Impressive intensity.
4. **Violence.** Astonishing and widespread violence.
5. **Volume.** Weight and volume.
6. **Orientation.** Impulsion and orientation by unknown winds with an origin that is unknown to those experiencing it.
7. **Delimitation.** Intelligent action that is intentionally delimited with regard to paraspace and our notions of chronological time.
8. **Mass.** Igneous mass similar to that which is felt in intraphysicality.
9. **Forms.** Forms of *paraflames* and *parablazes*.

Creptitations. Extraphysical fire has agitated whirling movements and creptitations that attract extraphysical beings and involve broad localized areas in a single environment, even over bodies of water.

Preservation. These masses of flames deliberately preserve certain zones, which are clearings of defense, but they exacerbate the sensation of high temperature in the extraphysical surroundings. They are always brief, according to chronological time, giving the impression of lasting for a few minutes.

Morphothosenes. The intelligence shown by the purifying action of extraphysical fire clearly evidences the action of the evolved consciousnesses that sponsor it. The fires appear to be performed by morphothosenes in previously installed force fields.

Purification. The purifying fire somehow affects certain energivorous, parapsychotic, post-desomatic extraphysical consciousnesses that feel burned upon being reached and try to evade its attraction and contact. They act like an extremely dirty person who does not want to take a bath. They therefore run away terrified, as do those intraphysical consciousnesses which are projected in the environment.

Hell. Over time, extraphysical fire has characterized the images of the terrestrial and ingenuous, although macabre, belief that became the doctrine of the *eternal fire* of hell where *human souls* are disturbed without relief. Fortunately, such formations constitute mere images or ephemeral consensual creations.

Parapyrogenesis. Extraphysical fire should not be confused with the cases of extraphysical parapyrogenesis that occur in the intraphysical dimension and stem from extraphysical causes.

Bibliography: Prado (1284, p. 118), Xavier (1883, p. 163).

318. GENERAL EXTRAPHYSICAL EMOTIONS

Definition. Extraphysical emotion: the intense and brief reaction of the projected consciousness to an unexpected event, which is accompanied by a painful or agreeable emotional state.

Synonymy: extraphysical commotion; extraphysical emotivity.

Types. Among the types of extraphysical emotions, the following can be singled out: self-control; emotionalism; extraphysical euphoria; laughter; solitude; compassion; embarrassment; fear; sexual impulse.

Causes. Among the main causes of the extraphysical emotions of an intraphysical consciousness, at least the following 14 can be singled out:

1. **Parahand.** Pass the extraphysical hand (parahand) of the psychosoma through the structure of physical objects.
2. **Walls.** Pass through walls with naturality.
3. **Bodies.** Pass through the bodies of human beings (somas).
4. **Soma.** Observe one's own inactive human body up close.
5. **Psychosoma.** See one's own psychosoma reflected in an ordinary mirror.
6. **Take off.** Take off suddenly from the human body (extraphysical escape).
7. **Cord.** Make a detailed examination of the silver cord.
8. **Hyperacuity.** Expand awareness (hyperacuity) and visual paraperceptions outside the human body.
9. **Self-transfiguration.** Perceive oneself to be partially configured in a semi-humanoid body of manifestation.
10. **Respiration.** Perceive the precise moment of the loss of respiration.
11. **Volitation.** Volitate alone and freely.
12. **Extraphysical euphoria.** Experience the state of extraphysical euphoria.
13. **Encounter.** Encounter the consciousness of a familiar personality which has undergone desoma.
14. **Attack.** Suffer an extraphysical attack from an ill extraphysical consciousness.

Reactions. Among the inner reactions of the projected intraphysical consciousness that are triggered or arise after extraphysical emotions, at least the following 6 can be singled out:

1. **Volitation.** Personal will (volition).
2. **Habits.** Social habits (personal sociability).
3. **Repressions.** Conditioned reflexes (personal repressions).
4. **Preconceptions.** Preconceived ideas (preconceptions, apriorisms).
5. **Recomposition.** Emotional recomposition.
6. **Ridicule.** Sensation of ridicule.

Effects. Among the effects stemming from the extraphysical emotions of the projected projector, at least the following 4 can be singled out:

1. **Holosomatics.** Differentiation between the psychosoma and the mentalsoma.
2. **Extraphysiology.** Extraphysical trauma.
3. **Intraphysiology.** Sudden, imposed, premature or traumatic interiorization.
4. **Thosenization.** Choice of serenity (thosenization with an *emphasis* on the *tho* of thosenes) as the best technical extraphysical conduct.

Serenity. The consciousness of the consciential projector needs to teach itself, through autosuggestion, to maintain composure, balance and serenity when outside the human body, in order not to succumb to fear and not panic when faced with traumatizing surprises.

Exercises. In order to achieve serenity outside the human body, it is necessary to begin to understand it and practice it while still in the body, namely while in the ordinary, physical waking state.

Athymia. On the other hand, when achieving a state of serenity is recommended, it obviously does not imply that the person should become a robot or arrive at a pathological condition, such as *athymia* – a reduction or disappearance of affectivity, or one’s external manifestations, which are common in stuporous and hebephrenic syndromes – and the *non-emotionality* that is the absence of emotional reactivity.

Sentiments. Many studious individuals currently consider that emotions are not the same as sentiments.

Emotions. Emotions are biological or more animalized. Sentiments are thoughts connected to emotions, rationality and self-critical judgment coming into play here.

Psychosomatics. Emotions are more restricted to the human body, the holochakra and the psychosoma. Emotional intelligence is only 1 of at least 12 modes of intelligence researched within conscientiology that the intraphysical consciousness possesses.

Mentalsomatics. Sentiments stem more from the mentalsoma of the consciousness.

Incapacity. There are individuals who do not know how to join their thoughts with their emotions and are always incapable of describing what they feel and precisely how their experiences feel.

Hemispheres. It is suspected that the inability to describe one’s own experiences is due to a disturbance in communication between the 2 cerebral hemispheres.

Alexithymia. The psychiatrist Peter Sifneos coined the term *alexithymia* to refer to the condition of persons who lack an adequate vocabulary for expressing their sentiments.

Pathology. These *emotional illiterates* appear to make up approximately 10% of the population. Among them, besides persons considered normal and healthy, alcoholics, hypochondriacs, patients with psychosomatic illnesses, seriously traumatized persons, sociopaths and drug addicts (toxicomaniacs) are found.

Hypotheses. Research has still not been performed in order to ascertain the relationship between lucid consensual projection and alexithymia. The author registers below 4 more projectological research and work hypotheses:

1. **Percentage.** What percentage of alexithymics become advanced lucid projectors?
2. **Paratrauma.** Does the consciousness of the alexithymic stop suffering extraphysical trauma (paratrauma) when projected with lucidity or does he/she experience traumas without being able to express them?
3. **Health.** Is alexithymia a positive or healthy condition (extreme extraphysical self-control, health), or is it negative or pathological (difficulties in paraperceptions, illness) with regard to development of the intraphysical consciousness’ lucid consensual projections?
4. **Parapsychopathology.** Does the insufficiency of communication between the 2 cerebral hemispheres reveal a pre-existing effect or disturbance restricted to the parapsychopathology of the mentalsoma headquartered in the parabrains of the psychosoma, or is it a disturbance acquired in this human life, restricted merely to the dense brain?

Bibliography: Monroe (1065, p. 205), Steiger (1601, p. 126), Vieira (1762, p. 120).

319. EXTRAPHYSICAL EUPHORIA

Definition. Extraphysical euphoria: the state of satisfaction, invulnerability and optimism with the sensation of perfect well-being, intense happiness or euphoria beyond words that overwhelms the intraphysical consciousness projected in the psychosoma in certain circumstances in the extraphysical dimension, especially in the paratropospheric dimension.

Synonymy: ephemeral extraphysical ecstasy; exacerbation of extraphysical emotivity; extraphysical euphoria; irresistible ecstasy.

Types. Extraphysical euphoria, as a temporary, ambiguous or hybrid sensation, can be productive or counterproductive, negative or positive. This is dependent upon the immediate decisions and attitudes

of the projected consciousness with regard to knowing or not knowing how to control it and taking advantage of this sensation.

Emotivity. The main cause of extraphysical euphoria is the exacerbated emotionalism of the consciousness stimulated by the psychosoma (emotional parabody) on that occasion.

Acme. Extraphysical euphoria represents the acme of primary forms of emotive reactions by the intraphysical consciousness in evolutionary ascension from the raw, earthly or tropospheric animality to the level of evolved self-conscientiality.

Causes. Among the secondary causes of extraphysical euphoria, at least the following 5 can be included:

1. **Volitation.** The satisfaction of indulging in unimpeded volitation far from material limitation and the draconian action of respiration and planetary gravitation.

2. **Megafreedom.** Attainment of the plenitude of a sense of extraphysical megafreedom.

3. **Peace.** The appearance of inner peace or immaculate and vivid inner pacification.

4. **Immateriality.** The sensation of immateriality and lightness typical of the discoincident or free psychosoma.

5. **Somatic.** Self-awareness of the condition of the temporary extraphysical freedom of the consciousness and its concomitant connection with the temporarily inactive human body.

Effects. The effects of extraphysical euphoria bring positive or negative consequences to the projected intraphysical consciousness.

1. **Positive.** The following are positive effects of extraphysical euphoria: benign awakening of the projector's sexochakra (*kundalini*) energy and the consequent awakening of the other basic chakras; stimulation of physical and extraphysical assistential works; appearance of sincere gratitude to the greater powers of extraphysical life; anxiousness to understand, forgive (reconcile) and cooperate in a positive manner with all beings and everything good that exists in the universe; appearance of a universalistic sense toward humanity and para-humanity.

2. **Negative.** The following are negative effects of extraphysical euphoria: extraphysical trauma and the consequent abrupt return to the human body; physical repercussions; the excesses of mysticism; difficulty in translating the extraphysical experiences and sensations into words.

Techniques. In techniques for the control and immediate use of extraphysical euphoria, various resources can be employed, such as the following 4:

1. **Evocation.** Make a grateful and sincere mental evocation when installing the state of euphoria.

2. **Volition.** Perform emotional readjustment or the recovery of serenity through willpower (volition).

3. **Target.** Endeavor to maintain maximum equilibrium without losing the current extraphysical mental or consciential target.

4. **Self-maturity.** Think about ceasing to be an animal, child or immature being as a projected consciousness.

Routinization. The definitive control of extraphysical euphoria by the consciousness can only be achieved by making one's extraphysical experiences routine through the repetition of continued self-lucid projections in series with the same nature and expression. This finally brings security, consciential self-maturity and serenity.

Expansion. When projected in the isolated *mentalsoma*, the intraphysical consciousness, in a state of cosmic expansion, does not actually feel the extraphysical euphoria that the psychosoma provides but an immanent well-being without coarse sensations or emotions. This cosmic expansion of the projected consciousness, in some *structural* way, is undoubtedly essentially superior, more evolved and quite different from the primary euphoria that arises when the intraphysical consciousness is overloaded by the emotionalism of the *psychosoma*.

Bibliography: Bozzano (188, p. 54), Rampa (1361, p. 17), Vieira (1762, p. 83), White (1831, p. 96).

320. EXTRAPHYSICAL FORMS OF THE PROJECTED PROJECTOR

Definition. Extraphysical form of the projected projector: the outline, physiognomy and *visual* appearance with which the projected consciousness presents itself when manifesting outside the human body.

Synonymy: extraphysical appearance of the consciousness; para-appearance of the consciousness.

Vehicle. The extraphysical form of the projected intraphysical projector is dependent upon 1 of 2 vehicles of manifestation of his/her consciousness:

1. **Mentalsoma.** When manifesting in the isolated mentalsoma it does not present a defined form, or does not present any form.

2. **Psychosoma.** When manifesting in the psychosoma, it commonly has a humanoid form with characteristics of its current human body, whether in whole or in part.

Environment. The extraphysical form of the projected intraphysical projector is closely related to the extraphysical environment where its consciousness is manifesting.

Agreement. No one reaches a certain extraphysical environment, nor does one fully manifest there, if not entirely in agreement (adequation, adjustment) with the characteristics of the environment. This is the case regardless of who, where or when, in any extraphysical situation involving the intraphysical or extraphysical consciousness.

Paraperceptions. Changes in the density of the psychosoma, according to the extraphysical environment, influence the projected consciousness' perception of surrounding extraphysical forms.

Impressions. The impressions of extraphysical forms can be entirely real or absurdly illusory, depending upon the perceptions, emotions, ideas and modeling of the consciousness, as with the following 3:

1. **Psychosomatics.** When projected in the psychosoma, the intraphysical consciousness can look much younger, taller and appear to have larger eyes.

2. **Extraphysiology.** One can have the impression that human and extraphysical constructions have higher ceilings.

3. **Walls.** Walls seem to be farther away from each other and environments generally seem to appear more ample.

Bibliography: Frost (560, p. 61), Greenhouse (636, p. 97), Ostby (1171, p. 232), Vieira (1762, p. 168).

321. EXTRAPHYSICAL CLOTHING

Definition. Extraphysical clothing: the elements that comprise the form of the psychosoma where the intraphysical consciousness manifests in the extraphysical dimension, including para-clothing, para-shoes, para-accessories or para-rings.

Synonymy: extraphysical apparel; extraphysical attire; extraphysical clothing; extraphysical garments; paraclothing of the projected projector.

Characteristics. Various aspects should be considered when analyzing extraphysical clothing, such as the following 12:

1. **Types.** Types, colors and variations of clothing, as well as indeterminate clothing.

2. **Parashoes.** Various types of parashoes.

3. **Paraglasses.** Various types of paraglasses.

4. **Replicas.** Para-replicas of bandages and casts of the wounded or injured projected intraphysical consciousness.

5. **Creation.** The manner or nature of creation of the clothing.

6. **Modifications.** Modifications – even unconscious and instantaneous – in the clothing.

7. **Imagistic.** The power of imagination in personal extraphysical presentations.

8. **Thosenization.** The act of wearing what is thosenized and what the projector thinks he/she is wearing.

9. **Somnambulism.** The extraphysical somnambulist and the unconscious creation of clothing.

10. **Psychosomatics.** The *enlargement* of extraphysical clothing together with the reconstitution of the psychosoma.

11. **Holochakrology.** The influence of the consciencial energies of the human aura (holochakrology).

12. **Sanitary napkin.** The intraphysical projector's sanitary napkin and its extraphysical replica.

Mentality. The facts show that extraphysical clothing arises naturally and not according to the reality of the extraphysical environment, nor is it derived from this environment, wherever the consciousness is projected, but according to its thoughts, thosenes and the mentality of the consciousness on that occasion.

Visual. While the intraphysical consciousness is projected, the visual appearance of the psychosoma is, as a rule, *androsomoid* for the man and *gynosomoid* for the woman. This seems to have the objective of better identifying the projected consciousness.

Nudity. Projected intraphysical consciousnesses instinctively dress themselves because they are conditioned against nudity by their repressive human education.

Paratroposphere. There are paratropospheric environments, however, that are veritable extraphysical nudist colonies.

Children. The projected projector frequently sees intraphysical children projected in the nude, without extraphysical clothing.

Attention. Could this be due to the natural distracted nature of children, their short attention span and the difficulty in focusing their will on a single issue, or that they are less conditioned to clothing than adults?

Changes. The same spontaneity, stemming from the unconscious, with which extraphysical clothing naturally arises, also appears to happen with the sudden changes that these clothes undergo, or even the state of alternation between being clothed or naked, according to the circumstances that influence the mental microuniverse of the consciousness.

Theories. The following 4 theories are proposed in explanation of the extraphysical clothing of the intraphysical consciousness projected in the psychosoma, although the fourth theory is more widely accepted by consciencial projectors or researchers in general:

1. **Double.** The extraphysical forms of all material objects, or the double of all existing things, might somehow unconsciously become joined with the intraphysical consciousness projected in the psychosoma in the extraphysical dimension.

2. **Holochakra.** The consciousness, in the psychosoma, might spontaneously manipulate the semimaterial components of the holochakra and the extraphysical clothing thereby appears.

3. **Material.** The consciousness projected in the psychosoma might interweave its form and clothing, absorbing elements of the wood and metal that already exist in the material sources of this physical dimension.

4. **Morphothosenes.** The accessories of the psychosoma might be morphothosenes or thought forms created by the consciousness, which is already responsible for the vitalization of the psychosoma and the human body.

Ectoplasmy. A subject directly related to the extraphysical clothing of the consciencial projector is the clothing of extraphysical consciousnesses materialized in ectoplasmy experiments performed since the nineteenth century, regarding which there is still much obscurity and, naturally, intense controversy.

Bibliography: Baumann (93, p. 48), Bozzano (184, p. 145), Carrington (247, p. 55), Crookall (332, p. 5), Currie (354, p. 98), Durville (436, p. 214), Engel (480, p. 29), Fodor (528, p. 383), Frost (560, p. 58), Greenhouse (636, p. 76), Hart (687, p. 243), Holms (735, p. 449), Kardec (825, p. 156), Lester (919, p. 61), Lischka (937, p. 117), Monroe (1065, p. 183), Muldoon (1105, p. 282), Müller (1107, p. 158), Osborn (1157, p. 159), Prado (1284, p. 45), Prieur (1289, p. 111), Shepard (1548, p. 267), Shirley (1553, p. 145), Steiger (1601, p. 66), Swedenborg (1635, p. 100), Tyrrell (1717, p. 166), Vieira (1762, p. 32), Walker (1781, p. 71), Xavier (1890, p. 179).

322. UNIFORM OF THE PROJECTED PROJECTOR

Definition. Uniform of the projected projector: the extraphysical attire in which the intraphysical consciousness projected in the psychosoma is most frequently dressed.

Synonymy: habitual paraclothing of the projected intraphysical consciousness.

Pajamas. The most common uniform of the projected intraphysical projector is ordinary pajamas, a nightgown or the nightwear in which the projector goes to bed, which is quite understandable.

Facts. The use of the form of pajamas or nightwear is due to 2 facts:

1. **Noctivagant.** The majority of projections of experienced projectors are produced at night when they go to bed. This is the reason for the predominance of noctivagant (noctivagous) projectors.

2. **Unconsciousness.** The mental texture of extraphysical clothing generally occurs unconsciously. The projected consciousness uses the attire it knows its human body was dressed in the last time it thought about the subject while in the ordinary, physical waking state, prior to projecting.

Projectors. Due to natural feminine vanity, a great number of projectors with some experience, when projected, frequently present themselves in a refined evening dress as extraphysical clothing, as though they were going to an elegant evening reception.

Inappropriateness. Pajamas (or a nightgown), when used as a uniform, besides characterizing and standardizing the consciousness' extraphysical appearance or image, facilitates its extraphysical awakening. This is because the projected projector perceives he/she is going about in inappropriate attire, with a ridiculous attitude and in a place where it would be inadmissible for him/her to be when in the ordinary, physical waking state, wearing pajamas in the middle of a commercial street, for example. This also helps the projector intensify his/her extraphysical self-awareness.

Habits. The extraphysical uniform, however, varies according to the projector's habits and daily concerns, such as the following 5:

1. **Discretion.** A clerk usually wears discreet clothing.
2. **Social.** The businessman wears a suit.
3. **Lab coat.** The medical doctor wears a lab coat.
4. **Surgery.** The surgeon sometimes wears appropriate attire for going into the surgery room.
5. **Sport.** The athlete wears sport attire.

Shoes. Whether wearing pajamas or any other attire, the intraphysical consciousness projected in the psychosoma is not always wearing shoes. He/she often finds that he/she is wearing only socks and is frequently not even aware of the fact.

Establishment. The establishment of the form, outline, fashion, size, style and appearance of the projector's uniform and his/her mental focus on that fact are notably relevant as measures capable of standardizing personal habits in order to have continued projections in series, without long-lasting periods of recess, as well as extraphysical contact with other projected consciousnesses and consciousnesses in general.

Bibliography: Butler (227, p. 71), Greenhouse (636, p. 71), Vieira (1762, p. 187).

323. EXTRAPHYSICAL SELF-TRANSFIGURATION

Definition. Extraphysical self-transfiguration: the changing of the external form of the psychosoma through the will of the consciousness (see fig. 323, p. 1,145).

Synonymy: deformation of the extraphysical appearance; *endometaplasia*; extraphysical disfigurement; extraphysical metamorphosis; extraphysical self-transfiguration; polymorphy of the psychosoma; *somurgoscopia*.

Form. In theory, depending upon its performance when manifesting in the psychosoma, the consciousness is able to temporarily assume different forms.

Environment. In most types of extraphysical self-transfiguration, the extraphysical environment, district or community seems to have a decisive influence in the transfiguration process.

Types. The following are 5 types of transfiguration of the psychosoma:

1. **Unconscious.** Unconscious, oneiric, spontaneous or involuntary self-transfiguration of the psychosoma. This spontaneous transfiguration stems from an extraphysical trauma.

2. **Conscious.** Conscious self-transfiguration is provoked by the impulse of the will of the intraphysical consciousness upon his/her psychosoma.

3. **Successive.** There are successive self-transfigurations of the psychosoma that follow one another uninterruptedly in certain extraphysical circumstances and according to parapatological disturbances of the intraphysical consciousness.

4. **Dialogic.** Dialogic self-transformation of the psychosoma is that which is unconscious and provoked by the transmental dialog of the parapsychotic, energivorous and viscous extraphysical consciousness that may accompany the projector in his/her extraphysical trajectory.

5. **Co-participant.** Co-participant self-transfiguration of the psychosoma is that which is shared by the participation of the psychosoma of the extraphysical visitor – or even of a projected intraphysical consciousness – that becomes infected with the phenomenon during transmental dialogue.

Influence. The extraphysical environment seems to have a decisive influence in most types of extraphysical self-transfiguration.

Cause. The main cause of self-transfiguration is in the plasticity of the psychosoma, which is sensitive to the will and emotivity of the consciousness.

Deformations. In order to understand unconscious self-transfiguration, it is sufficient to reflect upon the physiognomic alterations a person exhibits when faced with a positive or negative surprise, or in regard to certain physical deformations occurring during certain serious illnesses.

Soma. If the human body (soma) alters so much, weighing 154 lb. (70 kg), the psychosoma (emotional parabody), weighing only one thousandth of this, with 2.47 oz. (70 g), alters much more in the face of *parastresses*, critical traumas and unexpected impacts in the extraphysical dimension.

Effects. Among the countless effects of self-transfiguration of the psychosoma, from the frivolous-comical to the serious-productive, the following 10 can be singled out:

1. **Growth.** Transfiguration of the psychosoma explains the phenomenon of the biological growth of the soma, which is merely a transfiguration of the biological body, over a more or less prolonged period, promoted by the conditioning laws of genetics upon the consciousness when in the condition of physical restriction.

2. **Extraterrestrials.** Transfiguration of the psychosoma explains the resoma of extraterrestrial beings on this planet earth. In this way, the extraphysical consciousness having a psychosoma with a non-terrestrial form, which is exotic according to terrestrial shapes, is reborn here following the rigid evolutionary genetic laws of this planet and the anthropomorphic lines pertaining to our human bodies through the quality of transfiguration.

3. **Facial.** The phenomena of facial clairvoyance occur through the auric coupling of two or more persons. The exteriorization of bioenergy densifies, forming a compound energetic cloud, or aeriform ectoplasm on or between the faces of the intraphysical consciousnesses. This allows the appearance of other faces, extraphysical beings and even visual landscapes, projections or messages. As it is a typical initial manifestation of ectoplasmy, facial clairvoyance can evolve to the point where ephemeral transfigurations of the human body and psychosoma occur.

4. **Ectoplasmy.** In ectoplasmy or materialization experiments, transfigurations of the ectoplasmic sensitive's face and human body appear. They become modified, adopting facial features that are notably different from their own. This is especially due to his/her own ectoplasm, in a combination of their consciencial vehicles: the soma, the holochakra and the psychosoma.

5. **Elongation.** A more frequent effect of transfiguration of the psychosoma is the phenomenon of extraphysical elongation. This arises as though there were a prolongation of parts or organs of the human body through the exteriorization of bioenergy and, consequently, ectoplasm.

6. **Corrections.** Through self-transfigurations imposed on the psychosoma through the impulse of the will, certain extraphysical consciousnesses that have recently arrived in the extraphysical dimension or the post-desomatic intermissive period, and even some projected intraphysical consciousnesses with developed extraphysical abilities, upon becoming aware of this extraordinary resource of plasticity, endeavor to correct deficiencies in their appearance, or rectify their old inhibitions, complexes, repressions and conditioning in a lasting or temporary manner. The following are some examples of *paravanity*: women who dream of being young, lose their belly or endeavor to sculpt a perfect nose; men who correct their baldness, increase their height (extraphysical giants) or develop big muscles; frustrated artists who instantly become singers, adding the resource of morphothosenes to self-transfiguration.

7. **Parapsychism.** Transfigurations of the psychosoma occur during certain manifestations and *extraphysical parapsychic trances* (paramediumship).

8. **Clairvoyance.** Self-transfigurations of the psychosoma allow aiding, assistential and educational extraphysical consciousnesses to show themselves to other extraphysical consciousnesses and be seen by human clairvoyants, disguised as someone familiar (helper), an archetypal being worshiped in a parapsychic environment or group.

9. **Zoanthropy.** Transfiguration of the psychosoma provoked by autosuggestion or suggestion from another intelligence to weak and impressionable extraphysical consciousnesses occurs in cases of extraphysical zoanthropy or lycanthropy generated by hypnotist-intruders.

10. **Intrusion.** Transfiguration of the psychosoma enables ill, mystifying extraphysical consciousnesses to portray themselves with different appearances in processes of interconsciential intrusion, subjugation and fascination. They pass for those they are not, hiding their true identity. One should neither identify nor qualify an extraphysical interlocutor (an extraphysical consciousness or projected intraphysical consciousness) by its appearance, nor only by the discernment or coherence of its discourses, that which it shows, does or endeavors to do, but above all by the perceptible quality of the consciential energies it exteriorizes and the consequences thereof.

Transsexuals. It is sometimes very frustrating, in one's first extraphysical encounter, to come across a former male friend who, when intraphysical, was well-known and now, as an extraphysical consciousness, has the appearance of a beautiful woman. It is the form or retrosoma of another life, almost always that immediately prior to the most recent one, with which its consciousness has more affinity and feels more at ease. The author has already amicably and jokingly censured one of his acquaintances, who underwent desoma prematurely and had never shown any ostensive feminine tendency while in human life. Actually, this is a fact that is normal, understandable and totally different from the operations or surgeries of intraphysical transsexuals.

Sex. Sex is, above all, a manifestation that originates in the mind, or directly in the *coincident* intraphysical consciousness. Therefore, the more evolutionarily developed a consciousness is, the greater will be its possibilities for presenting the sexual appearance it wishes, whether masculine, feminine or transsexual.

Basic. It can thus be seen that there are 3 basic types of self-transfiguration:

1. **Somatics.** Transfiguration of the human body due to stress or illness.
2. **Holosomatics.** Ectoplasmic transfiguration, namely transfiguration of the human body, holochakra and psychosoma, is also known as *endometaplasia* or somurgoscopy.
3. **Psychosomatics.** Transfiguration of the psychosoma itself, in the extraphysical dimension.

Specific. Besides the specific types of extraphysical self-transfigurations referred to above, such as extraphysical clothing, the uniform of the projected projector and extraphysical elongation, zoanthropy, extraphysical mutation and extraphysical mimicry will be analyzed.

Bibliography: Ambelain (23, p. 40), Delanne (381, p. 256), Kardec (825, p. 153), Monroe (1065, p. 170), RPA (1481, p. 173), Vieira (1762, p. 18), Yogananda (1894, p. 383).

324. ZOANTHROPY

Definition. Zoanthropy: the presumed occurrence whereby a human being can, under certain circumstances, transform him/herself into an inferior or subhuman animal.

Synonymy: animal-human; cynanthropy; energetic mutation; human metamorphosis; lycanthropy; wolf-man; wolf-woman.

Metamorphosis. Since ancient times in primitive human areas, among savage tribes, and mainly during the Middle Ages, there has been a belief in the metamorphosis of persons into subhuman animals such as dogs (*cynanthropy*), horses (*hippanthropy*), jackals, hyenas, jaguars, lions, leopards, tigers, bears, other wild animals and even reptiles.

Lycanthropy. The typical form of transformation of humans into animals in Europe has been the wolf, thus the denomination of *lycanthropy* (Greek: *lukos*, wolf; and *anthropos*, man).

Epidemic. There was even a case of epidemic zoanthropy in a convent in Germany, wherein the nuns believed they had been possessed by cats, or transfigured into cats, and strangely behaved in that manner.

Confusion. In cases of zoanthropy, there has always been heightened confusion regarding the following 4 characteristics or categories of the phenomenon:

1. **Volition.** Whether the transformation is voluntary or involuntary (volition).
2. **Duration.** Whether it is temporary or permanent.
3. **Holosomatics.** Whether it is actually a transformation of the human body (soma) or the extraphysical body (psychosoma) of a male (androsoma) or female (gynosoma).
4. **Zoology.** Whether it manifests directly through the psychosoma or through an animal.

Psychopathology. According to psychopathology, regarding the obscure mental disorder of *lycanthropy* included in the chapter on delirious metamorphic ideas, the ill person believes him/herself to have been transformed into a wolf and imitates the habits and the voice of this animal. The agent therefore receives specific names in the following 6 languages:

1. *Licantropo* (Portuguese).
2. *Loup-garou* (French).
3. *Lubizón* (Spanish).
4. *Lupo mannaro* (Italian).
5. *Wahrwolf* (German).
6. Werewolf (English).

Regions. This occurrence also receives different names according to the region where it is addressed: *bigournes* or *ganipotes* (Saintonge); *garwbleiz* (Brittany); *sabaziens* (Greece); *varoux* (Normandy).

Nebuchadnezzar. This occurred to Nebuchadnezzar (604-566 B.C.), the powerful king of Babylonia, who spent 7 years thinking he was an animal, according to a report in the Bible (Dan. 4: 33).

Writers. Ancient writers, such as Titus Petronius Arbiter (?-66), Caius Plinius Caecilius Secundus (61-113), Sextus Propertus (50-15 B.C.) and Publius Virgilius Maro (70-19 B.C.), left their reference works on this strange psychopathology, lycanthropy.

Parapsychology. Parapsychology does not include zoanthropy in the sphere of its direct research areas, although in certain pathological cases of autosuggestion and even in external processes of hypnotic suggestion, individuals can feel like subhuman animals, extraphysically acquiring animal forms, besides other possible points of contact with parapsychological phenomena.

Facts. Projection of the intraphysical consciousness in the psychosoma provides 3 facts that merit analysis in relation to this subject:

1. **Self-transfigurations.** The projected intraphysical consciousness, when using the plastic properties of the psychosoma, can transfigure this vehicle of manifestation and assume any form he/she wishes.

2. **Bilocation.** In the phenomena of apparitions of living persons and physical bilocation, the projected intraphysical consciousness can appear visible and tangible to human beings.

3. **Repercussions.** The phenomena of large-scale repercussions of an extraphysical origin that occur during lucid projections and involve exteriorizations of sensitivity and motricity, as well as phenomena of ectoplasmic physical effects, show that when the intraphysical consciousness is projected in the dense or tangible psychosoma a wound inflicted by a physical object can be transferred to the human body.

Possibility. Based on the evidence above, zoanthropy can rationally be considered as a substantial, irrefutable parapsychic possibility that is beyond historical or mythological interests.

Research. Exteriorization of animal-human sensitivity provokes a series of research problems, such as the following 5:

1. **Sensitivity.** The effects of the transference of sensitivity upon the subhuman animal.
2. **Subhumanity.** The control of the subhuman animal by these influences.
3. **Reaction.** The reaction of the subhuman consciousness upon the human consciousness.
4. **Dangers.** The potential dangers that these experiments cause.
5. **Beliefs.** The element of truth or the trace of reality that exists at the root of many legends, sagas, myths and popular beliefs, even regarding folkloric creations such as vampires, Dracula, werewolves and others.

Registers. Along the same line of considerations, 2 types of manifestation are worth mentioning:

1. **Extraphysiology.** In the extraphysical dimension there are ill extraphysical consciousnesses that have aberrant forms, including animals, dragons, giants, centaurs and Cyclopes. These are often caused by hypnotic, obsessive and extraphysical fascinations and suggestions.

2. **Intraphysiology.** As previously mentioned, there are also rare and surprising materializations of subhuman animals with evident manifestations of life in intraphysical ectoplasmic experiments.

Transference. Besides that which has already been presented, the phenomenon of exteriorization of sensitivity raises pertinent questions: Would it be possible to transfer the sensitivity of a human being to a so-called evolutionarily inferior subhuman animal? In this case, would it also be natural to expect a repercussion from the animal's sensitivity to the human body?

Fetus. In its 9 months of evolution, the human fetus – the inhabitant of the uterus – passes through various zoological forms.

Hypothesis. To what degree are these embryonic transformations – derived from hereditariness and respected by the biological organizing system of the human body, a faculty of the psychosoma – directly related to the faculty of self-transfiguration of the psychosoma produced by the consciousness?

325. EXTRAPHYSICAL MUTATION

Definition. Extraphysical mutation: the faculty through which the consciousness constantly varies or deforms the humanoid shape of the psychosoma.

Synonymy: extraphysical metamorphosis.

Self-transfiguration. Voluntary extraphysical mutation is a particular type of self-transfiguration, in the same way that extraphysical mimetism and zoanthropy exist.

Types. Mutation of the psychosoma can manifest in two ways:

1. **Involuntary.** Parapathologically, in extreme cases of instability of the extraphysical form. It occurs independently from the will of the ill extraphysical consciousness.

2. **Voluntary.** Voluntarily and without serious parapathological connotations, although with intentions that are not always healthy or correct (which does not cease to be morbid).

Interpretation. Extraphysical mutation creates difficulties in interpretation of the extraphysical facts on the part of the inexperienced lucid consciencial projector, when projected. The projector finds him/herself confused with the occurrence, not knowing whether he/she should attribute it to hallucinations, oneiric images, morphothosenes or another logical cause originating from within him/her, or from the universe of the manifestations of his/her own consciousness.

Fiction. *Extraphysical mutants* show that the intensely elaborated creations in science fiction stories were often generated as mere copies of extraphysical realities seen by the somewhat lucid projected consciousnesses of their authors while outside the human body.

326. EXTRAPHYSICAL MIMICRY TECHNIQUE

Definition. Extraphysical mimicry: the resemblance of the projected intraphysical consciousness to the extraphysical environment where he/she is manifesting through the faculty of self-transfiguration of the psychosoma.

Synonymy: camouflage of the consciousness; consciencial dissimulation; extraphysical disguise; extraphysical distraction; extraphysical homochromy; extraphysical mimicry; extraphysical self-dissimulation; vibratory mimicry.

Protection. It is common knowledge that the protective artifice of mimicry is frequently used by subhuman animals that are considered inferior and even *unconscious*. They change not only the shape of the body as well as the color of the skin for short periods of time, according to the characteristics of the environment in which they want to camouflage themselves. The same occurs in the processes used in military camouflage.

Skin. Many people do not notice that human skin also makes its rudimentary attempts at camouflage or turns to the stratagems of the soma. The following are some examples: the erection of the papillae of the skin similar to the reaction of a startled cat with its hair on end; the abrupt whitening of the hair at certain critical situations in human life; discoloration of the skin, technically known as *fear melanosis*, which changes the color of the person's skin.

Camouflage. As a working hypothesis to be researched, extraphysical mimicry – one of the varieties or applications of the property of self-transfiguration of the psychosoma, produced by the consciousness through the will – constitutes asymmetric camouflage. It is sometimes an actual dissolving of the vehicle of consciencial manifestation into the environment which it temporarily assumes or, in other words, the structure of the morphothosenes, the color of the existing objects and the forms of the surroundings.

Types. The extraphysical mimetic adaptation of the intraphysical lucid projector's psychosoma can occur in an instantaneous manner – an artifice used when the consciousness wishes to escape from a location quickly – or in a well-elaborated, slow and calculated manner with the plasticizing and organizing power of thought.

Clothing. The mimetic process most commonly produced by the projected projector, in an unconscious manner, is the consciousness mimicking the appearance, clothing, fashion and costumes of the average autochthonous extraphysical consciousnesses existing in an environment (extraphysical community) that the projector temporarily visits. This is done in order to appear similar to the others and not call attention to the projector's status as an outsider, which is almost always uncomfortable, out of place or embarrassing. It should be borne in mind that it is also a protective artifice against fear in certain cases.

Trauma. The first change related to the extraphysical environment in the presentation of the projected intraphysical projector can occur unconsciously as a natural response to the intense desires of the consciousness to defend itself. In these cases a minor inconsequential trauma occurs, which is understandable.

Freeing. A series of factors of extraphysical origin come together in order to gradually free the consciousness of the intraphysical projector from the tyrannical image of the forms and nature of dense matter in human life. The following 3 are examples:

1. **Self-affirmations.** Extraphysical self-affirmations.
2. **Attributes.** The application of the attributes and properties of the consciousness when projected.
3. **Volitation.** Enjoyment of unimpeded extraphysical volitation.

Conquest. This inevitably amplifies the space of your interconscial micro-universe, freeing you from the animal-materialist level to achieve the more evolved conscial level of cosmoconsciousness. This inner conquest can apparently only be obtained through lucid conscial projections.

Bibliography: Vieira (1762, p. 103).

XI - Relationships of the Projected Consciousness

327. CONSCIENTIAL COMMUNICABILITY

Definition. Consciential communicability: the process and quality of participation of the consciousness in its existence and relationship with other consciousnesses.

Synonymy: consciential communication; consciential participation.

Types. The dynamic of consciential communication occurs through diverse manners of expression or means, in the fashion of the following 9:

1. Thought as universal language.
2. *Thought-speech*.
3. Transmental dialogue or extraphysical telepathy.
4. Unarticulated humanoid speech.
5. Echoing speech.
6. The resonant voice of undetermined origin (diverse frequencies).
7. The voice lacking inflection.
8. Mental reception of an indeterminate origin.
9. Presentiment.

Factors. The following are 16 factors, among others, which influence interconsciential communication:

1. Mental idiomatic base.
2. Characteristics of the native idiom (e.g.: slang).
3. Habit of thinking in the native language.
4. Comparison of native idioms.
5. Feminine speech.
6. Masculine speech.
7. Infantile speech.
8. Bradypsychism and tachypsychism, or the velocity with which one thinks.
9. Difficulties in extraphysical communication.
10. Comparison between pure telepathy in the ordinary, physical waking state and the extraphysical period.
11. Interference from radio and television stations, and telephony in consciential communication.
12. The existence and possible influence of telepathic transmitters and receptors.
13. The psychological state of the transmitter or receptor.
14. The influence of the extraphysical environment in consciential communication.
15. Spontaneous mental communication with extraphysical subhuman animals.
16. Extraphysical incommunicability.

Hearing. As a general rule, the projector *hears the thought* of the extraphysical consciousness in the extraphysical dimension in the same way that he/she *hears the voice* of the intraphysical consciousness in the ordinary, physical waking state.

Discrimination. The projected consciousness is sometimes able to discriminate or distinguish the intensity, frequency and timbre of the extraphysical interlocutor, when encountering a long-standing familiar intraphysical person, which is now an extraphysical consciousness in a dimension beyond the paratroposphere.

Echoes. In the extraphysical dimension, the words that are heard, or the thoughts that are understood, often appear to be *echoes*, because the projected consciousness seems to know the thoughts of the other interlocutor consciousness before they are exteriorized. In other words: the projector acquires what was thought by another, via telepathy, before the thought is expressed through extraphysical speech.

Simultaneity. The projected consciousness can simultaneously grasp telepathy and speech in the same extraphysical dimension, depending upon the interlocutor, the circumstances and the extraphysical environment where the projector is manifesting.

Mechanisms. It can be inferred from the above facts that the projected projector possesses inner mechanisms of intercommunication with other consciousnesses, which are frequently still unknown and evidently not controlled by the projector.

Bibliography: Kardec (824, p. 175), Sabom (1486, p. 70), Vieira (1762, p. 183).

328. INTERCONSCIENTIAL EXPERIENCES

Definition. Interconsciential experience: the joint, simultaneous experience of two (duo or couple) or more consciousnesses (group, crowd or collectivity).

Synonymy: consciential interconnection; consciential interfusion; interpersonal relationship.

Types. The following 5 basic types of interconsciential experience can be singled out, depending on whether they occur between intraphysical consciousnesses, extraphysical consciousnesses or projected consciousnesses in parapsychic trances or animic (intraconsciential) trances.

Scale. Besides the analysis of interpersonal unions, in an ascending scale of excellence of intraphysical-consciousness to intraphysical-consciousness communicability – being the most common interconsciential experiences – the following 5 maximal interactions or *inner apogees* can be singled out:

1. **Somatic.** Sexual intercourse or the apex of specific, primary consciential or human-body-to-human-body intercommunicability (somas). Effects: physical love; *kundalini*; orgasm; relief; reproduction; and animality.

2. **Holochakral.** Auric coupling or the culmination of specific, energetic consciential or holochakra-to-holochakra intercommunicability. Effects: energetic love; energetic interfusion; health; diagnosis; and cure.

3. **Psychosomatics.** The impassioned state or the zenith of specific, affective consciential or psychosoma-to-psychosoma intercommunicability. Effects: affective love per se; euphoria; mysticism; work of art; neurotic relationship; and fatal attraction.

4. **Mentalsomatics.** The cosmic colloquium or the pinnacle of specific, mentalsoma-to-mentalsoma, consciential intercommunicability. Effects: extraphysical love; maturity; cosmoconsciousness; spontaneous telepathy; conscientese; and oceanic sentiment.

5. **Holosomatics.** Lastly, as a hypothesis of possible research, the rational likelihood of the fifth and last totalizing or globalizing consciential interaction needs to be admitted: holosoma-to-holosoma intercommunicability, the simultaneous occurrence of the 4 abovementioned inner apogees, which may only occur with a pair of *serenissimi* in their last intraphysical life. Effects: cosmic love; transitory consciential interfusion.

Extraphysical consciousness. In the extraphysical-consciousness-to-extraphysical-consciousness intercommunicability of those beings which have already passed through the first and second desomas, there is an occurrence of only the 3 last components of the inner apogees of the above scale.

Fifth. The fifth, holosomatic, apogee – the *innermost* of them, in this case – only includes the emotional (psychosoma) and mental (mentalsoma) parabodies. Their effects are similar to the effects of the totalizing interaction of intraphysical consciousnesses, albeit in an evolved or potentiated condition. Another effect: group volitation.

Cord. The above presentation suggests that the golden cord – an energetic remote paracontrol – does not promote manifest consciential interactions due to its degree of subtlety.

Projective. Among the interconscial experiences of projected consciousnesses, joint conscial projections (JCPs) are included. Effects: extraphysical encounters; joint extraphysical assistance.

Animic. The interconscial experiences of consciousnesses during well-defined parapsychic trances are developed according to the type of the phenomenon, e.g.: *inter vivos* animism (only between intraphysical consciousnesses), the apparition of the intraphysical projector to another intraphysical consciousness. Effects: animic or animic-parapsychic messages.

329. CONSCIENTESE

Definition. Conscientese: the telepathic idiom, native to the extraphysical dimension, which is suitable for communication between the consciousnesses of this planet and the consciousnesses of the entire extraphysical universe.

Synonymy: *angelic language*; conscial idiom; cosmic idiom; cosmic language; extraphysical telepathy; galactic idiom; omniglot idiom; telepathic idiom; transmental dialogue; universal mental language; universalistic idiom.

Telepathy. As a theory for research, conscientese is the modeling – as a universal idiom of the consciousness – of extraphysical telepathy itself or, in other words, the sudden entrance of a thought or idea into the projected consciousness.

Difference. However, it is worth highlighting one difference: in certain cases, telepathy uses the articulation of words; conscientese is solely a pure mental or conscial language, devoid of any support, *crutch*, or artifice which is external to the consciousness.

Thoughts. There are 3 basic forms of human language: spoken language, written language and mime (expression). Telepathy is a form of conscial projection of thoughts, in this case.

Characteristics. Among the relevant characteristics of conscientese, at least the following 9 can be singled out:

1. **Self-awareness.** The act whereby the projected intraphysical consciousness is perfectly aware of what the other (extraphysical, projected intraphysical) consciousness is thinking, and vice versa.
2. **Communicology.** The instantaneous consciousness-to-consciousness transmission of an *en bloc* basic idea.
3. **Holomaturity.** Variation in the percentage of comprehension, according to the extraphysical district.
4. **Mentalsomatics.** Thought transmission performed directly from one mentalsoma to another mentalsoma eliminates errors in interpretation, heteroconscial interference and *psychic static*.
5. **Thosenology.** The interrelationship between conscientese and morphothosenes.
6. **Parapsychism.** Conscientese acting during parapsychic manifestations.
7. **Evolutiology.** Conscientese obviously makes universalism possible and inevitable as a philosophical doctrine in the natural evolution of the eternal consciousness.
8. **Monoglotism.** The monoglot individual and his/her difficulties regarding conscientese.
9. **Polyglotism.** The polyglot individual and his/her abilities regarding conscientese.

Science. Scientific language can be classified into 4 distinct categories:

1. **Natural.** Examples: the English language, the Spanish language, the Portuguese language.
2. **Artificial conceptual.** Example: arithmetical notation.
3. **Artificial non-conceptual.** Example: musical notation.
4. **Paranatural.** Example: conscientese.

Languages. Human languages are perhaps the last physical reflections from which the consciousness definitively frees itself, in the pure mentalsomatic dimension, upon fully reaching the mastery of conscientese.

Materthosene. This occurs due to the matrices or images of ideas of the human idiom or idioms that are predominant in the experiences which are rooted in the ego's integral memory or, in other words: the *mental idiomatic base* of each consciousness, which forms the average or predominant materthosene in its personal holothosene.

Eliminations. Conscientese represents the greatest advancement in consciential communication because it sponsors at least the following 3 primordial evolutionary eliminations:

1. **Terms.** Eliminates the articulation of words (terms).
2. **Symbols.** Eliminates words themselves (symbols).
3. **Language.** Eliminates symbolic or infantile language, currently employed in a *very rational manner*, even within the most logical science, mathematics, being the science of symbols in which an entire discourse can be synthesized in a single image that is universal and even atemporal.

Interpreters. Conscientese leaves behind all the diversities, orthographies, pronunciations and particularities of human languages, as well as the necessity for interpreters, dictionaries and grammars necessary for the consciousness to communicate.

Holokarmology. Conscientese is intimately related to polyglotism. Polyglotism, in turn, has a direct, rational relationship with karmic laws (holokarmology).

Depth. The personal task of an intraphysical consciousness shows greater depth in time and space or, in other words: it shows itself to be more multiexistential and pluri-secular when based on some fundamental service with direct multilingual manifestations which reaches various deep roots within the entirety of the experiences of the consciousness.

Case study. For example: the individual who is reborn in Brazil and solely interacts with the Portuguese language in his/her activities is, *generally speaking*, probably rearranging his/her superficial groupkarmic accounts, only with regard to the last 5 centuries and the most recent half-dozen personal lifetimes, the predominantly post-indigenous phase of life in the Americas.

Holobiography. In order to reach the more complex archives of one's even deeper past – the phase prior to the fifteenth century A.D. – one needs to reach one's prior origin wherein, *generally speaking*, the individual will have had contacts with intraphysical consciousnesses in other countries, with other languages and diverse customs, healthily complicating international relationships and sophisticating the prospection of the meanderings of the personal history or holobiography, within his/her holomemory.

Base. Conscientese leads the consciousness, regardless of its level of education, to discover the active existence of the phenomenon of the mental linguistic base while outside the human body in the mentalsoma.

Discovery. This mental linguistic base, in turn, leads the consciousness to discover the practical importance of at least the following 8 vital languages, which often transcend the scope of human universities:

1. **Sanskrit.** The Sanskrit language, in terms of the inestimable understanding of the theology of the East.
2. **Hebrew.** The Hebrew language, which is also historically and culturally precious to the theology of the West.
3. **Greek.** The Greek language, as an instrument for exhuming the classic texts of ancient thought.
4. **Latin.** The Latin language, also as an instrument for exhuming the classic texts.
5. **Chinese.** The Chinese language as the contemporary form of the effective political ideas of approximately ¼ of the terrestrial population.
6. **Russian.** The Russian language also as the contemporary form of the effective political ideas of a high percentage of the terrestrial population.
7. **French.** The French language, now in decadence, although a remnant of the cultural expression of twentieth century Western civilization.

8. **English.** The English language as the (not always efficient) resonator of ideas, is the key to the doors leading to the compilation of contemporary civilization's modern thought, as well as being a bridge to other languages.

Education. It can thus be observed that so-called modern formal education is found wanting due to its deficiencies. In the author's case, for example, language classes were attended for two decades in accredited schools where the basics of only 3 of the above 8 languages were learned. Additional self-studies had to be performed, almost always in other districts.

Precursor. It is presumed that, in the remote future, in the consciential era, only 4 or 5 languages will be used in the entire world – with one predominating – and that all individuals will be polyglots. This will therefore be the period precursory to conscientese actually being used in human life or in the ordinary, physical waking state with the irruption of the psychosoma in intraphysicity occurring in a reasonable percentage of intraphysical consciousnesses.

Awareness. Awareness of the existence and the uses of conscientese prepares the consciousness to gradually understand, seek out and achieve the following 4 conditions, among others:

1. **Universalism.** The conception of universalism.
2. **Cosmoconscientness.** The phenomenon of cosmoconscientness.
3. **Cosmism.** The state of the galactic conscientness.
4. **Conscientiality.** The state of continuous self-awareness.

Explanations. Conscientese – as a faculty essential for consciential manifestation – can serve to explain the *raison d'être* of the following 3 realities, among others, in a manner closer to reality:

1. **Intraconscientiality.** The extraphysical environments, multidimensionality or the consciential states.
2. **Holosomatics.** The vehicles of manifestation of the consciousness or the holosoma.
3. **Paraperceptiology.** The parapsychic waves in the manifestations of paraperceptiology.

Mnemosomatics. As a working hypothesis, it is presumed that the mental idiomatic base of the intraphysical consciousness is one of the fundamental causes that produces distortions in the reminiscences or memories of extraphysical experiences during the projective period.

Metabolism. The mental idiomatic base collides head-on with conscientese, in this case. There seems to be a lack of sufficient proficiency, agility or time for the cerebral hemispheres to *metabolize* or assimilate the information which is extraphysically accessed or acquired by the consciousness, when in the ordinary, physical waking state.

Recall. The repetition and accumulation of projective experiences tend to improve the processes of recall.

Jargon. It is worth noting the existence of extraphysical multilingual jargon stemming from many earthly languages. It can only be heard among extraphysical consciousnesses that still need – for themselves or for others – to articulate words in order to communicate among themselves.

Vocabulary. The following are 10 paratropospheric, extraphysical multilingual jargon words and expressions:

1. *Bellows*: the human body (somatics).
2. *Breathe*: the same as *breather* (intraphysiology).
3. *Breather*: intraphysical or human dimension (intraphysiology).
4. *Dog walker*: (pejorative), helper (projectiology).
5. *Down below*: the planetary crust, the paratroposphere (intraphysiology).
6. *Exit the breather*: go through desoma (desomatics).
7. *Go into a breather*: go through resoma (resomatics).
8. *Go to a breather*: go through resoma (resomatics).
9. *Grey people*: a group of ill or energivorous extraphysical consciousnesses (parapathology).
10. *Pajamaed*: projected intraphysical projector (lucid projectability).

Bibliography: Powell (1278, p. 34), Schiff (1515, p. 209), Sherman (1551, p. 192), Vieira (1762, p. 22).

330. EXTRAPHYSICAL COMMUNICABILITY TECHNIQUE

Identification. In order for you – as a projected projector – to better communicate with the extraphysical consciousnesses you come across in the extraphysical dimension, you should first locate yourself and identify the easiest process of communication allowing you to understand and make yourself understood by those you encounter.

Means. Extraphysical consciential communication can be conducted through means which are *verbal*, in a certain respect or, in other words, that are similar to the process of conventional human speech, as well as occurring telepathically, consciousness-to-consciousness, in a direct, mentalsomatic manner.

Aspects. As a general rule, mind-to-mind (brain-to-brain or parabrains-to-parabrains) telepathic communication, or transmental dialogue (conscientese), does not always work in all extraphysical environments. It is therefore important to observe the following 4 aspects:

1. **Environment.** Verify the possibilities or the evolutionary level of the extraphysical environment.
2. **Idiom.** Identify the mental or human idiomatic base derived from the native language formerly used by the average member of the *population*, now *extraphysical*, when they were intraphysical.
3. **Will.** Maintain the decided will to understand the mental emission of the interlocutor or listener.
4. **Psychosphere.** Endeavor to examine the psychosphere of the extraphysical consciousness, which is reminiscent of “lip reading”, as used by deaf persons in the ordinary, physical waking state.

Understanding. The difficulties in understanding extraphysical experiences are also due to the human language, which is still incapable of incorporating in the consciousness the experiences which are not synthesized into a number of specific operational concepts.

Bibliography: Vieira (1762, p. 89).

331. EXTRAPHYSICAL ACQUISITION OF ORIGINAL IDEAS

Definition. Original idea: new information acquired by the consciousness.

Synonymy: “creative hallucination”; fertile idea; illuminating idea; independent thought; “inventive dream”; new idea; original concept; unprecedented concept; unprecedented idea.

Neology. Neology is the logical science of ideological analysis that studies the rationales which represent mental conceptions and new theories.

Sources. Different sources act in the generation of original ideas, especially the following 11:

1. **Observation.** The direct observation of the behavior of nature.
2. **Reflection.** The fertile process of reflection.
3. **Brainstorming.** Brainstorming or the technique for stimulating creativity.
4. **Serendipity.** Serendipity (Horace Walpole: 1754) or the sudden interpretation of a phenomenon or fact.
5. **Gatherings.** Scientific gatherings, congresses, seminars and their debates.
6. **Libraries.** The periodic frequenting of libraries, holothecas and museums.
7. **Bookstores.** Frequenting new and used bookstores (megastore chains).
8. **Results.** Dissatisfaction in results from consciential solutions to problems.
9. **Doubts.** The spontaneous blossoming of doubts regarding facts.
10. **Students.** The questions posed or presented by all types of scholars from different areas.
11. **Extraphysiology.** The direct extraphysical acquisition of unprecedented concepts.

Factors. The following are 7 factors that influence intellectual creation and predispose the intraphysical consciousness to a greater acquisition of original ideas:

1. Emotional balance (a personality with minor consciential fissures).
2. Self-discernment (hyperacuity through the mentalsoma).
3. Mentality or self-conscientiality (qualification of intentionality).
4. Sensorial erudition (hyperacuity through the psychosoma).
5. Interdisciplinary or multidisciplinary erudition.
6. Consciential maturity or holomaturity (recuperation of cons).
7. Applied universalism.

Fact. The sudden emergence of profound knowledge, intellectual structures or visions in the consciousness projected in the extraphysical dimension has long been registered. These insights clearly never occurred to the same consciousness while in the ordinary, physical waking state, even when performing creative work.

Causes. The fundamental causes for the extraphysical acquisition of original ideas reside in the projector's own consciousness. Endeavoring to maintain an awakened discernment, the intraphysical consciousness, through attentive observations while projected in the extraphysical dimension – as well as the detailed analysis of Cartesian reasoning, the appeal of good sense regarding the parapsychic occurrences and acceptance of the wisdom of the natural laws and their conclusions – is able to acquire positive ideas of renovation and original concepts using the experiences of lucid projection. These experiences include educational lucid projection, in an efficient process of previously programmed ostensive inspiration.

Types. The fruit of inspiration, the extraphysical acquisition of ideas or the parapsychic acquisition of information by the projected intraphysical consciousness during the lucid projection phenomena – reported in numerous published cases – can be of various types, such as the following 7:

1. The pursued idea.
2. The unpursued idea.
3. The known idea.
4. The unknown idea.
5. The target-idea.
6. The brilliance of creativity.
7. Sheer inventiveness.

Effects. Among the effects resulting from the extraphysical acquisition of original ideas, at least the following 12 can be singled out:

1. Messages, prose, poetry, titles of works.
2. Unprecedented extraphysical instruction.
3. Working hypotheses.
4. Psychological fecundation.
5. The germination of new ideas.
6. A source of strategies for reasoning.
7. Solutions for pending issues (doubts, speculations, trial hypotheses).
8. Enhanced inventiveness.
9. The creation of innovative resources.
10. Effective learning.
11. Scientific discoveries.
12. Decision making under uncertain conditions.

Technique. The following is one of the most enriching practical suggestions for the interested reader: the *least fallible technique* for generating creativity or finding a new idea, as well as for

achieving inventiveness and original discovery – used extensively by the author when setting the foundations of projectology – is the establishment of analogies, parallels, comparisons, multiple interdisciplinary perspectives, enumerations and possible conflicts between diverse authors, their works and ideas.

Ideation. In this case, the polyglot researcher needs to have piles of books, materials (subjects) or publications at hand. He/she needs to mix them, merge them and *analyze* one against the other in detail as much as possible – even using sophisticated computer resources, if possible – adjusting them in a process of *ideation*, a centrifugation of ideas (a crucible of concepts) or *consensualization*.

Cosmogram. In this way, the librarian is transformed into an inventor, the curious individual into a discoverer and the ordinary reader into an original author (this is the modern cosmogram technique, proposed by the author).

Vehicles. The extraphysical acquisition of original ideas generally occurs when the consciousness manifests in the mentalsoma, in the mentalsomatic dimension, or through visual projections sponsored by helpers in the paratropospheric extraphysical dimension. In both cases, the consciential experiences are popularly taken to be extraordinary dreams or lucid dreams (semilucid projections).

Scale. The process of extraphysical acquisition of original ideas can be divided into a scale of 4 phases according to the combined observations of psychology, parapsychology and projectology:

1. **Preparation.** In the initial phase of preparation, the intense activity of the consciousness, while in the ordinary, physical waking state, allows the reception of information. It is thus approached from many angles and various preliminary attempts are developed unsuccessfully in order to solve the problem at hand.

2. **Incubation.** In the incubation phase, the consciousness further intensifies his/her attempts at solving the problem. This only culminates when the person sleeps, almost always exhausted from the fruitless efforts, finally forgetting his/her investigative intrusions.

3. **Acquisition.** In the acquisition or illumination phase – the most important and difficult one of the undertaking – the consciousness reaches the climax of the creative process (gestation). The solution arrives suddenly and spontaneously when the consciousness finds him/herself in the state of dis coincidence of the vehicles of consciential manifestation.

4. **Confirmation.** In the final confirmation phase, or subsequent verification phase, the individual (now in the ordinary, physical waking state) merely tests the practical viability of the solution that was directly acquired either in the extraphysical dimension or in the mentalsomatic dimension.

Bibliography: Denning (391, p. 50), Holroyd (738, p. 72), Walker (1782, p. 108), White (1829, p. 219).

332. HISTORICAL ORIGINAL IDEAS

Definition. Historical original idea: the acquisition of new information executed by a personality (pre-*serenissimus*) who became a celebrity in his/her time, being registered in the high points of human history.

Synonymy: “historical creative hallucination”; “historical inventive dream”; historical original concept; historical unprecedented concept; historical unprecedented idea.

Depositions. Human history shows numerous cases of parapsychic cognitive experience, or the extraphysical acquisition of ideas, according to the depositions of individuals. They actually constitute – as a last evolutionary recourse – authentic, more or less lucid projections of the intraphysical consciousness (hyperacuity), in the manner the following 23 categories of people, listed here in alphabetical order of their specific occupations:

1. Artists.
2. Autobiographers.
3. Chemists.
4. Composers.
5. Discoverers.
6. Executives.
7. Governors.
8. Inventors.
9. Mathematicians.
10. Novelists.
11. Painters.
12. Philosophers.
13. Physicians.
14. Physicists.
15. Playwrights.
16. Poets.
17. Politicians.
18. Researchers.
19. Scientists.
20. Statesmen.
21. Students.
22. Thinkers.
23. Writers.

Examples. The following are 42 historical examples of extraphysical acquisition of original ideas, listed by the name of the receptor and his/her new concepts or renovating works:

1. Abraham Lincoln (1809-1865), certain evolved ideas and politico-social stances.
2. Ann Radcliffe (1764-1823), *The Mysteries of Udolpho*, in 1794.
3. Bernard Palissy (1510-1589), ceramic pieces.
4. Charles Pierre Baudelaire (1821-1867), poems.
5. Charlotte Brontë (1816-1855), prose.
6. Dante Alighieri (1265-1321), *The Divine Comedy*.
7. Dmitri Ivanovich Mendeleiyev (1834-1907), the periodic table of elements
8. Edgar Allan Poe (1809-1849), stories.
9. Edward Lucas White, novel *Andivius Hedulio*.
10. Edwin Richman, the gyroscope.
11. Elias Howe (1819-1867), invented the sewing machine.
12. Étienne Bonnot de Condillac (1715-1780), metaphysical discussions.
13. Francis Thompson (1859-1907), *The Hound of Heaven*.
14. Friedrich August Kekulé von Stradonitz (1829-1896), arrangement of the atoms in the molecular structure of benzene.
15. Friedrich Gottlieb Klopstock (1724-1803), poems.
16. Girolamo Cardano (1501-1576), certain scientific ideas
17. Giuseppe Tartini (1692-1770), sonata *The Devil's Trill*.
18. Guy de Maupassant (1850-1893), poems.
19. Harriet Elizabeth Beecher Stowe (1811-1896), *Uncle Tom's Cabin*.
20. Henrik Johan Ibsen (1828-1906): "Brand, A Dramatic Poem."
21. Herman Volrath Hilprecht (1859-1925), deciphering of the inscriptions on fragments of agate from ancient Mesopotamia.
22. Isaac Newton (1642-1727), mathematical problems.
23. Jean Cocteau (1889-1963), certain intellectual creations.

24. Jean de La Fontaine (1621-1695), *Fables*.
25. Jean Louis Rodolphe Agassiz (1807-1873), restoration of the configuration of the fish fossil.
26. Johan August Strindberg (1849-1912), playwright.
27. Johann Wolfgang von Goethe (1823), scientific problems and poems.
28. John Bunyan (1628-1688), *The Pilgrim's Progress*.
29. John Dryden (1631-1700), poetry.
30. Leo Nikolayevich Tolstoy (1828-1910), prose.
31. Marie Jean Antoine Nicolas de Caritat, Marquês de Condorcet (1743-1794), mathematical problems.
32. Mary Wollstonecraft Shelley (1797-1851), *Frankenstein*.
33. Niels Henrik David Bohr (1885-1962), Nobel Laureate, model of the structure of the atom.
34. Otto Loewi (1873-1961), Nobel Laureate in medicine in 1936, the chemical transmission of nerve impulses by way of a chemical substance.
35. Percy Bysshe Shelley (1792-1822), some of his literary works.
36. Samuel Taylor Coleridge (1772-1834), the poem "Kubla Khan."
37. Thomaz De Quincey (1785-1859), confessions.
38. Voltaire (Pseud. of Jean François Marie Arouet de; 1694-1778), "La Henriade", epic poem.
39. William Blake (1757-1827), paintings.
40. William Cowper (1731-1800), certain ideas which were advanced for his time.
41. William Makepeace Thackeray (1811-1863), *Vanity Fair: A Novel Without a Hero*.
42. Wolfgang Amadeus M. Mozart (1756-1791), various musical compositions.

Instrument. Lucid consciencial projection, despite being a phenomenon which is basically contrary to the apparently rigid patterns of successive human lives will, over time and with the accumulation of experiences, present humanity with an increasingly greater reliability as a coadjutant working tool for the intraphysical consciousness in his/her multiple undertakings.

Bibliography: Bergier (122, p. 18), Coleman (291, p. 269), Denis (389, p. 144), Edwards (463, p. 108), Frost (560, p. 24), Garfield (568, p. 37), Guieu (660, p. 95), Krippner (862, p. 134), Monteith (1072, p. 198), Norvell (1136, p. 201), Tishner (1687, p. 29), Wang (1794, p. 891), Wilson (1858, p. 127).

333. CURRENT ORIGINAL IDEAS

Definition. Current original idea: the acquisition of new information, in the present, through lucid projection.

Synonymy: concept of neosynapses; contemporary neoconcept; currently new concept; leading-edge idea; leading-edge relative truth.

Acquisitions. Direct extraphysical knowledge is acquired through the most advanced process using lucid projection of the consciousness, whether of an intraphysical or extraphysical consciousness, in the mentalsoma, in the mentalsomatic dimension, free from the constraints of all types and conceptions of form, space and time that subjugate and restrict the manifestations of the individual's personality. There is an old popular expression that says: "I slept on it and dreamt of the solution."

Current. The author, through lucid projections, has made verifications, acquired fertile ideas and arrived at current extraphysical concepts that are logical and unprecedented to some degree. They were confirmed by the facts, just as with some apparently common concepts which, in one way or another, make some kind of creative contribution to the evolution of consciousnesses.

Phenomenology. These ideas at least serve to characterize minimal aspects which are still unknown, or are not fully identified, and are also not applied coherently in the phenomenological research of lucid projections, refining problem-solving ability.

Purpose. These concepts, terms and compound expressions are used here due to the lack of others which are more appropriate, precise and clarifying. They serve as aids for delineating the descriptions of real experiences, not being a dogmatic doctrine to be followed. As long as someone has experiences of this kind and analyzes them, the concepts can be applied in order to create new experiences.

Language. The language, or the form sketched out here, becomes organizing, disciplining, as well as being a guide for self-consciousness research.

Expressions. The following is a list or index of over 300 new expressions and neologisms, aside from many other existing ones. Their meanings can be consulted by the interested reader by performing a deeper projectiological analysis in the text of this book, notably through the remissive index at the end of this work: acceleration of digestion; adenoprojection; admonitory discomfort; aeromagnetic refrigeration; alternating resoma; anchor of the psychosoma; androprojection; animicity; animic-parapsychic takeoff; anticipated evocation; anti-resomatic function of lucid projection; archeoprojection; assistential ancestrality; assistential volitation; bariprojection; *bibilocation*; bicontrolled projection; biprojection; biprojector; blind projection; catalyst-projector; cephaloprojection; cephalosoma; chakroprojection; clarifier projector; class-projection; closed energization; *consciential continuum*; consciential energy; consciential laboratory; consciential retardation; consciential self-bilocation; conscientiogram; conscientioland; conscientiology; contiguity effect; continuous memory (holomemory); co-projector; *coronatron*; cosmification of the consciousness; cosmocracy; cosmoprojection; couple repercussion; crash-projector; deficiencyland; departure-return-new-departure; desomants; dormitory-planet; double attack; double projection; double restriction; duodrome; echocephalos; edaphoprojection; egology; empty brain; *en bloc* recall; energetic contraband; energetic eyes; energetic immolation; energetic omni-interaction; energetic trap; epiprojection; error of the consciousness; escape of the psychosoma; exocclairvoyance; exoprojection; extraphysical abductee; extraphysical advance visit; extraphysical agenda; extraphysical anamnesis; extraphysical bedroom community; extraphysical centrifugal power currents; extraphysical coma (paracomatosis); extraphysical consciential obnubilation; *extraphysical counter-approach*; extraphysical counterespionage; extraphysical decompression chamber; extraphysical disappearances of consciousnesses; extraphysical dissolution; extraphysical ecology (para-ecology); extraphysical exorcist; extraphysical faux pas; extraphysical hetero-awakening; extraphysical homicide; extraphysical homochromy; extraphysical inaudibility; extraphysical macrotraumas; extraphysical map; extraphysical microtraumas; extraphysical minivacations; extraphysical mutants; extraphysical oligophrenia; extraphysical peregrinations; extraphysical races; extraphysical remote control; extraphysical reurbanization; extraphysical ride; extraphysical satellites; extraphysical self-evocation; extraphysical self-location; extraphysical suicide; extraphysical superficial tension; extraphysical transsexuals; extraphysical traumas; extraphysical Trendelenburg; extraphysical uterus; extraphysical-intraphysical self-touch; first physical base; first semiphysical projection; fixed resoma; flight range; four-hands; gyroprojection; half-materialization; helper-projector; hemiprojection; historical semilucid projection; holochakra; holochakral self-desoma; holokarma; holosoma; *Homo projectius*; homologous projection; homoprojection; hydromagnetic shower; hydroprojection; ideoduct; ideogenetic projection; unknown hideout; immanent energy; impure post-desoma personality; indirect farewell projection; instability in the prone position; intracorporeal experience; inverse interiorization; laboratorial apparition; last physical base; libidoprojection; locked intraphysical consciousnesses; lucid megaprojection; lucidity-recall binomial; materialization-projection; mental idiomatic base; mental wedge installer (xenothosenes); mentofacture; miniprojector; mixed bilocation; mnemonic block; mnemonic opening; mnemonic seed; more and less evolved resomas; multimemory (polymemory); multivehicular plannings; musicoprojection; narcoprojection; old silver cord; omniglot language; omnicclairvoyance; oneiric projection; oneiric repercussion; oneiroprojection; orbiting body; orgasmolatry; para-android; para-anesthesia; para-asepsis; parabrain; paradoxical appearance; para-eyes; parafauna; paraflora; parageography; para-hypocrisy; parapolitics; paraprojection; paraprojective state; parapsychic android; parapsychic longing; parapsychic polyvalence; parapsychonautics; parapsychosphere; para-sociology;

para-somnia; parasurgery; paravision; passivating condition; penta; phenomenological crescendos; physical-extraphysical moment; phytoprojection; pivotal cause of death; pneumoprojection; polymemory; portable intraphysical base; possessive projection; post-desomatic discoincidence; post-desomatic parapsychosis; postnatal extraphysical regression; post-projective energetic shower; pre-final projection; pre-resomatic autobiography; primoprojection; professional hereditariness; prohibited locations; projectability; *projectarium*; projectiocracy; projectiocritique; projectiogenic current; projectiogenic dream; projectiogenic orgasm; projectiogenic; projectiography; projectiolatry; projectionics; projectionistics; projectiophobia; projectiorrhea; projectiotoxic; projective anthropology; projective astronomy; projective aura; projective chamber; projective cycle; projective déjà vu; projective haunting; projective medicine; projective mini-dream; projective parapsychology; projective physics; projective recess; projective rotation; projective self-diagnosis; projective self-persuasion; projective signal; projective sociology; projective trance; projective transition phase; projectively gifted; projector-spectator; protagonist-projector; pseudo-intrusion; psychic statics; psychofractures; psychofugal movement of the consciousness; psychological gaps; psychopetal movement of the consciousness; psychophonic monologue; psychophysical crutches; psychophysiological anchor; quasi-awakening; recapturing of the silver cord; reduction of the silver cord; refractory monoideism; relative inhibiting agents; reprojection; resomatic analysis; resomatic relay; resuscitative projection; retroparapsychic scars; rotation of the psychosoma; scale of extraphysical contacts; scale of extraphysical observation; scale of lucidity of the projected consciousness; seated projection; second universe; self-embrace; self-invisibility; self-kinesis; self-materialization; self-microscopy; self-programmed daydream; self-reluctivity of the psychosoma; self-revelation; self-target; semiphysical projection; semi-reborn personality; semi-takeoff; *serenissimi*; session of me alone; shared apparition; shared orgasm; silver mini-cord; simultaneous self-psychophony; solid psychosoma; sonorous projection; sterilizing predisposition; stroboprojection; student-projector; subintransient resomas; surprise-phenomenon; telekinetic projector; theorice; three desomas; three-and-a-half dimension; transconsciousness; transitland; triphasic reluctance; ultraclairvoyance; unipresence; unisonous vibrational states; unknown patient; vibratory chart; vibratory orgasm; voluntary self-combustion; wake-up-projector; waking discoincidence; zooprojection.

Chapters. The following are 40 entire chapters in this book that also represent more observations, essays, hypotheses and theories generated by the author's experiences, which await further confirmation from researchers: animal projection; assisted projection; auric couplings; conscientese; consciential era; consciential locations; energization by three technique; exteriorization of energy; extraphysical agenda; extraphysical code of ethics; extraphysical disappearances; extraphysical mimicry; extraphysical self-awakening technique; extraphysical sphere of energy; looseness of the holochakra; lucid projection in total institutions; paradoxes of projectiology; physical multilocation; physiology of the projected state; post-natal regressive projection; projectability; *projectarium*; the projected projector's uniform; (projection as a result of) the sex act; projection in the mentalsoma; projective aura; projective resomatic recycling; psychological contagion; psychophysiological anchor; quadruple memory; respiration during takeoff; rolling backward; scale of observation of the projected consciousness; scale of the state of continuous self-awareness; self-telekinesis; semi-materialization; spheres of action of the silver cord; transitional state; unapproachable beings; waking discoincidence.

Note. The ultrademanded reader who wishes to limit him/herself to the more common and evident facts or phenomena – being those readily accepted by the majority of researchers, as they consider certain advanced subjects to be excessively obscure, nebulous or surrealistic – should avoid the abovementioned chapters and others of a like nature in this book.

Heterodoxy. The author does not harbor any illusion about the full acceptance of the material presented here that is new and non-orthodox (unorthodox or heterodox). As incredible as it may seem, any type of new or leading-edge idea is not as well received today (neophobia) and is less likely to be adopted in this technological era than it was in the so-called *age of obscurantism*. This seems to be *very positive* and demonstrates progress or, in other words, shows a greater degree of consciential maturity in the intellectual mean of the planetary population.

Rationality. The reader who considers the author to be inventing too much, or creating an excess of words and expressions in his *mental meanderings* would be wise to reserve judgment, use good sense and observe logic or, more precisely, the rationality of each of the expressions in relation to the physical-extraphysical facts. This can be obtained through lucid experiences outside the human body, by the interested individual wishing to spend the time, expend the effort and repeat trainings just as many persons all over – including the author – have done.

Intraphysical consciousness. The intraphysical consciousness lives in a physical or animal world characterized by a struggle for life that is filled with cruelty, grief and ire, but also with radiant promises of the human implantation of pardon, pure megafaternity and spontaneous love.

Self-discernment. The more mature manner to exist or continue evolving, while passing through this dimension, is to maintain reason, good intention, good will, self-discernment and a high level of optimism, or good humor, endeavoring to assistentially serve others (assistentiology).

Philosophy. Lucid projection helps decisively in the execution of this process of evolutive existence to the degree that it provides the intraphysical consciousness with the means for perceiving new, as yet undetected patterns, or original ideas, in the apparently turbulent surrounding chaos, thereupon transmitting to others the introvisions, opinions, new and renovating examples that emerge from this chaos. In this respect, projectiology represents an active existential platform in the field of human philosophy.

Bibliography: Vieira (1762, p. 8). A recent book by the author on this subject: *200 Conscientiology Theorices* (in Portuguese).

334. AVOIDABLE EXTRAPHYSICAL IDEAS

Definition. Avoidable extraphysical ideas: inconvenient, inopportune, dislocated, extemporaneous, anticosmoethical or negative thoughts which should be avoided by the projected projector in order to maintain the harmonic and constructive continuation of the lucid consciential projection experience.

Synonymy: avoidable extraphysical contrathosenes; avoidable *mental venial sins*; avoidable oneirothosenes; avoidable pathothosenes; *extraphysical faux pas*; extraphysical mental improprieties; parapsychic interferences.

Factor. The power of thought in the extraphysical dimension is an extremely well-known factor that should always be respected by the intraphysical consciousness, endeavoring – through holomaturity and without ingenuosnesses – to perceive the better side of beings, things, ideas and events that he/she encounters while projected, if he/she wishes to evolve with his/her cosmoethical experiences.

Differences. Extraphysically speaking, the action of thought is more serious, direct and less subtle. Paradoxically, the utmost objectivity, so greatly sought after by materialist personalities, is precisely extraphysical and not intraphysical.

Intraphysiology. In the ordinary, physical waking state, any intraphysical consciousness can mask what he/she thinks, remaining silent, not allowing his/her ideas to become evident.

Graphothosene. While projected, the intraphysical consciousness thinks and simultaneously produces, executes and transmits his/her mental or thosenic creations – practically *para-yelling* – even without vocalizing them, in a lightning-fast manner, with no possibility to take back that which he/she exteriorized or added into the cosmos or, in other words: his/her graphothosene or indelible *thosenic signature*.

Present. The present remains set forever and never *unhappens* in any dimension, although this fact, in the extraphysical dimension, is more insinuating, ostensive and involving.

Hygiene. As a consequence of the above, the projector needs to make advance preparations by creating healthy thinking or thosenizing habits through mental or consciential hygiene (self-thosenes, orthothosenes) in order to avoid *para-embarrassments* and *paradeceptions* outside the body.

Case study. The following are 3 common examples of avoidable ideas or thosenes in the extraphysical dimension:

1. **Heterocritiques.** Immediately intraconscientially or mentally analyze the errors of others, upon providing assistance to certain ill extraphysical consciousnesses (spontaneous heterocritiques, contrathosenes, *mental words*).

2. **Sexosomatics.** Mentally create scenes regarding sexual and/or *parasexual* practices in inadequate paratropospheric environments (sexothosene, sexual fantasy, mental adultery, sexual holothosene).

3. **Factiousness.** Invoke beliefs and preconceptions in direct contacts with extraphysical consciousnesses accustomed to other lines of thought or even universalistic lines of thought.

Warnings. Many extraphysical warnings arise for the projected intraphysical consciousness, through intuition or direct suggestion from the helpers, to not think about a certain subject in a specific instance regarding experiences outside the human body – e.g.: on sex – in order to avoid mental approaches by *energivorous* or extremely deprived *extraphysical consciousnesses* with fixed ideas (monoideisms, monothosenes) on the theme, that are in search of energetic victims and human excitation.

Analogies. Extraphysical ideas that are avoidable by the projected projector follow 2 other types of analogous extraphysical attitudes:

1. **Locations.** Locations prohibited to the projected consciousness.
2. **Beings.** Beings unapproachable to the projected consciousness.

Bibliography: Vieira (1762, p. 44).

335. PROJECTIVE MENTAL TARGETS

Definition. Projective mental target: a predetermined goal that the consciousness plans to reach, through concentration and decision of self-determined will, upon seeing itself outside the human body.

Synonymy: consciential paragoal; consciential target; destination of the projected projector; extraphysical destination; extraphysical flight plan; point chosen as a consciential objective.

Categories. Projective mental targets can be classified into 3 categories, according to beings, locations and the projector's ideas.

1. **Beings:** intraphysical beings (target-person, person-target or destination-person); extraphysical consciousness; target-patient; self-target; intraphysical subhuman animal; extraphysical subhuman animal.

2. **Locations:** human or physical; extraphysical; *mental*; target-area, or area-target; mobile target-area; fixed target-area; three-dimensional target-object; two-dimensional target-object (e.g.: a picture).

3. **Ideas:** self-thosenes or thoughts conceived in the ordinary, physical waking state; target-idea or idea-target; self-thosenes or thoughts conceived in the extraphysical dimension; working hypothesis.

Analysis. The following are 18 fundamental aspects that should still be considered in the analysis of the consciousness' objectives or the projective mental targets:

1. An examination of potential targets in order to determine their importance to the consciousness.
2. Known or unknown target.
3. Single or multiple targets.
4. Unexpected target.

5. An error in action.
6. A correction in action.
7. Plausible reasons.
8. Indeterminate utility.
9. Conscious, anticipated or involuntary evocation.
10. Crash-projection.
11. Agreeable or disagreeable surprises upon reaching the mental target.
12. Extraphysical traumas.
13. Extraphysical obstacles.
14. Unforeseen or unknown obstacles (e.g.: a new resoma).
15. Target-being and consensual communication.
16. Extraphysical target-person *via human television*.
17. Petifree individuals, evolutiologists and *serenissimi*.
18. Oligophrenics and satellites of intruders.

Self-target. The projective self-target or the projector's human body allows the following 4 transcendent self-experimentations regarding the holosoma, among others:

1. **Self-examination.** Extraphysical self-examination.
2. **Autoscopy.** Internal extraphysical autoscopy.
3. **Cord.** Analysis of the silver cord.
4. **Holochakra.** Analysis of the holochakra as a whole.

Target-person. With the direct, deliberate use of a target-person, with whom the human consciousness has affinity, any experimenter is able to achieve a higher degree of hits in his/her attempts to reach a projective mental target.

Extraphysiology. In cases of target-persons, it sometimes happens that the projector's consciousness comes upon the targeted person, both of them being outside the human body. This occurs more frequently than one would imagine, due to the following 4 factors:

1. **Dimension.** When the projector plans to reach a target-person, he/she does not always think about which existential dimension the consciousness or person is located in at that time, whether it be a human or extraphysical dimension.
2. **Relationships.** Close relationships between family members, father and son, couples or lovers.
3. **Sleep.** Nighttime, when both consciousnesses are sleeping.
4. **Reflection.** Affective concerns or reflection upon daily activities, given that the target-person went to sleep thinking about the projector, although ignoring the subject of lucid projection.

Technique. A simple mental target, with which one employs the principle of focusing the attention in order to free the psychosoma, serves as an efficient projective technique for many projectors.

Curiosity. The following are 4 examples of the most sought-after projective target-places, due to curiosity:

1. **Tibet.** A subterranean library in Tibet.
2. **Vatican.** The secret section of the Vatican library in Rome.
3. **Temple.** The inside of a Masonic temple during an evening meeting.
4. **Headquarters.** The inside of the headquarters of a secret sect.

Pilgrimage. Veritable *extraphysical pilgrimages* are made to certain locations that involve consciousnesses with deep religious, social or historical motivations, such as the following 10:

1. Lourdes, France
2. The Vatican, in Rome, Italy.
3. The Kaaba, in Mecca, Saudi Arabia.
4. Jerusalem, Israel.
5. The Parthenon, in Athens, Greece.

6. The Taj Mahal, in India.
7. The pyramid at Giza, Egypt.
8. The cement sarcophagus in which the damaged nuclear reactor at Chernobyl in Russia was buried.
9. The graves of loved ones in distant cemeteries.
10. The spot where Apollo 13 made a moon landing.

Motivation. Many nonlucid projectors reach these places as a result of thinking about them so much – a condition of spontaneous saturation – and yearning to go there, because one of the basic vital forces for lucid projection lies in the great motivation of the consciousness which experiences them.

Bibliography: Andreas (36, p. 54), Crookall (343, p. 112), Ebon (453, p. 90), Frost (560, p. 50), Gioveti (593, p. 82), Monroe (1065, p. 225), Norvell (1139, p. 155), Sherman (1551, p. 190), Shirley (1553, p. 147), Steiger (1601, p. 124), Vieira (1762, p. 19).

336. TECHNIQUES FOR REACHING THE MENTAL TARGET

Target-being. Choose a friend for whom you have affinity and note down his/her address. Perform the experiment at a time that is best for both of you. It is necessary for you to nurture a positive intention and think fixedly about the mental target for a period of days, saturating your mind while in the ordinary, physical waking state.

Avoidances. You should avoid choosing a target-extraphysical-consciousness that has recently arrived in the extraphysical dimension (first desoma), as well as a recently-reborn consciousness or a target-fetal-consciousness, for obvious reasons.

Mnemosomatics. The target-intraphysical-consciousness does not always recall the extraphysical encounter. It is not only you, as a lucid projector, that will have difficulty in recalling the extraphysical events.

Somatics. When endeavoring to reach the mental target during the extraphysical stage, do not focus on the parts of your own human body or on the silver cord, in order to avoid returning to the physical base against your will.

Links. You can use psychic or affective links that assist profoundly in the establishment of *rapport* (affinity, empathy) with the target-person, vitalizing his/her image in your mind. An example would be something that has come directly from him/her, such as the following 5 items:

1. **Photo.** A recent photo of the individual.
2. **Manuscript.** A sample of a personal manuscript, such as a recent letter.
3. **Gift.** A gift recently received directly from the individual.
4. **Object.** An object of his/her personal use.
5. **Jewelry.** An inexpensive piece of jewelry owned by the individual.

Shower. If you have an intimate physical relationship with the target-person, of the opposite sex, whose habits you are aware of, you can even plan to take a shower with him/her, while only you are projected.

Dream. If, during the development of a dream, your consciousness tells you that you are dreaming and that you are going to separate from the human body, your dream will end and give way to a lucid projection. Upon interiorizing, simply tell yourself that you will leave again and this will end up happening.

Psychosoma. Those who dream with the target-idea of the psychosoma as a vehicle of manifestation of the consciousness end up projecting and maintaining lucidity during the entire extraphysical experience.

Telepathy. Reaching the mental target does not always represent a completed extraphysical operation. It is sometimes necessary for you to obtain telepathic communication with the target-being.

Adaptation. Each projector is better adapted to specific types of mental targets and certain extraphysical encounters.

Evocation. The thoughts you have immediately prior to projecting often serve to prepare, open the way for and remove the obstacles in order for your consciousness to reach the target-person, in an *anticipated evocation*.

Parapsychism. Parapsychism and consciential discernment of the target-person assist your task as a lucid projector.

Mystification. Be aware that you, as a projector, are not exempt from encountering a mystifying extraphysical consciousness, instead of the chosen and evoked target-being. This fact sometimes demands direct, extraphysical, interconsciencial confrontation.

Correction. As a projector, while in the ordinary, physical waking state, you will often plan to reach a certain target by way of a human address and, soon after exteriorizing, will intuitively sense that the person has moved and you were not aware of this fact. You need not concern yourself with this, however, as you will go to the new destination, thereby correcting your trajectory.

Personality. The consciencial microuniverse of the personality of the target-person has a more influential force upon your consciousness than his/her address, when extraphysically searching or tracking.

Failures. In special cases of perception failure, only a portion of your holochakra projects, without your consciousness or, more precisely, there is only a projection of your humanoid morphothosenes. This explains the *total absence* of recall, because your consciousness did not, in fact, project from your human body or, in other words, it did not dislocate from your cerebral base.

Connections. As strange or absurd as it may seem, the extraphysical destination that your projected consciousness arrives at when it is lost, or that particular environment which is reached, is always somehow related (affinity or synchronicity) to you. Your consciousness is nevertheless unable to perceive the reasons or identify the connections that make you visit it in a lucid projection on that occasion. Nothing happens by chance. Synchronicity permeates our *general self-thosenity*. Every one of our cells has some kind of relationship with every other electron in the universe or cosmos.

Recall. Nevertheless, the possibility of a lack of recall – which masks the success of the lucid projection – should be borne in mind regarding all experiments. The projector goes to the location, or even reaches the target-person, but does not recall the fact, thereby thinking that the projective attempt failed, only to later discover that the person did indeed perceive the projector's extraphysical presence.

Bibliography: Baker (69, p. 60), Frost (560, p. 98).

337. PROHIBITED LOCATIONS

Definition. Prohibited location: a human district or extraphysical environment which the projected intraphysical consciousness should avoid, or immediately consider to be off limits, due to personal motives and conveniences, other beings and circumstances in the environment, or the existence of potential or real risks.

Synonymy: avoidable place; critical location; dangerous location; extraphysical ambush; forbidden location; negatively impregnated location; prohibited space; prohibited zone; unapproachable location.

Locus. Medicine has always used the expression *locus minoris resistenciae* or, namely the weak point, the point of least organic resistance where an illness begins to manifest in the patient's human body.

Earth. Similar locations also exist between the tropospheric extraphysical dimension and the intraphysical dimension, on the *body* of planet earth, in reference to the places where ill extraphysical consciousnesses can manifest with less difficulty, such as the following 5:

1. **Poltergeist.** Houses presenting occurrences of poltergeist.
2. **Crimes.** Places where violent crimes were committed.
3. **Assassination.** The human scenario of assassination.
4. **Torture.** Ex-torture-chambers.
5. **Dungeons.** Former prison dungeons.

Geography. In every city, sociologists, anthropologists, urban heads of research and police reporters study that city's *shadowy geography*, composed of locations stigmatized by mega-intrusions, suffering and pain; and those addresses marked (environmental stigmas) by poltergeists and hauntings.

Holothosene. Natural tragedies and collective nightmares (landslides, cave-ins, collapses, fires, floods, shipwrecks, accidents, train pileups, riots); dramas; individual acts of violence and imprudence (kidnappings, rapes, homicides, attacks, assaults, gang raids) having a social impact; all profoundly imprint human environments and the mental-emotional archives (mnemosomatics) of the ordinary *unconscious-evocator-citizen*. They thereby unfortunately become integrated into the living memory of the city and its urban holothosene.

Energies. These human locations present *environmental stigmas* or retain parasitic energies, "walls with memories", microvibrations, gravitating waves, abstract waves or perceptible *waveforms*. This leads the projected intraphysical consciousness to maintain a self-restriction of actions or an intentionally conditioned freedom, sometimes even for reasons of self-defense.

Test sites. It should be borne in mind that there are even many locations on the planetary crust that are off-limits to visitors, and even to air, land and ocean traffic, such as sites where missiles, rockets and other armaments are tested.

Thoughts. According to biological research performed with electromagnetic fields, thoughts (the *tho* of thosenes) can be impressed upon matter. Evidence of this is found in the thoughts of terror, desperation, intense grief or extreme fear which parapsychically impregnates the structure of a building after a tragedy, assassination or the massacre of a group of intraphysical consciousnesses.

Paroxysms. In the events occurring in these places, the protagonists or involved parties act under extreme tension, in intense mental activity, with their affective, psychic, consciencial energies or negative and anticosmoethical bioenergies (energetic pollution) flowing at extremely high levels, triggering paroxysms of hate or zeniths of horror.

Excrescences. The extraphysical duplicates (second universe) of the objects in these environments remain deformed with indelible crusts or *extraphysical excrescences* that irradiate influences which are not always detectible by unrefined human senses. From this arises the need for *extraphysical reurbanization*.

Thosenes. The thoughts, thosenes or remnants of these emotional forces seem to have an indefinite permanence, transmitting sensations of depression, anguish or inquietude to visitors who are completely ignorant of the event for many lustrums after the tragedy.

Reurbanization. In this way, a pathological holothosene is formed which, over time, requires extraphysical reurbanization of the environment or community, performed by the *serenissimi*.

Trail. In these cases, the gravitating energies establish a clear trail which is consciously or unconsciously followed by those having a sharpened sensitivity, or a certain parapsychic development, as soon as they enter the human construction for the first time.

Locations. In certain occasions, such a place (*locus delicti*) saturated with consciencial energies functions, from a parapsychic point of view, just like a small hole in a dam through which it begins to collapse. In the same way that the above-cited physical-extraphysical locations exist, there are also critical extraphysical-physical locations.

Types. The locations that can spontaneously be considered prohibited to the consciousness projected with lucidity can be classified into: physical, extraphysical and ambivalent.

1. **Physical.** Among the physical or human locations that can be considered prohibited to the projected intraphysical consciousness, the following can be singled out: the couple's bedroom; a sectarian ritual initiation lodge that has gone out of business; abandoned monasteries; certain apparently inoffensive ruins; certain old monuments and mausoleums; the location of a bloody battlefield; a place with statues or images that were consecrated with the sacrificial blood of living beings; a place where "witches" were burned alive; certain cemeteries; medieval citadels; tombs; crypts; dolmens; certain psychiatric hospitals and institutions; and old prisons.

2. **Extraphysical.** Among the extraphysical locations that can be considered prohibited to the projected intraphysical consciousness, the following can be listed: a colony with openly hostile inhabitants or extraphysical consciousnesses; an unfamiliar and disagreeable extraphysical district.

3. **Ambivalent.** There are physical and/or extraphysical locations where, for example, rituals were practiced over long periods of time, which should be avoided by the projected intraphysical consciousness. Magic rituals leave sensations with *extremely intense emotional connotations* impregnated in those places, or gravitating energies which are difficult to dissipate or remove from the area. Those areas are able to cause parapsychic influences that can disturb the extraphysical balance of the intraphysical consciousness, when projected. They can be good for some and awful for others, depending upon the quality of the intentionality of the consciousnesses or their interests.

Interflows. Unapproachable places, whether they are in the open air, inside a house, or even in the bedroom of an apartment, often contain strictly *physical* negative influences, such as the intersection of energetic interflows between the component objects of the environment. These intersections can generate discomfort, a lack of coordination in thought, localized pains, indeterminate indispositions in the intraphysical consciousness who lives his/her everyday life or occasionally performs some task there. These interflows are easily detected by pendulum, aurameter and magnetic divining rod (radiesthesia, radionics) technicians.

Power. The so-called *place of power* in any environment can be precisely located and demarcated, even showing the correct direction of the consciential energies that are in contact with persons at that location. This can be executed with conscious or unconscious probing performed by any sensitive individual (psychometry), even when he/she is not using physical supports, instruments or crutches.

Hostility. There are 5 human areas that are traditionally prohibited to outsiders (humans), namely places where visitors or tourists are (physically) not welcome or are even treated with open hostility (unwelcome, *persona non grata*):

1. Badin Dalam, a village in Java.
2. Mecca, a city in Saudi Arabia.
3. Mount Athos, in Greece.
4. North Sentinel, one of the 200 islands that form the Andaman group, in the Bay of Bengal.
5. Staphorst, a city located to the north of Amsterdam, in Holland.

Prevention. If you decide, while lucidly projected outside your soma, to go to one of these curious but openly hostile places, go there forewarned, paying attention to your real intentions, the positive purpose of your visit and being willing to confront any disagreeable surprises.

Subhuman. There are, incidentally, subhuman beings which are also not welcome – in this case, *justifiably unwelcome* – in specific places, such as the following 3:

1. **Cats.** Cats in the home with a newborn (shedding of fur).
2. **Monkeys.** Monkeys in china shops (breaking of plates).
3. **Birds.** Birds (especially large ones) at airports (plane crashes).

Atmosphere. The tendency is for the atmosphere of the ambient holothosene in a physically hostile place to be *doubly hostile*, extraphysically speaking.

Bibliography: Castaneda (258, p. 21), Crawford (313, p. 53), Fortune (540, p. 76), Frost (560, p. 183), Kardec (824, p. 175), Russell (1482, p. 66), Vieira (1762, p. 185).

338. EXTRAPHYSICAL TELEKINESIS PRODUCTION TECHNIQUE

Definition. Extraphysical telekinesis: direct production of physical effects by the projected intraphysical consciousness.

Synonymy: animic telekinesis; intentional exteriorization of motricity.

Self-determination. When you, as a projected projector, find yourself to be lucid, denser in the free psychosoma, and well-constituted outside the human body, you can endeavor, using the full force of your will, to act upon material objects or people. This can be accomplished through actions that are simple, spontaneous or have been prepared prior to projecting, even with the presence of waking human volunteers.

Types. The physical effect phenomena provoked by the projected intraphysical consciousness can be of the following 19 types:

1. **Apparatus.** Turn on a TV, radio or computer that is far from the bedroom.
2. **Bell.** Ring a doorbell.
3. **Book.** Open a book.
4. **Candle.** Snuff a lighted candle.
5. **Chair.** Move a light rocking chair.
6. **Door.** Open a door.
7. **Ears.** Tickle an intraphysical being's ear.
8. **Face.** Affectionately touch the face of someone you know.
9. **Faucet.** Turn on a faucet.
10. **Feather.** Stop the movement of a feather in midair.
11. **Flashlight.** Turn on a flashlight using minimal pressure.
12. **Food.** Pick up a piece of food.
13. **Lamp.** Turn on a lamp by pressing the switch.
14. **Object.** Lift a small object.
15. **Page.** Turn a page of an open book.
16. **Pinch.** Pinch a friend.
17. **Refrigerator.** Open the refrigerator door.
18. **Table.** Knock on a door or the top of a table (typtology).
19. **Wing.** Touch a loose moth's wing.

Uses. Among the uses of the extraphysical telekinesis phenomenon, the following 4 can be singled out:

1. **Energies.** Development of energetic transmission.
2. **Projectability.** Effective proof of lucid projection.
3. **Research.** Practical application of working hypotheses.
4. **Assistance.** Assist an intraphysical being and prevent him/her from becoming a victim of a serious physical accident.

Repression. There are conditioned reflexes which are created by repressive factors, stemming from conventional education, which can provoke obstacles to the production of extraphysical telekinesis through inhibition or psychological action. Some examples are: not touching cards or diaries belonging to others; not entering the intimacy of an unfamiliar persons' bedroom.

Technical. Among the extraphysical telekinesis phenomena that can technically be provoked, the following 2 can be singled out:

1. **Ball.** Make a small, light ball fall from atop the bedside table to the floor in the bedroom.
2. **Impressions.** Imprint the fingerprints (parafingers) of the extraphysical right hand (right parahand) of the psychosoma on a flat surface sprinkled with fine flour.

Bibliography: Brittain (206, p. 50), Greenhouse (636, p. 57), Kardec (824, p. 237), Muldoon (1105, p. 267), Vieira (1762, p. 26).

339. SCALE OF EXTRAPHYSICAL CONTACTS

Definition. Extraphysical contact: the relationship of the proximity, vibratory frequency or parapsychic influence of the intraphysical consciousness with other human beings or subhuman animals, whether they be intraphysical or extraphysical consciousnesses.

Synonymy: consensual encounter; extraphysical encounter.

Evolution. The natural evolution of projections or the chronological development of each projector's lucid projections enables the possibility of rationally elaborating the most common and physiological scale of their consensual encounters, visual or *tactile* contacts with other beings, outside the human body.

Scale. The following is a scale of the projector's cumulative extraphysical contacts, on 4 levels of excellence, in the most common, ascending or evolving order of the unfolding of events outside the body:

1. **Self-contemplation.** There is firstly an occurrence of self-contemplation, or visual or even tactile encounters of the projected intraphysical consciousness with his/her own human body, obviously in the physical base or, in other words, the phenomenon of consensual self-bilocation.

2. **Inter vivos.** Secondly, the projected intraphysical consciousness encounters or visualizes another or other intraphysical beings, who are almost always in the ordinary, physical waking state. *Inter vivos* apparition may occur in certain cases.

3. **Confrontations.** Next, the projected intraphysical consciousness comes upon one or more extraphysical consciousnesses, whether they be deceased relatives, helpers, blind guides, energivorous extraphysical consciousnesses, satellites of intruders or intruders, sometimes in extraphysical confrontations.

4. **Joint.** Lastly, the projected consciousness has a direct contact with 1 or more projected beings or colleagues from extraphysical excursions, thereby having joint projections.

Mentalsomatics. The most frequent contacts occur through lucid projections in the psychosoma. Nevertheless, consensual encounters do arise in the mentalsomatic dimension on very different bases.

Disparities. This scale represents the typical development of more habitual occurrences. There are, however, projectors who naturally overturn the scale by having the most disparate experiences when they project, such as the following 4:

1. **Soma.** There are those who only examine their own human body – the soma – when projected.

2. **Intraphysical consciousnesses.** There are those who only encounter intraphysical beings when projected.

3. **Extraphysical consciousnesses.** Others only see extraphysical consciousnesses in their lucid projections.

4. **Isolation.** There are still others who so far have neither contacted anyone, nor have they seen any being while projected alone.

Complete. Evidently, the veteran projector will only have completed his/her panorama of experiences of extraphysical contacts upon being able to realize the 4 categories of different encounters in different extraphysical opportunities and instances. This will allow him/her to perform an overall analysis of the events and potentialities of the extraphysical dimensions.

Bibliography: Vieira (1762, p. 109).

340. THE PROJECTED INTRAPHYSICAL CONSCIOUSNESS AND THE HUMAN BODY

Definition. Individual: the consciousness who temporarily undergoes resoma, possessing a biocybernetic, cognitive, self-regulated male (androsoma) or female (gynosoma) human body through which he/she manifests, transforming him/herself, upon reaching physical maturity, into a human product of psychosocial conditioning and development.

Synonymy: citizen; human person; intraphysical being; intraphysical consciousness; personality; social being.

Categories. Among the categories of the relationship of the projected intraphysical consciousness and his/her own human body, at least the following 7 can be singled out:

1. **Self-bilocation.** Self-contemplation or observation of one's own human body at a distance, or the phenomenon of consensual self-bilocation.
2. **Viewing.** Ordinary viewing of the human body.
3. **Endoscopy.** Endoscopic viewing of the human body.
4. **Distance.** Viewing the human body from a distance.
5. **Psychosoma.** Viewing the human body together with the psychosoma and, consequently, with the consciousness.
6. **Eyes.** The characteristics of the eyes of the human body itself, while the brain is emptied of the consciousness.
7. **Mirror.** The reflected image of the psychosoma, a copy of the human body, in front of an ordinary mirror.

Touch. Various occurrences arise regarding the sense of touch, such as the following 5:

1. **Complexity.** Extraphysical-physical compound or complex touch.
2. **Self-embrace.** Psychosoma-human body self-embrace.
3. **Temperature.** Perception of the human body's temperature, sensed in the psychosoma upon touching the human body.
4. **Position.** Intentional change in the body's position.
5. **Saliva.** Deglutition of saliva that has accumulated in the mouth.

Aspects. The following are 8 aspects to be considered in the relationship between the projected consciousness and his/her own human body:

1. **Holochakrology.** Identification of the silver cord or the existence of the holochakra.
2. **Aura.** Viewing the human aura.
3. **Chakras.** Viewing the actual chakras in the holochakra and in the psychosoma.
4. **Respiration.** The observation of respiration, blood circulation and heartbeat.
5. **Catalepsy.** Extraphysical catalepsy as a reflex in the psychosoma from the state of the human body.
6. **Emotion.** Extraphysical emotion.
7. **Philosophy.** The tendency to philosophize when faced with one's own inanimate body of flesh and bones.
8. **Respect.** The sentiment of respect or frank rejection toward the *physical machine*.

Effects. Diverse critical and transcendent effects stem from the relationship of the projected intraphysical consciousness and his/her human body, such as the following 8:

1. **Experimentum.** The *experimentum crucis* or "acid test" of the human being who eliminates the intraphysical consciousness' serious doubts or rudimentary uncertainties regarding his/her condition and evolution.

2. **Intraconsciential recycling.** The doorway to *inner self-illumination* or full self-knowledge that inevitably causes intraconsciential recycling or even existential recycling for the intraphysical consciousness.

3. **Maturity.** The first effective and mature step inward, which makes the intraphysical consciousness dispense with a legion of immaturities. The following 12 items are examples: panics, phobias, myths, icons, taboos, manias, fads, illusions, enticements, excesses, faux pas and *abdominal brainwashing* in this still pathological intraphysical society.

4. **Exteriorization.** Definitive individual proof of the exteriorization of the consciousness.

5. **Brain.** Verification of the temporary *empty brain* condition of the consciousness.

6. **Somatics.** Verification of the human body's (soma's) temporary inactivity or its non-pathological vegetative state.

7. **Evolutionology.** A greater comprehension of the evolutionary use of the human body.

8. **Projectiology.** The experience of imposed interiorization within the phenomena of lucid projectability.

Relations. The intraphysical consciousness' viewing of his/her own human body is intimately related to the following 4 distinct phenomena:

1. **Internal.** Internal autoscapy or the direct viewing of the human body's internal organs.

2. **External.** External autoscapy or the viewing of the projected holochakra, while the projector is in the ordinary, physical waking state.

3. **Simple.** Consciential self-bilocation or the simultaneous viewing of the human body and the psychosoma, while the consciousness is headquartered in this vehicle in a simple projection.

4. **Double.** Compound self-bilocation or the simultaneous viewing of the human body with both the holochakra and the psychosoma coincident, while the consciousness is headquartered only in the mentalsoma, which occurs in cases of double projection.

Neurons. It can be observed that the production of lucid projection is being motivated by self-lucid extraphysical consciousnesses worldwide. Regardless of this, however, to what degree are the current intense technological cogitations of the human mind, the increase in stimuli due to the acceleration of history, the more frequent use of electronic instruments and the consequent greater utilization of neural networks influencing this fact?

Bibliography: Castaneda (258, p. 47), Monroe (1065, p. 168), Paula (1208, p. 42), Vieira (1762, p. 109).

341. CONSCIENTIAL SELF-BILOCAION TECHNIQUE

Effort. Any positive effort expended to produce lucid projection is worthwhile, even if it is just to experience consciential self-bilocation only once in your lifetime.

Doorway. The impactful phenomenon of consciential self-bilocation which, as already mentioned, is accessible to any sufficiently motivated individual, represents the *experimentum crucis* of the human being, the most practical doorway to the inner illumination of the personality, the first really efficient step inward. It is equivalent to deeply researching the entirety of an immense specialized library, or an intense intraconsciential educational immersion performed over many decades.

Conditions. Your projected consciousness should endeavor to contemplate your own *immobile* human body when you have sufficient extraphysical lucidity near the bed inside the energetically shielded chamber in the physical base where your body is inactive. The best occasion for this is when you feel fully motivated for the experience.

Attitude. The most suitable attitude for your consciousness, in this case, will be for you to think about your own human body without emotionalism, with a great deal of serenity and balance, being prepared for any surprise in order to avoid extraphysical trauma. Besides this, you should not think or wish to interiorize into it.

Touch. You should avoid touching your human body, upon seeing it while projected, in order to prevent being magnetically drawn toward an abrupt, extemporaneous and undesirable interiorization by the silver cord.

Physical. Your physical body can be clearly seen, in every detail, in a cataleptic state, apparently torpid in vegetative life, your consciousness not being inside it. It may also be seen merely as a silhouette or a form on the bed. However, even in this handicapped circumstance, your consciousness is entirely certain that this is your human body, even though you are *outside* the body, *distant* from the body, or *in front* of the inactive body.

Eyes. The contemplation of your human body when the eyelids are open, revealing the eyes – the *captors of intentionality* – to be dull or lifeless, aside from being a rare and impressive event, becomes more profoundly imprinted on your memory than when the eyelids are closed.

Orientation. This more frequent orientation of the self-bilocator's extraphysical perceptions is what allows viewing from above, as though your consciousness was poised in midair, at an elevated point over your human body.

Dimensions. It is more common for you to see a complete image of your own human body in 3 dimensions, and not in a flattened, plane, two-dimensional form, as you always see it reflected in mirrors, or copied in paintings, photographs and ordinary films. This occurs even when your human body is immersed in full physical darkness.

Perceptions. When your projected consciousness has difficulty seeing its own human body, this is due to a change in your extraphysical perception of energy and light. Depending upon the surrounding extraphysical environment, light can appear to become reflected, annulled or cancelled and the images may totally disappear from your consciential perceptions. This usually occurs when, while projected, you move from one level of awareness or existential dimension to another.

Frequencies. With regard to the phenomenon of consciential self-bilocation, you need to be observant of the fact – as the most important aspect of extraphysical analysis – that your projected consciousness manifests at a specific frequency, whereas your human body remains unaltered, at its own frequency in the intraphysical dimension. The greater the difference between the two frequencies, the greater will be the difficulty of your consciential visualization.

Bibliography: Vieira (1762, p. 109).

342. THE PROJECTED CONSCIOUSNESS AND INTRAPHYSICAL BEINGS

Definition. Intrapysicality: the temporary condition of the consciousness while living restricted in the human body, or the condition of the consciential principle when restricted to a still animal or vegetable body.

Intraphysiology. The condition of intraphysicality provoked the creation of the subdiscipline of *intraphysiology* within conscientiology, being the domain of intraphysical consciousnesses, as well as subhuman animals (animals, fauna, zoology) and vegetable beings (plants, flora, botany).

Forms. There are various forms of living intraphysical beings: vegetable (seed, tree), subhuman animal (egg, animal), fetus (intrauterine fetal life), child, woman (gynosoma), man (androsoma).

Traits. With regard to the basic aspects – strong traits and weak traits – of the personality in the intraphysical dimension and in contact with the projected intraphysical consciousness, at least the following 6 characteristics can be singled out:

1. **Knowledge.** To be known and recognized by the memory (or holomemory) of the intraphysical consciousness.
2. **Unknown.** To be unknown or not remembered by the intraphysical consciousness in his/her retrocognitions.
3. **Friendship.** Friendly personality: an old friend.

4. **Hostility.** Hostile personality: an intrusive intraphysical consciousness, an intraphysical consciousness suffering from intrusion who is a satellite of an intruder.

5. **Consciousness.** To be conscious: intraphysical blind guide, intraphysical helper.

6. **Unconsciousness.** To be unconscious: psychotic intraphysical consciousness, energivorous intraphysical consciousness.

Nature: Regarding the nature of the relationship between the projected intraphysical consciousness and intraphysical beings, it is important to highlight the following 15 variables:

1. Awake social being.
2. Clairvoyance.
3. Cooperation in the lucid projection of an intraphysical consciousness.
4. Deintrusion in general.
5. Extraphysical assistance in general.
6. Extraphysical awakening of a sleeping intraphysical being.
7. *Inter vivos* apparitions.
8. Intraphysical deintrusion.
9. Physical contact.
10. Psychography.
11. Psychophony.
12. Respect of another's privacy.
13. Respect of the consciential rights of others (respect of your fellow being).
14. Sleeping intraphysical being.
15. Telepathy.

Relationships. Many friendly relationships or long-standing human friendships are formed as a result of gatherings of intraphysical beings in the extraphysical dimension through spontaneous or assisted lucid projections, which may or may not be recalled.

Distinctions. In certain *extraphysical circumstances* – environments in which consciential perceptions are more difficult – it becomes necessary to use special resources in order to know if the beings which the projected projector begins to see are projected intraphysical beings, still living in the human body, or are already residing in the extraphysical dimension during the intermissive period.

Shouts. One resource, in this context, is the act of shouting, as though the (projected) intraphysical consciousness in the extraphysical dimension had a throat and vocal cords. If the interlocutors do not hear our shouts, it almost always indicates that they are intraphysical beings in the ordinary, physical waking state (somaticity).

Para-arm. Another contact resource, when in the extraphysical dimension, is to float (volitation) over the observed being, just as in paintings of angels, and pass an extraphysical arm (para-arm) in front of it. Generally, when the personality does not react and passes right through the para-arm of your psychosoma without perceiving it, this shows the observed consciousness to be an intraphysical being in the ordinary, physical waking state (somaticity).

Certainty. These rudimentary resources clearly cannot provide certainty in all cases, due to the subtle gradation of our perceptions and paraperceptions regarding the consciential dimensions.

Luminosity. It is easy to distinguish between the inanimate human body of the projected intraphysical consciousness, or even an ordinary cadaver, and the human body of a waking, intraphysical being. This is because this living vehicle irradiates a certain luminosity, a phosphorescence, which does not occur with the first 2, which generally are opaque and lack their own luminosity since they are devoid of the consciousness, whether temporarily (projected intraphysical consciousness, *brain emptied of the consciousness*), or definitively (final projection, desoma).

Photophoria. Parapsychic light, photogenesis, phosphorescence, photophoria or telephany, is somatic energy which is transformed and exteriorized in a form of light and is a relevant concept in this context.

Bibliography: Baumann (93, p. 27), Bozzano (184, p. 131), Leadbeater (901, p. 307).

343. THE PROJECTED CONSCIOUSNESS AND EXTRAPHYSICAL BEINGS

Definition. Extraphysical consciousness: the consciousness when free from the human body, in longer intermissive periods or during the intervals between two intraphysical lives.

Synonymy: being which has undergone desoma; consciousness which has undergone desoma; extraphysical consciousness.

Appearance. The extraphysical appearance (para-appearance) or the appearance of extraphysical beings in general varies greatly, as illustrated in the following 5 examples:

1. **Appearance.** The appearance (physiognomy) of a man, woman, child, animal or plant.
2. **Intelligence.** Intelligent beings.
3. **Forms.** Life forms that are often unknown.
4. **Extraphysicality.** Apparently autochthonous inhabitants of the extraphysical dimension.
5. **Exoticism.** Exotic or extraterrestrial appearances different from our humanoid form.

Traits. With regard to the basic characteristics – strong traits and weak traits – of the personality encountered in the extraphysical dimension and in contact with the projected intraphysical consciousness, at least the following 6 traits can be singled out:

1. **Known.** A being that is known and recognized by the memory of the projected intraphysical consciousness.

2. **Unknown.** A being that is unknown or not remembered by the projected intraphysical consciousness.

3. **Friendship.** Friendly personality: a deceased old friend, another projected intraphysical consciousness (“colleague”).

4. **Hostility.** Hostile personality: intrusive extraphysical consciousness (a being which is evolutionarily underdeveloped, an inhabitant of the paratroposphere), an extraphysical consciousness that is a satellite of an intruder.

5. **Consciousness.** Conscious being: blind guide, helper (calming para-appearance), evolutiologist, *serenissimus* (evolved being).

6. **Unconsciousness.** Unconscious being: post-desomatic parapsychotic extraphysical consciousness (ill being), energivorous extraphysical consciousness (disturbing para-appearance).

Types. Extraphysical beings manifest themselves in various forms or with various *paraphysiognomies* to the projected intraphysical consciousness. The following 15 are provided as examples:

1. **Colleague.** An evolutionary colleague or someone pertaining to the individual’s karmic group.
2. **Friend.** A recognized or identified deceased friend.
3. **Helper.** A helper which is known to the projected intraphysical consciousness.
4. **Host.** A host for the lucid projectability of the intraphysical consciousness.
5. **Ill.** A being which is visibly ill or disturbed (unbalanced extraphysical consciousness).
6. **Intraphysical consciousness.** An intraphysical consciousness which has recently undergone desoma and has not yet passed through the second desoma.
7. **Intruder.** An ostensive intruder.
8. **Karmic group.** The evolutionary group (karmic group).
9. **Mocker.** A mocking being with the appearance of a man or woman.
10. **Mutant.** An extraphysical mutant unable to maintain a tranquil para-appearance.
11. **Neighbor.** A neighbor who has already undergone desoma.
12. **Paraprotector.** Someone’s bodyguard or paraprotector.
13. **Relative.** A relative, with the para-appearance of a man or woman, which has already undergone desoma.
14. **Unknown.** An unknown being or one which is unidentified on that occasion.
15. **Vampirizer.** Extraphysical vampirizer.

Nature. With regard to the nature of the relationship between the projected intraphysical consciousness and extraphysical beings, the following 21 more expressive variables merit singling out:

1. Active interconscial relationship.
2. An interconscial encounter or reencounter.
3. Approaches made *by* the projector.
4. Approaches made *toward* the projector.
5. Blatant deintrusion.
6. Commemoration of the present or the past of kindred consciousnesses.
7. Conduct in the presence of post-desomatic parapsychotics.
8. Cooperation in the desoma phase.
9. Discipular relationship (disciple and master, student and teacher).
10. Embrace or para-embrace.
11. Extraphysical interdimensional ride.
12. Fruitless searches (investigations, research projects, evocations).
13. Impediments having diverse origins or causes.
14. Interconscial intrusion.
15. Many types of invisible union.
16. Negative or pathological relationship.
17. Passive interconscial relationship.
18. Positive or healthy relationship.
19. Reactions of lucidity by the consciousness regarding *unknown* beings or those which apparently were not seen before.
20. Sexual or parasexual company.
21. Undesirable company.

Density. The density of one's psychosoma determines the degree to which the projected intraphysical projector can be seen by extraphysical beings.

Ability. No present or past titles, hierarchy, social class or human positions have any value with regard to the extraphysical dimension. What counts is the real evolutionary superiority of the consciousness, which affords ability, experience, freedom, lucidity and proficiency (know-how, *modus faciendi*) to its unfettered and cosmoethical extraphysical actions.

Paradox. Due to the rejuvenation of the para-appearance of lucid extraphysical consciousnesses, the phenomenon of *paradoxical appearance* commonly occurs. In this case, the mature, white-haired intraphysical projector encounters the *former father* (extraphysical consciousness) having a more rejuvenated or younger (black hair) parapsychognomy than the projector; or the aged intraphysical projector encounters the *former great grandmother* (extraphysical consciousness), finding it to be youthful looking, in contrast with personal recollections or old family photos and films.

Surprises. Surprising events of this type can sometimes provoke some facts that are also unexpected, such as the following 3 types of side effects:

1. **Paralucidity.** Increase the extraphysical lucidity (paralucidity) of the projected intraphysical consciousness.
2. **Paratrauma.** Immediately provoke an extraphysical trauma (paratrauma) in the projected intraphysical consciousness.
3. **Retrocognitions.** Disturb the recall of the authentic extraphysical experiences (retrocognitions), which are mistaken for dreams or nightmares.

Threat. It is still unknown, within the scope of projectiological research, why and to what degree a well-intentioned projected intraphysical consciousness constitutes a threat to the tranquility of lucid ill-willed extraphysical consciousnesses with regard to their extraphysical condition.

Factors. There must be other still unknown factors, besides the existence of the positive conscial energy of the intraphysical consciousness projected in the psychosoma and the quality of

his/her personality, which is different from the residents (autochthons) in that district or extraphysical community. This positive consciencial energy also allows the projector – with his/her intromission as an outsider in a district distant from the human body – to awaken other consciousnesses sleeping in the extraphysical dimension.

Bibliography: Bayless (98, p. 100), Crookall (323, p. 1), Kardec (824, p. 174), Steiger (1601, p. 103).

344. THE PROJECTED CONSCIOUSNESS AND OTHER PROJECTED BEINGS

Definition. Projected being: the consciousness when projected from his/her vehicle or vehicles of manifestation.

Synonymy: projected consciousness; projected projector; projecting projector.

Types. Any projected consciousness can encounter diverse types of projected beings, such as the following 3:

1. **Psychosomatic.** Intrapysical consciousnesses projected in the psychosoma in the crustal or paratropospheric extraphysical plane.
2. **Mentalsomatic.** Intrapysical or extraphysical consciousnesses projected in the mentalsoma in the mentalsomatic dimension.
3. **Subhumanity.** Evolutionarily inferior beings or subhuman animals, not to mention plants projected in the paratropospheric dimension.

Characteristics. Within the characteristics of the relationships of the projected consciousness with other projected beings, the following 8 can be singled out:

1. **Para-appearance.** The extraphysical appearance of intraphysical projectors.
2. **Age.** Physical age and extraphysical appearance.
3. **Rejuvenation.** Extraphysical rejuvenation of the para-appearance.
4. **Returns.** Sudden returns to the human body and abrupt disappearances.
5. **Repercussions.** Joint physical repercussions.
6. **Empathy.** The influence of affinity or interconsciencial empathy.
7. **Kinfolk.** The influence of consanguinity or kinship.
8. **Friendship.** Friendly or hostile being.

Categories. Projected beings encountered by the projected intraphysical consciousness can be placed into various categories, such as the following 5:

1. **Colleagues.** Familiar projective colleagues.
2. **Unknown.** Unknown projectors.
3. **Relatives.** Projected relatives.
4. **Child.** Projected children.
5. **Subhumans.** Projected subhuman, intraphysical pet animals (very rare).

Joint. The lucid, joint consciencial projection of intraphysical beings or the encounter or reencounter of colleagues or projected intraphysical projectors enables extraphysical tasks of mutual cooperation, such as the following 4:

1. **Holochakrality.** Mutual energetic assistance.
2. **Self-awareness.** Help in the attainment of a high degree of extraphysical self-awareness.
3. **Volitation.** Joint volitation.
4. **Defenses.** Joint extraphysical defenses in the face of attacks by ill extraphysical consciousnesses.

Bibliography: Monroe (1065, p. 163), Vieira (1762, p. 121).

345. EXTRAPHYSICAL DISAPPEARANCES

Definition. Extraphysical disappearance: the sudden disappearance of an extraphysical consciousness or projected intraphysical consciousness from a certain environment or extraphysical community.

Synonymy: abrupt extraphysical disappearance; extraphysical disappearance; instantaneous extraphysical disappearance; sudden extraphysical disappearance.

Causes. The following are 3 of the main causes of instantaneous disappearance of beings in the extraphysical dimension:

1. **Dimension.** A change in dimension or vibratory frequency by the manifesting consciousness.
2. **Retraction.** Violent retraction of the silver cord due to a physical cause, or an *extraphysical* repercussion to the projected intraphysical consciousness.
3. **Trauma.** Extraphysical trauma to the projected intraphysical consciousness, or a *physical* repercussion.

Disappear. The following are 3 categories of beings that can suddenly disappear in the extraphysical dimension from your astounded or surprised paravision.

1. **Extraphysiology.** Extraphysical consciousnesses in general.
2. **Intraphysiology.** Projected intraphysical consciousnesses.
3. **Self-experimentation.** The projected projector him/herself.

Projector. Instantaneous disappearance in the extraphysical dimension is not always directly related to the projected projector's perceptions, nor does it depend upon his/her will or alter the conditions of the extraphysical environment that influences him/her on that occasion. This can, however, be traumatic if one is not accustomed to lightning-fast disappearance, sometimes of one's own closer extraphysical company, whether a helper, a projected colleague or an extraphysical interlocutor.

Multiple. Sudden, multiple extraphysical disappearances of various beings can occur simultaneously. This happens due to the abovementioned causes, especially with extraphysical consciousnesses subordinated to the same director responsible for a group volitating together or a holothosenically kindred team. It is reminiscent of so-called *group-souls* of subhuman animals and facts such as a school of fish immediately and unexpectedly turning together and swimming in the opposite direction when a noise is made in the sea.

Creativity. The extraphysical facts show that sudden disappearances in the paratropospheric dimension have inspired animated cartoonists, who make a character disappear in a lightning-fast manner on a road, upon which it shrinks rapidly until disappearing like a small point on the infinite perspective of the horizon. These 2 types of disappearance from the scene have deep analogies with our imagination.

Dissipation. The sudden disappearance of extraphysical consciousnesses, which are actually present in the extraphysical environment or community, should not be confused with the abrupt dissipation of mental images or artificial morphothosenes, which are generated in ordinary dreams, nightmares, lucid dreams and visual projections promoted by helpers. These occurrences are very distinct and clearly defined, in an unmistakable manner, due to certain characteristics affecting the extraphysical perceptions of the projected intraphysical consciousness which, because of his/her personal experience, has no doubts regarding this distinction.

Bibliography: Bardon (80, p. 386), Castaneda (256, p. 210), Frost (560, p. 57), Swedenborg (1635, p. 252), Vieira (1762, p. 183).

346. EXTRAPHYSICAL APPROACH TECHNIQUE

Definition. Extraphysical approach: the contacting of one consciousness by another in the extraphysical dimension in some manner.

Synonymy: extraphysical contact; the act of accessing an extraphysical consciousness.

Categories. There are various categories of extraphysical approaches, among which are the following 4:

1. **Donation.** An action performed by the projected projector on another being, such as a donation of consciential energies or information.

2. **Reception.** The act of a being approaching the projected projector, as in the reception of consciential energies or information.

3. **Helpers.** The healthy acts of helpers, petifree consciousnesses, consciential epicenters or evolutiologists.

4. **Intruders.** The ill acts of energivorous extraphysical consciousnesses, extraphysical blind guides, intruders and the satellites of interconsciential intruders.

Extraterrestrials. The projector can approach and be approached by non-human extraterrestrials (exotic para-appearances) or subhuman beings. Approaches made to the projected projector by extraphysical consciousnesses are particularly considered here.

Objectives. Among the relevant objectives of extraphysical approaches, at least the following 14 can be singled out:

1. Reception or donation of extraphysical assistance.
2. Interconsciential deintrusion.
3. Lucid assistential interconsciential bait.
4. Extraphysical rescuing of a deprived or ill extraphysical consciousness.
5. Intrusion or extraphysical attack.
6. Energetic draining.
7. Friendly or hostile reencounter.
8. Casual encounter.
9. Inoffensive jesting.
10. The consequence of conscious or unconscious evocation.
11. Physical awakening.
12. Extraphysical awakening.
13. Physical anchoring of the intraphysical consciousness in the human body or the act, whether positive or negative, of obstructing lucid projection.
14. Extraphysical parapsychism.

Nature. With regard to its nature, the extraphysical approach can be: agreeable; friendly; disagreeable; hostile; expected; unexpected; pathological; serene; or violent.

Vehicles. With regard to the vehicles of manifestation of the consciousness, the extraphysical approach can be based on 4 modes or conditions:

1. **Psychosomatic.** Psychosoma to psychosoma.
2. **Mentalsomatic.** Mentalsoma to mentalsoma.
3. **Telepathic.** Mentalsoma to psychosoma, by way of telepathic processes.
4. **Holosomatic.** The holosomatic psychosphere of the consciousness and its role in extraphysical approaches.

Processes. Among the more relevant processes of extraphysical approaches, at least the following 13 can be singled out:

1. A mind-to-mind approach (paratelepathy).
2. Transmental dialog.
3. Summons.
4. Extraphysical energetic transference.
5. Extraphysical eyes, glances, faces, smiles, embraces and kisses.
6. Overflowing tenderness.
7. Empathy or *rapport*.
8. Touch or direct contact.
9. The extraphysical right hand (parahand) of the psychosoma.
10. The use of morphothosenes.
11. The sudden attack and unexpected *extraphysical ambush*.
12. The positive or negative energetic jet.
13. The physical effect in the physical dimension which is analogous to morphothosenes in the extraphysical dimension.

Districts. Extraphysical approaches can occur in at least the following 5 basic consensual environments or districts:

1. **Dimension.** In the same consensual dimension.
2. **Extraphysiology.** From one extraphysical dimension to a different extraphysical dimension.
3. **Intraphysiology.** From the extraphysical dimension to the human dimension (intraphysiology).
4. **Holochakrology.** Within the extraphysical sphere of energy (consensuality, energetic dimension).
5. **Base.** Inside the physical base (domesticity, energetic dimension).

Effects. Extraphysical approaches cause at least the following 6 different effects for the projector (intraphysical consciousness):

1. Euphoria (extraphysical euphoria or intraphysical euphoria).
2. Clarifications or extraphysical lessons.
3. Extraphysical trauma with abrupt return to the human body.
4. Physical repercussions (somatics).
5. Unexpected difficulties in personal manifestations.
6. Unexpected ease in personal manifestations.

Bibliography: Monroe (1065, p. 132).

347. EXTRAPHYSICAL HETERO-AWAKENING TECHNIQUE

Definition. Extraphysical hetero-awakening: extraphysical procedure performed by the projected projector – the extraphysical awakener – whereby he/she sponsors the temporary departure (projection) of an intraphysical consciousness, the sleeping human, from his/her physical body (soma) (see fig. 347, p. 1,146).

Synonymy: consensual exteriorization of another; extraphysical approach made to the sleeper; extraphysical awakening of the intraphysical consciousness; extraphysical-physical approach; projector which projects another; takeoff induced by another; temporary *physical-extraphysical ejection*; transference of the consciousness of another.

Types. It is generally more difficult than it appears to force the extraction of an intraphysical consciousness from his/her physical body, in the psychosoma, in order for him/her to remain projected even for only some moments. This is true regardless of whether it is a known or unknown, semilucid or lucid, cooperative or hostile adult, child, or subhuman animal.

Sponsorship. Extraphysical hetero-awakening can be sponsored by an extraphysical or projected intraphysical consciousness.

Study. This act, per se, needs to be previously studied by the experienced projector in order not to represent an undue intromission into the privacy of the target-being or, in other words, an intrusion or undesirable invasion into the *dream* of another. By using the extraphysical approach, the projector helps to transfer the seat of another's intraphysical consciousness out from his/her human body.

Assistance. When you, as a projected intraphysical projector, receive telepathic suggestions or are ostensibly assisted and even teleguided by a helper, which is usually intangible, the task of exteriorizing an intraphysical consciousness becomes easier to execute.

Consent. The same occurs when you first receive the consent and open cooperation of the target-person, while in the ordinary, physical waking state and later receive the same cooperation while attempting to perform extraphysical hetero-awakening.

Resource. The following are 11 resources that should be remembered when temporarily *ejecting* an intraphysical consciousness from his/her own human body (soma):

1. **Discernment.** Good intention (quality of intentionality) and discernment on the part of the experimenter.
2. **Cosmoethics.** A plausible constructive or cosmoethical reason for the procedure.
3. **Conscientiality.** Extraphysical lucidity on the part of the projector-awakener's consciousness.
4. **Self-confidence.** Self-confidence on the part of the projector-awakener.
5. **Self-thosenity.** Maintenance of an undisturbed train of thought without deviations or imperturbable self-thosenity.
6. **Evocation.** Positively evoking a helper in favor of the target-consciousness.
7. **Selectivity.** Choice or selection of a fearless target-person, especially one who has no apprehensions regarding extraphysical consciousnesses and is knowledgeable on the subject of lucid projection.
8. **Time.** Choice of time (timing), preferably when the intraphysical being is tranquilly sleeping, alone, at night, with absolutely no possibility of human (intraphysical consciousness) or subhuman (dog, cat) interferences.
9. **Planning.** The act of beginning to concentrate on the target-person, even before initiating the production of lucid projection, if possible.
10. **Holothosenity.** Intentional direct exteriorization of consciential energies upon the target-person and his/her environment or personal holothosenity.
11. **Empathy.** The employment of all useful possibilities for establishing a deep *rapport*, empathy, affinity or interaction with the target-consciousness in question, including entering into his/her psychosphere in an energetic fusion or an intense auric coupling.

Measures. You, as a projector-awakener, can use the following 3 basic measures:

1. **Psychosomatics.** Utilize extraphysical telepathy and even physical touch, if possible, through the greater density of your own psychosoma.
2. **Interlocution.** Speak to the sleeper who is being parapsychically approached, extraphysically and audibly calling him/her gently by an informal name, when known.
3. **Volition.** Use imperturbable conviction and will power (volition), like a hypnotizer, with the singular intention of awakening the lucidity of the consciousness in the extraphysical dimension.

Helper. As a projected projector-awakener, you need to be aware that you should, at this point, act like a (projected) intraphysical helper which has been given a specific, dignified, respectful, cosmoethical and pure task, as though you were an extraphysical consciousness that is fully aware of your situation or assistential condition.

Hygiene. Using consciential hygiene, do not allow any interference of extemporaneous thoughts or spurious self-thosenes (pathothosenes) – even fleeting ones – in your consciousness, mentally concentrating exclusively upon your objectives without any vacillation.

Interiorization. A mere partial departure of the sleeper's psychosoma, transporting the consciousness, can occur. Upon becoming lucid and seeing the projector-awakener, the sleeper's consciousness becomes disturbed or alarmed such that it abruptly interiorizes and may even suffer inoffensive physical repercussions. In this case, you should abandon the attempt at extraphysical hetero-awakening.

Attempts. Generally speaking, if you are not able to bring about any effective communication with the target-person after 3 successive attempts, you should leave the experience for another more favorable opportunity.

Reactions. As a projected projector, you need to be prepared for any surprising reactions on the part of the intraphysical target-consciousness, in the sense of avoiding frustrations to both parties, in the manner of some of the following 5:

1. **Attack.** The target-consciousness furiously lashing out against you, the projector.
2. **Fear.** The target-consciousness demonstrating an insuperable fear of leaving the human body (thanatophobia).
3. **Somnambulism.** The target-consciousness being somnambulistic.
4. **Mistake.** The faulty judgment of the target-consciousness who is experiencing a nightmare in which you, the lucid projector, are his/her persecutor.
5. **Alienation.** The target-being, upon physical awakening, getting up from the bed and turning his/her back on you, the projected projector, without the slightest formality.

Extracorporeal. Extracorporeal sleep – the act of the target-consciousness sleeping while headquartered in the projected psychosoma, being close to but *outside* the human body, which is still inside his/her own bedroom – interferes in extraphysical-physical approaches much more often than one might suppose. This common fact brings with it some consequences that require observation.

Consequences. As a projected projector, you may approach your friend thinking that he/she is sleeping on the bed only to find that he/she is also projected. Your friend's consciousness might therefore extraphysically awaken with greater ease, which is a welcome and providential exception. The other possibility is an abrupt interiorization of the sleeper's consciousness, which is *sucked* by the human body through the silver cord, this being the most common occurrence. In this situation, it is useless to make another immediate attempt at hetero-awakening. The best option is to leave it for another more propitious occasion.

Miniprojector. It can also happen that the consciousness of a child, a relative or a friend – found to be sleeping, already projected, upon your approaching him/her while projected – floats over the human body, experiences a momentary extraphysical awakening upon recognizing you (the projector) and, drawing near you, smilingly, warmly, continues to sleep as though secure and comfortable in his/her own bed or crib. In this case, it becomes easy for you, the projector-awakener, to sponsor the extraphysical awakening of the miniprojector, skillfully and without even wishing to do so.

Joint. The act of extraphysically approaching the sleeper is intimately related to joint projections or shared extraphysical activities.

Sign. After the sleeper has gained awareness in the extraphysical dimension, you, the projected projector, can give him/her a sign, symbol, keyword or password, in an extraphysical visual projection which you have willfully created – or in other words, a specific morphothosene – in order for the sleeper to remember the encounter, even if only as a dream.

Impression. The extraphysical symbol or sign will become more firmly impressed upon the sleeper's memory, aiding in his/her recall after physically awakening. On this occasion, you can also transmit useful instructions or information to the target-consciousness.

Recoincidence. It is frequently useful for you to exteriorize calming consciential energies to the target-person after the interiorization or recoincedence of his/her consciousness. This helps to leave him/her in a serene or normal psychophysiological condition and assists him/her in the subsequent recollection of the extraphysical experiences.

Surprises. Both agreeable and disagreeable surprises can transpire in these approaches, as has occurred with the author on a certain occasion due to inexperience. An attempt was being made to extract a friend's consciousness from his human body in an exteriorization of the psychosoma, whereupon the friend approached the projected projector (the author) from behind his psychosoma, smiling. He was already projected and lucid, and this fact had not been perceived by the author.

Vampire. On other occasions, there are those who have even taken the author to be a vampire, an extraphysical monster, an intruder and a presumed hardened adversary during attempted extraphysical hetero-awakenings.

Rejuvenation. Upon leaving the human body, the intraphysical consciousness generally has an appearance that is rejuvenated, good looking and sometimes surprisingly luminous.

Duo. Extraphysically approaching a partner who sleeps in the same bed of the evolutionary duo almost always ends up in the undesirable and *abrupt interiorization* of the projector-awakener's already projected consciousness. This is due to the proximity of the human bodies of both or the phenomenon of spontaneous and habitual auric coupling.

Counterapproach. When approaching a sleeping friend, you, as a projected projector, should not be surprised if you receive an extraphysical counterapproach that is often terribly hostile from one or more intruders of the target-friend. They arise to simultaneously defend possession of their *prey* or their consensual space. In this case, there is no immediate alternative: you must extraphysically confront them, without fear or vacillation, doing your best in order to help these ill personalities, remaining confident that you will always receive powerful extraphysical assistance from the helpers, whether intangible or visible.

Uses. The following are 8 of the uses of temporarily extracting an intraphysical consciousness from his/her human body:

1. **Projectability.** Demonstration of the possibility of projecting during the period of natural sleep.
2. **Help.** Technical aid for the development of a friend's lucid projection.
3. **Development.** Elimination of the intraphysical projector's extraphysical idleness.
4. **Parapsychism.** Cooperation in the development of an intraphysical consciousness's parapsychism.
5. **Communicology.** Transmission of someone's edifying message, whether it is that of a helper, relative or friend which is an intraphysical being or an extraphysical consciousness.
6. **Paratelepathy.** Production of extraphysical telepathic prospecting.
7. **Cooperation.** Searching for the cooperation of the intraphysical being for positive extraphysical or even human tasks.
8. **Deintrusiveness.** Powerful aid in the services of interconsensual deintrusion of all types.

Bibliography: Baumann (93, p. 87), Cooke (300, p. 36), Dillon (402, p. 110), Farrar (496, p. 192), Lefebure (909, p. 65), Powell (1278, p. 90), Rogo (1444, p. 181), Smith (1574, p. 121), Vieira (1762, p. 57), Young (1895, p. 95).

348. UNAPPROACHABLE BEINGS

Definition. Unapproachable being: a human being or extraphysical consciousness in a difficult situation or an obviously critical position, wherein the projected intraphysical consciousness should avoid making an approach – for personal reasons or for the convenience of the projector or other beings – because any interference made by the projector (projected intraphysical consciousness) might unintentionally disturb that being (the target-being, in this case) or cause undesirable harm unintentionally.

Synonymy: critical target-being; interdicted being; untouchable being.

Intraphysicals. Among the intraphysical beings who are, in theory, unapproachable by the projected intraphysical consciousness, the following 3 merit singling out as examples:

1. **Driver.** The individual in a potentially dangerous condition, when driving a vehicle, whether it is a car, motorcycle or other vehicle.

2. **Worker.** The worker who is absorbed in the operation of machinery, which can cause a serious work-related accident.

3. **Barber.** The barber shaving a customer while holding the razor.

Surgeon. According to the theorice of unapproachable beings, for the purpose of research, the surgeon who is operating on the inactive human body of the intraphysical consciousness who is projected due to the effect of anesthetics should not be directly approached by the projected-patient-consciousness him/herself.

Perceptions. In the case of unapproachable human beings, the essential problem lies in the difficulty of the projected consciousness knowing, with certainty, if he/she will or will not be perceived by the intraphysical being – although this does not occur in the majority of cases – and when perceived, what that being's psychological reaction will be upon seeing the projector.

Meters. There are still no reliable meters, tracers or sensors for measuring parapsychic phenomena or the parapsychic reactions of the human being.

Extraphysical consciousnesses. Among the extraphysical consciousnesses that are unapproachable by the projected intraphysical consciousness, the following two, in theory, can be singled out:

1. **Suicide.** The extraphysical consciousness that is a recent arrival to extraphysicallity or the period of post-desomatic intermission and is extremely disturbed, as in certain cases of suicide, for example.

2. **Parasleep.** The extraphysical consciousness that is sleeping the so-called *restorative sleep*.

Conditions. Beings and places that are unapproachable to the projected intraphysical consciousness should be classified in the following manner, according to the projector's extraphysical condition on that occasion. The following 3 variables serve as examples:

1. **Hyperacuity.** Degree of lucidity: upon finding him/herself semilucid in a hostile environment, for example, it will be more prudent for the projector to return to the human body.

2. **Holosomatics.** Vehicle of manifestation: when in the mentalsoma, it becomes very difficult for the projector to have a direct influence upon intraphysical beings, human bodies or physical objects.

3. **Company.** Occasional company: it is *not advisable* for the projected projector to go for an extraphysical stroll with an ill extraphysical consciousness.

Bibliography: Monroe (1064, p. 164), Vieira (1762, p. 163).

349. EXTRAPHYSICAL-PHYSICAL SELF-TOUCH TECHNIQUE

Definition. Extraphysical-physical self-touch: the act of the projector touching his/her own human body while its consciousness is projected outside it in another vehicle of manifestation.

Synonymy: extraphysical self-embrace; self-tangibility.

Self-embrace. The *first* fully lucid consciential self-bilocation frequently leads the projected projector to an immediate subsequent *second* operation, which is not always feasible, of self-touch with the extraphysical arms (para-arms) of the psychosoma. This is soon followed by a *third* operation, the self-embrace or, in other words, embracing the human body, which remains inactive in a condition of inertia.

Face. The immediate physical point of self-touch is generally the face, as it is the area which is most accessible and most commonly seen. It is also the organic segment which identifies any person, followed by other areas of the human body.

Determining. The difficulties of self-touch and self-embrace lie in 2 determining factors:

1. **Proximity.** The close proximity of the 2 vehicles of the consciousness.
2. **Cord.** The preponderant action of the silver cord's mediation upon the projected intraphysical consciousness, inside the individual extraphysical psychosphere of consciential energy.

Reinteriorization. Both of these factors provoke an almost always irreversible abrupt reinteriorization.

Temperature. Upon touching it with the parafingers of the psychosoma, the human body can give the consciousness the sensation of being cold, like a cadaver, or hot, like a normal or feverish living being. These sensations depend upon the degree of the projected projector's self-awareness, his/her emotional reactions at that moment and his/her psychophysiological influences or, more precisely, his/her *parapsychophysiological* influences, upon his/her own extraphysical perceptions.

Trauma. Extraphysical self-touch commonly provokes a small trauma in the projected intraphysical consciousness, which thereby abruptly interiorizes into the human body which is touched. This can even bring about an inoffensive intraphysical repercussion.

Bibliography: Green (632, p. 45), Greenhouse (636, p. 62), Monroe (1065, p. 173), Vieira (1762, p. 109).

350. AURIC COUPLINGS

Definition. Auric coupling: the development of an empathy, interfusion and temporary union of the energetic auras of the vehicles of manifestation of two or more consciousnesses.

Synonymy: auric interfusion; empathetic coupling; energetic coupling; energetic Siamese twins; ephemeral consciential fusion; extraphysical xiphopagus; holochakral interpenetration; interaction of consciousnesses; occult polarity; parapsychic polarity.

Telemagic. Nothing occurs without an interaction. *Telemagic* is the attraction or sympathy existing between terrestrial objects and mother earth (geoenergy).

Gravity. Gravity, for example, represents a form of telemagic for physicists.

Pathemia. Pathemia, another form of telemagic, is the emotional relationship between things that are characterized, for example, by 3 factors relative to the psychosoma, the parabody of emotions:

1. **Attraction.** *Sympathy* (to feel *with*) or attraction, participation in the emotions of another.
2. **Indifference.** *Apathy*, per se, indifference or neutrality, insensitivity to the causes which habitually provoke emotions.
3. **Repulsion.** *Antipathy* or repulsion, the sentiment of disaffection, which reaches the point of open antagonism.

Empathy. Various concepts are based on pathemia, such as the following 7:

1. **Intropathy.** The *empathy* (to feel *as*), *unipathy* or *intropathy*, being a type of affective communion in which 2 beings identify with one another and conscientially understand each other in such a manner that they come to have the same sentiments; related to *rapport*, that mutual relationship between two or more persons which makes it such that each one is able to immediately and spontaneously respond to others.

2. **Implasty.** *Implasty* and other well-known phenomena such as the exteriorization of consciential energies.

3. **Sensitivity.** The exteriorization of sensitivity.

4. **Repercussion.** Physical repercussion during lucid projectability.

5. **Zoanthropy.** Zoanthropy.

6. **Stigmas.** Stigmas in general.

7. **Cord.** The connection process between the mentalsoma and the parabrain of the psychosoma through the golden cord.

Mimipathy. Aside from empathy, it is important to highlight the existence of *mimipathy*, the emotional state of the intellectual's mind when he/she is creating.

Cosmopathy. The state of *cosmopathy*, the detection of influxes of cosmic emotion: the maximal holothosene of the universe.

Tropisms. *Tropisms* and *tactisms* between inanimate realities, as well as between animate or living realities.

Machines. Attractions and repulsions between humans and machines – or the *human-machine relationship* – have been verified.

Films. It is common knowledge that the photographic film industry and other industries do not allow certain employees to process their film because these individuals damage it merely with the bioenergetic irradiation from their physical presence.

Telephones. Also, certain persons are not able to work in other specialized firms because they produce radio static, interfere in television films, or make telephones ring continuously without apparent cause.

Consanguineous. Successive, consanguineous intraphysical lives (existential seriation) can predispose the phenomena of profound auric coupling between individuals, particularly between mother and daughter, father and son, and others.

Polarity. Within parapsychic polarity, one position acts in opposition to the other. If the disturbing or entropic side exists, so does the constructive side also exist – whether it be the active leader or the receptive follower – and even the condition of auric coupling.

Exchange. All of the abovementioned occurrences show the subtle process that enables the exchange of emotions or, in other words, the affective reactions of great intensity, which are dependent upon the diencephalic centers and normally allow manifestations of a vegetative nature.

Emotions. Among the basic emotions, the following are included: happiness, grief (pain), fear, anger, love and repugnance. From these emotions, other consciential conditions arise, such as: attraction, compatibility, agreement, harmony, compassion, union, integration between two or more consciousnesses, which occurs intensely in the state of auric coupling.

Operations. The facts indicate that, in the current phase of *subhumanity*, the *consciential principle* (the individualized, human consciousness) does not submit itself to the following 4 arithmetic operations:

1. **Division.** It does not divide itself, as observed in the sensations of the phenomena of double awareness.

2. **Multiplication.** It does not multiply itself, according to the manifestations of the attribute of multiplicity of the psychosoma.

3. **Subtraction.** It does not undergo subtraction, according to the continuous evolution of the ego, because it neither backslides nor regresses, despite being able to remain stationary. The consciousness that remains stationary has already regressed in the march of evolution, because no one stops his/her thosenization process. This is why a prolonged sedentary life or physical inactivity signifies regression.

4. **Addition.** It is not possible to add (addition) one consciousness to others. Therefore, strictly speaking, so-called *soul mates* do not in fact exist, except for the expressions of romanticism or literature; also, definitive consciential fusions apparently do not occur, although interconsciential possessions do occur.

Phenomenon. Despite these occurrences, 3 types of the temporary phenomenon of auric coupling can occur:

1. **Intraphysiology.** Only between intraphysical consciousnesses.

2. **Extraphysiology.** Only between extraphysical consciousnesses.

3. **Multidimensionality.** Simultaneously between intraphysical and extraphysical consciousnesses.

Categories. According to the research theory, the following are the most common categories of auric coupling:

1. **Pairs.** Pairs of consciousnesses (evolutionary duo, mother and daughter, father and son, and others).
2. **Trios.** Trios of consciousnesses, including that between triplets.
3. **Groups.** Groups of consciousnesses, or consciential fields (groupkarma, group holothosene).

Contagion. Auric coupling presents energetic contagion.

Interaction. A simple auric duo can become amplified to the point where it forms an *auric group* – or a unified consciousness – with profound psychic interaction in which the isolated parapsychic aptitudes reinforce one another. This interaction is not easy, although it can be performed.

Classification. Auric couplings can generally be classified into physiological and pathological.

Physiological. Physiological or natural auric coupling encompasses various categories of two or more beings, such as the following 27 examples listed in alphabetical order:

1. Certain young (subhuman offspring).
2. Conscientiotherapist-evoluent.
3. Extraphysical master-disciple.
4. Father-son.
5. Godfather-godchild.
6. Hen-chicks.
7. Horse-rider integration.
8. Hypnotist-sensitive.
9. Leader-follower, whether political duos or religious professional duos.
10. Mother-daughter.
11. Partner-partner in an evolutionary duo or husband-wife.
12. Penta practitioner-helper.
13. A physically and extraphysically impassioned couple.
14. Physician-patient.
15. Preacher-*sinner*.
16. Pregnant woman and fetus or fetuses.
17. Projector-helper.
18. Prophet-interpreter.
19. Psychologist-patient.
20. Psychophonic sensitive-communicant.
21. Salesperson-customer.
22. Sensitive-extraphysical mentor or helper.
23. Sister souls or individuals who have a deep affinity and friendship.
24. Teacher-student.
25. Telepathic message emitter-receiver.
26. Therapeutic energy donator-recipient, as with exteriorization of consciential energies.
27. Uniovular or monozygotic, monochorionic and monoamniotic twins.

Pathological. The following is an alphabetical listing of the 8 most frequent pathological (or parathological) auric couplings:

1. Animal symbiosis.
2. A crowd of rioters.
3. A group of ill personalities, such as those with convulsive manifestations.
4. Group or collective hysteria.
5. Intrusion victim-intruder duo.
6. Lynch mob.
7. Mutinous persons (ship, rebellion).
8. Pregnant woman-intrusion victim-intruder trio.

Group. Auric couplings comprising more than 3 consciousnesses generally tend to become ill or pathological. There are those who affirm that this is the reason why Jesus of Nazareth *promised* to be present in groups of two or 3 persons who were gathered in his name and not in the middle of simply any crowd.

Efficiency. The most effective energetic transmission is always human aura-to-aura, or more precisely, the chakra-to-chakra donation of energy.

Crowd. A human, as an individualized consciousness, when a member of a crowd – a mass of heterogeneous elements – loses his/her personal identity, the ability to reason logically, moral choice, and the sense of individual and collective responsibility.

Crises. The suggestibility, excitability and energetic intoxication of the masses makes the individual, a member of the group, cease to have a personal opinion or will. This individual, who is subject to crises or sudden and violent attacks of hate, as well as enthusiasm, panic, and imposed, simultaneous, transmitted multiple madness, becomes capable of perpetrating the most heinous and gratuitous acts of violence against others and even him/herself. The abrupt immersion in the group holothosene, or the act of yielding part of one's own identity almost always represents a type of instantaneous, individual self-intrusion.

Worse. Individuals, in the midst of a crowd – inebriated without having ingested any drink – are thus worse in all aspects. The elements of a crowd level out to the lowest common denominator. Although union provides strength, a meeting of good individuals will not generally obtain an excellent result. It will often have a mediocre result and frequently one that is even worse.

Exception. It seems that the only existing exceptions regarding the auric coupling of more than 3 consciousnesses are those related to the human gestation and birth of quadruplets, quintuplets, sextuplets, or other healthy couplings. This may occur because the consciousnesses, in these cases, are under the more rigorous action of the pronounced physical restriction of fetal life (e.g.: the fetal aura is smaller in various aspects), and the powerful influence of the ego and the vehicles of manifestation of the pregnant woman's consciousness, logically including her human body.

Interactions. Aside from the auric couplings mentioned above, there are 4 specific interactions with nature, listed in decreasing order:

1. **Zoology.** Interorganismic communications, or the so-called *primary consciousness*.
2. **Humanity.** The human consciousness with the subhuman pet animal.
3. **Botany.** The phenomenon of the person with a *green thumb* and the plant which is zealously cared for.
4. **Matter.** Interactions of the consciousness with inanimate bodies (human-machine), such as the favorite object or that of personal use, the individual instrument and its owner: technician-electronic apparatus; virtuoso-violin; pianist-piano; automobile-driver/owner; airplane-pilot/owner; boat-fisherman/owner; and others.

Phenomena. The occurrence of auric coupling also acts in the predisposition and triggering of a series of phenomena that are substantially closely related and require further research, such as the following 4 examples:

1. **Parasurgery.** Parasurgery, performed indirectly by a third person who is interposed, being situated between the parasurgeon and the patient.
2. **Pharmacology.** A contact high related to light and heavy drugs.
3. **Projectiology.** The occurrence of projective contagion.
4. **Holochakrology.** The assistential technique of exteriorization of energies by three.

Ephemeral. Auric coupling, even if ephemeral, always occurs between the 2 partners of sexual union, in parapsychic trance and in hypnotic trance.

Hetero-hypnosis. The practically omnipresent phenomenon of hetero-hypnosis, or hetero-suggestion, evidences a continuous spectrum of possibilities that coexist with humans in all fields of their activities, starting with the simplest social gatherings. The facts show that this aspect of auric

coupling will be studied more deeply in the future in order to reduce widely practiced abuses in modern intraphysical society in the area of communication, political advertising, artistic areas and many others.

Rituals. In the mystical meetings of sects as well as in syncretic religious rituals, the prayers which are spoken out loud, the formation of healing circles, the music, the chants (mantras), the reliance on hymns, group dances, the cadences of the maracas and other hypnotic resources, have the purpose of installing a trance or an altered state of consciousness. This is achieved through the energetic maintenance of all those who are present, harmonizing them with these and other psychophysiological crutches in a single flow of energy or, in other words, creating auric coupling between all the participants.

Spheres. In many occurrences of auric coupling, the influence of the extraphysical psychosphere of the energy of each intraphysical consciousness involved enters into action.

Projections. Projections of the consciousness gradually enable the intraphysical consciousness to extraphysically and directly verify – and even make use of the sometimes profoundly shocking reality of – the affinities and antipathies of auric couplings between all types of beings.

Syndrome. The Stendhal syndrome (Henry Beyle: 1783-1842), or Freud's sense of being overwhelmed is the noble and elegant malaise or shock that some healthy tourists and visitors, who are highly sensitive and of good taste, manifest – notably persons between two and four decades of physical age, who are single or alone – when face-to-face with the beauty of artistic (paintings and sculptures) and extraordinary architectural works of famous museums, palaces, galleries and monuments.

Symptoms. The most typical symptoms of the state of esthetic exaltation of the Stendhal syndrome are the following 6:

1. Physical indisposition.
2. Vertigo.
3. Loss of orientation in space and time.
4. Confused state.
5. Sensations of abandonment, impotence and depression.
6. Crisis of amnesia (sometimes).

Case study. The most classic examples of works of art and more frequent examples of artistic monuments which cause shock, vertigo and delirium are found in Florence, the capital of Tuscany, Italy. The following are 5 examples:

1. **Brunelleschi.** Brunelleschi's cupola (Filippo Brunelleschi: 1377-1446).
2. **Botticelli.** Botticelli's *La Primavera* (Sandro di Mariano Filipepi Botticelli: 1444-1510).
3. **Michelangelo.** Michelangelo's *David* (Michelangelo Buonarroti: 1475-1564).
4. **Tiziano.** A painting by Tiziano (Tiziano Vecellio: 1490-1576).
5. **Caravaggio.** A painting by Caravaggio (Michelangelo Merisi Caravaggio: 1573-1610), the last 2 in the Galeria Uffizi.

Greece. Other examples of the Stendhal syndrome are reported to occur when in the presence of artistic and architectural works in Athens, Greece.

Mechanism. These facts occur due to the more intense *rapport* (or empathy) or the interaction of auric coupling between the visitor and the art objects (energy accumulators), or that environment (holothosene, psychometrizing). They become charged with consciencial energies which accumulated over time as a result of intraphysical consciousnesses being there, contemplating them ecstatically and depositing a portion of their personal energies in those objects. The more recent visitor therefore experiences the trauma of the initial departure of the consciousness from the state of holosomatic coincidence, or the exteriorization of energies of the holochakra (energetic parabody), notably those of the cardiochakra, or even the greater dis coincidence of the psychosoma (emotional parabody).

Discoincidence. This occurs regardless of the individual being aware of his/her parapsychic attributes and can lead him/her to a temporary state of waking dis coincidence.

351. EXTRAPHYSICAL HELPERS

Definition. Extraphysical helper: beneficent extraphysical consciousness, existing separately from protoplasm, which aids the intraphysical consciousness during extraphysical departures, in the periods experienced outside the human body as well as in human life during the ordinary, physical waking state.

Synonymy: angel of death; angel of light; being of light; extraphysical advisor; extraphysical aide; extraphysical ally; extraphysical assistant; extraphysical cicerone; extraphysical companion; extraphysical control; extraphysical copilot; extraphysical escort; extraphysical gatekeeper; extraphysical ghostwriter; extraphysical guardian; extraphysical master of ceremonies; extraphysical master; extraphysical mentor; extraphysical midwife; extraphysical partner; extraphysical protector; extraphysical tutor; facilitator of self-lucid projection; “god;” “gods;” friend entity; hidden instructor; hyperphysical being; initiator; intangible mentor; invisible assistant; invisible worker; projector’s hidden friend; protector spirit; psi entity; radiant apparitional being; spiritual benefactor; *supersoul*; trailblazer.

Categories. Among the types (categories) of extraphysical helpers, the following 10 can be singled out:

1. Extraphysical technician of projections of the consciousness.
2. Extraphysical master.
3. Man, woman, child: with regard to extraphysical appearance.
4. Former relative, former friend, former colleague, former convict, or even an apparent stranger, of greater affinity, which has already undergone desoma.
5. Intangible presence.
6. Helper of explicit assistance.
7. Deintruder.
8. Extraphysical police.
9. Desoma facilitator (first desoma).
10. Holochakra deactivator (second desoma).

Former relatives. There are projectors that, for example, evoke a helper-father, helper-mother, helper-sister or helper-cousin.

Extraterrestrials. Only continued extraphysical experiences allow the projector to distinguish terrestrial helpers from extraterrestrial helpers by their extraphysical forms, sensitivities and peculiar occupations that transcend this planet’s atmosphere.

Fringe benefits. Among their attributes or the *extraphysical fringe benefits* furnished by the helper to the projected human projector during the consciencial projection, with the aim of providing extraphysical assistance, the following 10 can be singled out:

1. **Assistance.** Frequent intangible, invisible or subtle extraphysical assistance; less frequent, explicit, tangible or direct extraphysical assistance.
2. **Awakening.** Sponsoring of extraphysical awakening as well as lucid and semilucid, assisted and commanded projections.

3. **Contacts.** The establishment of interconsciential encounters or contacts.
4. **Education.** Execution of didactic visual projections (pedagogy, education).
5. **Energies.** Energetic support: transmission of consciential energy.
6. **Lucidity.** An increase in the lucidity and self-awareness of the projected consciousness.
7. **Mentalsomatics.** Direct manifestation by the extraphysical consciousness in the mentalsoma, approaching the intraphysical projector's mentalsoma.
8. **Projectability.** Efficient aid in physical moments (related to consciential projection) and in extraphysical situations.
9. **Suggestions.** Promotion of inspiration or the transmission of intuitive suggestions.
10. **Volitation.** Extraphysical dislocation with volitation in group.

Relationship. In the normal relationship between the intraphysical consciousness and the helpers, there are no traces of mysticism, human preconceptions or artificiality in conduct. When this does occur, it indicates the presence of an extraphysical blind guide, an energivorous or needy extraphysical consciousness, or a deceased relative, which is not a helper: a technical and universalistic extraphysical consciousness within the world of solidarity and interconsciential assistance.

Para-appearance. When the helper wishes to provide assistance, it even takes on the appearance or the para-appearance of either gender, or even both genders, if necessary.

Call. The projector calls the helper through spontaneous and heartfelt evocative thought.

Evolution. While human bodies are resting during natural sleep, intraphysical consciousnesses project to extraphysical districts, communities or consciential environments with which they have an affinity. In projections guided by a helper, the projector goes to disagreeable as well as advanced extraphysical districts that do not correspond to the projector's level of discernment or evolution.

Technicians. Helpers are a specific type of extraphysical consciousness, being more common than others in extraphysical relationships with projected intraphysical consciousnesses. This is because they are *experienced experts* or technicians (specialists) in projectiology, although their appearances while working, para-appearances or *extraphysical physiognomies* vary infinitely.

Reality. Leaving the human body many times with lucidity, the intraphysical consciousness eventually encounters someone who, most often, is a helper. After various contacts with different helpers, the projector – as rigid in principles and skeptical in human conditioning as he/she may be – becomes convinced they are not fruits of the collective consciousness, much less archetypal figures or universal hallucinations, but tangible personalities, real intelligences and independent, active consciousnesses.

Cooperation. Regardless of the names that are given to them, such as guides, mentors, angels, guardians, extraphysical assistants or liberators, and the spectrum of their extraphysical appearance – a man on a throne, Tibetan monk, luminous apparition, point of colored energy, child, woman, friendly old man, relative, friend, stranger – helpers always efficiently cooperate with the projected intraphysical consciousness because it is their task under all circumstances.

Graduation. However, it is important to emphasize that, just as with any technician in any area of human service, the level of competence varies from helper to helper, this being one of the reasons for the diversity of forms in which they present themselves.

Hyperacuity. There are helpers that are equal to ourselves and those that are extremely lucid, the presence of which transmits a balance and serenity far removed from that of the planetary climate.

Merit. Every projector has the helper that he/she merits, according to the projection that is experienced. The services of the helpers are broader, more constant and sophisticated than we imagine at first sight.

Retention. The helpers, which are well-versed in the mechanics of lucid projection, trade off with each other according to the needs of their tasks. It should be remembered that, in the same way that they help the intraphysical consciousness temporarily leave the human body, the helpers also aid one to remain in the human body, detaining the individual in the intraphysical dimension without projecting, whenever circumstances require it for the benefit of the projector, who is sometimes unaware of the reasons for this procedure.

Programming. In projections guided by the helpers, the projector's possibilities of observation and analysis are programmed. The projector sees and recalls only what the helpers decide to expose. While outside the body, the projector enjoys a conditional freedom regarding great objectives that transcend his/her position as an obscure worker at the lowest echelon of the team or, in other words: a self-aware *minicog* engaged within a *maximechanism* of interconscial and multidimensional assistance. In this realistic situation, the intraphysical being ends up feeling entirely secure in his/her works of solidarity.

Mnemosomatics. The frequent suggestion made by the helpers not to record the recollections of selected extraphysical experiences which are part of a series of lucid projections serves to corroborate the selectivity of post-projective recall.

Areas. Upon continuing to have projective experiences, the intraphysical consciousness interrelates with extraphysical consciousnesses of diverse areas of interest, schools of learning, philosophies and extraphysical occupations, notably the following 6:

1. **Aborigines.** Beings who lived in South and North America, and still have common interests regarding life and nature. They deal with so-called *witchcraft*, shamanism, Afro-Brazilian worship services and parapsychic practices pertaining to the Spiritist movement. They are predominantly found in certain areas of paratropospheric environments. Among their leaders are a large number of magnetizers and technicians specialized in works performed together with subhuman beings or extraphysical consciousnesses that preserve nature.

2. **Africans.** Beings that come from previous intraphysical lives which occurred in primitive African tribes predominate in extraphysical environments of this continent, and act upon the 3 Americas. They extraphysically maintain parapsychic and religious cults and syncretisms in many countries.

3. **Asians.** Extraphysical beings with recent human experiences or, in other words, in the last few centuries, in India, Tibet, China and surrounding areas. They cultivate individual practices of primary intraconscial illumination among humans. They possess physical-extraphysical recourses which are more deeply rooted in antiquity. They are enthusiasts of primary research, lacking a higher level of cosmoethics from the mentalsomatic dimension. They are mostly proponents of Asian religions, including Zen, Yoga and Orientalism. They are generally inexperienced regarding interconscial deintrusion and are still very attached to egoistic processes (*siddis*).

4. **Magnetizers.** Extraphysical consciousnesses which almost always have holobiographical roots (existential seriation) in Europe. They are mostly engaged in paratropospheric activities related to extraphysical assistential tasks at Masonry centers, a great number of fraternal organizations and lines of antiquated esoterism.

5. **Sensitives.** Extraphysical consciousnesses with holobiographical experiences (existential seriation) in Western countries where they performed tasks in the field of parapsychism. They are consciousnesses involved in extraphysical assistance with all other groups of paratropospheric extraphysical consciousnesses, spiritists in general, umbandists, extraphysical former indigenous people and exorcist Pentecostals.

6. **Artists.** Groups of extraphysical consciousnesses that motivate artists in general, intellectual sensitives, authors, researchers and cultural institutions.

Preconceptions. The existence and activities of the extraphysical helpers are some of the most interesting and more frequently forgotten aspects in the experimental field of projectology. This is due to the scientific and religious preconceptions, stereotypes, archetypes, taboos and group abdominal brainwashing that still surround the subject.

Master. In parapsychic studies, it is common to affirm, "When the apprentice is ready, the master appears." Lucid projection enables the more lucid intraphysical consciousness to invert and transcend this affirmation. This is because the consciousness itself leaves the human body, *re*discovers extraphysical realities, expands the consciousness and renews its own way (intraconscial recycling, existential recycling). The projector therefore ends up finding the extraphysical benefactor (helper) that inspires the individual's existence and amplifies recollections of his/her intermissive course.

Exchange. Contact and prolonged or continuous exchanges between an intraphysical consciousness and an extraphysical consciousness depend upon conditions and factors that are not only related to the intraphysical consciousness but also to the extraphysical consciousness, both of which are important types.

Types. Prolonged low-level (tropospheric) exchanges with an extraphysical consciousness that is still constantly tied to a human mentality, appetites and sensations are always easier and more common to achieve. On the other hand, a prolonged high-level exchange can only be maintained in the mentalsomatic dimension, through the mentalsomas of the consciousnesses, after a certain period of continued cosmoethical experiences.

Extraphysical consciousness. As the extraphysical consciousness gradually refines its sensations and interests, its contact with humans becomes progressively more difficult. Remaining hereabouts then represents a personal sacrifice directed toward assistance to the components of its evolutionary group.

Sources. This is why more long-lasting extraphysical contacts only occur with two simultaneous sources.

1. **Laborer.** With the still unevolved, unpredictable, paratropospheric extraphysical consciousness or the *extraphysical laborer*, with a predominance of former influences from the cerebellum, psychomotricity and the *abdominal sub-brain* related to its retrosomas.

2. **Master.** With the evolved extraphysical consciousness, *distant* from the human atmosphere, or the *extraphysical master*, with a predominance of the former influences from the brain and mentalsoma related to its retrosomas.

Extraphysical consciousnesses. The majority of more developed human sensitives enable the intermediation of 2 basic types of extraphysical consciousnesses – though they may or may not be aware of this fact – and with the clear predominance of 1 type or the other:

1. **Workers.** *Extraphysical workers*, which are able to remain close to the earth for longer periods, being dedicated to tropospheric tasks, restricted to the psychosoma, using parapsychic transmissions that are more mechanical or motive, *manual*, on the *planetary surface*. They are more involved in the consolation task and groupkarmality (a great number existential miniprograms).

2. **Intellectuals.** *Extraphysical intellectuals*, dedicated to creative mentalsomatic tasks – which endeavor to operate through the mentalsoma, in more subtle parapsychic transmissions (pangraphy) through mental waves, without predominantly using the sensitive's nervous and muscular or motive system. They are more involved in the clarification task and polykarmality (existential maxi-program, macrosomatics).

Transfigurations. Extraphysical consciousnesses are multifaceted and many of them are sufficiently open, in evolutionary terms, to perform assistance to intraphysical consciousnesses in their trials and tribulations. This is the case whether consoling or clarifying, when evoked in a thousand ways through countless human procedures. They appear in a transfigured manner to the individual, respecting personal habits, customs, traditions, archetypes, beliefs and conditioning.

Characteristics. This is why they are characterized or present various personal traits, such as the following 4:

1. **UFOlogy.** The powerful, exotic, extraterrestrial extraphysical consciousnesses appearing to UFO enthusiasts.

2. **Civilization.** Humanoid beings of light appearing to the so-called civilized human.

3. **Syncretisms.** The personalities of the *preto velho*, peai and other forms, in the many Afro-American syncretic manifestations.

4. **Indigenous.** In the form of an immense eagle, a living black panther and other subhuman animals considered to be inferior, to more primitive indigenous peoples.

Service. Those who think that departures from the human body appear to be tours or simple nocturnal touristic excursions without any noble objective at first sight, are mistaken. Wherever an extraphysical helper appears, edifying fraternal work is being performed.

Maturity. *Conducting scientific work* with evolved consciousnesses is always far more relevant, productive and gratifying than *conducting religious work* with these same consciousnesses. It is a question of consciential maturity.

Coherence. The tasks of interconsciential assistance performed by the extraphysical helpers are disciplined, strict and continuous, being very different from those of the extraphysical blind guides.

Case study. It was impressive and confirmative of the author's contention to encounter for the first time an unknown, impactful and unforgettable helper working alone in an assistential task in a paratropospheric environment. Only 4 terrestrial years later, the author encountered this same coherent and perseverant extraphysical consciousness with the same appearance. It was acting alone in the same manner and line of work, but in another extraphysical assistential task and a different paratropospheric district, aiding another being with diverse needs.

Projector-helper. The experienced projected consciential projector can serve as a helper for a novice projected consciential projector.

Rotation. Today's intraphysical consciential projector can be tomorrow's helper, and vice versa, in the multiexistential rotating cycle of successive intraphysical lives and intermissive periods.

Serenissimi. *Serenissimi (Homo sapiens serenissimus)* are parapsychically evolved helpers, true fulcrums of anti-emotive operant serenity exhibiting extreme and constant inner and outer tranquility in all extraphysical actions. They always present a clear psychosphere, namely one devoid of *consciential clouds*.

Harmony. *Serenissimi* are not robots, cyborgs, mutants, unclassifiable mannequins or statues. They are consciential worlds that are harmonized and made peaceful by elevated sentiments, illuminating ideas and awakened will.

College. An Invisible College of the *Serenissimi* exists. The *serenissimi* have extraphysical teams for providing continuous interconsciential assistance.

Scale. In an ascending evolutionary scale, a distinction can be made between pre-*serenissimi*, helpers, petifree consciousnesses, evolutiologists, *serenissimi* and free consciousnesses (FCs).

352. LUCID PROJECTION AND EVOCATION

Definition. Evocation (Latin: *evocatio*, to call forth with energy): the willful act through which the extraphysical presence of extraphysical consciousnesses or projected intraphysical consciousnesses are summoned and end up appearing to the evocator, whether in the paratropospheric dimension or distant from the intraphysical dimension.

Synonymy: consciential summons; consciential tracking; directed supplication; evocatory act; extraphysical summons; invocation; telepathic convocation; telepathic tracking.

Telepathy. It is above all worth highlighting that, in almost all of its categories and manifestations, evocation constitutes a strictly telepathic effect between two or more consciousnesses.

Categories. The basic categories of evocation vary according to the aspect in which the facts are analyzed. The following 14 are listed as examples:

1. **Lucidity.** Conscious evocation or that which is produced intentionally.
2. **Unconsciousness.** Unconscious or spontaneous evocation.
3. **Projective.** Projective evocation or that which is inserted into the context of the extraphysical events of lucid projection.
4. **Waking.** Waking evocation or that which is produced during the ordinary, physical waking state.

5. **Extraphysical consciousness.** Evocation of an extraphysical consciousness or a projected intraphysical consciousness.

6. **Target.** Evocation of a target-being, target-place or target-idea, as places and objects can be evoked.

7. **Thosenic.** Evocation by thoughts (self-thosenes), through spoken words or gestures.

8. **Chronological.** Immediate, delayed or anticipated evocation.

9. **Health.** Positive or healthy evocation.

10. **Pathology.** Negative, uncomfortable or pathological evocation.

11. **Natural.** Natural evocation.

12. **Ritual.** Ritualistic evocation.

13. **Formulated.** Evocation with an evocative formula.

14. **Self-evocation.** Self-evocation or one regarding the consciousness' own microuniverse.

Induced. Besides the abovementioned evocations, probings and personal evocations induced through the stimulation of electrodes in different parts of the human brain were conducted in the laboratory, thereby exhuming long forgotten memories and sentiments.

Sentiments. Patients did not feel any discomfort with these tests because the brain does not have nerve endings for registering pain. It became evident, however, that not only were past events registered in detail, but also the sentiments associated with these events. In this way, an experience and the particular sentiment associated with it are interconnected such that one cannot be elicited without the other.

Thosenology. This occurrence serves to corroborate the principles of the thosene and the studies of thosenology, based on the fact that these 3 elements – thought, sentiment and conscial energy – manifest themselves together constantly and indissociably through our consciousnesses.

Recollection. The evoked recollection is not an exact photographic or phonographic reproduction of past scenes or events, but the reproduction of what the patient saw, heard, felt and understood. In this case, the intraphysical consciousness operates together with the mentalsoma and psychosoma upon the human body (cerebral hemispheres) through conscial energies.

Consciousnesses. Evocation, even when it is a conscial process without the direct participation of any other awake being, occurs efficiently and triggers telepathic processes including those with other extraphysical consciousnesses residing on earth, as well as extraterrestrial, intraphysical and extraphysical consciousnesses residing on other planets. This is the reason for the natural connection between projectiology and *naphology* or the concern with conscial lives on other heavenly bodies in the cosmos.

Agents. Among the most relevant factors involved in the phenomenon of evocation of consciousnesses, linking agents or psychic connections should be highlighted, such as the face of the evoked being and notably the recollection of his/her eyes.

Name. Besides this, the name of the person, specifically his/her nickname, known only to a small circle of friends, serve as powerful agents of *rapport*, affinity or empathy.

Oligophrenics. Extraphysical oligophrenics neither perform fluent extraphysical telepathy nor do they coordinate critical judgment in a normal fashion. This is because they are not able to maintain mental concentration and, due to their general conscial deficiencies, they have neither syntony of thought nor sufficient mental resources to respond to conscious and unconscious evocations from intraphysical consciousnesses.

Somatics. The projected projector's thought regarding his/her distant inactive body – which sometimes makes him/her return to the physical base and even interiorize abruptly and unexpectedly – and retrocognitive recall, or that regarding the consciousness' previous intraphysical life (personal retrosoma), can sometimes be classified as self-evocations.

Existential seriation. More rarely, self-evocations can involve personal multi-existential or interconscial aspects.

Case study. The author is aware of many cases of evoking intraphysical consciousnesses in which the presence of a personality – that had supposedly already been living in the intermissive

period for a long time – was called upon. However, in these cases, it was that selfsame person in one of his/her prior human existences (holobiography, retrosoma).

Occurrences. Multi-existential self-evocations can generate the following 3 unexpected occurrences, among others:

1. **Intrusiveness.** The *paradoxical intrusion* by an intruder which seeks to pass as the evoked personality or, in other words, to take the place of the *evoked personality*, and which the evoker does not identify as not being the personality he/she is evoking (negative or pathological, interconscial).

2. **Personification.** The predisposition of animic phenomena, in this case, a phenomenon of unconscious mystification, personification or incorporation of oneself, one's own personality, in the conditions of the previous human life (negative and, in many cases, pathological in regard to holosomatics and psychosomatics, intraconscially speaking).

3. **Self-retro-cognition.** The pluri-existential recollection of the intraphysical consciousness, who definitively identifies him/herself as the evoked person (relatively positive or healthy regarding the expanded consciousness' access to his/her holomemory). In this case, he/she can be aided by an extraphysical helper acting as a triggering factor of the phenomenon.

Identification. In line with the preceding presentation, self-evocation or the phenomenon in which the evocator and the evoked personality are the same consciousness, should be included as an existing resource – albeit not always easy to execute – for the intraphysical consciousness to identify and research his/her own past human lives. Certain cases of spontaneous, unconscious self-evocation should also be included when the occurrences of animic personification seem to be characterized as a conscial disturbance pertaining to the area of parapsychopathology of the mentalsoma.

353. CONSCIOUS EVOCATION TECHNIQUE

Definition. Conscious evocation: a mental summoning intentionally made by the consciousness.

Synonymy: intentional evocation; premeditated evocation; voluntary evocation.

Positivity. You, as a lucid projector, can use conscious evocations in a positive manner not only in the ordinary, physical waking state, but also when lucidly projected in the extraphysical dimension, as long as you pay attention to the following 6 essential factors:

1. **Objectives.** The productive, healthy or cosmoethical objectives of your evocation.
2. **Personality.** The characteristics or personal traits of the personality of the evoked being.
3. **Holothosene.** The circumstances regarding the environment or the specific context (personal holothosene, notably that of the evoked being) on the occasion of the evocation.
4. **District.** The district or community where the evoked consciousness is supposedly located.
5. **Self-thosenity.** The evocator's current psychophysical condition (self-thosenity, intentionality, animus or motivation).
6. **Consequences.** The anticipated analysis of the consequences subsequent to your evocation.

Uses. Among the main practical applications of the evocatory phenomenon for the lucid evoking projector (you), the following 4 can be singled out:

1. **Interview.** A useful interview or encounter with a certain being, that has been shelved for a long time and has still not been realized.
2. **Assistance.** Assistential aid provided to extraphysical consciousnesses which generally have not undergone the second desoma, or the discarding of the entire holochakra.

3. **Hetero-awakening.** An encounter with a loved one – an empathic personality in your life – provoked by intentional evocation, in order to prove its own desoma to it or its extraphysical, intermissive, consciential hetero-awakening.

4. **Subhuman.** An extraphysical encounter with a former subhuman animal or a pet, which is now an extraphysical consciousness (subhuman consciential principle, parazoology).

Technique. Direct evocation can be used as a process whereby you project with lucidity. Get a photo, personal object, or piece of clothing belonging to a personality which is now an extraphysical consciousness that you wish to contact (obviously one which you presume to be in good, non-intrusive, extraphysical, intraconsciencial condition). Then think intensely about this for a long time. You should reflect on the person and try to remember some of the experiences you shared with this conscientially evolved personality with whom you always had affinity or empathy.

Absence. The evoked being does not always appear to the evoker. All categories of intelligences or consciencial principles can be evoked for a useful purpose. However, the evoked being will not always be willing, available, or in a condition to show up. This is due to various impediments, which can even frequently be against its will.

Avoidances. Evidently, evocation of intraphysical consciousnesses with a debilitated human body should be avoided, such as: seriously ill persons, ill aged persons, infants, and all intraphysical consciousnesses who underwent desoma with personal problems regarding their existence in the extraphysical dimension, as well as problems stemming from the extraphysical dimension.

Spontaneity. There are intentional evocations which are so spontaneous that they seem unconscious because the evocator is actually not aware that he/she is performing an evocation. Here are 2 examples: the simple recollection of a distant location and, often, of an object which one has not seen for a long time; a mental supplication directed to an extraphysical mentor.

Biographers. The greatest technical evocators are biographers of deceased personalities or extraphysical consciousnesses which were celebrities or *former persons* that are cherished through the memories of the *populace*.

Bibliography: Kardec (825, p. 366), King (846, p. 173), Mittl (1061, p. 8), Monroe (1065, p. 112).

354. UNCONSCIOUS EVOCATIONS

Definition. Unconscious evocation: a mental summons made unintentionally and in an unnoticed manner by the intraphysical or extraphysical consciousness, whether in the physical or extraphysical dimension.

Synonymy: involuntary evocation; uncomfortable evocation; unexpected evocation; unintentional evocation; unnoticed evocation; unpremeditated evocation.

Contumacious. There are unconscious contumacious evokers among persons of advanced age (from sixty-five years of age and over) who lack adequate intraconsciencial preparation and are not accustomed to the mechanisms of exchanges between the spheres of consciencial life.

Energivorous. These persons provoke the living and frequently uncomfortable presence of energivorous consciousnesses which appear in order to seek help or speak with unbridled frankness, through the self-thosenes charged with tropospheric human emotions from which they are still not detached.

Avoidance. Unconscious evocations should always be avoided because, in most cases, they have negative consequences, beginning with the unwary evoker him/herself. They can also provoke transitory or permanent intrusions. This is why the lucid projector, whether in the ordinary, physical waking state, or in the extraphysical dimension, should be alert regarding his/her real intention, as well as the nature and quality of personal thosenes.

Semilucidity. Unconscious evocations are common to semilucid intraphysical projectors who have extraphysical experiences that are mixed with oneiric interurrences. They almost always take them to be simple dreams or nightmares (altered states of consciousness), reminiscent of personalities from the dreamer's past.

Bait. In certain cases of *anticipated evocation*, the projector, while in the ordinary, physical waking state, makes an unconscious evocation of a being and later comes face-to-face with that same being during the consciential projection. This evocation operates similar to the process of physical and extraphysical interconsiential, assistential bait.

Agents. Foremost among the more common and active evocatory intermediary agents in the production of unconscious evocations is the nostalgic viewing of old family photo albums and verbal, direct, humorous, irreverent and many other types of observations made in front of the portraits of ancestors in the family gallery (groupkarmality).

Bibliography: Vieira (1762, p. 121).

355. EXTRAPHYSICAL MANIFESTATIONS OF THE SENSITIVE-PROJECTOR

Types. Among the extraphysical manifestations of the sensitive-projector, at least the following 8 can be singled out:

1. Extraphysical intuition.
2. Close or distant clairvoyance.
3. Clairaudience.
4. Extraphysical psychophony.
5. Extraphysical retrocognition.
6. Extraphysical precognition.
7. Energetic exteriorizations by three.
8. Group evocations.

Conditions. The consciential condition of the sensitive-projector varies during parapsychic manifestations in the extraphysical dimension and can be passive, in a trance, or lucid, either with complete self-awareness or with semi-awareness.

Psychosoma. The vehicle that is best suited for the sensitive-projector's extraphysical manifestations is the psychosoma, when it is reasonably laden with the holochakra.

Phenomena. The sensitive-projector's deep extraphysical passivity, during the phase of intense activity, can predispose various post-projective phenomena, especially post-projective energetic showers and the condition of waking dis coincidence. Both phenomena are healthy and have gratifying effects.

Bibliography: Currie (354, p. 107), Greenhouse (636, p. 173), Smith (1572, p. 110), Turvey (1707, p. 170).

356. PHYSICAL MANIFESTATIONS OF THE COMMUNICANT-PROJECTOR

Definition. Communicant-projector: the intraphysical consciousness who manifests through a human sensitive as though he/she were an extraphysical consciousness.

Synonymy: intraphysical communicant; intraphysical consciousness-communicant; intraphysical consciousness-possessor; intraphysical possessor.

Types. Projective psychophony is the communicant-projector's most common physical or human manifestation. Besides this, energization by three and the apparition of the intraphysical projector should be listed, including his/her presence at the deathbed of persons who are about to undergo desoma (terminally ill persons, ICU). On these occasions, the intraphysical consciousness is usually found to be sleeping, or at least semi-awake.

Personalities. The communicant-projector can manifest as his/her current personality or in the form of one of his/her prior personalities or, in other words: from one of his/her previous intraphysical lives and, therefore, like a person who has already undergone desoma.

Density. The facts show that the psychosoma's density diminishes due to its distancing from the organism which it left – taking the consciousness with it – in order to manifest through an intraphysical sensitive.

Possession. Rare cases of possession of the intraphysical being by a projected consciousness of another intraphysical being have been registered. These perfectly characterize the phenomenon of the communicant-projector, in this case, the possessor-projector and the possession-projection. These facts are doubtlessly always brief, cyclic and pathological or parathological.

Bibliography: Aksakof (09, p. 534), Armond (53, p. 87), Currie (354, p. 107), Delanne (381, p. 136), Denis (389, p. 162), Gauld (576, p. 265), Müller (1107, p. 239), Oesterreich (1145, p. 27), Rigonatti (1402, p. 82), Souza (1585, p. 122), Turvey (1707, p. 175).

357. ENERGIZATION BY THREE TECHNIQUE

Definition. Energization by three: the transference of consciential energy transmitted by a helper through 2 sensitives at the same time, one being a *lucid projected* intraphysical consciousness and the other being an intraphysical consciousness in a conventional *parapsychic trance*.

Synonymy: compound energetic transfusion; compound extraphysical energization; energization by 6 hands; transference of compound consciential energies; triple energization.

Participation. The author has already participated in assistential-parapsychic activities outside the human body as a projected projector with complete lucidity. One of them is precisely the transmission of consciential energies by three in *kardecist* (Spiritist) parapsychic sessions in domestic environments, as well as others in *terreiros de Umbanda* sessions.

Universalism. Actually, this is one of the reasons the author declares himself to be openly universalistic. Although understanding human reactions in this case, he does not defend the excesses of *parochial purism* or *egoistic entrenchment* in the practice of any doctrine, principle, theology, religion or sect. These should be universalistic, above all, but never are and cannot be. This is because of the doctrinaire, fundamentalist, orthodox, sectarian or factionalist principles on which each of these lines of human knowledge are based and remain statically rooted. They are all very different and even antipodal and irreconcilable regarding the principles of science, its rational experiments and continued scientific refutations of leading-edge relative truths.

Regression. Strictly speaking, being a disseminator of a dogmatic religion is an evolutionary regression for the adult intraphysical consciousness with multidimensional lucidity, regardless of who it is or where that individual is located.

Coherence. We need to live coherently with ourselves in any dimension where we manifest or thosenize.

Hypocrisy. The author, after reaching physical, intraconsciential maturity, was not able to hypocritically be a *mere* doctrinaire sensitive, disseminator of a religion or sectarian, fundamentalist, orthodox line while in the ordinary, physical waking state and simultaneously operate as a universalistic sensitive while lucidly projected outside the human body. Multidimensional coherence is required.

Labels. Extraphysical reality – existing prior to intraphysical realities – does not arise already labeled by humans. Parapsychism operates independent of labels.

Assistance. The assistential service of the human *minicog* within a *maximechanism*, especially the extraphysical one, cannot depend upon human preconceptions. If it were any other way, the indispensable conditions of *rapport*, empathy or affinity would not occur with the helper, which simultaneously operates as a friend of the sensitive and the assisted being. This is because, in this case, the helper serves as an extraphysical mentor with the common sensitive or as a *preto velho* (*para-appearance*), endeavoring to clarify what it can, removing the extraphysical blind guides, intruders

and the satellites of intruders related to all of them. There would also not be any *rapport* between the sensitive and the ill intraphysical or extraphysical consciousness, which needs to be assisted by the transferences of consciential energies by 3 consciousnesses. This must occur without thinking, as a priority, about whether someone is intraphysical, extraphysical, lucid, materialist, agnostic, or anything else. This represents a consciousness or someone in need of assistance, which is sufficient in this case.

Inexistence. For the extraphysical helpers there is no racism, particularism, sectarianism or instinctive factiousness, which are restricted to the abdominal sub-brain of the unthinking human masses (see fig. 357, p. 1,147).

Choice. Parapsychic practice, common sense and self-discernment demand that the intelligent projector realistically situate him/herself on the lowest echelon of the scale of service in the extraphysical assistential work team. This is why he/she should not and cannot be performing any type of segregation, demanding specific working conditions, exhibiting infantile shamefacedness or choosing human locations, extraphysical environments, beings to be assisted or helpers for performing tasks and working together jointly as a lucid assistential minicog. The projector should demand nothing, but should be thankful for everything he/she receives, because he/she always ends up benefiting from consciential evolution in group, as in the practices of penta.

Ladder. The transmission of transferences of consciential energies by three technique forms a ladder of consciousnesses with descending rungs spanning from the sensitive's extraphysical-mentor-helper, the *highest* rung; to the projected projector, the *middle* rung; to the intraphysical sensitive – the *cavalo* (“horse”) in *Umbanda* – the *lowest* rung. The energies that flow downward from above reach the assisted ill personality, whether an intraphysical or extraphysical consciousness, the base of the energetic ladder. The comparative scale of the rungs of this *ladder* is derived from the level of the consciential plane or dimension.

Sex. The sensitive in this case can be a man or a woman, the gender being of little importance, as there is no alteration in the process of transmission of energization by three. There are female sensitives who afford a greater passivity in the lucid parapsychic exchanges, thereby further facilitating the realization of the assistential process due to the characteristics of the gynosoma.

Approach. The author, in the performance of transferences of assistential consciential energies by 3, generally arrives alone at the location, teleguided by extraphysical intuition. The works progress with the extraphysical helper together with a sensitive from the beginning of the session, or even before the session in certain cases.

Encasing. With the aid of the benevolent helper, the sensitive is approached as though performing an anatomical encasing from behind in a forward direction, coming in contact with his/her back from above his/her shoulders and arms.

Irradiations. The energetic irradiations do not originate from the projector, or from his/her psychosoma, but come *from outside*, or *from above*, from a rich source (extraphysical helper). Although entering in a more rarefied or subtle state, they condense with intensity and vigor upon passing through the psychosoma, and even more so soon afterward when passing through the coincident sensitive. The irradiations quickly reach each one of the 4 heads, first the two extraphysical ones and then the two physical ones. The movement of the para-arms and parahands of the psychosoma are generally made in synchrony with the arms and hands of the sensitive.

Information. To those who are interested, it is worth mentioning something about that which occurs within the intraphysical consciousness projected in the psychosoma upon making him/herself passive in order to participate in energization by three. What follows is that which has been occurring with the author in his experimentations. We do not know what happens with others. It has still not been possible to find better details in the International Bibliography of Projectiology on the subject in order to present it here.

Frustrations. Sometimes, the circumstances of energizations by three create dramatic, silent and indescribable frustrations. In this case, the sensitive interferes, blocks and stops his/her participation in the transmission before it ends, when the energetic current is flowing most intensely. The projector, with the aid of the helper, therefore has to continue the energization without counting on the sensitive until the energetic transmission is concluded.

Will. The wish to transmit an initial energization in the sensitive constantly arises in the projector prior to each more serious task in order to calm him/her or, more precisely, to more forcibly subjugate him/her. However, the projector cannot force the parapsychic interface because this attitude would affect the central nervous system and even the neuromuscular system of the sensitive's entire human body.

Automatism. There comes a point at which the projector, under the guidance and energies of the benevolent helper, is able to control the sensitive. However, the sensitive unexpectedly begins to think about other subjects that are foreign and negative for the transmission, automatically acting like a robot. This interrupts the interface by three and the flow of the energies.

Sensations. Lastly, the projector continues to withstand the transmission of various energizations sustained by the patience, benevolence and the impressive example of the helper. Nevertheless, due to the constant effort made in order to maintain the interface or synchronization, or to overcome the continued disconnectedness or asynchrony, the projector starts feeling – in his/her psychosoma (emotional parabody), which is dense and even more *laden* by the silver cord – the reflections from the heavy irradiations from the patients, the sensitive and the participants in the environment.

Vomitings. An irrepressible urge to vomit is among the reactions that commonly occur on these occasions. It is characteristic of the physical effect phenomena that are more vigorously reflected in the projected projector, as the projector is an intermediary element or the one operating as a sensitive between the 3 participants in the work, like 1 electric wire between 2 terminals. If the sensations increase, the solution is to return to the human body, which is lying in the physical base. The projector still takes with him/her the impressions of vomiting which, everything aside, soon pass with the energetic showers sponsored by the helpers, which are more easily transmitted in the *field* of the projector's *home* (personal holothosene).

Sacrifices. In spite of everything, it is quite worth all the effort required to participate in energization by 3, where the most sacrificial role is actually not performed by the projected projector, despite all the abovementioned possible frustrations. The one which suffers most, in first place, is the helper, which is aware of everything and sees everything, and is sometimes also in an embarrassing condition of impotence. In second place is the sensitive who knows nothing and generally does not see anything clearly. This is followed by the sensations and experiences of the projected projector.

Validity. The participation of the projected projector is always valid to some extent. The helpers would obviously not go to so much trouble for nothing. According to explanations received in this sense, the energetic density of the projected intraphysical consciousness' temporarily freed psychosoma is at a frequency which is intermediary between the helper's less dense or rarefied psychosoma and the denser psychosoma of the sensitive who is coincident with the human body. This circumstance allows a greater interfacing between the different dimensions of these lives – the physical and the extraphysical dimensions – and the 4 psychosomas, energy condensing vehicles that participate in the energization by 3: the first 3, in the final analysis, are transmitters or relay stations, and the fourth psychosoma (that of the assisted individual) is the receptor. This is how the intraconsciential-parapsychic phenomenon operates within the parapsychism-animism binomial.

Psychosoma. Strictly speaking, the projected consciousness should not feel the urge to vomit while in the psychosoma, owing to the fact that the physical, or physiological, impressions do not reach his/her para-anatomy or his/her parapsychology. Nevertheless, this does happen due to his/her greater density. The projector, during energization by 3, in this illustrative context, acts as though he/she were a *half-intraphysical consciousness*, or a *half-extraphysical consciousness*, between the helper (extraphysical consciousness) and the sensitive (intraphysical consciousness) who is in trance, or in the ordinary coincident, waking state.

Predisposition. Although somewhat parapsychically developed sensitives are more predisposed to extraphysically participate in energization by 3, the individual wishing to produce lucid projections, whether assistential or assisted, should psychologically predispose him/herself to have these experiences. Such extraphysical aid comprises the list of assistential tasks pertaining to the teams of helpers.

Parapsychism. Many individuals who are not sensitive in the ordinary, physical waking state are transformed into powerful extraphysical sensitives in energization by 3. A great number of the projected intraphysical consciousnesses working in these teams are not sensitives in ordinary human existence.

Recollections. Hundreds of projected intraphysical consciousnesses are constantly participating in energization by 3 everywhere. However, the consciential energies from the holochakra, which ballast the psychosoma on these occasions, disturb the recollections that are always fragmentary in most cases. The projectors end up not recalling extraphysical occurrences after physically awakening. They are unconscious workers in the world of interconsciential assistentiology on earth.

Bibliography: Vieira (1762, p. 80).

358. INTER VIVOS COMMUNICATION TECHNIQUE

Definition. *Inter vivos* communication: the physical, animic-parapsychic communication of the intraphysical consciousness projected from the soma (cellular body) with the consciousnesses of other human beings in the waking state.

Synonymy: case of parapsychic reciprocity; communication between living beings; *inter vivos* animism; *inter vivos* parapsychism; mediumistic trance; parapsychic manifestation of living beings; physical manifestation of the communicant projector; sophisticated communication between intraphysical consciousnesses.

Terminology. There are linguistic purists who may find a number of errors in the terminology below. This is because they work from the principle that there is no parapsychic, or even animic-parapsychic *inter vivos* communication. Nevertheless, certain terms are used here for a lack of better ones. Many of them have been used for a long time. The *pure* phenomenon, whether complex parapsychic (with two consciousnesses) or *pure* animic (with only one consciousness) is not only rare, in practice, but extremely difficult to verify.

Types. Among the types of animic-parapsychic *inter vivos* communication, at least the following 11 can be singled out:

1. Apparition to an intraphysical consciousness.
2. Bilocation or materialization-projection.
3. Extraphysical telekinesis.
4. Projective parapyrogenesis.
5. Projective pneumatophony.
6. Projective poltergeist.
7. Projective psychography.
8. Projective psychometry.
9. Projective psychophony.
10. Projective raps.
11. Telepathic transmission and reception with an intraphysical consciousness.

Conditions. The consciential levels of the projected intraphysical consciousness can be: active, unconscious, or amnesic (amnesic).

Interposed. In manifestations through the psychophonic sensitive, the communicant-projector operates as a consciousness which is interposed between the sensitive and the sensitive's own extraphysical mentor, the extraphysical supervisor of the parapsychic works in that are in progress.

Materializations. Among the physical manifestations of the communicant-projector, we can include all the psychophysical materializations of intraphysical consciousnesses (living persons) *with* sensitives or, in other words, those which are projected and manifest through the ectoplasmic resources of a human sensitive.

Animism. In the eyes of the observers, when a projected intraphysical consciousness communicates through an intraphysical sensitive – prior to the occurrence of an ordinary parapsychic phenomenon – a purely animic phenomenon (which is rare) occurs between two intraphysical consciousnesses which utilize the extraphysical dimension. Under these circumstances, both apply their own parapsychic capacities, thereby often dispensing with the direct participation of any extraphysical consciousness or external intelligence.

Bibliography: Aksakof (09, p. 542), Bozzano (185, p. 63), Crookall (343, p. 61), Crouzet (344, p. 429), Currie (354, p. 11), Ebon (453, p. 101), Flammarion (522, p. 206), Gauld (576, p. 226), Greenhouse (636, p. 162), Gurney (666, p. XXV), Lombroso (943, p. 254), Marryat (1001, p. 35), Martins (1009, p. 95), Muldoon (1103, p. 23), Riverain (1408, p. 119), Rodrigues (1431, p. 27), Salter (1498, p. 133), Smith (1574, p. 121), Turvey (1707, p. 175), Xavier (1873, p. 43).

359. INTER VIVOS APPARITION

Definition. *Inter vivos* apparition: the appearance of the consciousness of the intraphysical projector to other intraphysical beings.

Synonymy: apparition of a living being; human specter; *inter vivos* projection; projected apparition; projective apparition; projective tangibilization; self-induced phantasm.

Phantasm. In various countries, including England, for example, the person's double is called a *phantasm* or *spectrum*.

Superstition. It is generally – and superstitiously – presumed that the apparition is a harbinger of death for the one who was seen. This is based on the fact that the approach of the first desoma weakens the connections (silver cord, holochakra) between the human body (soma) and extraphysical body (psychosoma) of the individual.

Spontaneity. Parapsychic apparitions of projected intraphysical consciousnesses most often occur spontaneously during deep natural sleep and often with complete unawareness on the part of the agent, the projector.

Phenomenology. This is one of the most difficult projectiological phenomena to voluntarily and consciously provoke due to the inevitable, intense expenditure of consciential energies.

Sensitive. The least difficult means for producing an intentional apparition is for the projector to make an intraphysical consciousness into an energy donor, predisposed to the production of the phenomenon.

Qualities. This person or candidate should have 4 essential qualities:

1. **Empathy.** He/she should truly have affinity with the projector in order to facilitate *rapport*.
2. **Maturity.** He/she should live without fear of experiencing multidimensionality and the apparitions of intraphysical and/or extraphysical consciousnesses.
3. **Parapsychism.** He/she should have a pronounced parapsychic clairvoyant sensitivity.
4. **Holochakrology.** He/she should demonstrate a capacity for the practical application of consciential energies, most notably those related to the frontochakra. The purpose of this is to reduce the required degree of the physical condensation of the psychosoma that will be seen by the percipient.

Shared. In this case, for example, the percipient's clairvoyance promotes 50% of the *shared apparition*, leaving the other 50% to be supplied by the intraphysical projector-agent, which is projected in the psychosoma as densely as possible or, in other words, laden with the holochakra. The phenomenon thus occurs as though it were the harmonious conjugation of the manifestations of a *pair of sensitives*.

Circumstances. The conjugation of human circumstances most propitious for the deliberate production of the *inter vivos* apparition phenomenon is when a male consciential projector appears to a solitary female sensitive-percipient. This may occur due to “attraction of the opposite sex”.

Characteristics. Apparitions of the projected intraphysical consciential projector can occur while the intraphysical percipient is sleeping or apparently awake. The apparitions generally appear to be immobile or gliding in front of the percipient. In many cases, immobile apparitions are mere morphothosene projections at a distance.

Forms. *Inter vivos* apparitions can be: vaporous, diaphanous, vague, imprecise, or clearly defined with regard to the outline, physiognomy, features, posture, corpulence, gestures and other aspects of the appearance of the human person. The inferior members of the humanoid form – obviously including the feet – are less pronounced during the apparitions.

Dialogue. The rarer cases of the apparition of intraphysical beings are those in which the projected consciential projector is seen, is tangible and, in addition, maintains a lively, intelligent conversation with the human-percipient-witness, unmistakably characterizing an occurrence of physical bilocation.

Animals. Among the more frequent spontaneous apparitions of projected intraphysical beings are those in which the percipients are children and pets, especially cats and dogs.

Bibliography: Andrade (27, p. 117), Baumann (93, p. 29), Bennett (117, p. 28), Bozzano (184, p. 151), Crookall (331, p. 23), Green (633, p. 26), Hart (687, p. 182), Kardec (825, p. 133), Mackenzie (970, p. 242), Martins (1005, p. 97), Muntañola (1108, p. 107), Vieira (1762, p. 168).

360. REACTIONS OF INTRAPHYSICAL CONSCIOUSNESSES TO THE APPARITION OF THE PROJECTOR

Varieties. The reactions of intraphysical beings in the ordinary, physical waking state to the apparition of a likewise intraphysical consciousness or a projected projector vary considerably according to the psychological state of the percipient, the human environment, the degree of the apparition's tangibility, and the ideas, emotions and reciprocal intentionalities that come into play among the triggering factors of the phenomenon.

Categories. Among the categories of reactions of intraphysical beings – adults, children and subhuman animals – to the apparition of intraphysical projected projectors, the following 12, presented in alphabetical order, can be singled out:

1. **Appeal.** Extend the right hand toward the crucifix hanging around the neck (nun).
2. **Attack.** Sic a guard dog against the projector's apparition.
3. **Beatitude.** Contemplate the apparition in contrite silence and introspection.
4. **Escape.** Run away quickly without looking back (immaturity).
5. **Extroversion.** Try to communicate with balance (laryngochakra).
6. **Fear.** Become fearful, and often terrified.
7. **Indifference.** Remain indifferent, as though he/she were a mere hallucination.
8. **Infantile.** Try to touch the apparition's shape (child).
9. **Mysticism.** Piously cross oneself.
10. **Panic.** Scream in desperation (woman).
11. **Self-defense.** Brandish a weapon (an armed individual).
12. **Surprise.** Become deeply shocked and speechless.

Subhumans. Subhuman animals – intraphysical beings aside from human beings – exhibit reactions to the apparition of a human projector, such as the following 8:

1. Happiness when it perceives the projected owner.
2. Agitation.
3. Behavior which is not characteristic of its temperament.
4. Leaving quietly with its tail between its legs (dog).

5. Temporary paralysis or shock due to fear or stupefaction.
6. Secondary physiological effects.
7. Barks (dog).
8. Neighs (horse).

Bibliography: Baumann (93, p. 33), Monroe (1065, p. 58), Vieira (1762, p. 168).

361. EXTRAPHYSICAL ATTACKS UPON THE PROJECTOR

Definition. Extraphysical attack: the act of someone aggressively attacking the personality of the human projector when in the ordinary, physical waking state or when projected from the soma in the psychosoma.

Synonymy: ambush; extraphysical aggression; extraphysical assault; extraphysical spat; parapsychic attack.

Attackers. Among the characteristics of the extraphysical attackers of the projector – including projected intraphysical consciousnesses – the following 12 examples can be pointed out:

1. Projected intraphysical consciousness or extraphysical consciousness with a masculine para-appearance.
2. Projected intraphysical consciousness or extraphysical consciousness with a feminine para-appearance.
3. Projected intraphysical consciousness or *extraphysical consciousness with an undefined* para-appearance.
4. Habitual extraphysical assailant.
5. Common extraphysical vampire (energivorous extraphysical consciousness).
6. Known projected intraphysical consciousness or extraphysical consciousness.
7. Unknown projected intraphysical consciousness or extraphysical consciousness.
8. Conscious intraphysical consciousness or extraphysical consciousness.
9. Unconscious intraphysical consciousness or extraphysical consciousness.
10. Oligophrenic extraphysical consciousness.
11. Ill extraphysical consciousness with no bad intention.
12. A group of various extraphysical attackers at the same time (mega-intruders).

Attacks. Among the characteristics of extraphysical attacks upon the projector, the following 10 occur most frequently:

1. **Impulsion.** The ill extraphysical consciousness throws itself onto the projected projector's psychosoma with full force.
2. **Restriction.** The intention of restricting the projected consciousness' extraphysical movements.
3. **Obstacles.** The successive placement of extraphysical obstacles, or dense morphothosenes, in order to block the projected consciousness' translocation. Some examples are the abrupt creation of a closed door or window and walls unexpectedly appearing in front of the projector.
4. **Paraforms.** The disagreeable paraforms or para-appearances of the beings that appear.
5. **Transfiguration.** The transfiguration of the attacker, aiming to provoke fear.
6. **Darts.** Throwing *energetic darts*.
7. **Pursuit.** Open pursuit.
8. **Hunting.** Extraphysical hunting.
9. **Cornering.** Extraphysical cornering.
10. **Pressures.** Extraphysical pressure upon one's consciential microuniverse.

Expressions. Extraphysical attackers generally have a special predilection for directing their typically verbally (humanoid) articulated accusatory expressions, endeavoring to reach the emotional balance of the projected intraphysical consciousness. This is done through the creation of a sadistic,

embarrassing, humiliating and nightmarish atmosphere. They thus use all possible negative resources, including the exaltation of actual errors in the projector's conduct of which they are aware.

Causes. Among the causes of extraphysical attacks upon the human consciousness while projected outside the human body, the following 5 can be singled out:

1. **Lack.** Energetic lack due to the parapathology of the psychosoma of the attacker or energivorous extraphysical consciousness.
2. **Parapsychopathology.** Genuine parapsychopathology.
3. **Awakening.** Extraphysical awakening of an ill extraphysical consciousness (second desoma).
4. **Self-motivation.** Simple or mutual emotional self-motivation.
5. **Intrusion.** Evident intentional interconsciential intrusion.

Effects. Among the effects of extraphysical attacks upon the lucid projector, at least the following 12 should be listed:

1. Extraphysical attacks pertaining to or due to tasks of extraphysical deintrusion.
2. Temporary extraphysical influence.
3. Consciential obnubilation.
4. Physical exhaustion.
5. Irresistible sleep.
6. Energetic drainage of the projected projector's consciousness.
7. Energetic duels.
8. Waking dis coincidence.
9. Learning of extraphysical self-defense.
10. *Loss of time* and the extraphysical opportunity.
11. Deep worry based on some unfounded fear, even when only during a single hour of isolation or solitude (psychosomatics).
12. Hypomnesia of a specific vital point that is not remembered at the moment in a critical existential situation (mnemosomatics).

Mentalsoma. Simple, negative mental approaches occur while in the ordinary, physical waking state or while in the preparatory stage for lucid projection, in pre-takeoff and during extraphysical awakening of the projected consciousness. This is performed by other consciousnesses, whether in the psychosoma or directly in the mentalsoma.

Psychosoma. Nevertheless, ostensive, direct extraphysical attacks seem to only occur when the intraphysical consciousness is projected in the psychosoma, and not when he/she is projected in an isolated manner only in the mentalsoma in the pure mentalsomatic dimension.

Double. Frequent attacks by extraphysical beings upon intraphysical beings originate firstly in his/her ordinary, physical waking state, later continuing during lucid projection. They are therefore double attacks.

Types. There are two types of extraphysical attacks:

1. **Pathology.** Pathological, per se, generally having a sexual or parasexual origin.
2. **Unconsciousness.** Unconscious or performed by an energivorous or deprived post-desomatic parapsychotic extraphysical consciousness.

Parapolitics. Extraphysical attacks can also be generated due to parapolitical motives or, in other words, when the intraphysical projector's consciousness confronts the negative intentions of the attackers while performing extraphysical fraternal assistance or any other work inside or outside the human body. The assistance thus becomes a natural obstacle to the continuation of the attackers' plan of action, which is like an unconscious invasion into their space of manifestation or their specific holothosenes.

362. SELF-DEFENSE TECHNIQUES OF THE PROJECTOR

Dimensions. The extraphysical dimensions where the intraphysical consciousness projects when temporarily leaving the human body – especially the paratropospheric dimension, which is interpenetrant with the physical world – present legions of mentally or conscientially ill extraphysical consciousnesses, extraphysical psychopaths (parapsychopaths), as well as rare projected intraphysical beings which are also ill. The first are commonly known as *intrusive extraphysical consciousnesses* and the second are called *intraphysical intruders*.

Satellites. However, not all of these beings are genuinely a bad lot or intruders with bad intentions. The vast majority are extraphysical somnambulants or unhappy ill beings controlled by post-desomatic parapsychosis, needy extraphysical consciousnesses or, for the most part, unconscious energivorous satellites of intruders and even of extraphysical *blind guides*.

Learning. Without entering into the merits of the characters or nuances of the ill extraphysical personalities, one fact should be considered from a practical point of view: if the projector wishes to develop his/her activities in these extraphysical districts or communities, he/she should inevitably learn to extraphysically coexist with all types of ill extraphysical consciousnesses.

Self-defense. In light of the above, it is necessary for the lucid projector to prepare him/herself with extraphysical resources and self-defense methods which are appropriate and capable of maintaining the consciousness' indispensable balance while projected, as well as in the ordinary, physical waking state.

Mentalsomatics. In the pure mentalsomatic dimension, where consciousnesses manifest directly through the mentalsoma, there are no ill manifestations such as those mentioned above, which occur in the dense intraphysical dimension where consciousnesses manifest through the psychosoma or soma.

Undisguisable. The intraphysical consciousness projected in the extraphysical dimension has to make an effort not to have any type of fear (neophobia, thanatophobia). The psychosoma, or emotional parabody, is visible in the extraphysical or paratropospheric dimension. Likes attract. The psychosoma clearly shows the character, the true intention, the strength or weakness that the consciousness actually feels in relation to other extraphysical beings. Intentions become *exposed*, unhidable, patent, *undisguisable* and inexcusable. Rudimentary interconsciential seductions are impracticable.

Resource. Among the dignified and effective self-defense resources available to the lucid projector, the following 20, listed in alphabetical order, can be singled out:

1. **Assistant.** Utilize the help of the *intraphysical assistant*.
2. **Assistentiology.** Exteriorization of consciential energies with a therapeutic intention (conscientiotherapy).
3. **Base.** Take advantage of the natural isolation of the physical base.
4. **Behavior.** Practicing productive or enriching extraphysical activities.
5. **Contacts.** Extraphysical relationships that are healthy, positive and fearless, without mysticism.
6. **Cord.** Use of the operational energetic resources of the *silver cord*.
7. **Cosmoethics.** Awareness of applied cosmoethics.
8. **Density.** Use the psychosoma's extraphysical density as an extraordinary self-defense resource.
9. **Disappearance.** Instantaneous disappearance provoked by focusing the will upon the inactive human body, which is in the intraphysical base.
10. **Exteriorizations.** Intelligent graduation of the potency of exteriorizable consciential energies.
11. **Helpers.** Productive coexistence with the extraphysical helpers.
12. **Holochakrology.** Self-confidence in the emission of defensive thoughts and energies before, during and after consciential projection.
13. **Interiorizations.** Use of voluntary and involuntary interiorizations.

14. **Paralysis.** Energetic repulsion or repulsion like a *paralyzing gas*.
15. **Psychosomatics.** The condition of opacity of the psychosoma.
16. **Self-luminosity.** The self-luminosity of the psychosoma.
17. **Serenity.** Constant serenity, if possible.
18. **Telepathy.** Transmental dialogue or extraphysical telepathy.
19. **Thosenology.** Constant beneficial self-thosenes.
20. **Volitation.** Lucid volitation.

Defenses. Within holosomatics, there are two categories of defense available to consciousnesses:

1. **Holochakral.** The holochakra, through the consciencial energies, serves to defend the consciousness against other beings, intraphysical consciousnesses and extraphysical consciousnesses or, in other words: against interconsciencial intrusions, fascinations, subjugations and possessions.

2. **Mentalsoma.** The mentalsoma, through an expansion of lucidity or consciencial hyperacuity, serves to defend the consciousness against itself or, in other words: against self-intrusions, self-fascinations, monoideisms and fixed ideas (rigidity or caustic stubbornness) within its own consciencial microuniverse. It is a question of consciencial self-concentration.

Warning. When projected in the extraphysical dimension, the intraphysical consciousness should not underestimate the potency and capacity of the powerful thosenes stemming from the decided will of yourself and others. Therefore, all anti-fraternal or anticosmoethical thoughts need to be definitively and absolutely removed. There is no wiser alternative regarding personal evolution.

Intentionality. The high-quality cosmoethical, positive or healthy intentionality of one's will to succeed is always irreplaceable in the extraphysical cogitations and thosenizations of any consciousness.

Certainty. It becomes vitally necessary to maintain absolute certainty regarding the character of those consciousnesses with which we are obliged to energetically confront or wage a war of wills. They may be extraphysical consciousnesses that have already passed through the transition of final projection (desoma) and *can no longer die*, physically speaking. They may also be intraphysical consciousnesses, still ill or with anticosmoethical intentions but susceptible to undergoing desoma or *losing* the human body in a fatal extraphysical trauma.

Assassinations. There are intraphysical consciousnesses (*intraphysical mega-intruders*) that are temporarily projected with lucidity and operating in the (paratropospheric) extraphysical dimension which assassinate (or *para-assassinate*) other *sleeping* intraphysical consciousnesses in the intraphysical dimension. They even impede the interference of (healthy) helpers and (ill) extraphysical intruders. The disturbing emotions and interrelationships between intraphysical consciousnesses predispose these insane actions of *intraphysical mega-intruders*.

Burdens. The final consequences of the mental burdens of a consciousness are still very obscure to us, intraphysical lucid projectors.

Self-thosenes. The self-thosenes of the human consciousness are sometimes disconcerting and profoundly surprising.

Actions. On the other hand, it is positive for an intraphysical projector to work together with the helpers in desomatic processes which are just and in line with the natural time spans of egokarmic laws. Another action (negative in this case) is for the consciencial projector to assume an unbalanced righteousness, or to serve as an instrument of the intruders and contribute to an unjust, extemporaneous or *inappropriately timed* demise of an intraphysical companion, being one which is not in accordance with the natural time spans of egokarmic laws.

Avoidances. Generally, when in the extraphysical dimension, the consciousness that cooperates and assists as a deintruder should never respond to an extraphysical attack with another attack of equal intention, quality and nature, thereby lowering itself to the anticosmoethical and infracosmic moral level of the ill para-attacker.

Clarification task. Assistential thoughts, methods and strategies always have to be more *human*, fraternal, consoling and clarifying (the clarification task) in order for them to be fruitful and not leave any undesirable and disturbing residues.

Approach. The following is a basic rule in physical-extraphysical interconsciential assistance: the intraphysical consciousness projected with lucidity should relate to those consciousnesses in need of his/her extraphysical assistential tasks as though he/she were a parent, sibling, social worker, physician, nurse, professor, colleague or peer. The aim of this is to deepen the *rapport* and empathically and effectively help the extraphysical patients and common intruders.

Ideal. This will always be the ideal extraphysical attitude or approach for achieving effective results in the development of the lucid intraphysical consciential projector, independent of any personal cultural background or mystical resource.

Mysticisms. Mysticism, in these cases, *if not in all cases*, is an entirely anachronistic and infantile attitude. This is because it is not based on the rationality, maturity and universalistic cosmoethical discernment of those who have a panoramic vision of multidimensional realities.

Para-instinctive. With regard to consciential self-defense techniques, it is clarifying to note the ego's *para-instinctive* resources, or those processes in which the consciousness – paradoxically, through an apparent animalistic regression – subsequently shields itself against an extraphysical attack or a negative charge of consciential energies. The following are 3 categories:

1. **Intraphysiology.** Intraphysical, in the ordinary, physical waking state.
2. **Projectiology.** Extraphysical, in the projected consciential state (intraphysical or extraphysical consciousness).
3. **Intermission.** Extraphysical, in the *desomant* state, per se.

Stratagems. In these self-defensive resources, the consciousness almost always unconsciously resorts, in the beginning, to stratagems or talents which have already been used in prior phases of its evolutionary journey in the self-defensive condition of animals considered to be inferior. The following are 4 of these stratagems:

1. **Aura.** The exacerbation of the personal aura, which becomes ostensive, impressive, insinuant, up to the consciousness' maximum auric irradiation. The effects of this process are shock, surprise and intimidation, which affect the consciousness of the attacker or attackers.

Peacock. This auric resource, which is clearly reminiscent of the reaction of the peacock (*Pavo cristatu Linneus*) and other animals, can and should be used intentionally, even in the ordinary, physical waking state. In certain cases, however, this stratagem can be so effective that it hampers the development of the intraphysical consciousness' assistential service in his/her deintrusive condition as energetic bait for ill extraphysicals. This is because it can *scare the captive (the netted consciousness)* that flees with terror far from the psychosphere of the assister – the *consciential bait*.

2. **Vibrational.** The installation of a maximal vibrational state, intentionally promoted by the impulsion of the consciousness' will. The effects of this process are those of energetic repellants, which are unquestionably felt by the attacker or attackers.

Electric eel. There are many types of energetic repellants. It is worth highlighting the electric shock like the discharges of the electric eel (*Electrophorus electricus*), which has a paralyzing effect similar to other known fish. In certain cases, it impels the attacking extraphysical consciousness to abruptly let go of the *red-hot psychosoma* of the attacked consciousness (victim). It is ejected a certain distance away and can even be overtaken by a restful sleep or a deep torpor for awhile. In certain extraphysical circumstances, this self-defensive process acts surprisingly quickly and is highly efficient in its objectives.

3. **Self-transfiguration.** The attacked consciousness' deliberate self-transfiguration of its own psychosoma, thereby installing the condition of extraphysical mimicry. The effects of this process are asymmetrical camouflage or throwing others off the trail, in certain delicate or highly critical extraphysical situations.

Chameleon. Extraphysical mimicry occurs in the same way as with subhuman animals that are able to change color, such as the chameleon and certain fish and insects.

4. **Coupling.** The intentional triggering of a profound and intense auric coupling of the attacked consciousness with the attacking extraphysical consciousness or consciousnesses. The effects of this process are to calm or even paralyze the intruder or intruders that *run out of steam*, give up their anticosmoethical intentions (at least temporarily), or leave the scene as soon as possible.

Spider. Defensive auric couplings are reminiscent of the spider's techniques of using the threads of its web to entangle and envelop its incautious prey. Strictly speaking, this process, instead of being a pure self-defense against an open attack, is an opposite strategy – *self-defense through counterattack* – which is of a different positive and well-intentioned nature. The attacking-attacked-consciousness often feels extremely uncomfortable under the unexpected condition of semi-submission to the incompatible consciential energies that are characteristic, different or pertain to the self-defending-counter-attacking-consciousness. If it actually does submit, there can be a sympathetic assimilation of the parapsychological disturbances of the attacking-attacked-consciousness by the self-defending-counter-attacking-consciousness.

Energies. It can be seen that the fundamental mechanism of all these processes is an energetic one or, in other words, they are developed through the lucid mobilization of the consciential energies of the awakened ego, who is aware of his/her potentialities and inner resources stemming from the workings of his/her ironclad will.

Bibliography: Fortune (540, p. 155), Hope (756, p. 50), Mickaharic (1044, p. 20), Northage (1135, p. 63), Targ (1651, p. 236), Vieira (1762, p. 182), Yram (1897, p. 96).

363. EXTRAPHYSICAL INTRUDERS

Definition. Intruder (or *obsessor*; Latin: *obsessore*, intruder, pursuer, persecutor): the consciousness that exercises a direct or indirect negative action upon another – whether by disturbing, provoking, pursuing and malevolently influencing – through waves of thosenes (emotions, ideas and consciential energies).

Synonymy: alien spirit; *anhangá*; astral parasite; couplings with ill extraphysical consciousnesses; *diakki*; entropic spirit; extraphysical ambusher; extraphysical antigodfather; extraphysical maniac; fascinator; foreign spirit; *gaki*; ill astral being; ill deceased being; ill extraphysical consciousness; incubus; infernal spirit; intrusive spirit; *kiumba*; malevolent spirit; nefarious spirit (New Testament); obsessing; obsessive; obstructer to consciential projection; outsider spirit; parapsychic influencer; pathogenic spirit; peripheral spirit; possessive entity; possessor agent; possessor; post-desomatic parapsychotic; *preta*; spiritual antiguru; subjugator; succubus; tempter; *theta* agent; unevolved extraphysical or projected intraphysical entity; unhappy ghost.

Warning. What follows below should only be read by those who consider themselves to have sufficient psychological balance to understand and calmly reflect upon the more painful and unfortunate subjects regarding the physical-extraphysical populations of this planet without negative emotional involvement. If the reader is afraid of the unknown in terms of the extraphysical dimensions, or nurtures an apprehension of extraphysical consciousnesses, he/she should not read this chapter. There are other milder chapters before and after this one.

Characteristics. The following are 13 general characteristics of the intrusive consciousness:

1. **Ignorance.** Ignorance regarding interconsciential relationships.
2. **Incomprehension.** Incomprehension of its own evolutionary situation.
3. **Contradiction.** Contradictoriness regarding itself and the realities of the cosmos.
4. **Paradoxes.** Experiencing the despair of paradoxical emotions directly through the psychosoma.

5. **Awareness.** Awareness of being anticosmoethical, or knavish.
6. **Affinity.** Possession or lack of a personal connection with the victim of its intrusions.
7. **Realization.** Desire to continue an impracticable activity in the intraphysical dimension, forcing the victim to accept it.
8. **Addiction.** Eagerness to share human emotions or the still animalized emotions of the victim, misleading him/her toward some addiction (drugs), bad habit or mega-weak-trait.
9. **Confusion.** Taking satisfaction in lewd or pathological rudimentary pranks which are characteristic of consciential immaturity, delighting in causing confusion or mega-entropies, usually together with other like-minded extraphysical consciousnesses.
10. **Satellites.** Using semiconscious recent extraphysical arrivals to the extraphysical dimension and even intraphysical beings who are predisposed to its influence as aides – which may be conscious, unconscious, satellites and blind useful-innocents – when they are blocked from acting directly.
11. **Inductions.** Physically and mentally damaging the victim through hate, capable of arriving at the point of inducing the individual to practice the worst diatribes, even including suicide.
12. **Lacks.** Attempting, through egoistical love, to bring the victim back to the extraphysical dimension in order to satisfy its own energetic lacks. It is good to remember that *longing* is the hungering for the specific consciential energies of a loved one by the longing individual.
13. **Pseudo-help.** Endeavor to aid its victim in an apparent and dissimulated manner through antagonistic emotions.

Intrusion. In order to precisely characterize the intruder, it becomes indispensable to define interconsciential intrusion: a mental, or parapsychic, attitude, monothosene, fixed idea or monoideism that pathologically dominates the consciousness' microuniverse on a continuous basis.

Self-intrusion. As a general rule, all intrusion has its beginnings in a self-intrusion.

Adults. Adults are customarily more predisposed to interconsciential intrusion than children. This is a paradox corroborated by the facts.

Ambassador. The worst type of pathological interdimensional personality is the intrusion victim-intruder-intraphysical consciousness. He/she is actually the classic ambassador of the paratropospheric conglomerates of ill extraphysical consciousnesses. Consciential entropy increases around him/her and the internal tension of his/her karmic group or group holothosene intensifies.

Problematic. The intruder that is most problematic and difficult to deal with, contact and speak with is the one that is lucid, intelligent and discrete. It evades healthy extraphysical consciousnesses and does not let itself be seen or *paraperceived* by sensitives in crucial circumstances and moments of parapsychic probing, during deintrusive animic-parapsychic trances or group conscientiotherapy sessions.

Leadership. The veteran intruder generally plays the role of the intellectual author of meticulously planned mega-intrusion, with the intraphysical consciousness-extraphysical consciousness binomial. It lets the *small fish* (satellites of intruders) be caught in the net of deintrusion, but discretely distancing itself, with refined class, from the battlefield of intrusion, carefully conserving its status as a *big fish* (intruder-leader, often for one or more centuries).

Types. There are various types of interconsciential intrusion from the perspective of the extraphysical intruder's attack. The following are 17 examples:

1. **Mutuality.** Mutual, reciprocal or bi-directional intrusion.
2. **Intraconscientiality.** Self-intrusion.
3. **Simplicity.** Simple or naïve intrusion.
4. **Extensibility.** Mini-intrusion regarding the effects or consequences in time and space.
5. **Complexity.** Complex intrusion or one involving the combined actions of multiple intruders.
6. **Group.** Triangular intrusion.
7. **Direction.** Direct intrusion.
8. **Ricochet.** Indirect intrusion or one performed through a ricochet system.
9. **Intraphysical consciousness.** Self-intrusion by the intraphysical consciousness.

10. **Extraphysical consciousness.** Self-intrusion by the extraphysical consciousness.
11. **Intraphysiology.** Intrusion exclusively between intraphysical consciousnesses.
12. **Extraphysiology.** Intrusion exclusively between extraphysical consciousnesses.
13. **Multidimensionality.** Intrusion between an intraphysical consciousness and one or more extraphysical consciousnesses.
14. **Nightmare.** Intrusion based on nightmares.
15. **Hypnosis.** Intrusion with hypnotic bases.
16. **Physiology.** Intrusion with physiological or organic bases (somatics).
17. **Groupkarmality.** Group intrusion (groupkarmic stigma).

Invasion. All types of intrusion of one consciousness upon the intimacy of the microuniverse of another consciousness – even when consented to, but unaware of the extent or depth of the process – tends, in theory, to be *harmful to the consciousness which is being invaded*. It does not matter what the parapsychic condition is or if the interconscial phenomenon in question is, for example, any of the following 7:

1. **Possession.** Interconscial possession in its various degrees.
2. **Hetero-hypnosis.** Hetero-hypnosis (ideally used as a last resort).
3. **Impressionability.** Impressionability originating outside the conscial microuniverse.
4. **Ectoplasmy.** Unconscious ectoplasmy (physical effects).
5. **Psychophony.** Psychophony which is more unconscious and involving.
6. **Psychography.** Psychography which is more unconscious and impressive.
7. **Parateleportation.** Unconscious human parateleportation.

Self-awareness. These facts reaffirm the irrefutable importance and superiority of the condition of interdimensional self-awareness over ordinary, mere human awareness, and the insufficiency of living an intraphysical life which, although lucid, is only conventional, ordinary and fearful of conscial alienations.

Homo. The self-aware intraphysical intruder is the prototypical *Homo hostilis*, the creator of the figure of the enemy or the social being that he/she tries – and is sometimes successful – to appear as to his/her adversary, or to the potential victim who comes to suffer intrusion. However, when *Homo hostilis* comes across a positive or cosmoethical being, *Homo amicus*, intrusion is not installed as there is no atmosphere or predisposition for it.

Paranoia. Intrusion is always a system of *paranoia à deux*, a symbiosis of adversaries. Popular psychology summarizes this fact with the saying: “It takes two to tango.”

Consensus. War, carnage, extermination and genocide constitute collective intrusion (gang raids, lynchings, armed conflicts) taken to their zenith, through the frequently dissimulated leadership of *Homo hostilis*, the *warlord*, which installs *consensual paranoia* through some type of *abdominal brainwashing*. In this case, it is the masses once again leveling individuals according to the lowest possible common denominator.

Objectives. Among ill extraphysicals, the chronic extraphysical intrusive personalities should be singled out for special study. Intruders act upon the inferior ideas and emotions of adults and children, even using intraphysical subhuman animals in their efforts. However, they do not aim – as a considerable number of studious persons think – toward a mere temporary or permanent possession of the person, but also the circumstances and objectives of the community and its existential conditions.

Charisma. Conscial energies and an impactful physical presence can fool imprudent intraphysical consciousnesses. It is sufficient to observe that leader-intruders or mega-intruders are generally highly charismatic personalities. Adolph Hitler is an example from the twentieth century.

Types. There are interconscial intruders which specialize in all interests, appetites, passions, situations and instances of the individual’s life, as can be seen in the following 6 aspects:

1. **Locations.** There are permanent intruders of certain locations, such as: the headquarters of organizations dedicated to gambling; drug trafficking (mafocracy); tanneries or slaughterhouses; battlefields; armament factories (bellicosity); cigarette, pipe and cigar factories, and tobacco shops (tobaccoism).

2. **Functions.** There are intruders related to certain public functions that act upon individuals only while they are performing that action, such as: the corrupt administrator.

3. **Ideas.** Other intruders, which are related to specific ideas, act upon beings who, for example, nurture: the idea of assaulting someone; the promotion of mafia-related acts within mafiocracies of all types and psychopathies.

4. **Punctual.** There are intruders associated with a certain time of day, such as: vampires or energivorous extraphysical consciousnesses that act during the night when intraphysical beings are nonlucidly or semilucidly projected during natural sleep. “At night, all cats are gray.”

5. **Special.** There are intruders that endeavor to influence special events, such as: during certain carnivalesque commemorations, in *Oktoberfests* or in promiscuous sexual group encounters, orgies and *mixers*.

6. **Technicians.** Some intruders act alone and others work in connected, cohesive groups. There are those that act only upon intraphysical beings or only upon extraphysical beings.

Carelessness. Regarding mini-intrusions, any carelessness on the part of the intraphysical being can be problematic. There are many cases of exclusive interconsciential intrusion masquerading as nervous breakdowns.

Domestic. Among the everyday extraphysical influences upon developed sensitives and projectors, indirect techniques should be singled out, such as those operating through relatives and close relationships. They can even occur in the home, beginning with actions that are apparently more innocuous, as well as more trivial domestic accidents. The following are 3 examples:

1. **Cold.** The maid who leaves the window (or a vent) ajar, covered by the curtains, causing the individual to catch a cold from the cool night air.

2. **Air-conditioner.** Someone who replaced the air-conditioner cover incorrectly so that it falls on the unwary victim.

3. **Cleaning.** Excessive cleaning of a section of the floor, which predisposes a fall. *Even detergent dirties.*

Commentaries. One serious problem in relation to these domestic accidents is that individuals generally think that all physical disturbances are triggered only by the negligence or carelessness of the accident victims. These persons do not like interconsciential energies or intrusions to be mentioned. They immediately label the accident victim as monoideistic in terms of multidimensionality or some persecutorial syndrome.

Discretion. The best approach to these facts is for the intraphysical consciousness to see, research and be discreet in personal commentaries in order not to be misinterpreted.

Residues. Incidentally, the rupture of the silver cord (*desoma*) does not only occur close to the human body, or inside the individual extraphysical sphere of energy. *Desoma*, or the rupture of the silver cord, while the consciousness is close to the human body, allows him/her to leave *less* vital energetic *residues* in the cadaver. This does not occur if the silver cord ruptures while the ill projected consciousness – suffering from intrusion for a long time – is far from the human body. Many cases of extraphysical vampirization are committed in this second condition, often being provoked by intruders interested in the increased energetic residues that will be left in the cadaver by the final retraction of the silver cord.

Conflicts. The factors that generate interconsciential intrusion due to conflictual relations or conflicts with other consciousnesses can be listed in 6 variables, in order of decreasing incidence:

1. **Emotionalisms.** Various types of emotionalism involving reminiscing about other personalities.
2. **Grief.** Grief, susceptibilities or repressed resentfulness (*envy*).
3. **Sexosomatics.** Negative sexual contacts, whether physical or extraphysical.
4. **Belligerence.** Thoughts of aversion or outright belligerence regarding another.
5. **Evocations.** Conscious or unconscious evocations of extraphysical or even intraphysical consciousnesses.

6. **Preconceptions.** The morbid cultivation of self-guilt, fixed ideas or repressive conditions because of preconceptions, fanaticisms and erroneous psychological conditioning.

Dependents. *Not all ill extraphysicals are intruders and not all extraphysical intruders are perverse.* If, in human existence, we live with individuals who are mentally deficient, are technically considered to be uneducable and live entirely dependent lives, we obviously must also encounter extraphysical consciousnesses which are, in all aspects, dependent in the extraphysical dimensions.

Oligophrenics. Extraphysical oligophrenics should not be confused with extraphysical intruders or subhuman consciential principles. These exceptional individuals – whether extraphysical mentally retarded beings, imbeciles or idiots, ill consciousnesses or parapsychopaths – need understanding and assistance. They have deficiencies in their mental development because they disrupted their consciential mechanisms and have still not been able to readjust them in order to reason correctly.

Psychosomatics. Para-oligophrenias, or extraphysical mental retardations, especially alter the psychosoma, despite the fact that the generating cause is in the mentalsoma. An unconscious extraphysical persecutor can itself be a victim of one or more conscious persecutors.

Impracticalities. Although the extraphysical oligophrenic can unconsciously operate as an occasional intruder, which is sometimes induced by conscious intruders, it is generally inoffensive due to the following 6 mentalsomatic intraconsciential deficiencies:

1. **Telepathy.** It is not able to perform extraphysical telepathy.
2. **Self-concentration.** It is incapable of maintaining its thoughts on a single subject due to its attention dispersal or short attention span.
3. **Self-dislocation.** It is not able, on its own, to go from one extraphysical environment to another environment of a different frequency, density or nature.
4. **Self-volitation.** It is not able to volitate on its own.
5. **Self-lucidity.** It does not have the acuity necessary for voluntarily and consciously penetrating the psychosphere of the projected intraphysical consciousness in a deeper manner.
6. **Telethosenity.** It does not have sufficient mental syntony and resources to respond to the conscious or unconscious evocations of intraphysical beings.

Hypotheses. Oligophrenia is a complex reality that gives rise to many questions and work hypotheses, such as the following 3, listed here in order to be the subject of future investigation:

1. **Self-thosenity.** Do all oligophrenics have a negative psychosphere (individual extraphysical atmosphere) or are there oligophrenics with a positive personal atmosphere?
2. **Oblationality.** Does the extent of the conditions of renunciation (oblationality) and extraphysical tasks of solidarity and abnegation surpass our normal human capacity for comprehension?
3. **Megafraternity.** Up to what point would an evolved extraphysical consciousness (evolutiologist, *serenissimus*) be interested in being reborn into an oligophrenic physical body that is insensible and incapable of expressing its consciential magnitude in human life, aiming solely to maintain direct contact with the extraphysical (paratropospheric) dimensions, making one of them into a hub or a central station for its own transcendent activities of megafraternity?

Facts. The author has considered these pertinent hypotheses as fact for decades.

Reactions. It is worth informing the public at large that there are 3 consciential conditions or reactions of the intraphysical consciousness that clearly reveal the characteristic and active influence of extraphysical intruders in most, *but not all*, cases:

1. **Accidents.** A predisposition toward accidents (accident proneness) which is characteristic of certain individuals who seem to always be susceptible or likely to suffer repeated accidents, whether in the home, at work, in the street, on the road or even at the club.
2. **Traumatophilia.** Traumatophilia, or the aggressive person's appetite for commotions and his/her apparently spontaneous pursuit of violent physical conflict.

3. **Raptus.** *Raptus* – whether anxious *raptus*, epileptic *raptus*, confused *raptus*, post-commotional *raptus* or post-traumatic *raptus* – which is a sudden and irresistible impulse that leads the individual to perform sometimes serious acts, such as: uncontrolled flight, attacks of violence, sudden attacks of destruction, explosive panic, suicide, violent attacks of homicidal mania (*amok*), assassination.

Actions. The actions of intruders are executed by direct and indirect attacks (ricochet) upon other nearby individuals or loved ones, at their parapsychic (Gordian knot, crux, mega-weak-trait), psychological or physical-organic weak point while either in the ordinary, physical waking state or during natural sleep, nonlucid projection or semilucid projection.

Anticosmoethical. Various anticosmoethical resources are employed by intruders, such as the following 4:

1. **Self-transfigurations.** Transfigurations of the psychosoma, when trying to look like a personality that has some moral, affective or intellectual ascendancy which can impress and persuade the inexperienced victim.

2. **Heterosuggestions.** Depressive hypnotic heterosuggestions upon the individual's mentalsomatic and emotional (psychosomatic) critical points, such as that person's unconfessed self-guilt, pathothosenes or innermost secrets.

3. **Sadism.** The creation of maximally exacerbated sadistic atmospheres (holothosenic intrusion) for the occasional or regular victims.

4. **Nightmares.** The detailed elaboration of artificial nightmares through hetero-hypnosis.

Addicted. There is a type of intrusive extraphysical consciousness which does everything it can in order for the intraphysical being – the victim of its intrusion – not to undergo desoma. If this were to occur, the intrusive extraphysical consciousness would lose its main source of exploitation or vampirization of consciential energies, through which it is able to consume, sometimes even *para-instinctively*, the intense human, animal or paratropospheric sensations it longs for in its tormented condition as a *post-desomatic addict* (energivorous extraphysical consciousness). Many of these intrusive extraphysical consciousnesses are the victim's very close former relatives.

Running. It is worth pointing out the frantic *extraphysical running* that intruders use in order to compensate for their volitional difficulties, often occurring in human (paratropospheric, in this case) environments. The projected intraphysical consciousness should always suspect extraphysical consciousnesses that transport themselves by moving the extraphysical legs of their psychosoma (paralegs), as though they were participating in a marathon or making an escape, instead of serenely gliding, moving naturally or even being carried along by an energetic current. This is very different and easily distinguished by the projected projector.

Points. The following are the 3 weak points that the extraphysical intruders most often use in order to act upon intraphysical consciousnesses:

1. **Intentionality.** Firstly, the individual's bad intentions (pathothosene), from a psychological perspective.

2. **Phobia.** Secondly, a type of fear or a phobia that is specific to that intraphysical victim.

3. **Somatics.** Thirdly, the physiological or organic points follow in this order: the intraphysical consciousness' brain (including the cerebellum); soon after, his/her lungs or respiratory system; next, his/her cardiochakra (emotionalism).

Principle. In law, there is a general principle that should be borne in mind when analyzing all types of major intruders, at any time, and in any place or consciential dimension: "No one is strong against everyone." That is why there are cosmoethical evolved extraphysical communities.

Mini-intrusion. The most common extraphysical influence upon intraphysical consciousnesses is the nightmarish mini-intrusion, the nightmare in the ordinary, physical waking state or, in other words, the negative or uncomfortable daydream or *waking dream*. The lucid projector can be more predisposed to this type of extraphysical influence, especially if performing assistential projections.

This generally occurs when the projector is alone in a moment of trivial reflection or introspection, during natural sleep, in the silence of mental solitude, in the darkness of his/her physical base (often not *energetically shielded*).

Xenothosene. Mini-intrusion upon the projector always occurs when – through a lack of mental self-vigilance – the consciousness allows a xenothosene or *mental wedge* to be cunningly *inserted* into his/her mind under the apparently innocent pretext of an idea or emotion which is suggestive, but negative or pathological.

Infiltration. The cunning idea gently infiltrates and nestles itself in the individual's mind and the psychophysical circumstances further exaggerate the figures and darken (*weigh down*) the colors of the scenario with regard to its nature and consequences.

Relief. The more attentive reader has probably already experienced these nocturnal 5-minute mini-intrusions and laughed nervously and felt relieved upon recalling the fact while alone the following morning.

Resources. These everyday occurrences hinder the projective development and should be combated with at least the following 8 inner resources:

1. **Hygiene.** Mental or intraconsciential hygiene (self-discipline).
2. **Self-vigilance.** Disciplined self-vigilance (self-organization).
3. **Reflection.** Profoundly sincere and thoughtful reflection (thosenology).
4. **Helper.** Confidence in the assistance of an extraphysical helper, when known.
5. **Rationality.** Rational analysis of the facts in question (mentalsomatics).
6. **Self-disposition.** Maintenance of a positive and optimistic inner disposition.
7. **Balance.** Maintenance of serene balance in the face of all intraphysical and extraphysical circumstances (level of self-conscientiality).
8. **Confrontation.** Through lucid projection, perform a direct and courageous extraphysical confrontation (personal deintrusion) with the responsible extraphysical promoter – the generator of xenothosenes or *mental wedge installer* – which, *at first sight*, is frequently a *very welcome intruder*.

Intraphysical societies. There are toxic intraphysical societies that are more pathological and less pathological, reflecting their coexisting paratropospheric extraphysical communities. The difference between them evidently depends upon the average individual of the population suffering either a greater or lesser degree of intrusion from ill or energivorous extraphysical consciousnesses.

Maintenance. The intensity of intrusion and the construction of a pathological, intrusive holothosene can be maintained and deepened in an ephemeral parochial-group manner or in a long-lasting broad-collective manner.

Morphothosenes. Energetic-mental domination (holochakra-mentalsoma), stemming from the extraphysical dimension (paratroposphere), is based on the use of morphothosenes, extraphysical substances and transfigurations of the extraphysical consciousness' psychosoma (macrocephalic giants and microcephalic pygmies), projected intraphysical consciousnesses and intraphysical consciousnesses suffering from interdimensional abdominal brainwashing.

Para-equipment. Aside from using consciential energies, technicians in energetic-suggestive domination, in these cases, also utilize emotionalism of the unwary; fallacious logic (sophism); seductive paratechnology, including interdimensional apparatuses (intrusive para-equipment); in addition to the complete range of immaturities, inexperience, interests and terrestrial human appetites.

Countries. All this shows the importance of the service of extraphysical reurbanization and the advantage of being reborn in New World countries, which are considered to be *adventurous* but have global holothosenes that are young as well as pathological materthosenes that are still very weak.

Imitations. Those who wish to know more on the subject of interconsciential intrusion need only reflect upon the resources that human assailants, traffickers and criminals (mafocracy, anti-social acts) use to perform their infelicitous and illicit activities. This is because everything they do against active human laws (sociopathy) are reflexive, simple and parody-like imitations of the consciential plots of extraphysical and intraphysical intruders in general, or of depraved, obscene and anticosmoethical beings.

Gang raids. That is why they act alone or in groups (gang raids, lynchings), disguised or in the dark, using all possible circumstantial advantages or those that they chance upon.

Pseudodead. It should be stressed again: at this evolutionary stage on the earth, it is not the extraphysical beings that imitate intraphysical beings, but the other way around. The *pseudodead* continue to lead the *pseudoliving*.

Holothosene. It is well known that volitation stems from the will of the consciousness that is volitating, but it is also influenced by the atmosphere of thoughts or the group holothosene of the consciousnesses based in each extraphysical environment or community.

Volitation. One specific resource of the activities of extraphysical intruders is precisely to make (often in conjunction) extraphysical consciousnesses or projected intraphysical consciousnesses – which are volitating, sometimes fleeing, trying to become free from pursuers – *fall* or return defenseless to their realm, like a bird that has been hit in mid-flight by the bullets of their negative thosenes (pathothosenes).

Principles. The following are 2 more valuable principles or warning signals regarding human conduct while performing intraphysical and extraphysical assistance related to interconsciential intrusion:

1. **Irritation.** The most common initial inner emotional characteristic of the individual's mood related to extraphysical influences upon one's intraphysical consciousness is a blind, gratuitous and silent irritation with no real cause or plausible reason. It is alien to the individual's temperament and his/her good intentions. It also sometimes manifests against everything and everyone with the appearance of certain irrational, eccentric or absurd opinions and convictions, even tending toward antisocial behavior. The individual should therefore constantly be on guard against any irritation or atypical bad mood of any kind which arises in one's inner world when engaged in any task that may constitute or result in an interconsciential deintrusive or assistential task.

2. **Foreboding.** Likewise, take precautions when there is a clear sensation of foreboding which is negative, uncomfortable and involving, before a speaker begins to talk with you on some subject which quickly turns out to be trivial or unimportant.

Videotapes. It is recommended that the interested intraphysical consciousness – who is closer to the person suffering from unconscious human intrusion or mini-intrusion, or that person who does not recognize his/her own condition of occasional intrusion – record on videotape (camcorder) various moments and environments, including natural non-intrusive conditions and intrusive manifestations of the intrusion victim. This is suggested so that the filmed individual can later establish a comparison between his/her healthy state and the condition when suffering from intrusion or undergoing a crisis while under the influence of a disturbed extraphysical consciousness. This therapeutic measure is ideal for making someone aware of all types of personal occasional unconscious mini-intrusions.

Therapies. As a general rule, any person who begins to question his/her personal mental health, or fears losing it, should seek professional help. This aid should not be limited only to psychiatrists, psychologists or therapists, but should also, depending upon the case, include conscientiotherapists dedicated to the treatment of patients clearly suffering from intrusion. It is not intelligent to undervalue or reject atypical, albeit cosmoethical, therapies in this era of inveterate consumerism, wild sexuality and the excessive permissiveness of our intraphysical society, which is still pathological and altogether dominated by capitalism and, in part, by medical imperialism.

Addicts. The modern image which is closest to – while still being a parody of – the shadowy atmosphere of intrusiveness and its intrusive climate, is the so-called *sadism session* sometimes promoted by death squads, addicts, and assailants of houses and parties, in the twentieth century.

364. POSSESSIVE CONSCIENTIAL PROJECTION

Definition. Possessive consciential projection: that projection whereby the projected intraphysical consciousness temporarily possesses an intraphysical person or subhuman intraphysical animal.

Synonymy: intrusive consciential possession; invasive consciential projection; mutual consciential projection; possession-projection; superimposed consciential projection.

Possession. The concept of possession by an extraphysical consciousness currently enjoys wide acceptance among the neospiritualists of Europe, spiritists in general and a large percentage of the Chinese people, in which case it is not considered to be an illness.

Abnormality. It is well known, through comparative psychiatry, that the idea of abnormality varies, according to cultures, times, customs and places. For example: the shaman is considered a genius in Siberia and insane or a psychopath (suffering from hysterical partial dissociation) in Europe; the fakir is considered to be normal and even a saint in India and a psychopath (suffering from catatonic schizophrenia) in England; and so on. Note: reference is not being made here to any tribe studied by anthropology, but countries considered to be part of greatly acclaimed *contemporary civilization*, researched by sociology and political science and even within the current phenomenon of the *acceleration of history*.

Possessor-projector. In possession-projection, the projected projector is temporarily an intraphysical intruder or intraphysical (human) possessor.

Possession-projection. There are cases of projectors in areas of India and in African tribes, witches of primitive human groups which take possession of the physical body of a domestic or wild subhuman animal to act through it in a conscious manner, in order to satisfy similar personal animal passions. This constitutes one of the most primitive forms of exercising animism and parapsychism through possession, as described by anthropologists who research tribes, sects and rites.

Tiger-men. From these possessive projections arise the facts attributed to so-called *tiger-men* or, in other words, tigers humanized through incorporation or animic-parapsychic semi-incorporation. This is a blatant confirmation of the parapsychism of subhuman animals.

Animals. Among the subhuman animals used by primitive intruder-projectors, the following should be listed: wild animals, such as tigers, wolves, jackals, foxes, deer; and pets, such as cats and dogs.

Aims. Among the causes or aims of possession-projections we should highlight the satisfaction of the intraphysical consciousness' animal passions, the search for information and the tracing of missing persons. These actions are undertaken in order to maintain the personal prestige of the possessor-projector in the eyes of primitive tribes, or ignorant clans, in which the projector acts as a witch, priest or oracle.

Positivity. Besides the above-cited aspects, it is important to point out that generally only negative, pathological or macabre possession is mentioned. However, possession can sometimes be a very positive force. An example of this is the extraphysical benefactor or mentor that communicates fully through the sensitive using psychophony. In that moment, the sensitive's human body is completely possessed, in a positive manner, by an extraphysical consciousness, the human body or soma of which has already decomposed, sometimes decades before.

Mutual. Another positive aspect of the phenomenon is mutual possession, or reciprocal incorporation, which serves as a powerful therapeutic resource. Young married couples frequently want to experience the actual sensations of the other partner or mate. Through mutual possession, or the possession of the other's body, even for brief moments, these couples or the partners of an evolutionary duo can better understand each other, the real individual motivations and sensations between them and, if they so desire, can even achieve mutual orgasm in their temporarily exchanged human bodies.

Types. Two types of interconsciencial possession have been universally recognized:

1. **Voluntary.** Voluntary possession is accomplished when the individual allows him/herself to be possessed by an extraphysical consciousness, as with the sensitives of Spiritism, *Umbanda* (*Candomblé*, *Catimbó*), Pentecostals (evangelical sects dedicated to exorcism) and others. They allow the possessor to manifest itself, an action which the extraphysical consciousness is normally unable to perform.

2. **Involuntary.** Involuntary possession occurs when the individual does not freely allow him/herself to be possessed, but is overtaken by an external force that is generally malevolent, ill, pathological or anticosmoethical, sometimes even being destructive.

Incorporation. Effective interconsciential possession is established through the phenomenon of parapsychic incorporation. This can be classified into at least 4 categories, according to the variables that interfere in its development:

1. **Consciousness.** The consciousness that incorporates: an extraphysical being or an intraphysical being.

2. **Intraphysical consciousness.** The consciousness or the lucid or semilucid consciousness (intraphysical consciousness).

3. **Area.** The area of activity: generally encephalic (coronochakra, inspiration), abdominal-encephalic (umbilicochakra, ectoplasm) and manual-encephalic (palmochakra, psychography).

4. **Healthiness.** The condition of healthiness: natural possession (healthy parapsychic communication) or pathological possession (frank pathological interconsciential intrusion).

Analyses. Further details on possession can be obtained in the analyses of zoanthropy herein; in the physical manifestations of the communicant projector; in lucid projection related to subhuman animals.

Watseka. The best known and most investigated case of possession in all of the metapsychical, parapsychological or parapsychical literature is that of Mary Lurancy Venum (1864-1949)–Mary Roff (1846-1865), or the case which occurred in Watseka, Illinois, in the United States of America, where many experiences of lucid projection during possessive trances were studied in 1878 (Fodor, 528, p. 404; Gauld, 576, p. 156; Knight, 851, p. 303; Myers, 1114, p. 360; Riland, 1403, p. 336; Smith, 1572, p. 168; Steinour, 1612, p. 240; Stevenson, 1620, p. 493; Wang, 1794, p. 486; Wilson, 1858, p. 57).

Hypothesis. Possession is the best and most rational explanation to substitute the controversial hypothesis of adult consciential relay or adult resoma.

Police. After various fruitless attempts, while lucidly projected, the author was able, with the inestimable aid of a helper, after intense auric coupling, to temporarily (for perhaps about 10 minutes) and extraphysically take possession of an enormous male police dog during the early morning of October 14, 1984 in a police headquarters located in the state of Rio de Janeiro, Brazil.

Running. On this occasion, the author was able to make the dog temporarily stop its nervous barking and its eagerness to leave the inside of the building where it was located. Soon thereafter, he felt, together with the dog, the exotic sensations of the impressive and stimulating uncontrolled running between the fences and walls of the headquarters.

Return. The return to the physical base, to the human body, and lucid physical awakening occurred abruptly, albeit with no physical repercussions.

Name. It was not possible to ascertain the dog's name because it was loose in a large area that was partially covered and there was no direct contact with human beings.

Brain. In this case, there was some type of interconsciential possession. The author maintained a certain level of self-lucidity. This indicates that the dog's physical brain permitted it. Why do other animals not present a greater level of self-lucidity and self-knowledge? Could it be because those consciential principles, just like we human beings, still do not use the entire potential offered by the brain? Does evolution actually signify absolute mastery of the human brain on this planet, which *serenissimi* have achieved for a long time?

Bibliography: Armond (53, p. 87), Crookall (343, p. 96), Currie (354, p. 108), Drury (414, p. 121), Fodor (528, p. 294), Frost (560, p. 192), Gomes (611, p. 127), Monroe (1065, p. 160), Myers (1114, p. 298), Riland (1403, p. 336), Sargant (1508, p. 199), Souza (1585, p. 122), Vieira (1762, p. 125), Wang (1794, p. 482), Warcollier (1796, p. 98).

365. DEINTRUSIVE CONSCIENTIAL PROJECTION

Definition. Deintrusive consciential projection: assistential projection that is specialized in tasks of extraphysical interconsciential deintrusion.

Synonymy: *apometria*; battle of wills; direct deintrusion; dispossession; explicit deintrusion; extraphysical confrontation; extraphysical deintrusion; head-on deintrusion; projective deintrusion.

Reasons. Among the essential principles of the *raison d'être* of the deintrusive consciential projection, at least the following 5 can be singled out:

1. **Assistentiology.** Just as cure (self-cure and therapies) is the most important field that an individual can dedicate him/herself to in human life, deintrusive lucid projection represents the most relevant multidimensional task outside intraphysicality, namely superior extraphysical assistance.
2. **Conscientiotherapy.** It functions as extraphysical therapy for the projector and close relatives.
3. **Paraprophylaxis.** It promotes the ideal prophylaxis against interconsciential intrusion.
4. **Projectiology.** It arises as an inevitable stage in each person's development of lucid projection.
5. **Conscientiology.** It makes continued critical interconsciential contacts possible.

Effects. The positive effects of deintrusive projections can be classified into physical and extraphysical.

Physical. The following are the 10 most important physical effects of deintrusive projection:

1. Personal improvement of lucid projection.
2. Increase in the capacity for remembering extraphysical events.
3. Intensification of consecutive lucid consciential projections and those in series.
4. Anonymous intangible assistance to others.
5. Relief from the existential atmosphere or the domestic holothosene of the physical base.
6. Dynamization of physical and extraphysical parapsychism.
7. Self-awareness of the projective aura.
8. Discovery of personal parapsychic signals (signage).
9. Reception of notices of consciential projection (practical use of signage).
10. Service performed as self-aware, assistential, interconsciential bait (consciential epicenter).

Extraphysical. The following are the 7 most relevant extraphysical effects of deintrusive projection:

1. Increase in the assistance received by the projector.
2. Amplification of the circle of beneficial intervening extraphysical relations.
3. Amplification of extraphysical self-awareness.
4. Overall improvement in the intraphysical projector's extraphysical performance.
5. Improvement of assisted or guided lucid projections.
6. Installation of the intraphysical consciousness' personal extraphysical clinic.
7. Preparation of the intraphysical consciousness' work in order to be a self-aware *minicog* within an interconsciential assistential *maximechanism* (consciential epicenter, penta practitioner).

Assisted. The following are the 16 most common categories of beings which are assisted through deintrusive projections: victims and persecutors, extraphysical consciousnesses and intraphysical consciousnesses; leader-intruders of *extraphysical* groups and *gang raids*; conscious extraphysical intruder consciousnesses; unconscious extraphysical intruder consciousnesses or *floating cadavers*; extraphysical consciousnesses aware that they are suffering from intrusion; extraphysical consciousnesses unaware that they are suffering from intrusion; extraphysical consciousnesses suffering from self-intrusion; assistant extraphysical consciousnesses or *satellites of intruders*; parapsychopaths in general; *unattenuated* former suicide extraphysical consciousnesses; somnambulant extraphysical consciousnesses which are ignorant of their own extraphysical situation; challenging, persecuting or ridiculing extraphysical consciousnesses; intrusive intraphysical beings; intraphysical beings suffering

from intrusion; intraphysical beings suffering from self-intrusion; extraphysical and intraphysical consciousnesses which are useful-innocents, under the control of mega-intruders.

Knowledge. It is extremely important for the self-lucid projector to have an inner knowledge of intrusive manifestations because, upon projectiologically developing, they will perform various vital assistential functions, such as the following 3:

1. **Parapsychism.** Clarifying sensitive in deintrusive projections, or an *extraphysical exorcist* (clarifying projector).
2. **Bait.** Self-lucid extraphysical consciential bait.
3. **Aide.** Lucid aide in extraphysical assistential tasks.

Intraphysical consciousness. Individuals or intraphysical consciousnesses who constantly feel uncomfortable when consciously leaving the human body in the psychosoma (emotional body) are generally involved in a direct extraphysical situation with an imbalanced energivorous extraphysical consciousness which is almost always a recent arrival to the extraphysical dimension. As they do not have any resources for promoting a direct deintrusive projection with the ill extraphysical consciousness, the projectors therefore experience regrettable suffering from coming face to face with the ill intruder. This occurs almost every time the projectors go to sleep or leave the state of coincidence of their vehicles of consciential manifestation.

Recommendation. It is recommended that all abovementioned novice projectors perform assistential deintrusion practices – which aim to reconstitute the field of consciential energies (personal holothosene) through the vibrational state and other bioenergetic practices – thereby aiding the projector’s lucid extraphysical departures. In this sense, lucid projection and even psychophony performed in favor of ill extraphysical consciousnesses interact and mutually support each other.

Temporary. Lucid projection clears up all cases of interconsciencial intrusion. No one should consider him/herself to be abandoned or miserable as a result of discovering, anatomizing and dissecting his/her own real extraphysical situation. It is always relevant not to lose sight of the fact that, above all, small interconsciencial intrusions happen to *all* intraphysical beings. This occurs to the benefit of our fellow beings and in favor of everyone’s evolution.

Duration. There are interconsciencial intrusions that last 5 minutes, 5 hours, 5 days, 5 months, 5 years, and so on. In these cases, there are always beneficent extraphysical consciousnesses aiding, inspiring and transmitting energies to the consciousness suffering from intrusion, in order to help it to improve its extraphysical performance during lucid departures. These temporary influences cooperate extraordinarily toward the lucid projector’s development during departures from the human body.

Evolutiology. At the current critical phase of terrestrial progress, it becomes impracticable for the intraphysical being who seeks to produce some consciential evolutionary benefit not to suffer some repercussion from ephemeral extraphysical influence, from time to time, in favor of the ill ones, in favor of him/herself, and in favor of all with whom he/she coexists.

Summary. In summary, 8 important aspects regarding the services of conscious deintrusion can be listed:

1. **Attitude.** The worst *attitude*: the ostrich approach, or avoiding the subject because of superstition or erroneous conditioning. Fear always represents submission and anticipated defeat to intraphysical and extraphysical interconsciencial influences.
2. **Sign.** The main *sign*: exoticism as a foreign element in the deintrusive encounter, the breaking of the pattern of assistential works in group.
3. **Symptom.** The greatest *symptom*: having a *short fuse*, unusual irritation which is different from the habitual behavior of the intraphysical consciousness who is being influenced.
4. **Precaution.** The most important *precaution*: the execution of consecutive deintrusive lucid projections.
5. **Resource.** The most efficient *resource*: the exteriorization of consciential energies in the ordinary, physical waking state, as well as in the extraphysical dimension.

6. **Occurrence.** The most common *occurrence*: sudden interiorization of the lucid projector upon having an impactful vision or after experiencing an unforgettable extraphysical *flash*.

7. **Gratification.** The greatest *gratification*: the projector that gets out intact, compared to the high number of persons who succumb to extraphysical interconsciential influence.

8. **Misfortune.** The greatest *misfortune*: the negative influence on health professionals, such as doctors, psychologists, nurses, paramedics and others.

Development. Lucid projection, besides offering the opportunity to work directly with ill personalities, is the basic effective resource for the *intrapysical consciousness* to live better among the consciential dimensions, sustaining consciential integrity, emotional balance, and the maintenance and development of parapsychic practices.

Intentionality. Head-on, explicit, *paraface-to-paraface*, boundary-free contact with any ill extraphysical consciousnesses, with the intentionality for conciliation and fraternal understanding, dynamizes the intraphysical consciousness' lucid departures, improving his/her projective methods.

Sympathy. Assistance performed in favor of ill persons attracts the sympathy and aid of evolved extraphysical consciousnesses. They directly promote and help the detachment or takeoff of the consciential projector's psychosoma – which transports the consciousness – and the acquisition of extraphysical lucidity when projected from the soma.

Practice. The practice of deintrusion is performed under different names and with specific methods according to the area of human activity, such as the following 5:

1. **Shamanism (*pajelança*):** between the peais and the other members of the tribe.
2. **Cleansing (*descarrego*):** between the practitioners of syncretic religions, such as *Candomblé*, *Catimbó*, *Macumba*, *Quimbanda*, *Umbanda* or *Xangô*.
3. **Exorcism:** between the priests and followers of Catholicism.
4. **Expulsion of the *devil*:** between the evangelical clergy and pastorate of various religious orders (Bible).
5. **Deobsession:** between the indoctrinators and spiritist mediums, whether fundamentalist (Christians), orthodox (*Kardecists*), *Roustaingist* (Roustaing) or rationalist (Centro Redentor, Rio de Janeiro, RJ, Brazil).

Evolution. The consciential projector's psychophysical evolution becomes impracticable without the production of continuous deintrusive projection. Even if it is for periods determined by the helpers, it constitutes an indispensable consciential element, notably if the projector wishes to: intensify his/her extraphysical departures with greater frequency; prolong the lucid consciential projections, or improve the quality of the extraphysical consciential perceptions.

Psychosomatics. These imperative measures are due to the fact that the emotional body (psychosoma) acts directly in the paratropospheric, excessively emotional dimension that surrounds the earth's planetary crust. It is a common gathering place where intraphysical and extraphysical consciousnesses debate while immersed in the same atmosphere which is determined by a permanent climate of intense, reciprocal and continued consciential influences.

Group. Ample group deintrusive activities can also occur through the retrocognitive experiences of others. In this case, the projected intraphysical projector operating as a sensitive in the extraphysical dimension, for example, makes him/herself passive (psychosoma) and uses sympathetic assimilation and extraphysical incorporation in order to facilitate the energetic shocks made upon a formerly militant extraphysical consciousness from a rival politico-terrorist group, and even from other extraphysical beings and other different groups, if this is the case. The projector later recalls all the extraphysical experiences.

Gladiator. It is always important to reflect upon the fact that the practice of deintrusive lucid projection is not at all related to the techniques of the gladiator.

Bibliography: Costa (308, p. 4), Fortune (540, p. 155), Martins (1006, p. 161), Muldoon (1105, p. 292), Rosin (1475, p. 140), Swedenborg (1639, p. 52), Vieira (1762, p. 99), Yram (1897, p. 105).

366. DEINTRUSIVE PROJECTION TECHNIQUE

Possibilities. The first steps for deintrusive projection are sometimes made in a typical oneiric or nightmarish climate, because the projected intraphysical consciousness is still not able to maintain the serenity and balance required to preserve the correct recall of the extraphysical events.

Alert. The novice projector should remain alert to all nightmares, attempting to establish their cause and the possibility that they are erroneous interpretations of his/her assistential tasks performed during the conscial projection.

Functions. During the deintrusive projection, the projector simultaneously functions as the director of activities, the clarifying sensitive and the sensitive which is extraphysically receiving illuminating ideas and therapeutic energies from the helpers for the extraphysical consciousnesses which are ill and in lack of fraternal assistance.

Assistance. In summary, the projector acts alone and as directly as possible in the place of an entire team of an ordinary parapsychic deintrusion meeting, making all the elements of dense matter unnecessary. That is why this extraphysical activity is the utmost assistential service that can be executed by an intraphysical being.

Procedures. Deintrusive projection techniques can be classified into extraphysical and physical.

Extraphysical. Among the extraphysical techniques of projective deintrusion, at least the following 15 procedures can be singled out:

1. **Self-confidence.** Absolute self-confidence.
2. **Balance.** Conduct involving neither weakness nor superiority, but balance.
3. **Cooperation.** An attitude involving neither argument nor challenge, but cooperation and team spirit.
4. **Helpers.** Absolute confidence in the visible and/or intangible cooperation of the helpers.
5. **Resource.** To appeal to the helpers when necessary.
6. **Parapsychism.** The use of extraphysical parapsychism when the intraphysical consciousness is projected.
7. **Serenity.** Maintenance of constant serenity.
8. **Exteriorizations.** The use of exteriorizations of conscial energies.
9. **Thosenology.** Only allow yourself to have benevolent and fraternal self-thosenes.
10. **Bait.** Consciously and satisfactorily exercising the role of extraphysical bait (self-lucid conscial epicenter) during the production of conscial projection.
11. **Evocations.** Making intentional evocations when necessary.
12. **Hygiene.** Eliminate all inopportune mental discussions (conscial hygiene).
13. **Extraphysical consciousnesses.** Pay special attention to the *para-eyes* of extraphysical consciousnesses.
14. **Cord.** Remain, whenever possible, inside the extraphysical sphere of energy or in the totipotent perimeter of the silver cord's influence.
15. **Interiorizations.** Use the resource of rapid consecutive interiorizations (*emergency landings*).

Physical. Among the physical techniques that aid projective deintrusion, at least the following 6 procedures can be singled out:

1. **Parahygiene.** Do not nurture any kind of negative idea (mental hygiene).
2. **Self-thosenity.** Do not allow any type of *psychological openings* or pathosenes (mental peccadilloes) through which ill extraphysical consciousnesses can act.
3. **Services.** Participate in deintrusive tasks in the ordinary, physical waking state, serving as a clarifying sensitive, a psychophonic sensitive or a projected projector.
4. **Penta.** Maintain a daily time for mental irradiations and exteriorization of conscial energies, together with a helper, as a practitioner of continuous penta sessions.

5. **Prophylaxis.** Always remember that you will temporarily and inevitably coexist with ill extraphysical consciousnesses, beginning some hours prior to consciential projection.

6. **Self-lucidity.** Perform the role of psychophysical, assistential and self-lucid bait while in the ordinary, physical waking state.

Defenses. Assistential extraphysical consciousnesses – helpers – establish an energetic system of prophylactic surveillance in the surrounding energetic dimension. It is similar to an intense force field, a strong cordon of isolation or parasanitary encapsulation, defending the intraphysical beings from consciousnesses which are *restricted to the human brain*, as well as from ill extraphysical consciousnesses and nearby consciousnesses in general.

Shielding. The physical base of the projector who is willing to perform extraphysical deintrusion thereby becomes *energetically shielded*, even when he/she still does not have advanced technical resources for projecting and remembering extraphysical events in full detail.

Holochakrology. The clarifying projector or the one that produces deintrusive projections needs all the attributes of the intraphysical sensitive as well as a high level of emotional control. This is because, despite the expansion of his/her consciential faculties, the projector remains, the entire time, close to the silver cord, which returns him/her to the human body. The closer the projector is to the human body and the greater the emotional pressure, the more difficult it is to maintain distance from the vital link (extraphysical sphere of energy) during the crucial processes of assistential tasks between consciousnesses in the intraphysical and the other dimensions.

Respiration. Novice projectors, as well as psychophonic sensitives in general, should always be predisposed to consciously help – without losing sight of the subject, while in the state of parapsychic passivity – those extraphysical consciousnesses which have passed through somatic deactivation (desoma) with pulmonary disturbances. Some examples are advanced pneumonia, pulmonary tuberculosis or lung cancer due to the direct relationship with natural respiration, being the touchstone for the interface of 2 psychosomas (emotional parabodies), that of the projector and that of the extraphysical consciousness. The cardiochakra and its consciential energies play relevant roles in these processes.

Formula. In order to execute the above-cited works, the following 5-point assistential formula is recommended in order for it to be applied with self-determination:

1. **Positivity.** Think positive, healthy and cosmoethical thoughts, not nurturing any type of negative, pessimistic or sick idea.
2. **Megafraternity.** Feel intense well-wishing for your fellow being, regardless of who it is.
3. **Fearless.** Eliminate all feelings of fear, under any pretext, without exceptions.
4. **Trustfulness.** Consider yourself to be constantly assisted and incredibly strong, being a powerhouse of consciential energies ready to be exteriorized in favor of the common good. It is important, when in the presence of an ill extraphysical consciousness, not to transfer personal fears, anxieties or even prepotency. It is necessary to create a climate of mutual trust.
5. **Self-conscientiality.** Through uninterrupted exercises, maximally intensify your lucidity outside the human body whenever possible upon going to bed every day or every night.

Echelons. It should be borne in mind that the technical services of deintrusiveness – which sometimes have complex, multi-secular group roots – can only be efficaciously and fully executed through consciential energies and effective assistance, by implementing a 4-step *orderly annulment* with the supervision of (intraphysical and) extraphysical helpers:

1. **Third.** Initially, deintrusion of the third echelon of intraphysical and extraphysical intruders (unconscious energivorous extraphysical consciousnesses, the *cannon fodder* of the mega-intruders).
2. **Second.** Soon thereafter, deintrusion of the second echelon of intraphysical and extraphysical intruders (the satellites of interconsciential intruders).
3. **First.** Then, the first echelon of senior intraphysical and extraphysical intruders.

4. **Intraphysical consciousness.** Lastly, the direct renewal of the intraphysical consciousness suffering from intrusion, the main victim, the polarizer and main component in the parapatological group in question.

Signs. The signs of the condition of psychophysical bait, even when it occurs consciously, vary according to the characteristics of the influence of the extraphysical consciousness' psychosphere. For example, if the extraphysical consciousness underwent desoma due to a heart attack and the sensitive intraphysical consciousness is predisposed to cardiac problems, he/she can experience labored breathing, tachycardia, restlessness and anxiety. Auric coupling, in this case, predominates through the cardiochakra. This occurs in the same manner with other disturbances, illnesses or mortal crises.

Extraphysical clinic. Regarding this point, it is important to bear in mind the daily practices of penta and the extraordinary results of the interconsciential assistance performed in the consciential epicenter's extraphysical clinic.

Pain. The sensitive who is an intraphysical-bait extraphysical-consciential epicenter is that individual who literally and directly feels (or suffers) "all the suffering of humanity." For example: when working on a haunted (poltergeist) location with a "skull and crossbones," the author hosted at his side, removed and directed a post-desomatic, parapsychotic extraphysical consciousness with a totally altered or transfigured psychosoma (one of the key components of the disturbances). This transpired from 9:00 AM (the moment of auric coupling) until 6:00 PM, when energy exteriorization was performed at that location which was infested with sick energies (pathological holothosene). During these 9 hours as extraphysical bait – coupled with an ill extraphysical consciousness or a conscious intruder – the author silently felt constant but bearable pain and paralysis of the middle finger of the left hand and the left elbow. All the pain, paralysis and other uncomfortable symptoms disappeared at the precise moment when the vigorous, intraconscientially disturbed extraphysical consciousness was removed.

Consciential epicenter. Among the symptoms and signs which indicate that the intraphysical being, sensitive, projector or consciential epicenter is serving as psychophysical bait in order to attract and retain an ill extraphysical consciousness in his/her proximity or energetic psychosphere (personal holothosene) so as to eventually perform extraphysical deintrusion, the following 13 can be singled out:

1. **Obnubilation.** Light intraconsciential obnubilation or obfuscation.
2. **Oppression.** A sensation of undefined and nonlocalized oppression.
3. **Weight.** A sensation of weight on the thorax (cardiochakra).
4. **Irritability.** Unfounded irritability, which is different from the individual's own temperament.
5. **Exhaustion.** Physical exhaustion without any visible cause.
6. **Indisposition.** Sudden, generalized indisposition with no apparent cause.
7. **Foreboding.** A sensation of imminent misfortune or a *sensation of foreboding*.
8. **Sleepiness.** Irresistible somnolence or sleepiness.
9. **Pessimism.** Ideas of sadness, melancholy, bitterness or pessimism which are foreign to the projector's self-thosenes and *mentalsomatic* or psychosomatic habits, denoting heavy parapsychic interferences.
10. **Presence.** An impression of the close and intangible presence of a stranger.
11. **Showers.** Unaccustomed energetic currents, *energetic showers* or disagreeable vibrations sweeping over the human body from time to time.
12. **Odors.** The perception of nauseating odors without origin.
13. **Discoincidence.** Excessive, disturbing or uncomfortable discoincidence while in the waking state.

Self-diagnosis. The detection or self-diagnosis of the above-cited sensations is the fundamental and irreplaceable measure for developing any assistential undertaking or research which involves other consciousnesses from this and other dimensions. This is the attitude which can establish the theoretical bases of self-lucid consciential epicentrism.

Reward. The greatest reward or garland which the animist-sensitive can receive is to serve as bait and as a pivotal component for the helpers to place a group of lucid extraphysical consciousnesses – which are on the threshold of resoma – *interning* around the sensitive for some days. This aims to provide them with direct contact, in the terrestrial or intraphysical troposphere, with the manifestations, problems and difficulties of interdimensional and multidimensional exchange between intraphysical and extraphysical consciousnesses.

Advantages. One of the main immediate advantages of serving as psychophysical bait is the avoidance of mishaps or prevention (paraprophyllaxis) of events which are worse than a simple, pathological, interconscial (but ephemeral) influence. For example: the driver of your car (*chauffeur*; relative or friend) comes to work with you unconsciously controlled by an ill extraphysical consciousness. Your extraphysical helpers extraphysically encapsulate this ill extraphysical consciousness together with you, thereby isolating and calming the driver at the wheel. This avoids a probable accident that could also involve you and other persons.

Unconsciousness. Almost always, the intraphysical sensitives and persons around the pivotal component or conscial epicenter are not able to detect the actual status of the developmental stage of the extraphysical observers in detail, generally occurring with positive or healthy energetic irradiations. More rarely, not even the animist-sensitive becomes aware of the events while they are occurring.

Aura. The greater expansion of the vibrant encephalic aura (nimbus, aureole), its enlarged form and its pulsating or reverberating movements – determined by the impulsion of the will – is a phenomenon that is accessible to any intraphysical consciousness who is more alert to animic-parapsychic problems.

Expansion. This auric expansion acts as a defensive resource, which is deintrusive and mild, in the sense of removing disturbing or intrusive extraphysical consciousnesses which flee as a result of being surprised or terrorized by our presence. This holds true whether we are in the ordinary, physical waking state or projected in paratropospheric environments.

Mentalsomatics. The projector who wishes only to leave the human body in the isolated mentalsoma soon after beginning his/her experimentations and to always reach the spheres of the mentalsomatic dimension, avoiding the emotional interferences of the tropospheric and paratropospheric environments, which are characteristic of the psychosoma, would do well to leave this ambition until such time as he/she is an extraphysical consciousness, during the intermissive period in the extraphysical dimension (the next interval between this and the subsequent human existence). He/she should first take advantage of the assistential opportunities that the current human life and the existential program offer. This is because the intraphysical projector generally only achieves habitual projection in the mentalsoma after fully mastering the common techniques of projection in the psychosoma.

367. ASSISTENTIAL CONSCIAL PROJECTION

Definition. Assistential conscial projection: beneficial service performed by the intraphysical consciousness projected from the human body, generally in the psychosoma, alone or participating in a multidimensional team, within assistentiology, a subdiscipline of conscientiology (see fig. 367, p. 1,148).

Synonymy: anonymous extraphysical service; conscious extraphysical mission; extraphysical clarification task; extraphysical consolation task; projective assistance.

Idleness. There are two categories of conscial idleness:

1. **Human.** *Human* assistential idleness is the worst condition of the intraphysical consciousness. This is because, in line with conscial evolution, each one of us is reborn, above all, in order to lucidly serve other consciousnesses. This is so regardless of our existential program, when there is one. It even reaches the point, in certain more evolved contexts of existential maxiprograms, of *rationaly justified cosmoethical self-sacrifice*.

2. **Extraphysical.** Extraphysical idleness is the worst possible projective condition. It is even capable of completely annulling the more aware intraphysical projector's extraphysical life, regardless of his/her existential program, when there is one.

Projectiology. Lucid assistential projection is the only existing resource capable of completely eliminating the projector's extraphysical idleness.

Import-export. Through the exchange of lucid projection, the intraphysical consciousness has the resources of *interdimensional import-export*, wherein he/she can *import* extraphysical energies, therapeutic interconsciential resources and original ideas to the human dimension from the more evolved extraphysical communities; and is able to *export* consciential energies and intraphysical assistential resources to the energivorous, needy or ill extraphysical consciousnesses, notably to the paratropospheric districts.

Reception. Because of the precariousness of the funneling imposed by the intraphysical and extraphysical restriction of human existence (cerebral hemispheres) or *resoma*, in this reception-donation exchange, the projected intraphysical consciousness invariably receives more than he/she gives.

Assistentiology. At least 6 basic types of extraphysical assistance are executed by the projected intraphysical consciousness:

1. **Intraphysiology.** Assistance provided to intraphysical consciousnesses.
2. **Extraphysiology.** Assistance provided to extraphysical consciousnesses.
3. **Desomatics.** Aid provided for first *desoma*.
4. **Intermissiology.** Aid provided for second *desoma*.
5. **Deintrusion.** Deintrusive services.
6. **Rescues.** Rescue tasks provided to abductees or those extraphysical consciousnesses suffering from intrusion.

Voluntary. The *volunteer-assistant-projector* condition can be obtained and developed through at least the following 8 universalistic resources:

1. **Self-discernment.** Sincere compassion, stemming from cosmoethical self-discernment, for group and collective problems in instances of natural cataclysms and accidents, such as earthquakes, seaquakes, tornadoes, volcanic eruptions, cave-ins, contaminations, epidemics, large fires, continental pollution and floods.

2. **Hetero-help.** Desire to help in areas of human conflicts, pathological atmospheres and holothosenes of war (bellicosity).

3. **Orthothosenity.** Healthy, cosmoethically and sincerely felt self-thosenity in favor of needier individuals.

4. **Evocation.** Confident evocation of the helpers, aiming toward the well-being of other consciousnesses.

5. **Self-predisposition.** Continued psychophysiological, parapsychic or holosomatic predisposition to serve extraphysically (helpful projected intraphysical consciousness or parasocial assistant).

6. **Holochakrology.** Cultivation of a personal aptitude for exteriorizing therapeutic consciential energies (assistentiology, conscientiotherapy).

7. **Fearlessness.** Complete and permanent absence of any fear (thanatophobia) or pessimistic or negative idea (intraconsciential depression).

8. **Self-discipline.** Self-discipline regarding the exaltation of the better side of persons, institutions, things and facts.

Law. The following is the first active law in assistential lucid projections: the more assistance the intraphysical consciousness gives others, the more assistance he/she will receive to project with lucidity.

Resources. The following are 9 resources that the projected intraphysical consciousness can count on for executing extraphysical intraconsciential assistance:

1. **Parapenta.** Exteriorization of consciential energies when in the state of dis coincidence of the vehicles of manifestation or during *parapenta*.

2. **Groupality.** A sense of groupality in the employment of conscious evocation in favor of others (self-conscientiality).

3. **Psychosomatics.** Self-transfigurations of the psychosoma.

4. **Mimicry.** Experience of the phenomenon of extraphysical mimicry.

5. **Bait.** The applied condition of lucid intraconsciential bait (consciential epicenter).

6. **Cosmoethical.** Cosmoethical counseling or extraphysical confrontation.

7. **Pangraphy.** Parapsychic self-passivity for extraphysical pangraphy.

8. **Couplings.** Competent execution of healthy auric couplings.

9. **Institution.** Exchanges with the assistants of the “Extraphysical Red Cross”.

Characteristics. The following are the five essential characteristics of assistance provided to intraphysical and extraphysical consciousnesses which are realized by the projected intraphysical consciousness:

1. **Individualism.** The productive individualism of the projector-assistant, which is not known by third parties due to the animism of lucid projection.

2. **Anonymity.** Complete anonymity due to the imperceptibility of extraphysical events by human beings in general.

3. **Secrecy.** Natural absolute secrecy which is characteristic of extraphysical undertakings in relation to intraphysical beings.

4. **Unawareness.** A definitive unawareness on the part of others – notably our peers and the physical elements of our karmic group – regarding assistential activities.

5. **Gratification.** The lucid consciential projector’s singular satisfaction or insuperable gratification.

Case study. No other assistential action of human origin can compare with the fraternal work performed through lucid consciential projection. It is sufficient, for example, to consider the following possibility: a seriously ill individual who is removed from concerns regarding extraphysical realities, being skeptical and unapproachable with simple therapeutic energetic exteriorization, can receive palliative aid, or a factor that triggers self-remission, from the fully lucid projected projector. This can occur without the ill person, his/her relatives, the projector’s close friends or any other intraphysical being knowing or even suspecting the assistential facts that are transpiring. For the intraphysical consciousness, this is an extremely individual inner reality that is unknown to everyone except the consciential projector. It is thus more of a *cosmoethical secret* which is shared by the projector, the helpers and the extraphysical evolutionary companions.

Approach. Upon finding yourself projected with lucidity and approaching an extraphysical or even an intraphysical consciousness (projected or in the waking state) – which was naturally sent by a (almost always intangible) helper, or one which demands your direct attention (as an assisted personality) – you should endeavor to establish an interaction (affinity, extraphysical empathy, auric coupling) that dissipates obstacles and eliminates barriers. This is done in order to exteriorize consciential energies, transmit renewing ideas and, lastly, to perform competent extraphysical assistance, if required (together with the helper).

Actions. Through the use of your human consciential energies, under the guidance of the helpers, the projected intraphysical consciousness helps the extraphysical consciousness (which is a recent arrival to the extraphysical dimension) in various intermissive actions that immediately follow the deactivation of its human body, notably the following 6:

1. **Desoma.** The definitive departure from the human body.

2. **Self-awareness.** Achievement of extraphysical self-awareness on the part of the intraphysical consciousness, which returns to the status of an extraphysical consciousness.

3. **Self-orientation.** Orientation of the extraphysical consciousness in time and space: the extraphysical environment in which it finds itself and the period of the extraphysical approach.

4. **Contacts.** Help in direct contact with other extraphysical consciousnesses or, more specifically, extraphysical consciousnesses which have recently arrived due to the conscial shocks of accidents, catastrophes and battlefields.

5. **Introduction.** Introduction to and communication with the extraphysical consciousness' relatives and friends.

6. **Sleep.** Introduction of the extraphysical consciousness to a period of restorative extraphysical sleep.

Ancestrality. According to holokarmology, there is, in the extraphysical dimension, a type of *assistential ancestry* (a resomatic renewal, or a *professional hereditariness*) which acts upon all intraphysical beings. These are apparently diverse but fundamental aspects of a single phenomenon that supersedes and dominates human activities.

Generations. Past generations endeavor to aid current generations in terms of group works in favor of others, such as the following 4:

1. **Metapsychics.** Former metapsychics help current parapsychologists.
2. **Mesmerism.** Former mesmerists cooperate with contemporary hypnotists.
3. **Navigators.** Ancient seafarers (navigators) sponsor the development of the astronauts.
4. **Political science.** Yesterday's politicians inspire today's politicians.

Directive. The projector who wishes to develop his/her beneficial activities should not lose sight of this basic directive of assistential ancestry. It allows the individual to identify his/her helpers and evoluitologists, according to the assistential tasks he/she is requested to perform. The individual can also deepen his/her *rappor*t with assistants and those who are assisted in the extraphysical dimension.

Procedure. In helping an ill extraphysical consciousness, the projected projector first needs to make contact with it. Secondly, the projector needs to remain very calm in order to prevail upon the extraphysical consciousness until the helpers can remove it, transferring it to another extraphysical district which is more appropriate for its conscial condition.

Punctiform. In an attempt to provide relief from, remission or self-cure of the ill consciousness' sufferings, the projector establishes a direct auric coupling with the patient (evoluit) while nearby or distant, and can mentally condition him/herself to penetrate the assisted individual's psychosphere, deep into his/her conscial microuniverse, as a *punctiform consciousness*. Soon afterwards, the projector can penetrate each of the assisted consciousness' chakras, or only the chakra which is most indicated for this therapy, in order to directly transmit positive heterothosenes of health and restoration, flows of therapeutic energy and an extraphysical cleansing of the patient's own sources of energetic distribution.

Measures. These measures, which are evolved, but perfectly executable, depend only upon the performance of the decided will of the projector which has the assistance of the helpers.

Interned. One of the common types of extraphysical assistance performed by the helpers is to aid – even by promoting lucid projection – many intraphysical consciousnesses who are generally overlooked and in unsuspected conditions. They suffer intense mortification, humiliation, degradation or violation of their self-esteem, being involuntarily interned in total restrictive institutions: prisons, concentration camps, refugee areas or hospitals, in order to avoid the extreme despair of suicide or homicide.

Volitation. It is evident that free *assistential volitation* is far more useful and appropriate for the intraphysical consciousness in these maximally restrictive conditions than for the individual in regular life. The author has personally tried to sponsor the departure of the consciousness of certain persons in these circumstances, which is not easy, although always proving a promising challenge.

Preparation. Major, prolonged, impactful, educational, assisted conscial projection can be imperceptibly prepared by the helpers over a 3-day period, for example, in order to preserve the physiology of one's human body. Upon recalling the projective events, the projector can sometimes identify – through his/her acts and the events over the last few days – the preparation which was previously unsuspected and unconsciously performed by the projector him/herself, being *teleguided* by the helpers.

Recall. The veteran projector who is accustomed to assistential projections ends up more frequently recalling various actions in which he/she is exteriorizing consciential energy in favor of different extraphysical consciousnesses in the extraphysical dimension.

Studies. Before beginning to aid others through lucid consciential projection you should have a full command of the vehicles of manifestation of your consciousness and be very aware of all of your physical and extraphysical resources. This confirms the vital importance of knowledge gained from a deep study of projectiology.

Tasks. One of the inescapable ambiguities for the lucid consciential projector is that you, as a human lucid projector, an aide in extraphysical tasks, should not, for example, merely be the lesser of the following 4 conditions:

1. **Office.** Not only the overseer in the air-conditioned office, but also the uniformed manual laborer working for the benefit of others.
2. **Headquarters.** Not only the general protected in the headquarters, but also the private on the front line of general interconsciential deintrusion.
3. **Farm.** Not only the *white collar worker* seated at a desk, but also the tanned field worker *sowing the seeds of good*.
4. **Club.** Not only the *well-dressed* country club manager, but also the athlete in sport attire, sweating in order to maintain his/her assistential health.

368. THE PROJECTOR AND DESOMANTS

Definition. Desomant: the intraphysical consciousness who has reached the final stage of intraphysical life, with a lessened expectation for continued human existence, being over 65 years old, an age which is currently accepted as being the beginning of old age, or between 65 and 84 years of age.

Synonymy: a person between sixty-five and eighty-four years of age; a person beyond eighty-five years of age; candidate for final projection; pre-extraphysical consciousness.

Elderly persons. Just as infancy and adulthood are not illnesses, old age is also, strictly speaking, not an infirmity. However, desoma is more imminent for aged persons, because they are constantly aware that their life expectancy on earth reduces moment by moment, notably in the current intraphysical society, and even more in Western society, where myths and stereotypes only strengthen and value youth, good looks, and physical strength, and where the aging process (gerontology) becomes a condemnation and even a stigma.

Relationships. The veteran lucid projector, who has assisted the biological death of others – acting while projected or on the extraphysical side – should seek a deep empathy in extraphysical relationships with extraphysical consciousnesses that have recently arrived in the extraphysical dimension. In order to establish this rapport, the refined study of desomant consciousnesses is of great importance, as occurs with the extraphysical helpers in relation to resomant extraphysical consciousnesses, or those extraphysical consciousnesses which are about to take on another human body (soma).

Ill consciousnesses. The percentage of desomants among the extraphysical consciousnesses which are recent arrivals to the extraphysical dimension, or the post-desomatic intermission, that the projected lucid projector is requested to aid together with the helpers is much greater than the other categories of extraphysical ill consciousnesses during lucid assistential projections. It should be borne in mind that, according to social gerontology, from one-fourth to one-third of the planetary population will be over sixty years of age in the twenty-first century, it being possible for humans to live up to 14 decades (centenarian) in this intraphysical dimension.

Understanding. The lucid consciential projector’s understanding of the influencing characteristics and factors in desomants’ intraconsciential life is of great value. It allows the projector to be able to help them efficiently when called upon to do so as an intraphysical consciousness projected in the psychosoma, an activity that will therefore increase the development of his/her lucid projections in general.

Complexity. Through the individual characteristics and factors that typify the desomant, the lucid projector – through the psychological study of existential companions, in the ordinary, physical waking state – can, upon projecting, expect to encounter considerable diversity in the characteristics which comprise the ill consciousnesses that they endeavor to aid. This is because, although there are common basic lines, appearances and para-appearances, self-strong-traits and self-weak-traits, each different personality (each complex case) demands on-the-spot individual analysis in order to achieve greater affinity, *rapport*, empathy, synergism, ease of mental syntony, extraphysical communication, energetic transmission and, finally, effective fraternal help.

Average. Whereas the natural genetic limit for human beings is considered to currently be approximately 14 decades – because no biological reason for impeding human life from lasting up to this age has yet been found – the average advanced age of desomants can be taken to be 7 decades. Intellectual growth can proceed normally even at 90 years of physical age.

Characteristics. Desomants generally present the following 11 basic characteristics:

1. **Hair.** White hair.
2. **Hypomnesia.** Benign loss of short-term memory (hypomnesia), characteristic of senility.
3. **Grandparent.** Being a grandparent, or great grandparent.
4. **Isolation.** A more isolated lifestyle.
5. **Retirement.** Retirement and its consequences.
6. **Security.** Social security (geriatrics, gerontology).
7. **Community.** Participation in retirement communities.
8. **Pensions.** Special funds and pensions.
9. **Will.** A will, which is sometimes signed in advance.
10. **Cremation.** Prearranged funeral plans, in certain cases (burial or cremation, organ donation).
11. **Pastimes.** Calm pastimes, such as checkers, chess or cards in the park, group activities, or stamp collecting.

Personality. The desomant is the most common individual in homes for the aged and geriatric hospitals dedicated to the treatment of the problems associated with aging (gerontology).

Positive. The following are 10 positive (self-strong-traits), healthy or characteristic factors of desomants:

1. **Age.** A biological age which is lower than the chronological age.
2. **Interests.** Development of new interests which overcome the problems of retirement.
3. **Mentalsomatic.** A person who is intellectually productive and remains lucid.
4. **Sociability.** Maintenance of a good number of varied social relationships.
5. **Coexistology.** A constant exchange of their personal life experiences with vital individuals.
6. **Temperament.** A temperament that tolerates ambiguities (the “nice old person” who is everyone’s friend), without being cantankerous, cranky or stubborn.
7. **Optimism.** Constant optimism and a certain happy extroversion.
8. **Self-prophylaxis.** Psychological preparation for desoma without taboos.
9. **Immortality.** Respect for the realities pertaining to the perennial nature of the consciousness or personal immortality.
10. **Desomatics.** An understanding of the biological shock of desoma.

Negative. Among the negative (self-weak-traits) or pathological factors of desomants, at least the following 8 stand out:

1. **Wear.** Biological age which is above the chronological age (personal decadence).
2. **Involution.** Accentuated senile involution.
3. **Withdrawal.** Lack of social activities (*withdrawal into the personal mega-ego*).
4. **Pessimism.** Pessimism, defeatism or a certain stubborn introversion or vitriolic indisposition.
5. **Psychosis.** Senile psychosis (accentuated arteriosclerosis) or Alzheimer's disease.
6. **Thanatophobia.** Thanatophobia or an undisguisable fear of the soma's death.
7. **Materialism.** Frank and sincere materialism in all attitudes.
8. **Unpreparedness.** Accentuated unpreparedness for biological (human body) death.

Classification. It is worth mentioning that an attempt was made some time ago to empirically classify elderly persons – considered from the perspective of biological age – into 6 basic types:

1. **Depressed.** The depressed individual, who sees biological death as an imminent end.
2. **Intolerant.** The moralist, who considers him/herself to be virtuous, being generally irritated, intolerant, a meddler and vitriolic.
3. **Amoralist.** The amoralist, usually considered joyous, funny or senile.
4. **Regressive.** The *regressive* individual, dominated by family and circumstances, who becomes unprotected, hypochondriacal and dependent, constantly begging for affection.
5. **Authoritarian.** The *authoritarian* individual, who is elegant, insinuating, athletic, educated and experienced, and judges him/herself to be irreplaceable in his/her particular autocracy.
6. **Ideal.** The *realized* individual, the ideal type, who is a *nice old person* and a friendly grandparent to everyone.

Homologies. Only the principle of homologies, when applied to the sequential analysis of the ego evolving from the interval between resomas or intermission – passing first through the biological shock of the extraphysical consciousness in resoma and then through the biological shock of the intraphysical consciousness in desoma, to return to a new period of intermission – can clarify the facts of thanatology, desomatics or the specific study of the first, physical, somatic desoma.

Chrysalis. The abovementioned sequence of the ego can be metaphorically or homologically compared to the transformation of a larva into a chrysalis and then a butterfly.

Pregnant woman. The same period is similar to the alterations of the pre-mother, or the candidate to maternity, who develops an affinity with the pre-resomant, becomes pregnant and, soon thereafter, a nursing mother to the newborn, or the newly reborn extraphysical consciousness.

Intraphysical consciousness. The same homology can also be observed in the sequence of the intraphysical consciousness who successively becomes a pre-desomant, then recently-deceased from first desoma, until becoming recently-deceased from second desoma.

Holobiography. After this, the entire sequence starts again within the specific, personal multiexistential cycle in the evolutionary group, thereby forming the holobiography of each one of us.

Changes. It is worth emphasizing that the consciousness' extremely personal characteristic attitudes and habits from its recently ended human life do not change from one moment to another just because it has undergone desoma and recently arrived at the extraphysical dimension or its post-desomatic intermissive period.

Hypotheses. Incidentally, Siamese twins, when able to project, do so in the psychosoma, separately. What is the condition of the psychosoma's para-organs in the projected Siamese twin's areas of common connection? Can we conclude that the mechanism of separation through consensual projection is the same as the connection and projective separation of the fetus-pregnant woman duo? This is one more research hypothesis for future verification. The following are subjects which are of interest here: parapathology of the psychosoma, self-transfigurations of the psychosoma, paragenetics, genetics, as well as many others.

Bibliography: Carrington (245, p. 287), Greenhouse (636, p. 125), Leadbeater (903, p. 15), Norvell (1136, p. 244), Vieira (1763, p. 5), Zaniah (1899, p. 60).

369. PROLONGED CONSCIENTIAL PROJECTION TECHNIQUE

Definition. Prolonged consciential projection: that projection in which the consciousness remains projected from the human body longer than one hour, whether spontaneously or deliberately.

Synonymy: lucid megaprojection; prolonged extraphysical excursion.

Remain. Those who project their own consciousness from the human body with some frequency note clearly that the projected projector's problem is actually not how to return to the physical base, interiorize him/herself and physically awaken, but rather, *how to remain projected* longer, having more and better experiences, obtaining a king-size consciential projection (king-size obe, lucid megaprojection).

Resources. Based on the fact that a lucid projection lasts from a few seconds to several hours, it is helpful to become familiar with the following 9 extraphysical resources that you, as a lucid projector, can use in order to prolong your stay outside the human body:

1. **Serenity.** Maintain serenity in all situations and in the face of any extraphysical event, removing occasional traumas.
2. **Self-awareness.** Increase self-awareness of your extraphysical conditions in that situation, maintaining personal balance in the environment in which you find yourself.
3. **Energies.** Mobilize your consciential energies through the willful, extraphysical installation of the vibrational state; do this when fully projected in order to increase your degree of extraphysical lucidity and consequently prolong the duration of your projection.
4. **Freedom.** Discard all thoughts about the human body, silver cord, physical base and human concerns, progressively feeling yourself to be in the condition of a free consciousness.
5. **Cord.** Respond to any demand or admonitory warning made by the silver cord, without being affected by it, attempting to counteract the cord's vigorous action with your decided will. This can be a fierce battle. If possible, your projected consciousness should endeavor to forget the silver cord by fixing your attention on something in the physical base outside the human body.
6. **Distance.** When an inevitable return to the proximities of the dense body occurs, do not interiorize, but try to go further from the physical base.
7. **Re-takeoff.** Interiorize after a consciential projection if necessary, as a last resort, but try to avoid physical awakening, taking off again.
8. **Catalepsy.** Take advantage of benign catalepsy in order to exteriorize and not awaken in the ordinary, physical waking state. Catalepsy and the duration of the consciential projection interact with each other, given that one condition can provoke the other.
9. **Target.** Keep a positive mental target in mind, ready for any emergency, trying to reach it after your first lucid projection.

Case study. There are cases of prolonged consciential projection that are provoked in the phenomenon of voluntary burial, coma states and certain instances of individuals who sleep longer than normal. These facts prove the classic example of prolonged consciential projection, namely the case of Lazarus, in the New Testament (John 11:44). Somnambulism is sometimes related to prolonged consciential projection.

Temperature. One of the easily verified basic characteristics of prolonged lucid projection is the consciousness almost always finding the human body – upon consciential return and interiorization – to be rigid, dehydrated (joints) and cold throughout, at a temperature lower than the environment of the room where the body remains inactive, as though the room were warmer before, during and after the lucid projection.

Extraphysiology. The parallel world, right next to dense physical life, appears to remain at a temperature of zero degrees Celsius, or frozen, just as in interstellar space.

Dimensions. The prolonged (according to chronological time) consciential projection does not always represent a translocation of the consciousness in an extensive extraphysical trip, from the perspective of physical measurement. The phenomenon of consciential projection above all takes place within the consciential world in different dimensions.

Bibliography: Bayless (98, p. 101), Bozzano (184, p. 127), Denning (391, p. 42), Greene (635, p. 63), Swedenborg (1635, p. 256), Vieira (1762, p. 180).

370. EXTRAPHYSICAL AGENDA

Definition. Extraphysical agenda: a written annotation of a list of priority extraphysical mental targets which the projected projector should endeavor to reach gradually, in a chronological manner, establishing intelligent plans for his/her own development.

Synonymy: extraphysical report; list of mental targets; personal projective archive in one's laptop or notebook computer; projective journal.

Targets. It will always be productive for the projector to keep certain important mental targets in mind for any instance in which he/she finds him/herself projected.

Types. The following are 4 different types of mental targets, without negative consequences, for the novice projector to choose, one at a time, as long as they are forewarned against possible extraphysical traumas:

1. **Ideas.** Suggestions for target-ideas: contemplate your own inactive human body; pass through a large physical structure; carefully examine the silver cord; look at yourself in a large ordinary mirror; change your extraphysical attire through the action of your will; find lost objects or treasures, such as the works of Johann Sebastian Bach (1685-1750) which were not used by his son; consult the Book of Toth, burned in Alexandria, in a retrocognitive manner.

2. **Beings.** Suggestions for target-beings: extraphysically awaken the mate or partner of a sleeping evolutionary duo; meet with an awake relative; meet a friend who is informed of the extraphysical visit; embrace a bedridden acquaintance; evoke a familiar extraphysical benefactor.

3. **Physical.** Suggestions for physical target-places: go to a distant physical base that you like; visit the inside of an active volcano; probe the depths of the ocean; enter a dense jungle; go inside caves; scale the peaks of the Himalayas, the Andes and the Rocky Mountains; stroll through a museum which is closed to the public; attend a parapsychic session; enter a photographic studio during a shoot and attempt to appear on the photos being taken; attend a live television show; extraphysically witness poltergeist activity; consult the Vatican Library in the sections which are still closed to the public; penetrate an Egyptian pyramid; go to the moon, the sun, or the planets of this and other solar systems; look for, locate and visit a UFO.

4. **Extraphysical.** Suggestions for extraphysical target-places: visit an extraphysical telephone exchange for intelligences which speak through audiotapes, televisions, telephones and intercoms; visit an evolved extraphysical community.

Person. The projector can only enhance his/her experiments if he/she obtains a very clear photograph of the target-person, holds it in his/her hand and concentrates deeply upon it in order to imprint the image into his/her mind moments before predisposing him/herself to lucid projection.

Photo. Using a good photograph of the physical place you wish to reach through lucid projection also greatly helps the lucid projector.

Maximum. The following are 8 expressive mental targets indicated for the advanced projector's experiments:

1. **Resomatics.** Extraphysically attend a phase of the resoma process.
2. **Desomatics.** Extraphysically attend a phase of the desoma process.

3. **Pregnancy.** Perform an *internal* examination of the organic interior of a pregnant woman and fetus.

4. **Electroshock.** Feel an electric shock while outside the human body manifesting through the psychosoma.

5. **Sneeze.** Analyze the possibility of an extraphysical sneeze.

6. **Psychosomatics.** Extraphysically see the psychosoma of a larger subhuman animal while it is in the discoincident state.

7. **Parazology.** Extraphysically attend the desoma of a larger animal.

8. **Parabotany.** Extraphysically attend the provoked death of a felled tree.

Cities. While projected from the soma, the intraphysical consciousness can psychometrize his/her own presumed past life in historically famous cities, of which only ruins remain. The following 5 serve as examples:

1. **Babylonia**, in the lower valley of the Euphrates, close to Baghdad, Iraq.

2. **Carthage**, close to Tunis, Africa.

3. **Gomorrhah**, in the area of the Dead Sea, Palestine.

4. **Thebes**, the villages of Abu Simbel, Karnak and Luxor.

5. **Troy**, close to Hissarlik, Asia Minor.

Bibliography: Vieira (1762, p. 120).

XII - Interiorization of the Consciousness Stage

371. RETURN TO THE PHYSICAL BASE

Definition. Return to the physical base: departure of the projected intraphysical consciousness from its current location in the extraphysical dimension to the physical place where its human body rests, almost always occurring in the final period of a lucid consciencial projection.

Synonymy: regress to the human body; return to the physical base.

Types. The following are the 8 main forms of return of the projected consciousness to the physical base:

1. **Lucidity.** Lucid return.
2. **Nonlucidity.** Nonlucid return.
3. **Imposition.** Imposed return.
4. **Unforeseeability.** Unforeseen return.
5. **Abruptness.** Abrupt return.
6. **Slowness.** Slow return.
7. **Isolation.** Solitary return of the projected consciousness, the most frequent condition.
8. **Company.** Accompanied return of the projected consciousness, the rarest condition.

Causes. The following, for example, are the 9 main causes for the return of the projected intraphysical consciousness to the physical base:

1. **Holochakrology.** Action of the silver cord.
2. **Self-determination.** The self-determination of the projector's consciousness.
3. **Inspiration.** Extraphysical inspiration.
4. **Hetero-suggestion.** Suggestion of another through transmental dialogue or paratelepathy.
5. **Somatics.** The concentration of the projected consciousness upon the human body (soma) from a distance.
6. **Phobia.** Fear (phobia) of various origins.
7. **Paratrauma.** Extraphysical intraconsciencial trauma.
8. **Indetermination.** Cause not determined by the projected consciousness.
9. **Intraphysiology.** Factors that are internal or external to the inactive human body, such as sound, cold or heat.

Effects. The following are examples of 5 of the main immediate effects of the return of the projected intraphysical consciousness to the physical base:

1. **Continuity.** The consciousness continues the consciencial projection in the physical base.
2. **Interiorization.** The consciousness interiorizes.
3. **Sleep.** The consciousness enters into a period of natural sleep.
4. **Extraphysiology.** The consciousness goes through a period of extracorporeal sleep.
5. **Oneirism.** The consciousness starts to dream (altered state of consciousness).

Rule. No projected intraphysical consciousness encounters greater or frequent difficulties in returning to the physical base, interiorizing and physically awakening him/herself.

Recall. In some lucid projections, the return to the physical base can greatly influence the recall of the extraphysical experiences soon after physical awakening.

Self-lucidity. The return of the consciousness to the physical base while still in a condition of profound extraphysical self-lucidity generally predisposes good post-projective recall.

Bibliography: Baumann (93, p. 17), Crookall (325, p. 49), Vieira (1762, p. 109).

372. INTERIORIZATION OF THE PROJECTED INTRAPHYSICAL CONSCIOUSNESS

Definition. Interiorization of the projected intraphysical consciousness: the act of the consciousness projected in the psychosoma entering the human body, thus reestablishing the normal state of coincidence of the vehicles of manifestation of the intraphysical consciousness.

Synonymy: consensual reintegration; corporal re-fusion (rejoining); extraphysical-physical landing; fusion of the consensual bodies; landing of the consciousness; physical embodiment; psychosoma-soma re-coupling; reoccurrence; reentry of the projected intraphysical consciousness; retraction of the silver cord; vehicular re-fusions.

Parahead. Interiorization also occurs when the consciousness, projected in the isolated mentalsoma, enters directly into the extraphysical head of the psychosoma (in this case, the parabrains of the parahead). Nevertheless, the sensations in this condition are extremely difficult to detect.

Types: The following are examples of 14 main types of interiorization of the projected consciousness into the human body:

1. **Self-lucidity.** Lucid, semilucid or nonlucid.
2. **Intentionality.** Common or intentional.
3. **Ease.** Easy or difficult.
4. **Parapsychism.** Animic-parapsychic.
5. **Mildness.** Mild or abrupt.
6. **Imposition.** Imposed, premature or traumatic.
7. **Sounds.** Interiorization with intracranial sounds or in silence.
8. **Completeness.** Complete, incomplete or partial (semi-interiorization).
9. **Imperfect.** Imperfect or slow.
10. **Inversion.** *Inverse* (from feet to head).
11. **Self-awakening.** With immediate awakening or without sleep.
12. **Sleep.** With natural sleep.
13. **Dive.** Dive head-first into the soma.
14. **Atypical.** *Enter into the human body* in any manner possible.

Position. The interiorization of the consciousness into the human body can occur in the following 5 manners, in regard to the position or point of entry of the psychosoma:

1. **Above.** From above the soma.
2. **Side.** Right side or left side.
3. **Back.** Through the back of the human body.
4. **Encephalic.** Through the physical head.
5. **Podalic.** Through the feet or inversely.

Common. The most common interiorization of the intraphysical consciousness into the soma starts through the parahead (head of the psychosoma) into the head of the human body.

Animic-parapsychic. The projected intraphysical consciousness using the psychosoma can also return to the human body through an animic-parapsychic interiorization. For example: the projected projector begins a transmission of consensual energy while in the extraphysical dimension, under the command of the helper, while caring for two sick or energivorous extraphysical consciousnesses. The projector immediately returns to the human body, together with the 2 patients and the helper, intensely feeling the flows of energy and all the phases of the assistential tasks which are completed in the physical base, in the act of awakening, with no extraphysical traumas or intraphysical repercussions.

Successive. Successive reoccurrences allow the rarefaction and condensation of the structure of the projected psychosoma.

Free-fall. In semilucid projections it is common to have an interiorization from above in free fall, as with a parachutist in an exhibition, in which the projector using the psychosoma – with outspread arms and legs – falls from an apparently great height at high speed into the human body which is lying on the bed on its back. This causes a physical repercussion with an abrupt physical awakening. The semilucid oneiric state of the projected intraphysical consciousness produces this occurrence.

Trendelenburg. While maintaining full awareness, it is possible to interiorize the extraphysical head of the psychosoma (parahead) alone into the physical head. The psychosoma then remains in the *extraphysical Trendelenburg* position without engaging the rest of the human body.

Human cannonball. Once, when the author was projected while returning to the physical base, he remembered the position in which he had left the human body: on his front, with the left side of his face resting on the bed, arms stretched alongside the legs in the direction of the feet. In tenths of a second the psychosoma assumed the same position. He then briefly volitated with this posture and *reentered* in a horizontal *dive* like a *human cannonball*, with such force it gave the impression that the head and shoulders of the resting human body had suffered an impact and momentarily been stretched forward. This all occurred before experiencing a fully lucid intraphysical self-awakening. This occurred due to the inherent plasticity of the psychosoma.

Metaphors. The following are 11 symbols, metaphors, images, analogies or comparisons used by lucid projectors when reporting the interiorization into the human body, *as if the consciousness were*:

1. **Bag.** “Entering a sleeping bag.”
2. **Blotting-paper.** “A sheet of blotting-paper absorbing ink.”
3. **Gloves.** “A hand entering a glove.”
4. **Lock.** “A key entering a lock.”
5. **Magnet.** “Steel filings being attracted by a magnet.”
6. **Sack.** “Entering a big sack.”
7. **Sheath.** “Just like a sword entering its sheath.”
8. **Shoe.** “A foot going into a shoe.”
9. **Sponge.** “A sponge absorbing water.”
10. **Suit.** “Getting into a bathing suit.”
11. **Trousers.** “A person’s body entering a pair of trousers.”

Soma. Depending on the angle of consciential approach for interiorization – from the extraphysical to the intraphysical dimension – the projected intraphysical consciousness does not recognize his/her own human body (soma) and can even be startled. This occurs frequently when entering through the back as the individual is generally not used to seeing him/herself from the back.

Intraphysical consciousness. It is, in fact, much more difficult for the intraphysical consciousness to remain projected outside the human body than to return to the body after having been projected. Generally speaking, lucid interiorization of the intraphysical consciousness is much easier, frequent and more common than lucid takeoff of the same consciousness.

Blackout. Projective blackout can occur after return of the projected consciousness to the physical base, during interiorization into the human body, at the exact moment of transition of the focus of the consciential operations (parabrain) of the psychosoma to the physical body (brain).

Reluctance. In near-death experiences (NDEs), as well as in ordinary lucid projections, the intraphysical consciousness can feel profound extraphysical reluctance to return to human life, trying to resist or openly oppose his/her return to the physical world. This negative attitude should be combated by the enlightened projector.

Triphasic. Extraphysical reluctance, as a *parapsychic* phenomenon, can manifest itself in 3 ways, characterizing triphasic reluctance which appears to be stubbornness or obstinacy of the projected intraphysical consciousness. In this case, it is considered to be immature or inexperienced and to be of infantile consciential age:

1. **Return.** Firstly, the projected intraphysical consciousness does not wish to return to the physical base, endeavoring to remain, albeit temporarily, in the extraphysical environment where he/she arrived, on a fleeting visit.

2. **Recoincidence.** Secondly, the projected intraphysical consciousness – already back at the physical base – does not wish to interiorize or realign him/herself in the inactive human body that awaits him/her.

3. **Awakening.** Thirdly, the projected intraphysical consciousness – already back in the human body – does not wish to wake up and continue living the ordinary physical existence. Nevertheless, such resistance is useless due to the physical restriction imposed by the human body, notably the 2 cerebral hemispheres.

Conditions. The following 5 consciential conditions are similar and should not be confused with one another:

1. **Interiorization.** The act of ordinary interiorization of the intraphysical consciousness that was projected.

2. **Meditation.** The greater interiorization of the consciousness within itself, without consciential projection (*ISBE or inside-the-body experience*), common in cases of deep meditation.

3. **Self-projection.** Self-projection, namely any type of lucid consciential projection, as long as it is produced by the consciousness itself.

4. **Autoscopy.** Internal autoscopy or clairvoyantly seeing the interior of one's own human body, which is performed directly by the projected intraphysical consciousness.

5. **Mentalsoma.** Lucid consciential projection, or the entrance of the intraphysical consciousness, in the mentalsoma, deep inside the microcosm of that individual's human body. This simultaneously constitutes projection, a case of direct autoscopy and self-projection.

Recess. The extraphysical reluctance of the intraphysical consciousness to return to human life, when pronounced, generates a period of projective recess that is deliberately sponsored by the helpers in order to help the lucid consciential projection practitioner.

Case study. It is common knowledge that nonlucid and semilucid consciential projections are indiscriminately experienced by everyone, apparently without exception. The author witnessed the nonlucid interiorization of a certain woman (an intraphysical consciousness) whose consciousness, after being projected at a distance from the physical base in the psychosoma and in a semilucid condition, returned to the physical base. The projected projector did not notice the *presence of the projected intraphysical consciousness* (on that occasion, the author was participating in extraphysical assistance that was being provided to an intraphysical child living in the house). She took off her extraphysical para-dress, reentered her human body – that was inactive under the blankets on the bed – kept her underwear on, as though preparing to sleep again, in accordance with her nightly habit. She also did not notice the *presence of her own human body* lying on the bed.

Abrupt. Abrupt interiorizations that are unexpected by the projected intraphysical consciousness are, nonetheless, inoffensive as they do not leave any residue that is harmful to the consciousness. They are common to some lucid, albeit inexperienced, projectors who do not know how to coexist peacefully with the silver cord.

Causes. The most diverse causes, such as small extraphysical traumas or extraphysical mini-repercussions can provoke an abrupt interiorization or recoincedence of the projected intraphysical consciousness. Even the loud extraphysical laughter of the projector watching a comedy show while projected in front of the stage of a theater can cause an abrupt recoincedence.

Bibliography: Baumann (93, p. 15), Bord (170, p. 51), Bozzano (188, p. 78), Crookall (343, p. 52), Giovetti (593, p. 107), Green (633, p. 170), Greene (635, p. 84), Greenhouse (636, p. 215), Huson (768, p. 127), Monroe (1065, p. 28), Perkins (1236, p. 10), Reis (1384, p. 85), Sabom (1486, p. 75), Shay (1546, p. 98), Smith (1574, p. 54), Vieira (1762, p. 31), Weil (1810, p. 144).

373. SEMIDISCOINCIDENCE OF THE VEHICLES OF MANIFESTATION

Definition. Semidiscoincidence of the vehicles of manifestation: imperfect reoccurrence and discordant coexistence between 2 or more vehicles of manifestation of the consciousness (holosoma).

Synonymy: altered disconnection of the bodies; imperfect holosomatic joining; imperfect reoccurrence; incomplete reoccurrence; semi-fusion of the bodies.

Types. There are diverse types of disconnection – ephemeral to a greater or lesser extent, or even permanent – that can occur between the state of the intraphysical consciousness and the coincidence of his/her vehicles of manifestation (holosoma), when entering into reoccurrence. The following 3 should be highlighted:

1. **Semitrance.** The disconnection that occurs with the badly performed or incomplete restoration of the parapsychic trance, or the animic trance (between 2 intraphysical beings), that leaves the consciousness of the sensitive or animist in a semitrance or obnubilation for a variable period of time. This generally does not result in any greater lasting negative consequences or discomfort.

2. **Discoincidence.** The disconnection that occurs with the badly performed interiorization or incomplete reoccurrence of the consciousness of the projected projector who remains, for a period of time, in a state of waking discoincidence. This is an animic condition that generates the phenomena addressed by projectiology.

3. **Psychopathology.** The disconnection due to the badly performed or incomplete resoma of the consciousness into its human body. This generates a misdirected trip – and one for which the individual is not prepared – into one's inner world (the consciousness), and without correct return (alienation) to the reality of external mundane (human) life. This is generally diagnosed as *madness*, mental insanity or a category of psychopathological manifestation for which there are other technical classifications. In this case, the deeper disconnection refers to parapsychopathology of the mentalsoma.

Bibliography: Vieira (1762, p. 14).

374. POST-INTERIORIZATION

Definition. Post-interiorization: the state of the intraphysical consciousness immediately subsequent to the interiorization of the psychosoma into the human body, or the interiorization of the mentalsoma into the extraphysical head of the psychosoma (parahead) that is already in the dense body.

Synonymy: the state subsequent to consensual projection.

Mentalsoma. The characteristics of the post-interiorization stage analyzed here deal more with the period following reentry, which occurs more frequently and is richer in occurrences. This refers to the period in which the intraphysical consciousness is returning to the human body in the mentalsoma and in the *psychosoma*. It does not refer to the period subsequent to the direct interiorization of the intraphysical consciousness projected in the isolated mentalsoma, which is rarer and more difficult to analyze.

Characteristics. The post-interiorization period of the projected intraphysical consciousness has its specific characteristics that should be studied, such as the following 11:

1. Return to the extraphysical dimension.
2. Post-projective or quasi-coincident sleep.
3. Extracorporeal post-projective or discoincident sleep.
4. Post-projective catalepsy.
5. Post-projective double awareness.
6. Post-projective vibrational state.
7. Post-projective parapsychic phenomenon.
8. Liberation from sleep.

9. Combat against laziness.
10. Zone of quietude.
11. *Blind, deaf and mute* consciousness.

Extraphysical consciousnesses. On one occasion, an extraphysical consciousness witnessed the interiorization of the author (projected with lucidity) into the human body when he was trying to rid himself of some disturbed beings or extraphysical intruders. Soon thereafter, trying to escape from the same extraphysical consciousnesses, it tried to interiorize in the same manner as the author, openly forcing a possessive approach to the physical body, with him already *inside* it, completely unaware of what it was doing.

Deintrusion. A new consciential projection and a cold and direct confrontation was needed in order for the inexperienced extraphysical consciousness to go away. It insistently repeated that, in the same way that the author had *entered*, it also wanted to *enter* into that body to hide and defend itself. It did not perceive the different condition of an intraphysical being and that the body had the identical visual appearance or physiognomy of the author.

Bibliography: Vieira (1762, p. 73).

375. PSYCHOPHYSICAL REPERCUSSIONS

Definition. Psychophysical repercussions: reactions that have occurred between 2 vehicles of consciential manifestation when they come in contact with each other; either between different vehicles of the same consciousness or between similar vehicles of two or more consciousnesses.

Synonymy: aborted consciential projections; extraphysical-physical reflexes; parapsychic counter shocks; physical-extraphysical reflexes; projective repercussions; reflexive parapsychic commotions.

Categories. Vehicular repercussions of the consciousness can be classified into various phenomenological categories according to the nature of the perspective of the occurrences, such as the following 7:

1. **Physical.** Physical repercussion.
2. **Extraphysical.** Extraphysical repercussion.
3. **Psychosomatic.** Repercussion between the human body and the psychosoma, and vice-versa.
4. **Mentalsomatic.** Repercussion between the psychosoma and the mentalsoma, and vice-versa.
5. **Holochakrology.** Repercussion between the human body and the holochakra.
6. **Hyperacuity.** Repercussion with or without the lucid participation of the consciousness.
7. **Group.** Repercussion between the psychosomas, holochakras and somas of two or more consciousnesses.

Innocuousness. Consciential trauma is the basic characteristic of psychophysical repercussion. Nevertheless, although they are mild traumas, temporary marks, surprises and shocks that involve repercussive phenomena of the consciousness, they are not the source, per se, of any considerable organic perturbation or lasting condition. They are, therefore, innocuous to the physical and mental health of the consciential projector.

Stigmatization. Among the repercussive phenomena of the consciousness we should not omit the cases of stigma or stigmatization on the hands or forehead, such as those known of for centuries that originate from the willful autosuggestion of a person who is highly impressionable, susceptible or emotionally deprived. Such people are generally religious fanatics.

Variations. There are psychophysical repercussions which occur coming from the psychosoma to the human body, as well as from the human body to the psychosoma. They may or may not provoke the physical awakening of the consciousness. Aside from this, psychophysical repercussions occur with or without oneiric components; with or without the occurrence of lucid consciential projections; and, lastly, with or without correct recall of the physical-extraphysical occurrences.

Consequences. In order to better understand the repercussions generated from the psychosoma to the human body, and those produced in the opposite direction, from this vehicle to the psychosoma, at least the following 4 variables need to be analyzed:

1. **Self-awakenings.** Physical self-awakenings of the consciousness.
2. **Oneirism.** Oneiric components, or those story lines shaped by lightning-fast dreams.
3. **Mnemosomatics.** Clear recollections of authentic consciential projections.
4. **Projectability.** The non-existence of lucid consciential projections.

Dreams. In order to understand lucid consciential projections, it is necessary to observe the relationships of psychophysiological repercussions with ordinary dreams, with respect to the 3 following variables:

1. **Mini-dreams.** The awakening of the consciousness when the psychosoma is slightly discoincident, creates physiological repercussive *mini-dreams*. These *mini-dreams* commonly occur before the first sleep period and after the last sleep period.

2. **Story lines.** In physical repercussions, when the mind sleeps with the psychosoma slightly discoincident, the imagination inserts small, colored oneiric story lines in tenths of a second. This occurs at the exact moment of the abrupt return to the condition of juxtaposition with the human body, with some physical motor action that is rational and acceptable to the consciousness thus creating the repercussive mini-dream.

3. **Case study.** The following are 5 examples of repercussive mini-dreams: someone tugging on a part of the human body; catching an object that is unexpectedly thrown at our human body; an imminent and unexpected fall; the surprise of abruptly encountering someone; any banal material shock, whether it is generally electrical, thermal or physical in nature.

Bibliography: Bayless (98, p. 111), Bertrand (127, p. 27), Carrington (245, p. 247), Crookall (333, p. 169), Delanne (381, p. 164), Muldoon (1105, p. 83), Sculthorp (1531, p. 143), Shay (1546, p. 92), Vieira (1762, p. 146), Walker (1781, p. 69).

376. EXTRAPHYSICAL REPERCUSSIONS DURING CONSCIENTIAL PROJECTION

Definition. Extraphysical repercussion: the reflex of the human body, inactive in the physical base, upon the projected psychosoma of the intraphysical consciousness that is temporarily projected in the extraphysical dimension.

Synonymy: extraphysical parapsychic counter-shock; extraphysical projective repercussion; extraphysical reflex.

Causes. Listed below are 11 physical causes, stemming from the human body, of extraphysical repercussions that have occurred during a lucid or nonlucid projection of the intraphysical consciousness:

1. **Circulation.** Irregular blood circulation.
2. **Cramps.** Cramps, in general.
3. **Mouth.** Oral respiration (or through the mouth).
4. **Throat.** *Dry throat.*
5. **Respiration.** Stertorous respiration.
6. **Nose.** Nasal obstruction.
7. **Touch.** Physical touch on the human body or soma.
8. **Object.** The falling of an object onto the human body.
9. **Light.** The abrupt entrance of natural light or the turning on of artificial light that shines onto the human body, due to the noise, the action itself, the irradiation of photons or the suddenness of the act.

10. **Company.** Movement of the evolutionary duo's spouse or mate, at his/her side, on a spring mattress.

11. **Subhuman.** The abrupt jumping over the inactive human body by a domestic animal, dog or cat, that has an affinity with the family environment.

Noises. Among the physical causes of extraphysical repercussions, during a lucid or nonlucid projection, we should point out the disturbing ambient noises of the physical base that are near the projected intraphysical consciousness' inactive human body.

Maximum. The combination of the distance between the human body and psychosoma, plus the speed of the return of the psychosoma, produces a maximal (physical or extraphysical) repercussion. This occurs through the energetic conduction and the retractility of the broad or thin silver cord.

Couples. The *repercussion of couples* is a common telepathic phenomenon, or energetic reflex, that manifests when a person who is already sleeping, and another – who tries to project, or simply starts sleeping – has their human body in close proximity to the human body of the first. A repercussion occurs with the first person or, in other words, a joint repercussion.

Extraphysical. Among the extraphysical causes of repercussions – which are also extraphysical – that occur during a lucid or nonlucid projection, we can point out the reaction between one psychosoma and another nearby psychosoma or, in other words, of an intraphysical consciousness which will project to another consciousness that is already projected, and the actuation of the holochakra.

Effects. The following are 6 *extraphysical effects* of the repercussions, which are also *extraphysical*, stemming from the human body, that happen to the projected psychosoma and consciousness during a lucid or nonlucid projection of the intraphysical consciousness:

1. **Base.** Admonitory discomfort inside and outside the physical base.
2. **Cord.** Admonitory discomfort within the potent perimeter of the silver cord.
3. **Sensitivity.** Admonitory discomfort far from the projector's physical base; resulting from a pinprick in the holochakra through space, in the phenomenon of provoked *exteriorization of sensitivity*.
4. **Return.** Abrupt return of the projected consciousness to the physical base.
5. **Movement.** Duplication or mimicry of a physical movement, in the extraphysical dimension, by the psychosoma through the energetic transmission of the silver cord.
6. **Interiorization.** Imposed, premature or traumatic consciential interiorization.

Oneiric. The extraphysical repercussion during the projection is, generally speaking, similar to the *oneiric repercussion*, a phenomenon common to all people. This occurs when the dreamer experiences a nightmare and suddenly becomes frightened. Due to the fear, the individual suffers a consciential oneiric trauma and, as a result, physically awakens.

Bibliography: Greene (635, p. 62), Vieira (1762, p. 165).

377. PHYSICAL REPERCUSSIONS DURING CONSCIENTIAL PROJECTION

Definition. Physical repercussion: the reflex of the psychosoma of the intraphysical consciousness, who is temporarily projected in the extraphysical dimension, upon his/her human body that is inactive in the physical base at that time.

Synonymy: jerks in the human body; paradysbarism; parapsychic-physical counter-shock; physical projective repercussion.

Causes. The following are 11 extraphysical causes of physical repercussions, stemming from the projected psychosoma. They occur during the lucid or nonlucid projection of the intraphysical consciousness.

1. **Takeoff.** Instantaneous takeoff.
2. **Clairvoyance.** Extraphysical clairvoyance.
3. **Surprise.** Extraphysical surprise.
4. **Self-awakening.** Abrupt *extraphysical* self-awakening.
5. **Fear.** Fear of projected consciousnesses (phobia).
6. **Trauma.** Extraphysical trauma.
7. **Attack.** Extraphysical attack of an extraphysical consciousness or another projected intraphysical consciousness (passion) upon the projected consciousness.
8. **Extraphysical euphoria.** Temporary extraphysical euphoria.
9. **Psychosomatics.** Projective stretching of the psychosoma.
10. **Telekinesis.** Telekinesis of extraphysical origin.
11. **Holochakrology.** Intense actuation of the holochakra.

Effects. The following are 17 effects of physical repercussions, stemming from the psychosoma, upon the human body and the projected intraphysical consciousness. They occur during lucid or nonlucid projection:

1. **Return.** Abrupt return of the projected intraphysical consciousness to the physical base.
2. **Interiorization.** Interiorization of the projected intraphysical consciousness.
3. **Self-awakening.** Abrupt *physical* self-awakening.
4. **Commotion.** Reflexive commotion.
5. **Spasms.** Inoffensive muscular spasms.
6. **Jolts.** Stronger spasmodic jolts (jerks).
7. **Sounds.** Intracranial sounds.
8. **Tachycardia.** Ephemeral and inoffensive tachycardia.
9. **Jerk.** Jerking of the entire human body.
10. **Area.** Repercussion of a segment or region of the human body.
11. **Members.** Simultaneous repercussion of both legs or arms.
12. **Mini-dream.** A lightning-fast repercussive mini-dream or the creation of oneiric story lines in tenths of a second.
13. **Mnemosomatics.** Clear recollection of an authentic projection.
14. **Joint.** Joint repercussions.
15. **Catalepsy.** Intraphysical and extraphysical catalepsy.
16. **Burns.** A light sunburning of the individual who is sleeping under the rays of the sun.
17. **Stigmatization.** Stigmatizations, in general.

Intensity. The intensity of the physical repercussion, however great it may be, during the lucid or nonlucid projection, varies from projector to projector and from one experiment to another. Nevertheless, it causes neither serious physical damage nor severe problems to the projection practitioner. A very quick extraphysical awakening can generate a physical repercussion in the human body, along with the immediate physical awakening of the projected consciousness.

Case Study. One afternoon, the author was lying on his right side and turned, in his second nap, remaining on his front, resting the left side of his face at the edge of the bed. While laying on his front, an instantaneous takeoff occurred along with extraphysical awakening at the moment at which he took off entirely, from top to bottom. Due to the instantaneous nature of this event, the consciousness concluded that it was still in the ordinary, physical waking state with the human body falling from the edge of the bed. He thereby experienced an abrupt repercussion in the human body with a physical awakening that was also abrupt.

Equivocal. In this case, it became very clear that all 4 sequential conditions – the ordinary, physical waking state, the extraphysical awakening and the physical repercussion, followed by the physical awakening – occurred in a matter of seconds. In this event, there was no inclusion of any oneiric component. It was just a *mistake of the consciousness*, due to the rapidity of the spontaneous takeoff that caught the intraphysical consciousness by surprise (*extraphysical faux pas*).

Partial. Aside from the small jerks in the extremities of the soma generated by the stimulus of the nerve pathways – popularly called *pranic blocks* – that disturb the circulation, physical repercussions occur because of partial disconnections or isolated projections of the paralegs or para-arms (of the psychosoma).

Physiology. The physiological movements (at times vegetative) of the entire human body that are normally made in life – common during the period of natural sleep – are not related to the movements, travels and experiences of the intraphysical consciousness when he/she is in a freer condition, projected in the psychosoma or mentalsoma. Often, the projector is very distant in the extraphysical dimension when the physical repercussion occurs, which is not a frequent occurrence.

Myoclonuses. We should not confuse the simple, routine jerks occurring with the sleeping person, called myoclonuses – clonic muscular spasms, explained by diverse normal physiological occurrences such as the releasing of the cortical control of the spinal motor neurons – with repercussions that are physical but of an extraphysical origin during the phenomenon of lucid or nonlucid projection. The practice of lucid projection shows conclusively the differences between one type of jerk and another to the projector.

Retention. When the psychosoma of the projected intraphysical consciousness is denser, with a high degree of consciential energies, the phenomena of physical repercussion and the *retinal retention* of the extraphysical image of the scene can occur with greater ease. This occurs especially in regard to an extraphysical consciousness which has more deeply impressed us or generated the extraphysical trauma that triggered an abrupt interiorization. In this case, the projected intraphysical consciousness returns to the physical base, interiorizes and, upon opening the eyes while awakening, surprisingly continues to see the traumatizing image. This provokes the immediate, reflexive closing of the eyelids.

Mentalsoma. It seems not to be possible to have significant physical or extraphysical repercussions when the intraphysical consciousness is projected exclusively, and in an isolated fashion, in the mentalsoma in the mentalsomatic dimension without the direct influences of the psychosoma.

Ectoplasts. Materialization sensitives, or ectoplasts, frequently experience physical repercussions through exteriorizations of ectoplasm. This is analogous to physical repercussions of lucid projectors caused by the silver cord.

Bibliography: Ambelain (23, p. 38), Crookall (325, p. 125), Fortune (540, p. 155), Frost (560, p. 85), Kardec (824, p. 219), Steiger (1601, p. 125), Stokes (1625, p. 22), Vieira (1762, p. 165), Walker (1781, p. 68).

378. SELF-TELEKINESIS

Definition. Self-telekinesis: extraphysical touch that occurs with or without the abrupt interiorization of a segment of the humanoid shape of the projected psychosoma. The segments are most commonly of a finger, hand, arm, foot, or leg, generally causing the muscular contraction and quick spasmodic movement of a member of the human body.

Synonymy: abrupt partial interiorization; partial physical repercussion.

Repercussion. Self-telekinesis constitutes an inoffensive phenomenon of physical repercussion which occurs in a semi-disconnection or partial disconnection of the projected intraphysical consciousness in the psychosoma. The psychosoma may or may not brusquely return to the condition of coincidence with the vehicles of manifestation.

Sensations. The intraphysical consciousness can have a greater, lesser or no awareness of the self-telekinesis. When telekinesis is experienced, it is similar to an inoffensive electric shock. This shock is very strong and clearly discernible in the organic area or part of the human body where the phenomenon occurs.

Cause. The *electric shock* of self-telekinesis is caused by the touching of an extraphysical segment – whether a parafinger, parahand, para-arm, parafoot or paraleg – to its correspondent physical part.

Discovery. Individuals can experience self-telekinesis many times during their existence, until the day they have a major lucid projection in the psychosoma. Only after having a lucid projection do many people become aware that they have already experienced many occurrences of self-telekinesis without, however, realizing the fact or interpreting it in an adequately rational manner.

Direction. The extraphysical movements of self-telekinesis always occur instantaneously in an *inward* direction or, in other words, centripetally, from the extraphysical dimension to the intraphysical dimension, from the psychosoma to the soma.

Vegetative. The vegetative life that is developed in the human body by the autonomous nervous system, when the body seems inactive, temporarily without the consciousness, can trigger self-telekinesis, even due to a simple, louder borborygmus (abdominal area).

Thought. When the movements of self-telekinesis involve the physical trunk and head it is because the consciousness was *thinking while outside the brain* and the part of the psychosoma which was disincident, abruptly interiorizes.

Story line. A small mental or oneiric story line, created in tenths of a second, can establish, accompany or determine the movements of re-coincidence or *coincidentization*, always stemming from a situation or extraphysical point close to the human body, until the instantaneous and perfect coincidence between the psychosoma and soma occurs.

Cord. Self-telekinesis always occurs in a segmented fashion, not only with regard to the physical body, but also the part of the silver cord that corresponds to the segment or organic area, and not the *entire* silver cord or that which reaches the human body in its entirety.

Bibliography: Vieira (1762, p. 53).

379. INTRACRANIAL SOUNDS DURING INTERIORIZATION

Definition. Intracranial sounds during interiorization: noises that are difficult to characterize, perceived only by the consciential projector, almost always inside the cranium – but which can be intracerebral as well as extracerebral – occurring at the precise instant of the interiorization of the psychosoma into the human body.

Synonymy: encephalic echoes; extraphysical tinnitus (*acúfeno*); internal clicks; paraphysiological intracranial sounds.

Causes. The main cause of simultaneous intracranial sounds upon interiorization is the abrupt or traumatic interiorization only of the parahead of the psychosoma. The indispensable action of the holochakra and silver cord evidently influence the occurrence.

Spreading. These sounds can be provoked by the movement of the *spreading* of the silver cord, which gradually ceases to be a *cord* in order to distribute itself throughout the head in the form of a *layer*.

Frequency. The extraphysical tinnitus (*acúfenos*) that occur simultaneously with the abrupt *interiorization* of the integral psychosoma are more frequent than the intracranial sounds that occur simultaneously with the abrupt takeoff of the psychosoma. Sounds can occur consecutively or, in other words, during the *takeoff* of the consciousness in the psychosoma and, later, simultaneously during interiorization.

Characteristics. Projective intracranial sounds create *sonorous repercussions* and are internal, subjective or highly personal. In general, they seem to come from inside the head, whether from the right ear or the left ear; centripetal or centrifugal. They are invariably inoffensive.

Intensity. The intensity of projective intracranial sounds varies: according to the types of consciential projections; from projection to projection, of the same lucid projector; from one consciential projector to another. It often seems that the intensity of the extraphysical tinnitus (*acúfenos*) depends on the rapidity of the maneuvers of the psychosoma in *leaving* from and *entering* into the human body.

Types. The most common types of intracranial sounds that occur during interiorization are: buzzing, tinkling or sibilations. These are interpreted by lucid consciencial projectors using diverse metaphors, such as: vibrations in the head, as if there were an internal tightly stretched cord; crackling fire; electrical spark; exploding balloon; dog's bark; ebbing and flowing hissing sound or animic audition.

Direction. Projective intracranial sounds, particularly during the act of recoincedence, are characterized as following the direction in which the psychosoma is interiorizing, whether from the left, the right, from below, or from above the inactive human body on the bed. For instance, if the inert human body, *emptied of the consciousness*, is lying on the left side, the sound will be heard from the outside into the right ear.

Volume. The volume of intracranial sounds during interiorization is sometimes so loud and intense that the inexperienced projector thinks that a sudden physical accident has occurred, throwing the body from the bed to the floor. The following are some examples: apparently being pushed by a person; someone knocking at the door; a piece of furniture falling over near the human body; or a nearby explosion.

Tympanum. Aside from the stimulus of cerebral origin, it becomes very difficult to define whether 1 tympanum vibrates or the 2 tympanums vibrate simultaneously in the production of projective intracranial sounds, or if the 2 tympanums always act or, in some projective occurrences, do not act.

Uncontrol. Extraphysical tinnitus (*acúfenos*) that occur during interiorization do so because the psychosoma *enters* the human body in an uncontrolled or agitated manner. This clearly constitutes a generic affirmation.

Hypothesis. Intracranial sounds that occur during interiorization prove, to the experimenter, the existence of the psychosoma as a semiphysical, or semimaterial, vehicle. This point requires further research from consciencial projectors and is a valuable hypothesis for projectiological research.

Onomatopoeia. Various experimenters have sought to characterize precisely the various sounds that they hear inside their head when the consciousness, in the psychosoma, interiorizes into the human body. They employ the resources of analogy and onomatopoeia according to the language used and the graphic-sonorous characterizations of text balloons in cartoon strips. Nevertheless, no consensus or common denominator has been reached which proves the individual character of the occurrence.

Cord. Besides the aspects of parapsychic sounds that have been analyzed, there are cases of partial and even complete and abrupt interiorization of the psychosoma. In these cases, cracking noises occur due to the violent interiorization of the silver cord and psychosoma together, in another part of the physical body outside of the human head, such as between the ribs or in the area of the solar plexus (umbilicochakra).

Bibliography: Andreas (36, p. 57), Bonin (168, p. 429), Crookall (343, p. 91), Greenhouse (636, p. 45), Holzer (751, p. 104), Monroe (1065, p. 222), Shirley (1553, p. 146), Vieira (1762, p. 92).

380. HYPNOPOMPY

Definition. Hypnopompy (Greek: *hypnos*, sleep; and *pompikós*, procession): the transitional condition of natural sleep, or the state of consciousness introductory to physical awakening, during the semi-sleep state that precedes the act of awakening, characterized by oneiric images with auditory effects and hallucinatory visions that continue after intraphysical awakening.

Synonymy: end of the sleep-dream cycle; hymnopompy; hypnopompic state; post-sleep state; quasi-awakening; semi-awake state. The term *hypnopompic* was coined by Myers, in 1904.

Awakening. The hypnopompic state, or hypnopompy, characterizes and defines the essential part of the physical awakening of the intraphysical consciousness, after a consciencial projection, whether it is a lucid, semilucid, or nonlucid experience.

Continuous. The projection with continuous self-awareness eliminates the hypnopompic state.

Coincidence. The hypnopompic state – the last phase of the sleep sequence – is the line of demarcation between the unconscious and conscious state of the ego. It also distinguishes the condition of discoincedence and coincidence of the vehicles of manifestation of the consciousness.

Recall. The hypnopompic state constitutes the ideal opportunity for the recall of extraphysical events, for the lucid consciencial projector who has just interiorized.

Hypnagogy. The condition that is essentially opposite to hypnopompy is hypnagogy.

Bibliography: Coxhead (312, p. 78), Edmunds (461, p. 41), Gómez (613, p. 87), Grattan-Guinness (626, p. 392), Martin (1003, p. 67), Morel (1086, p. 91), Muldoon (1105, p. 232).

381. PHYSICAL AWAKENING

Definitions. Physical awakening: the action wherein the projected consciousness awakens in the intraphysical or human dimension soon after a lucid projection; entrance of the consciousness into the ordinary, physical waking state after any altered state of consciousness, such as dream, sleep, or another.

Synonymy: human awakening.

Types. Among the various types of physical awakening, at least the following 7 can be singled out:

1. **Continuity.** Awakening without the asleep-awake transition or the condition of continuous self-awareness.
2. **Health.** Natural or healthy awakening.
3. **Urgency.** Instantaneous awakening or awakening with the intraphysical consciousness manifesting a sense of urgency, e.g.: in the case of an intraphysical repercussion.
4. **Immediate.** Immediate awakening.
5. **Gradual.** Slow or gradual awakening.
6. **Sensation.** Agreeable or disagreeable (uncomfortable) awakening.
7. **Imposition.** Voluntary or imposed awakening.

Causes. The physical awakening of the consciousness can occur due to various causes. The following are 11 examples:

1. **Psychomotricity.** Minimal movement of the human body or soma.
2. **Self-awareness.** Opening of the eyes, common in projections with continuous self-awareness.
3. **Clairaudience.** Notice through clairaudience.
4. **Extraphysiology.** Extraphysical touching of the human body by an extraphysical consciousness.
5. **Self-telekinesis.** Self-telekinesis, or touch by the projected projector itself.
6. **Intraphysiology.** Physical touching of the human body.
7. **Noises.** Noises close to or contiguous to the soma.
8. **Tremors.** Tremors in the physical base (floor).
9. **Holochakrology.** Energetic shower.
10. **Exteriorizations.** Spontaneous exteriorizations of consciencial energies.
11. **Catalepsy.** Post-cataleptic physical awakening (benign projective catalepsy).

Soma. There are cases in which, during the night, the mate or partner in an evolutionary duo has a strange feeling and endeavors to awaken his/her companion by shaking her/his human body that is on the bed. At this point, however, the individual observes that he/she is, in fact, attempting to awaken his/her own human body that is laying down and inactive, devoid of his/her consciousness. The individual thus becomes aware of his/her own extraphysical state of projection of the intraphysical consciousness.

Primoprojection. Such an occurrence, generated by an error of interpretation by the inexperienced projected consciousness, occurs more frequently in a first lucid projection (lucid primoprojection).

Bibliography: Vieira (1762, p. 31).

382. PHYSICAL AWAKENING TECHNIQUE

Sleep. The lucid projector does not always interiorize and immediately awaken after consensual projection. Sometimes his/her consciousness sleeps again.

Catalepsy. The projector can also reacquire awareness *in the human brain* and not be able to move physically. This is the inoffensive or benign state of projective catalepsy, which should not be feared. When in this condition, it is sufficient for your consciousness to produce any movement, however slight it may be, with some part of the human body, in order to awaken immediately.

Minimovements. The following is a list of 5 examples of effective minimovements that are useful in ending the condition of projective catalepsy:

1. **Eyes.** Open the eyes.
2. **Finger.** Move a finger or toe.
3. **Tongue.** Move the tip of the tongue inside the mouth.
4. **Breathing.** Breathe, in this case, inhaling more deeply.
5. **Trunk.** Resolutely wish to turn the trunk of the human body.

Continuous. In a projection with continuous self-awareness, the intraphysical consciousness dispenses with post-projective physical awakening in the same way that he/she earlier dispensed with extraphysical awakening. This is because the intraphysical consciousness does not suffer lapses of lucidity during any stage, thus also eliminating the hypnagogic and hypnopompic states in the majority of major projective occurrences.

Bibliography: Vieira (1762, p. 178).

383. POST-PROJECTIVE ENERGETIC SHOWER

Definition. Post-projective energetic shower: the energetic discharge or pleasurable corporal sensation that the projector can feel, even with a certain degree of frequency, soon after the hypnopompic state, subsequent to a consensual projection, at the beginning of the act of recalling the extraphysical experiences.

Synonymy: post-projective energetic discharge; post-projective energetic shower.

Confirmation. In certain cases, the post-projective energetic shower acts as one of the most useful confirmatory resources of the experiences of the consciousness outside the human body. It is generally accompanied by recollection, whether *en bloc* or in fragments, of the extraphysical events experienced by the projected intraphysical consciousness.

Characteristics. The post-projective energetic shower presents the following 5 characteristics, among others:

1. **Spontaneity.** It is spontaneous and often agreeably surprising.
2. **Area.** In the majority of cases, it begins in the head and flows to the feet (direction).
3. **Position.** It occurs with the human body of the projector in any physical position, whether laying down, seated or standing (erect).
4. **Intensity.** It can present an impressive intensity in the vibratory frequency of the consensual energies.
5. **Absorption.** It seems to be somehow related to the absorption of extraphysical energy that was performed by the intraphysical consciousness that was projected.

Sensations. The agreeable, healthy, positive and strengthening sensations of the shower of consensual energies generally occurs in all parapsychic practices. It is felt like internal shudders or tremors, sometimes moving from left to right and from top to bottom, crisscrossing the human body as though they were poured all at once over the head, to the feet and floor, like a large bucket full of energy turned over onto the top (sinciput) of the cranium.

Assisted. The post-projective energetic shower occurs most frequently after an impactful assisted projection, when the act of recalling the projection is the triggering factor of the process. This almost always occurs with the invisible presence, whether detectable or not, of a helper. This also evidences its animic-parapsychic nature, which is common among sensitive-projectors, and those who habitually sense the consciential energies circulating in their vehicles of manifestation, from the inside-out and the outside-in of their consciential micro-universe. Nevertheless, not all post-projective energetic showers are influenced by a helper.

Sleep. Undoubtedly, the post-projective energetic shower always considerably diminishes the need for physical rest through sleep (personal number of hours of sleep) in the period after a lucid projection. Sometimes, sleep becomes completely unnecessary in this period.

Dream. A common dream, by itself, does not have the potentiality or the psychophysical resources to predispose or promote the post-projective energetic shower. This only occurs when the intraphysical consciousness has just returned to the ordinary, physical waking state, after temporarily being outside the human body and absorbing extraphysical energies directly through the psychosoma, whereupon these energies overflow and pour out in a post-projective energetic shower.

Related. The post-projective energetic shower is sometimes directly related to prolonged consciential projections and occurrences of projective somnambulism.

Bibliography: Vieira (1762, p. 58).

384. STATE OF WAKING DISCOINCIDENCE

Definition. Waking disincidence: the psychophysical condition of the consciential projector after interiorization, in which the intraphysical consciousness perceives itself, with the psychosoma, with or without the holochakra, to be outside the state of coincidence of its vehicles of manifestation, while in a full ordinary, physical waking state, without feeling completely integrated into the human body.

Synonymy: a “foot-larger-than-shoe” state; “half-shut” drawer state; natural trance; prolonged disjunction of the consciential bodies; self-phantoming; state of spontaneous trance; waking dislocation of the consciential bodies.

Categories. The condition of waking disincidence of the intraphysical consciousness can present itself in the following two basic categories:

1. **Duration.** Brief or prolonged.
2. **Health.** Natural (healthy) or pathological (ill).

Specifications. The phenomenon of waking disincidence is dependent upon the fact of presenting various inoffensive, agreeable and surprising physiological sensations when it manifests over a short period of time; or ill sensations, when they transform into symptoms restricted to parapatology of the extraphysical vehicles of the intraphysical consciousness and present themselves in a prolonged and disturbing manner.

Disincidence. Furthermore, the state of waking disincidence can occur through a mini-disincidence or a maxi-disincidence of the vehicles of consciential manifestation.

Sensations. The following is a list of 12 sensations, among others, that the person in the disincidental state can frequently experience, due to the state of waking disincidence:

1. **Lightness.** Sensation of a lack of corporal weight (looseness of the holochakra, irruption of the psychosoma).
2. **Stature.** Sensation of being taller than normal.
3. **Fluctuation.** Sensation of “walking on air” or “walking on clouds”.
4. **Retreat.** Sensation of retreating from persons and objects observed.
5. **Microscopy.** Visual sensation of microscopy.
6. **Spaciousness.** Sensation of expanded space.

7. **Legs.** Sensation of “walking on stilts”.
8. **Haptics.** Loss of a tactile sensation of the solidity of physical objects (haptics), including solid foods tasted and ingested through the mouth.
9. **VS.** Permanent predisposition toward the installation of the personal vibrational state (VS).
10. **Self-vacillations.** Ephemeral self-vacillations in attitudes or with regard to gestures and decisions.
11. **Illumination.** Perception of a brilliant, diffuse illumination of things and upon physical things and objects.
12. **Energetic dimension.** A lucid experience in full three-and-a-half dimension or in the energetic dimension.

Semi-interiorization. The state of waking dis coincidence, in the essence of the phenomenon, represents a semi-interiorization of the projected intraphysical consciousness, the difference being that it is longer-lasting.

Causes. Physical-extraphysical facts indicate that the state of waking and temporary dis coincidence is essentially provoked by at least the following 8 basic causes:

1. **Interiorization.** An alteration in the mechanism of interiorization of the projected intraphysical consciousness.
2. **Energies.** An excess of conscial energies of the recently-projected psychosoma.
3. **Holochakrology.** The condition of total looseness of the holochakra.
4. **Projectability.** A high degree of lucid projectability (LPB) of the intraphysical consciousness.
5. **Intraphysical euphoria.** Emotional exaltation, whether as a result of a recent fleeting extraphysical euphoria or an intraphysical euphoria of the projected intraphysical consciousness, including here a period of energetic springtime.
6. **Interval.** The intermittent and short-lived condition that sometimes arises between two consecutive assisted conscial projections.
7. **Exteriorization.** The more advanced or intense exteriorization of the energies of the holochakra resulting from the individual installation of an intense field of bioenergies.
8. **Psychosomatics.** Irruption of the psychosoma in intraphysicality through the soma.

Effects. The following examples are 3 natural effects of the condition of brief waking dis coincidence:

1. **Semiconsciousness.** Superficial semiconsciousness of the intraphysical consciousness while in the ordinary, physical waking state.
2. **Projection.** The ease with which the intraphysical consciousness may initiate another lucid conscial projection immediately, because the consciousness, the psychosoma and the human body remain predisposed to a new experience.
3. **Uncomfortable.** The *wasting* of exteriorized conscial energies, for a period of time, with no apparent finality, in the manner of a negative or uncomfortable effect.

Consequences. Among the consequences verified by other persons who have observed intraphysical consciousnesses in a state of waking dis coincidence, the following 4 should be highlighted:

1. **Elongation.** The appearance of the phenomenon of elongation of the head, neck, trunk and arms of the person being observed.
2. **Luminosity.** The appearance of a brilliant and diffuse luminosity above the head of the person in dis coincidence, along with the expansion of the aura and the coronochakra.
3. **Elevation.** The observation of the person’s human body being taller than usual.
4. **Teleguidance.** Verification of the movements of the soma under analysis seeming to be teleguided or, in other words, commanded from a distance by its dis coincident consciousness. This gives rise to actions that are clearly insecure, automatic or occur in slow motion.

Self-awareness. The state of waking dis coincidence shows that the consciousness can be *inside* the mentalsoma, in the extraphysical head of the psychosoma (parabrain), as always occurs when the intraphysical consciousness is in the waking state and, in turn, remains *inside* the human head and maintains self-awareness in regard to the partial projection of the members or the trunk of the dense body (soma).

Attacks. The condition of waking dis coincidence can be caused by extraphysical attacks upon the intraphysical consciousness, with or without the help of other intraphysical beings. It is preceded, in this case, by very clear sensations, such as: consciencial cloudiness, physical exhaustion or overwhelming drowsiness (sleepiness).

Drugs. Certain drugs can generate the condition of waking dis coincidence soon after the intense, profound psychedelic experiences have ended.

Migraine. As previously indicated, certain people who suffer from migraines or hemicrania, a headache that almost always occurs on one side of the head, the main symptom being a debilitating headache – as well as some of their sons or daughters who do not have the classic headaches (*migrainoids*) – usually experience the state of waking dis coincidence, or the sensation of possessing 2 bodies, even when they are walking or driving a vehicle. This condition is termed “hallucinations of physical duality” by psychiatrists and neurologists.

Note. The condition of waking dis coincidence should not be confused with hypnopompy or with the twilight state of incomplete awakening, which is post-alcoholic behavior and is studied in psychiatry (Elpenor Syndrome).

XIII - Post-Projection Physical Waking State

385. THE PHYSICAL MIND

Definition. Mind: the organized totality of the physical, conscious, unconscious and endopsychic structures and processes of the consciousness when it is intraphysical.

Synonymy: intelligence; thought.

Problem. *Cartesian dualism* is the establishment of the idea that the mind is independent from the soma. Skeptics refer to this idea as the *ghost in the machine*. In general, this theme is addressed as the *mind-body problem* or the *psychophysical question*.

Levels. There are 4 basic levels of the mind: conscious, subconscious, supraconscious and unconscious during sleep.

Brain. The human brain is used by the consciousness as a physical agent or vehicle for the exercising of its functions. The consciousness is in the brain in the same way that the broadcasting station is in the radio. The consciousness – or the essence of the personality – depends upon processes located in the mentalsoma, passing through the extraphysical parabrains of the psychosoma, and not directly through the dense physical brain.

Obscurities. The connection between the following 7 variables related to the human mind still remain obscure for sciences in general:

1. **Somatics.** The human body (soma) and the mind.
2. **Physiology.** Physiology and psychology.
3. **Psyche.** The soma and the psyche.
4. **Consciousness.** The cerebral cortex and the consciousness.
5. **Idea.** Nerve impulses and ideas.
6. **Thought.** The neuronal electrochemical phenomenon and conscious thought.
7. **Parapsychism.** The stimulation of brain cells and the animic-parapsychic experience.

Characteristics. The consciousness utilizes the human body as a controlled machine, and makes the human being into a microcosm, or a miniature of the universe, thereby distinguishing at least 5 characteristics of the mind:

1. **Wakefulness.** The state of the consciousness during the ordinary, physical waking state.
2. **Restriction.** The mind when restricted to the physical brain or in the condition of the conscial restriction of human life (resomatics).
3. **Emptiness.** The *full* brain, due to the presence of the consciousness in the ordinary, physical waking state, as opposed to the *empty* brain, due to the absence of the consciousness during a lucid or nonlucid projection (projectiology).
4. **Hyperacuity.** Degrees of conscial lucidity (cons).
5. **Cerebration.** Cerebral consciousness.

Histology. It is worth adding that, aside from the *thinking* consciousness, a type of physiological, organic, cellular (histology), genetic or somatic consciousness seems to exist.

Memory. In the complex composition of the mind, memory plays a fundamental role.

Bank. The small and restricted memory bank that only contains the current human life, generally having a maximum of 7 decades of human experiences, is similar to a poorly programmed computer.

Sophistic. This cerebral memory bank always responds to all inquiries, even if it needs to rationalize the unknown facts through sophisms. The amount of general knowledge that the conscial projector carries stocked in the physical memory or, in other words, the personal idea bank, therefore becomes extremely important in order to facilitate the recollection of extraphysical experiences.

Trillions. It is currently estimated that in the course of 7 decades of existence, an individual, while awake in the ordinary, physical waking state, receives, registers and almost always stores or permanently retains 50 trillion *bits* of information.

Bit. Bit, the abbreviation for binary digit (Binary digIT), valued at either 0 or 1, is the smallest unit of information with which, for example, data can be registered and stored in a computer.

Engram. The *engram* is the mnemonic sediment of a lasting nature which is left in the protoplasm of nerve tissue.

Mneme. The *mneme* is the memory that is conserved in the cells of the soma. It is responsible for the behavior of organized matter.

Holomemory. Every occurrence in life, as small as it may be, is stored, although a great number of facts can be temporarily forgotten. Those facts that we consciously remember represent only a fraction of our integral memory or, in other words, the source of the personal identity of the consciousness: the holomemory.

Children. There are cases of children who, after learning how to speak, are able to recall incidents that occurred before they could speak and verbally describe them correctly. This would show that memory persisted in a non-verbal form during the entire period prior to learning to speak, and only later encountered verbal expression.

Area. It is believed that ordinary memory occupies an area of about 2" (5 cm) long and 1½" (4 cm) wide, situated in the very interior of the temporal lobe, in the 2 cerebral hemispheres. This region constitutes the archive or warehouse of all past, current and future experience of the physical life of the human being or intraphysical consciousness.

Neurology. The internal communications that occur inside the brain are made through the prolongation of nerve cells or neurons.

Biochemistry. Bioelectric and biochemical memory also exist. Long-term (biochemical) memory seems to be stored throughout the brain, or even in organic regions beyond the brain, and not only in the small circumscribed region referred to. For example, auditory memory seems to be linked to the cortical area predominantly responsible for audition.

Recollection. Recollection is an act of thinking that awakens sets of memories.

Hypomnesia. All of us, intraphysical beings, generally forget (hypomnesia) at least 5 periods of our existence:

1. **Incidents.** Incidents that occurred only some years, months, or days ago.
2. **Youth.** Ample segments of our youth.
3. **Childhood.** Part of our childhood.
4. **Neonatology.** The first years of human existence.
5. **Prenatal.** The prenatal period.

ASC. We don't remember the greater part of our dreams and, much less, the majority of the projections of our consciousness outside the human body, as well as other *altered states of consciousness* (ASC) that remain blocked in the mnemonic center and are therefore called unconscious experiences.

Faces. Human beings generally recognize faces more easily than names.

Reality. In fact, conscious life is only a thin surface over the ocean of thoughts, sentiments, motivations, sensations, experiences and the integral memory which, for us, represent the greater part of reality.

Categories. Neurosciences list a respectable number of memory categories according to the approach of their study: daily, semantic, episodic, echoic, primary, secondary, private and operational.

Conscientiology. Nevertheless, psychology, for example, does not address the world of extraphysical memory (multidimensional memory) in its entirety. It is an everlasting, indestructible archive pertaining to the projected consciousness and therefore constitutes an area of study of projectiology, a discipline of conscientiology.

Analogies. Various analogies come to mind that characterize memory processes, such as: archive, collection, computer, dictionary, encyclopedia, tape recorder, VCR and warehouse. However, human memory is a system that is superior to all these examples and everything humankind has thus far invented for storing and remembering.

Wisdom. So far, nature has been extraordinarily wiser than scientists.

Learning. Current studies on *human* memory demonstrate that everything one remembers has its *raison d'être*, because it is not possible to remember something if it has not been learned. This affirmation constitutes, to some extent, patent evidence for the theory of successive intraphysical lives and for the experiences of the lucid consciousness outside the human body or soma.

Factors. The degree of excellence of the projector's recollection of extraphysical episodes depends on his/her personality. The most diverse factors interfere in the quality of even ordinary memory, in the normal, physical waking state, of any individual who is more evolved than a savage – from the complete amnesiac to the memory expert – such as: accident, illness, education, emotionalism and genetics.

Aspects. Neuroscientists distinguish 3 different relevant aspects in the word *memory*:

1. **Systems.** The memory systems or the mechanisms that execute the mnemonic processes.
2. **Representations.** The contents of memory banks, or representations of past experiences which are stored in memory systems.
3. **Performance.** The performance of the memory, or the capacity to recall.

Distinctions. It is indispensable for the lucid consciential projector's parapsychic development, that his/her consciousness distinguish between mental images, morphothosenes and extraphysical events.

Imagetic. Mental images are reconstructions of sensorial experiences. They are formed from information stored in the memory bank, being mere subjective elements of use only *by* and *for* the consciousness. They are the foundation of common dreams, nightmares and hallucinations, 3 different altered states of the intraphysical consciousness. The mental image is the first stage of the morphothosene, that exists only for the consciousness. The difference between images and morphothosenes becomes clearer with an expansion in the intensity of the *thosene* upon a specific *image*.

Morphothosenes. When the projected intraphysical consciousness has a greater degree of lucidity, it does not confuse mental images with real extraphysical events, although these same mental images orient the modeling of morphothosenes in the extraphysical dimension. In other words: morphothosenes are simple mental images that are shaped extraphysically. However, even these are very different from real extraphysical events.

Types. An ordinary mental image can be: visual, tactile, auditory. Extraphysical mental images can be: paravisual, paratactile, para-auditory.

Hypothesis. The recognition by modern neuroscientists of the extraordinary versatility of human memory systems, as well as the fact that there is no demonstrative proof that *all* experiences are permanently stored in common memory, speaks in favor of the hypothesis that a *branch of mnemonic reserves*, more important than the brain, is located in the parabrains of the psychosoma, and that the permanent *headquarters* is in the mentalsoma.

Cord. Without a doubt, in consciential projections in the psychosoma, the silver cord is the fundamental element for the recuperation of the recollection of extraphysical events that are stored by the projected intraphysical consciousness. Note that when the cord is denser, within the extraphysical sphere of energy, in a quick projection, recall occurs more easily. The same does not occur when the silver cord is more rarefied in a projection that transpires at a distance from the human body. As the mind-brain contact becomes imperfect, it makes the recall process more difficult.

Reserve. Facts indicate that during the consciousness' lucid projections in the psychosoma, extraphysical events are normally stored in the mnemonic reserve, following the same processes employed for common facts while in the ordinary, physical waking state.

Mentalsoma. The above-mentioned observations are not valid for the intraphysical consciousness' recollection when projected in the mentalsoma, where the direct process of acquisition and storage transcends the recuperation capacity of ordinary human memory. This is why it is so difficult (perhaps it is more precise to say *impractical*) to recuperate the *integral* experiences of the consciousness projected in the isolated mentalsoma in the pure mentalsomatic dimension.

Intuition. There is some consolation in the even more obscure process of semi-recuperation that is characteristic of the common phenomenon of intuition, which is a type of antidote against forgetting.

386. CONSCIENTIAL PROJECTION RECALL

Definition. Projective recall: the act through which the intraphysical consciousness recalls the events he/she experienced during the period in which he/she was projected outside the human body.

Synonymy: memory of extraphysical events; post-projective recall; projective memory; projective mnemonics; projective mnemotechnique; projective recollection.

Processing. The biochemical and hormonal changes that habitually occur at night during natural sleep can impede the consciousness' assimilation of new information. Perhaps that is why people forget dreams as well as lucid projections. The brain apparently cannot receive and process this information during the state of natural sleep.

Analogy. In the same way that we do not recall most of our dreams (although, in theory, everyone dreams every night), we also do not recall most of the extraphysical events experienced during our lucid consciential projections, upon awakening in the morning (although every person projects, at least unconsciously, every night). In this particular aspect, the 2 altered states of consciousness, dream and lucid projection, are analogous.

Factors. The capacity to remember dreams, as well as the capacity to recall the facts experienced during lucid projections, depends on various factors, especially the following 3:

1. **Depth.** The depth of the altered state of consciousness, whether dream or lucid projection.
2. **Interest.** The person's conscious interest, or the consciousness' lucidity, regarding the contents of his/her oneiric experiences or the projective experiences.
3. **Personality.** The characteristics of the dreamer's or projector's personality.

Lucidity. The process of storage and retrieval of extraphysical events during a consciential projection is aided by the projected consciousness' degree of lucidity during the unfolding of the experiment.

Replay. To memorize is to catalog and store for future evocation. It is not possible to replay what was not recorded. Therefore, recall of the facts of lucid projections demonstrates that memory transcends the cerebral hemispheres.

Evidences. The inability and difficulty in recalling the experiences of lucid projection show the distinction between the consciousness and the human body or, in other words, the existence of another vehicle of manifestation of the consciousness (psychosoma), beyond the human body and its 2 cerebral hemispheres (in this case, the parabrains).

Involvement. The consciousness' recollection regarding events that occurred during normal intraphysical life, or in the ordinary, physical waking state, seems to involve cerebral activity. Anyone remembers what was eaten yesterday because the human body or, in other words, the mouth, stomach and the cerebral hemispheres, were involved in the acts (thosenizations) of eating.

Suspension. However, extraphysical activities take place during a period when physical activities are suspended. In this case – as those activities do not involve the use of the cerebral hemispheres – it becomes almost impossible for the intraphysical consciousness to remember the related facts. That is the neurophysiological reason why most of the components of somnambulant humanity do not remember the events experienced during a lucid consciential projection.

Parabrains. We can thus infer that recall of projective facts depends, above all, upon the transmission of recollections from the psychosoma's parabrains to the human body's dense physical brain, notably in projections of the consciousness that are extraphysically experienced in the psychosoma.

Parapsychophysiology. The parapsychophysiology of the parabrains of the psychosoma evidences the fact that this organ naturally can hold the memories of the consciousness' experiences in two or more different consciential dimensions (parallel worlds).

Hypoxia. This is why a lack of oxygen in the cerebral hemispheres (cortical hypoxia) helps the intraphysical consciousness project with lucidity, on the one hand, but makes the transmission of these memories from the parabrains to the brain more difficult, on the other hand, thereby impeding projective recollections.

Anesthesia. Conclusion: the individual who undergoes general anesthesia, as a rule, has the consciousness projected outside the human body with some lucidity. However, few individuals are able to later recall the facts that transpired in this period.

Mentalsoma. Based on these facts, we can also deduce that the structure and nature of the recollection of projective occurrences experienced directly by the consciousness (intraphysical, in this case) when in the isolated mentalsoma are far richer, more complex and difficult than recollections of events experienced when in the psychosoma.

Psychosoma. When projected in the psychosoma, the consciousness, headquartered in the mentalsoma and therefore in the psychosoma's parabrains, has only the task of transferring the memories from this parabrains to the human body's natural brain.

Transfer. When one is projected directly in the mentalsoma, the transference or the transmission of the recollections is performed twice:

1. **Extraphysiology.** First, from the mentalsoma to the psychosoma's parabrains.
2. **Intraphysiology.** Then, from the psychosoma's parabrains to the human body's brain.

Holomemory. Obviously, continuous integral memory, or holomemory, exists constantly in the consciousness when manifesting itself through the mentalsoma.

Categories. Among the categories of lucid projection recall, the following 9 can be singled out:

1. Recall is dispensed with in projections of continuous self-awareness.
2. Natural recall.
3. *En bloc* recall.
4. Fragmentary recall.
5. Random recall.
6. Mnemonic hiatuses.

7. Complete or incomplete mixed recall (*en bloc* plus fragmentary).
8. Delayed recall, the memories of which only return hours or days later.
9. Traumatic recollection or recall of extraphysical occurrences that are very difficult to forget.

Phases. Among the mnemonic functions, there are 3 well-characterized phases that stand out in the entire strictly physiological process of memorization:

1. **Acquisition.** In the acquisition phase, the consciousness acquires new knowledge through the ability to focus on the experienced fact in great detail for the duration of its occurrence, through concentrated attention and personal interest.

2. **Retention.** The retention phase, having no time limit, includes the period in which that which was memorized is found to be conserved in a latent manner.

3. **Reactivation.** In the reactivation phase, the consciousness reactivates or updates the acquired material, utilizing the capacity of evocation.

Reinforcement. The memories last longer when they are reinforced through repetition.

Qualities. Among the qualities of lucid projection recall, the following should be singled out: logic; clarity; coloration; duration; details; rapidity; slowness; and others. These qualities are improved with repeated projective experiences.

Physiology. Various aspects call the experimenter's attention within the scope of the physiology of lucid projection recall, such as the following 7:

1. **Comparison.** The natural process of comparison (association of ideas, panoramic vision, the act of *tying together loose points*) of extraphysical consciousnesses, extraphysical districts and extraphysical events with beings, locations (generally paratropospheric), objects and familiar human circumstances.

2. **Interpretation.** A better *translation* or personal interpretation of forms and known ideas.

3. **Chronology.** The chronology of recalled episodes.

4. **Flashes.** Mnemonic flashes.

5. **Clarification.** The spontaneous and abrupt clarification of the recollection itself.

6. **Repetition.** The repetition of projective experiments, bringing greater ability or competence to the intraphysical consciousness, naturally improves the precision and coherence of the recollections.

7. **Memory.** A good ordinary cerebral memory in the physical waking state predisposes the recall of extraphysical events.

Extraphysical. The active lucid projector, with the accumulation of projective experiences, ends up discovering the *delayed extraphysical recall* that consists in the projected intraphysical consciousness recalling previous extraphysical experiences which, for some reason, were not recalled immediately after interiorizing into the soma on the same day of that previous lucid projection.

Prolonged. The phenomenon of recall is directly related to the occurrence of prolonged projections. There is a great deal of evidence which indicates the intraphysical consciousness' difficulty in maintaining a clear and coherent recollection of the extraphysical experiences after an hour's absence from the human body. It seems that the human brain of the majority of intraphysical consciousnesses does not handle or hold both memories simultaneously after this period. The macrosoma with mentalsomatic foundations influences this capacity, overcoming this mnemonic deficiency in some cases.

Inclusions. It should be borne in mind that the *extraphysical* memory includes the physical memory and exists closer to the integral memory or holomemory. Physical memory is obviously lesser in capacity, being weaker or less efficient. In no way does it include the memory of all the lucid projective experiences of an entire human life. On the other hand, this makes 100% recuperation of the consciousness' cons difficult in intraphysical life.

Research. From now on, the more that biological, chemical, pharmacological, therapeutic, geriatric, psychological and general medical research is able to improve the practical application of the resources of the human brain – a *black box* still only partially decipherable – and improve the attributes and qualities of human memory (mnemosomatics), the greater will be the possibilities of ordinary intraphysical consciousnesses to recuperate more extensively the recollection of their diuturnal extraphysical experiences which have, until now, routinely remained buried in oblivion due to mnemonic imperfections in the joint and separate manifestations of the 2 cerebral hemispheres.

Work. Therefore, all neuroscientists who currently dedicate themselves to various fields of research are consciously or unconsciously working toward the inevitable evolution of projectiology and conscientiology.

Technology. It is important to inquire, based upon chronological time considered in the inverse direction, namely from present to past: To what degree is the evident and unquestionable general increase in human lucid consciential projections, in this *era of acceleration in history*, directly due to the technological improvement of drugs, foods, the electronic radiation of recently discovered and created instruments, and of modern life itself acting upon the cerebral hemispheres of adults and children, with new, intense, continuous and very potent stimuli?

Aspects. Besides the subsequent chapters, there are others in this book that address aspects of the intraphysical consciousness' memory: projective *déjà vu*; extraphysical precognition; extraphysical retrocognition; projective panoramic vision; and another extremely important topic: the binomial lucidity-recall.

Bibliography: Bozzano (193, p. 104), Crookall (343, p. 182), Frazer (549, p. 156), Powell (1278, p. 90), Swedenborg (1639, p. 133), Vieira (1762, p. 33).

387. FRAGMENTARY RECALL

Definition. Fragmentary recall: coherent or scattered slow recall in parts, segments or fragments, of the extraphysical events experienced by the intraphysical consciousness which has recently interiorized into the human body.

Synonymy: fragmented recall; discontinuous recall.

Inefficiency. Fragmentary recall is the least efficient process by which the intraphysical consciousness remembers the extraphysical experiences, because it is subject to mistakes and the creation of gaps in the flow of recollections.

Discontinuity. In fragmentary or discontinuous recall, besides recollections that emerge in parts, each part often presents its own degree of clarity and intelligibility of recall that is perfectly perceptible and easily differentiated by the consciousness. One may be of an extreme sharpness of precision and perception, another one cloudy and yet another completely obscure.

Order. The *first* fragments to surface *in the memory* of the intraphysical consciousness which has recently arrived from the projective experiment are almost always the *final* extraphysical events.

Lucidity. Projective occurrences show that certain lucid projections – notably those in which the intraphysical consciousness floats or moves at high speeds over rural areas and cities – although being experienced with intense lucidity during the events can, in the end, cause one to recall the events as though they had been semilucid experiences. There are unknown organic, cerebral factors, or those related to the nervous system, that interfere in the mechanisms of the memory in these cases.

Bibliography: Vieira (1762, p. 66).

388. EN BLOC RECALL

Definition. *En bloc* recall: rapid, integral and coherent recall of extraphysical events by the intraphysical consciousness that has recently interiorized into the human body.

Synonymy: *en bloc* recollection; continuous recall.

Efficiency. *En bloc* recall is the most efficient process for recalling extraphysical facts. The only system better than this is to completely dispense with the need to recall the experiments outside the human body, which occurs in projections with continuous self-awareness.

Clarity. The clarity or refined level of acuity of the intraphysical consciousness' recall of extraphysical experiences, when always uniform, refers to the possibility of *en bloc* recall.

Mixed. Depending on the intensity of the ideas and emotions, as well as the velocity of the succession of extraphysical events, *en bloc* recall can coexist with fragmentary recall, resulting in a mixed recall. In this case, highly emphasized *en bloc* memories of an experience (generally the main one) occur first, followed by other fragmentary recollections.

Bibliography: Vieira (1762, p. 33).

389. FACTORS FAVORABLE TO CONSCIENTIAL PROJECTION RECALL

Impacts. According to public opinion research, the following are the most frequent impacts that lucid projection has on people, as separated into 3 distinct periods:

1. **During.** During the experience: the intraphysical consciousness feels calm, peace or quietude; feels absolute freedom; feels spontaneous happiness; feels fear.

2. **Afterward.** Immediately after the experience: the intraphysical consciousness becomes interested in parapsychic phenomena; speaks about the experience; feels curious about the subject; feels that life has changed (*breakthrough, turning point*); feels that it was a transcendent experience; feels in possession of parapsychic abilities, a condition that was previously unknown.

3. **Subsequently.** A longer time after the experience, the intraphysical consciousness: wishes to have the experience again; feels that a greater awareness regarding the reality of human life was developed; feels the experience to be very agreeable; feels the experience has brought personal benefits; feels an inner change to a peaceful self-conviction regarding life after death or deactivation of the human body; feels the experience to have been imbued with great beauty; feels the experience to be the greatest thing that has ever occurred in his/her intraphysical life.

Classification. The factors favorable to recall of lucid projections can be classified into 4 categories:

1. **Psychological:** motivation regarding lucid projection; psychological derepression; mnemonic catalytic agent; meditation upon the memories of lucid projections; extraphysical event selection know-how.

2. **Physiological:** dorsal position of the human body; physical awakening immediately after the lucid projection; lucid projection produced in the second half of the night; maintenance of cerebral circulation or, better still, cerebral circulation which is increased without being pathological, maintaining normal intracranial pressure, a verification of which can be performed through funduscopy; lateral rotation of the head during the post-projective period; mild swinging of the human head back-and-forth; the habit of recalling the lucid projection twice before getting up from the bed to register the experience; an extensive array of general knowledge stored in the ordinary physical memory; youthfulness, signifying that the individual possesses a good acquisition memory; a good ordinary memory in the physical waking state, thus predisposing the recall of extraphysical events.

3. **Physical:** orally relating the lucid projection to a listener; organizing the lucid projection's extraphysical episodes in chronological order with a certain keyword corresponding to the relevant point of each one; immediate registration of lucid projection experiences; rereading of the register to yourself in a loud voice; keyboarding the register of extraphysical events; personal recall technique or projective mnemotechnique; certain types of developed parapsychism; energetic post-projective shower.

4. **Extraphysical:** simple extraphysical episodes; the climax of extraphysical events; the last extraphysical scenes; fixation of the key moments of extraphysical experiences; the cooperation of extraphysical helpers; often, the projected human consciousness' discontinuous lucidity causes fragmentary recollection; interiorization accompanied by immediate physical awakening predisposes *en bloc* recall.

Opening. A deep extraphysical emotion or non-habitual experience of the projected consciousness can provoke a *mnemonic opening*, which facilitates recall remarkably. In these cases, traumatic extraphysical experiences which are impossible to forget occur.

Dreams. The person who is able to learn to recall natural ordinary dreams, improves the recollection of lucid projection experiences.

Details. The person who, in the ordinary, physical waking state, is able to remember apparently negligible details during the unfolding or development of the everyday facts of daily existence, retaining impressions and sensations that are very close or intimate to the psychosphere, presents a greater tendency to enjoy extraphysical lucidity while projected, as well as observing the extraphysical experiences without traumas and clearly recalling the facts witnessed or experienced while projected.

Universe. To accept the conditions of proximity and the influences of the macro-universe upon our consensual micro-universe, in a balanced manner, is the first step toward intelligent multidimensional coexistology. Lucid projection increases our circle of consensual relationships and interdimensional communicability in an unforeseeable manner.

Feedback. It is worth paying attention to the act of feedback and the improvement of accuracy – sharpness, acuteness, perspicacity and exactness – regarding that which is around you, in relation to your attention and memory. Take the example of discovering for the first time the brand name printed on the bathroom accessories that you have been using every day, for decades, and have never noticed.

Medication. This common fact frequently occurs when an older person begins taking anti-arteriosclerosis medication, thus triggering a renovation in the capacities of attention, concentration and memory (mnemonics). This occurrence considerably improves the degree of extraphysical acuteness and the habitual lucid projector's post-projection recall. This even influences an intensification in the number and quality of ordinary dreams. At this point, many extraphysically lucid projectors, nevertheless without good physical recall, discover and easily deduce the number and extension of enriching consensual projections which they have been having but did not recall.

Bibliography: Twemlow (1710, p. 454), Vieira (1762, p. 180).

390. FACTORS UNFAVORABLE TO CONSCIENTIAL PROJECTION RECALL

Classification. The factors unfavorable to consensual projection recall can be classified into 4 types:

1. **Psychological:** disinterest regarding lucid projection; excessive self-censorship; fear of extraphysical occurrences; superimposition of data or engrams in the memory bank; hypomnesia or deficient nominative memory; difficulty in acquiring pure thoughts that have to be *translated* into unprecedented words and human expressions; deformation of memories; the fugacity of extraphysical memories; skepticism regarding lucid projections.

2. **Physiological:** position of the human body in the prone position or lying on its front on the bed during projection; surrender of the consciousness to post-interiorization sleep; narcolepsy, an illness that is the opposite of insomnia, or one in which the individual suffers excessive sleeping bouts; intercurrent of dreams; dream-visions and nightmares that mix with the realities of extraphysical events pertaining to the conscial projection; the mnemonic burden of two simultaneous lives, intraphysical and extraphysical; reduction in intracranial circulation or cerebral hypoxemia; discouragement of laziness and comfort of the projector's bed; the act of producing consecutive conscial projections; organic reflexes from freedom from diurnal tensions; difference in the velocity of transmission of thoughts through the free mind and through the dense brain; the act of dreaming *with* and *about* lucid projection; advanced physical age because of a recently acquired weak memory; organic intoxication.

3. **Physical:** later or postponed registration of the conscial projection; the heavy burden of human life's daily tasks; a change of the projector's physical base.

4. **Extraphysical:** prolonged disparate extraphysical events that occur at a distance from the physical base; impactful extraphysical surprises; priority services of extraphysical assistance; subtleness of extraphysical sensations and events; extraphysical parapsychism exercises; prolonged extraphysical parapsychic trance.

Nap. Recent research shows that a good nap before beginning a learning process can impair the mechanism of memory as it aggravates the capacity to forget. This *mnemonic block* occurs due to the action of the substance called somatotropin, which is liberated during sleep. For this reason, post-interiorization sleep, whether brief or prolonged, light or deep, impairs the recall of extraphysical events experienced by the projector during the lucid projection.

Ambivalence. Not all factors unfavorable to conscial projection recall are actually unfavorable to projection itself, with regard to the quality of the experience and its purpose. Examples of this are extraphysical assistential services and parapsychism exercises outside the human body.

Bibliography: Rampa (1357, p. 190), Vieira (1762, p. 136).

391. EXTRAPHYSICAL EVENT RECALL TECHNIQUES

Reasons. All intraphysical consciousnesses, upon falling asleep every night, produce at least nonlucid miniprojections, common to human beings in general and even to some developed and larger subhuman animals. This is why many candidates to lucid projection need to apply an efficient extraphysical event recall technique far more than they need to apply an improved technique for projecting, because once a small, mild projection is obtained with some degree of extraphysical lucidity, even with a nonlucid takeoff, the projector develops with greater ease with repeated experiences.

Self-programming. The self-programming recall technique can be divided into two phases: prior and subsequent.

1. **Prior.** In the prior phase, program yourself ahead of time by employing autosuggestions such as the following sentence: "I will remember the projection in detail!" Say this to yourself 5 times shortly before falling asleep, during the hypnagogic state.

2. **Subsequent.** In the subsequent phase, upon awakening, remain lying down for some minutes, moving the soma as little as possible, until recalling the extraphysical occurrences twice. Immediately write on a paper, in great detail, everything that you remember having occurred outside the dense body, because the quite fugacious recollections of the conscial projection can easily be masked by *mnemonic entries* of the facts related to diurnal tasks, that obliterate the physical or cerebral *memory bank*.

Exceptions. In exceptional circumstances, due to advanced physical age and the projector's deficient intracranial circulation, the posterior phase of the indicated process can be altered by slowly rotating the head, moving it to another position soon after physical awakening. This is a posture that helps in consciential projection event recall.

Improvement. There are 3 simple extraphysical resources that can serve to develop the human projector's recall:

1. **Names.** First: repeat to yourself the names *heard* at the exact moment in which they arise during the unfolding of the lucid projection's events in the extraphysical dimension.

2. **Register.** Second: learn names and ideas in the extraphysical dimension, immediately return to the human body, physically wake yourself up and register them without delay. These 2 expedients unblock the *nominative* memory, which is generally blocked. This is generally the most difficult memory for human projectors to conserve.

3. **Interconnection.** Third: if the projected intraphysical consciousness, upon experiencing various different scenes outside the human body during a single projective experience, is able to attentively carry the subject of the prior scene to the next extraphysical scenario – or interconnect the diverse experiences into one homogeneous, similar, continued experience – this consciential expedient will greatly facilitate the recall subsequent to the lucid projection.

Index. The following is a simple technique that, in some cases, has produced results for recalling the extraphysical events which occurred during a lucid projection: touch an index finger to your forehead in order to remind yourself of what you saw or experienced outside the human body.

Hypothesis. In this case, we imagine, as a tentative hypothesis, that the closed circuit circulation of consciential energies that is established stimulates the frontochakra (generally responsible for clairvoyance), which activates the intraphysical consciousness' integral memory bank through the pineal gland.

Comparisons. Another process that can favor the recall of extraphysical facts is the act of establishing comparisons between extraphysical beings, things and facts observed by the projected intraphysical consciousness with familiar physical or human beings, things and facts which – although very different – still have some similarities in regard to their images or characteristics which serve as a point of fixation for the memory.

Bibliography: Guéret (659, p. 163), Vieira (1762, p. 186), Walker (1782, p. 242).

392. FRAGMENTARY RECALL TECHNIQUE

Drowsiness. Generally you, just like any person, wake in the middle of the night and remain sleepy or in a *conscential twilight zone*, more asleep than awake. At this point, your human organism entices you (your consciousness) to sleep a little more. The quasi-absolute control of the physical discouragement characteristic of drowsiness prevails and must be overcome by you as a projector, at all costs.

Awakening. You should, then, attempt to remain more awake without getting up from the bed, acting only through thoughts and will. At most, you can move the head to one side, which will help recall, or change the position of the entire human body on the bed.

Recall. Once you have overcome sleep, you should endeavor to recall, without giving up easily, something that occurred immediately prior to that moment. The first oneiric or projective recollection, as small as it may be, will serve as a *mnemonic clue*.

Fragments. From one simple oneiric memory, you need to *draw out* the other memories. The occurrences or small episodes of the extraphysical facts will be *plucked* or *fished* little by little, through

small and large fragments, until composing a succession of coherent scenes, in a logical sequence of experiences, that you should analyze with great acumen, separating the oneiric images, the projective images and those that are a mixture of the two.

Impression. The fragmentary recall technique can thus be characterized in detail. If you wake up without any memory of projective experiences but have the *impression* or *intuition* that you projected, you should endeavor to obtain, at all costs, the initial fragment of the memories, or the *mnemonic seed*.

Seed. If you wake up in the morning, or during the night, with a specific fragment of the initial memory of a lucid projection (the mnemonic seed), you should endeavor to recall a small fact immediately prior to the fragment. After you have obtained this, endeavor to remember an immediately subsequent fact. Continue in this way successively and alternately, until reaching the most extensive, deep and best possible projective recall.

Review. Next, you should review many times for yourself the entire sequence of the extraphysical experiences recalled in order to see if you can remember anything else. It is important to avoid inventing, even though unconsciously, portions of memories that can become subtly incorporated into the real memories.

Vibrations. Your greater awareness can sometimes provoke a post-projective energetic shower, a vibratory discharge throughout the human body that is characteristic and confirmatory of the lucid projection experience in a pacific, definitive and unquestionable manner. The energetic shower, due to the prior discoincidence of the vehicles of manifestation of the consciousness, besides confirming the occurrence of your projection, often dynamizes the flow of recall of the scenes, images and experiences that occurred in the extraphysical dimension.

Bibliography: Vieira (1762, p. 191).

393. QUADRUPLE MEMORY

Definition. Quadruple memory: simultaneous recall by the intraphysical consciousness which is projected and in a state of expansion, of similar or interrelated facts from 4 diverse sources, epochs, places or existential circumstances.

Synonymy: continuous memory; integral memory; multimemory; polymemory.

Types. In the ordinary, physical waking state, the intraphysical consciousness utilizes 2 types of memory: factual memory and functional memory.

Factual. *Factual* memory is the capacity to take in and store explicit information. Examples: retain names, dates, historic facts, faces, maps. Amnesiacs can lose short-term or long-term memory.

Terms. *Long-term* factual memory constitutes the general archive in which our knowledge is kept. *Short-term* factual memory (limited working memory) retains information that is being processed only in the moment. Example: store a telephone number only until it is dialed.

Functional. *Functional* memory, a generally unconscious longer-lasting process, can only be acquired through repetitive practice. Examples: typing; riding a bicycle with balance.

Continuous. It can thus be concluded that in the ordinary, physical waking state, the individual's cerebral hemispheres have still not been put to work with the integral, *continuous* memory that the consciousness possesses. The latter is almost always maintained unconsciously prior to resoma or, in other words, its total essence as a personality and the entire stock of its experiences or the holomemory.

Hypothesis. The following are some observations about quadruple memory, one of the aspects of continuous memory, a working hypothesis to be developed by researcher-projectors. When there is an expansion of the projected consciousness, there can be a simultaneous recollection of facts related to the theme or the *fact thought about* in the *extraphysical moment*, originating from 4 different existential periods:

1. **Moment.** Events experienced at that moment in the extraphysical dimension.
2. **Waking.** Occurrences originating from the ordinary, physical waking state in the current human life.
3. **Retrocognition.** Occurrences of the last intermissive period, or the extraphysical interval experienced by the consciousness between this human life and the previous one, perceived retrocognitively.
4. **Prior.** Occurrences in past intraphysical lives, especially the human existence immediately prior to the current one.

Separations. Although revolving around a single subject, but originating from diverse epochs, locations and physical or extraphysical *circumstances*, these memories are also specific because, in their details, they exist as separate, impervious, and unaligned from each other, almost always demarcated by clear limits, provoked by solutions of traumatic continuity, such as the lucid projection preceded by a blackout (*intraconsciential deactivation*), the biological shock of desoma, as well as the shock of the consciential restriction of resoma.

Restriction. Obviously, the human body's limited memory bank, restricted by only 7 terrestrial decades, for example, is not programmed with all these data.

Case study. The following is an example of the recollection of polymemory. At daybreak on August 3, 1982, the author, while projected with a certain extraphysical helper in the extraphysical dimension, but above the earth's crust in the German countryside, remembered 4 occurrences at the same time:

1. **Somatics.** An acquaintance (intraphysical consciousness) in the current human life.
2. **Intermission.** The same personality in the most recent intermissive period (as an extraphysical consciousness).
3. **Retrosomatics.** The personality of this individual in a previous intraphysical life with another body (retrosoma).
4. **Relations.** That individual's personal relationships with that physical environment in Germany.

Mentalsoma. The projected intraphysical consciousness can experience quadruple memory when manifesting through the psychosoma, as well as, and more appropriately, when manifesting through the isolated mentalsoma.

Periods. The intraphysical consciousness does not always recall 4 different periods. A person may only recall 2 periods (ordinary double memory); 3 periods (triple memory); or even more than 4 periods (quintuple memory and others).

Recall. In fact, quadruple memory disturbs the later recollection of the lucid projection experience after physical awakening. This provokes confusion in the human brain's mnemonic centers in terms of the now awake consciousness being able to orient – in time and space – its various experiences on the same theme, or correlated themes, which are recalled simultaneously, in an unexpected circumstance and in a rapid manner.

Psychopathologies. A certain type of mentally disturbed personality (psychopath) or conscientially insane individual becomes even more disturbed due to a quadruple memory, or even a double or triple memory, which irrupts abruptly, as though it were a musical piece composed of variations on the same theme. In this case, what occurs is a disturbance that is characteristic of the parapsychopathology of the psychosoma's parabrain, which stems from the natural functions of the mentalsoma, in which it is headquartered.

Pseudomnesia. Quadruple memory, retrocognition, precognition and manifestations of extraphysical consciousnesses through semiconscious psychophony, should not be confused with pathological paramnesia, pseudomnesia or false memory, which is a mental occurrence having a chemical, mechanical or biological origin, and which is very different.

Hypertension. One afternoon the author went to a copy center where he stayed in a closed environment for about two hours monitoring the copying of hundreds of original pages of the first edition of this book. Upon arriving home, he had a brief, mild attack of pseudomnesia that was attributed to long-standing arterial hypertension which, when elevated, increases intracranial pressure and subsequently generates a false memory, a horribly disagreeable disturbance in which the consciousness seems to recall experiences that never fit with the experiences which it has experienced and recalls.

Ammonia. In the above-cited case, upon checking the arterial pressure, which was thought to be normal as the author had been medicated over a period of time, its elevated level was confirmed and its cause was immediately identified: the ammonia, or concentrated ammonia, used in great quantities in the services performed in the closed environment of that xerographic center. Ammonia is also used as liquid rocket fuel. The storage of this toxic product (ammonia) also presents certain problems.

Fainting. Ammonia increases arterial pressure and is frequently used to awaken people who faint by making them smell a vial filled with an aqueous solution of ammonia from which vapors are emitted. Hours later, after staying in a ventilated environment, the arterial pressure returned to normal without the need of any special medication or an increased dosage of routine medication.

Continuity. Memory related to previous or past human lives is not automatically accessible during a lucid projection experience. The phenomenon of quadruple memory calls researchers' attention to the concept that continuous, uninterrupted memory does not exist, at least at this level of our consciential evolution. Memory generally seems to be composed of isolated fragments that join together.

Cubbyholes. It is possible that many compartments or cubbyholes of memory exist, some for the experiences in the ordinary waking state and others for extraphysical experiences. Facts show that only the state of continuous self-awareness conduces the intraphysical consciousness to the acquisition of integral memory or holomemory.

Bibliography: Müller (1107, p. 71), Vieira (1762, p. 160).

394. FINISHING TIME OF THE PROJECTIVE EXPERIMENT

Habits. At the finishing time of the projective experiment, you should, as a lucid projection practitioner, create good habits that serve to help your development as a projector, especially observing the following 4 variables:

1. **Instruments.** Consultation of the clock and instruments installed in your bedroom (energetically shielded chamber).
2. **Time.** Verification, as precisely as possible, of the time of your physical awakening.
3. **Data.** Annotation of other appropriate or pertinent data.
4. **Registration.** General registration of your recently concluded lucid consciential projection.

Positivity. The finishing time of the intraphysical consciousness' projective experiment is *characteristically positive*, even when going to environments of suffering and sadness. This is because you arrive from the extraphysical experiment in a psychologically uplifted condition, in a period of well-being with regard to extraphysical achievements and a feeling of abundance, from an energetic point of view. This is the most propitious occasion for you to take advantage of this exceptional condition of consciential positivity in order to deepen your realistic self-analysis and establish new productive programs in your parapsychic goals and projective developments.

Bibliography: Vieira (1762, p. 191).

395. METEOROLOGICAL CONDITIONS AFTER THE LUCID PROJECTION

Observations. It is sometimes important to observe meteorological conditions after the projective experiment, in view of certain extraphysical occurrences and confirmation of the projective occurrences.

Characteristics. In the identification of meteorological conditions, the following 8 characteristics can be kept in mind:

1. Good weather.
2. Rain or storm.
3. Windstorm.
4. Lightning discharges.
5. Humidity.
6. Cold or heat.
7. Thunderclaps or other noises.
8. Unchanged meteorological conditions.

Comparisons. Two distinct comparisons can be made between the pre-projective and post-projective atmospheric conditions, as well as comparing these, if appropriate, with the environment or bad weather at or distant from the earth's crust, visited by the projected intraphysical consciousness.

Examples. You can check chronological time, duration of the lucid projection, terrestrial geography, or even parageography, observing and comparing, for example, the following 3 occurrences:

1. **Day.** A clear day in one dimension, with night in the other.
2. **Weather.** Good terrestrial weather while in the ordinary, physical waking state, with rain observed in another physical environment visited by the consciousness projected in the psychosoma.
3. **Temperature.** The heat felt in the physical base prior to lucid projection, with the cold of the extraphysical location visited by the projected consciousness.

Bibliography: Vieira (1762, p. 166).

396. DURATION OF THE LUCID PROJECTION

Zones. Chronological time considered in regard to conscial projections is also relative with respect to time zones. The projector can leave the human body in the physical base at nighttime and perform extraphysical actions in the crustal or paratropospheric dimension corresponding to the other terrestrial hemisphere where it is daytime at that moment, or vice-versa. This occurs frequently with the veteran projector.

Paramesology. That is why the examination of time differences – keeping the characteristics of the extraphysical environment (paramesology) in mind – is of great importance in the analysis of each lucid projection.

Time. Lucid projections, in certain extraphysical environments, can make “time pass at a different speed” than that of physical time. In certain cases, for example, 10 physical minutes can correspond to 10 hours of extraphysical experiences. This fact cannot be forgotten when analyzing the time span of any lucid projection.

Autonomy. The average duration of the projector's lucid projection constitutes the *flight range* outside the human body, a time span that should be respected by the experimenter who wishes to develop his/her projective processes and experiments.

Types. Conscial projection can be: instantaneous; lightning-fast; short; prolonged; or indeterminate duration.

Chronology. In the chronology of projections, we can encounter those with durations of tenths of a second, seconds, minutes, hours or days.

Tenths. Projections that last for only tenths of a second are more frequent than one might think and are not always clearly perceived by the intraphysical consciousness due to this selfsame rapidity. In certain cases, this non-pathological phenomenon is quite similar to the pathological phenomenon of epileptic absence or *petit mal*.

Minutes. The projection having a complete cycle lasting only a few minutes is the most common and includes the vast majority of all lucid projections of all projectors. It is theoretically possible for a person to have more than 400 consciential projections of 1-minute duration in a single 8-hour night of natural sleep. Nevertheless, this does not occur because of the incessant alternation of consciential states.

Average. The majority of great lucid projections last for about a half-hour.

Hours. The lucid projection lasting for two or more hours – with the exception of cases of near-death experience (NDE) – only occurs with experienced projectors and generally during the period of a series of projections. This demonstrates that, in fact, it represents an improvement in the voluntary projective process.

Days. The projection lasting for days is generally rare, is of a singular nature in the intraphysical projector's life, and is frequently impure or pathological. It is due to a coma, near-death experience, or voluntary burial of the living person.

Trifles. You should not waste time with trifles or irrelevant occurrences during the period in which you, an intraphysical consciousness, find yourself to be projected, especially in extraphysical environments that are capable of providing evolutionary teachings to the projector.

Prioritization. You are urged to decide to apply extraphysical attention to that which is primarily useful.

Helpers. The more the projected intraphysical consciousness demonstrates a willingness to learn with cosmoethical intentions, the greater will be the possibility of being assisted by the extraphysical helpers.

Case study. There are human occurrences that can help the projector calculate the duration of a projection. For example, an electrical blackout due to an unforeseen accident that subsequently leaves a specific human location dark at night. In this case, if the intraphysical consciousness projects in the physical base that was left while in darkness, it is possible to know if the location's lights came back on before interiorizing and calculate the time by the period of the electrical blackout.

Return. The longer the intraphysical consciousness remains projected with lucidity outside the human body, the less willing he/she will be to return to that selfsame human body. We can, in this way, precisely evaluate the inferior quality of human life as compared to the extraphysical dimensions, for that intraphysical consciousness who is more self-aware of his/her personal evolution.

Bibliography: Baumann (93, p. 63), Blackmore (145, p. 308), Bozzano (188, p. 50), Frost (560, p. 59), Green (632, p. 92), RPA (1481, p. 29), Steiger (1601, p. 5), Vieira (1762, p. 210).

397. CONSCIENTIOLOGICAL STATE AFTER THE LUCID PROJECTION

Categories. Among the categories of the projector's conscientiological state after a lucid projection experience, the following 6 can be singled out:

1. **Serenology.** Serene or balanced.
2. **Self-confidence.** Self-confident and optimistic.
3. **Intraphysical euphoria.** Euphoric or possessed of a mild intraphysical euphoria.
4. **Shock.** Tearful or still under the emotional shock of the lucid projection.
5. **Guilt.** Depressed or having some sensation of guilt or lack of accomplishment.
6. **Unaltered.** An unaltered state similar to that prior to the projective experience.

Comparisons. Clarifying comparisons can be made between the projector's conscientiological state after the lucid projection experience and the state prior to the projection, as well as with the extraphysical altered state (*paraconscientiological* state) of consciousness during the projection.

Supranormal. During the extraphysical period of projection of the consciousness, an agreeable sensation of supranormality (in nature as well as intensity) generally arises, which tends to continue within the projector even after physical awakening.

Bibliography: Vieira (1762, p. 215).

398. PHYSIOLOGICAL STATE AFTER THE LUCID PROJECTION

Physiology. The projector needs to begin the essential study of the vehicles of manifestation of his/her consciousness (holosomatics) starting from the human body; and there is nothing better for this than analyzing the functions of his/her organism after the projective experiment.

Types. Among the physiological aspects that should be highlighted in the physiological self-examination of the projector, at least the following 8 can be singled out:

1. **Relaxed.** Relaxed physical state.
2. **Alert.** Alert state of hyperacuity.
3. **Tiredness.** State of *physical* tiredness (psychomotricity, cerebellum).
4. **Fatigue.** State of *mental* fatigue (intellectual fatigue, cerebral fatigue).
5. **Discomfort.** Discomfort or irritability (pathological).
6. **Hangover.** Early morning hangover or, in this case, energetic hangover (pathological).
7. **Cardiology.** Heart rate condition.
8. **Unaltered.** Unaltered physiological condition.

Female projector. The female projector, in particular, should observe the extremely personal characteristics of her gynosoma in relation to the projective experiments, such as: menarche, menstrual cycle, gestation, breast-feeding, reinstatement of the menstrual cycle, menopause.

Bibliography: Vieira (1762, p. 146).

399. PERIOD OF LOSS OF PHYSICAL WAKEFULNESS

Intercurrences. The period in which ordinary physical wakefulness is lost becomes important for the lucid projector, in order to pinpoint the duration of the projective experiment and the relationships between this and other intercurrent altered states of consciousness, either before, during or after the consciential projection experience.

Sleep. Lucid projection can occur with a state of natural, prior, quick, delayed, light, deep, tranquil and apprehensive sleep. It can even occur without any sleep.

Extracorporeal. Lucid projection can also occur after a state of extracorporeal sleep, while you (the consciousness) are seated in the parabrain of the psychosoma, with your vehicles of manifestation discoincident. It can also occur prior to a period of post-interiorization sleep.

Loss. The period in which ordinary physical wakefulness is lost is characteristic of general natural somnambulism or, in other words, the loss of approximately one third of alert consciential activity which may occur with the majority of contemporary terrestrial humanity.

Evolution. This loss will be eliminated and all this time which is still currently wasted will be utilized with the consciential development of individuals through self-awareness and the healthy experiencing of 3 inevitable major evolutionary conquests:

1. **Cycles.** The successive multi-existential cycles or the cycles of multidimensional existences (resomas, desomas and intermissions).
2. **Projectiology.** The continually intensified and improved practice of lucid consciential projections, notably of the state of continuous self-awareness.
3. **Cosmoconsciousness.** The incomparable experiences of cosmoconsciousness.

Bibliography: Vieira (1762, p. 198).

400. PHYSICAL POSITION AFTER THE LUCID PROJECTION

Types. The projector's physical position after lucid projection can be identified as being at least 1 of the following 5 types:

1. **Unaltered.** The position of the human body which remains unaltered or immobile during the entire projective period.
2. **Altered.** The position of the human body which is altered due to a physiological or physical cause that should be researched and identified.
3. **Comfortable.** Comfortable position.
4. **Uncomfortable.** Uncomfortable position, the cause of which should be identified.
5. **Bed linen.** The unchanged conditions of the bed linen during the projective period.

Effects. The conservation of the unaltered position of the human body (the one prior to takeoff that continues after lucid projection) unequivocally demonstrates the absence of neuromuscular physical reflexes in the inactive soma during the exit of the intraphysical consciousness (you) that temporarily left the brain emptied of the consciousness.

Evidence. Based on the fact that a sleeping person normally changes positions at 15 to 20-minute intervals, any lucid projection that seemed to last more than an hour – by the human body having remained unaltered, in a single position, during the entire period – evidences, by this fact alone, an uncommon state of consciousness beyond natural sleep. The difficulty here is proving the physical immobility of the sleeper with any degree of certainty.

Clairvoyance. The human body remaining in an unaltered position over a longer period of time proves, through the process of elimination, the departure of the consciousness from the physical brain, removing the possibility of having changed position and later reassumed the original position. This also disallows that only simple clairvoyance or remote viewing or even traveling clairvoyance has occurred, wherein the intraphysical consciousness generally does not leave the dense brain in a fuller, more prolonged manner, and the physical brain remains *filled* by the consciousness. In this case, only the expansion of extraphysical perceptions occurs, mainly the visual ones, without the entire dislocation of the consciousness in the psychosoma or in the isolated mentalsoma outside the cranium, accompanied by ample movements of the human body and even speech during the experience.

Bibliography: Vieira (1762, p. 210).

401. CONDITIONS OF THE HUMAN BODY AFTER THE LUCID PROJECTION

Occurrences. The following are the 6 events that are most often verified to occur with the human body after the projective experiment:

1. **Torpidity.** Physical torpidity of the soma.
2. **Dehydration.** Mild dehydration, notably of the joints or articulations.
3. **Cracking.** Cracking noises in the joints.

4. **Disposition.** Good physical disposition.
5. **Bladder.** Full bladder.
6. **Unaltered.** Unaltered physical conditions.

Temperature. Prolonged projection naturally tends to alter the human body's conditions, especially the organism's temperature and heart rate which can lower between the beginning and the end of the experiment.

Bibliography: Butler (227, p. 74), Vieira (1762, p. 191).

402. PROJECTIOGRAPHY

Definition. Projectiography: the set of detailed self-descriptions and reports of the personal lucid projections of one or more conscial projectors.

Synonymy: archive of conscial projections; collection of projective reports; propaedeutic of projectiology.

Propaedeutic. Projectiography is, strictly speaking, a merely descriptive, propaedeutic discipline related to projectiology.

Research. Projectiography restricts itself to the presentation of technical, historical and statistical material relative to lucid projectors or the projectiological problem to be studied or researched.

Sociography. Projectiography is to projectiology what sociography is to sociology, or what ethnography is to ethnology.

Classification. The discerning lucid projector is accustomed to classifying or inserting each of the projective experiments in the personal documentation of experiences, according to the relevant aspects of the occurrences that are experienced extraphysically. This habit helps enormously in the improvement of personal projective techniques.

Relationships. The following are directly related to projectiography: the historical accounts of projectiology; the diary of the lucid projector; selected cases (case studies) of conscial projections; statistical public opinion research regarding lucid projection experiences; the international projectiological bibliography.

Categories. Various aspects can be shown in order to characterize a conscial projection, defining it, for example, according to one of the following 13 categories:

1. **Primoprojection.** The first conscial projection, primoprojection or shock-projection.
2. **Singular.** Singular conscial projection.
3. **Sporadic.** Sporadic conscial projection.
4. **Seriated.** Lucid projection in series.
5. **Recessive.** Lucid projection in a period of projective recess.
6. **Routine.** Routine conscial projection.
7. **Typical.** Typical lucid projection.
8. **Impactful.** Impactful or unforgettable lucid projection.
9. **Miniprojection.** Lucid miniprojection.
10. **Mild.** Mild lucid projection.
11. **Surprising.** Surprising lucid projection.
12. **Recognized.** Conscial projection in which an environment or mental target is recognized.
13. **Recurrent.** Chronic or recurrent lucid projection.

Comparison. The comparison of a recently produced conscial projection with other experiences already registered by the projector, permits him/her to define the main trend of personal experiences (parapsychic cosmogram), thus perceiving which directions were well chosen or which way is best to follow, in order to develop lucid projections from that point on.

Technique. The projector should consult and analyze his/her projectiography from time to time. Sometimes, as you know, the simple attentive reading of one of the projector's previous lucid projections will induce a new similar extraphysical experience. This fact allowed the creation of the projective repetition technique through the impulsion of the ironclad will.

Bibliography: Frost (560, p. 225), Vieira (1762, p. 210).

403. FINAL REGISTER OF THE LUCID PROJECTION

Recollections. The immediate registering of extraphysical experiences operates as a mnemonic method and should be the rule for neutralizing the natural fugacity of the recollections of the projected intraphysical consciousness' extraphysical period.

Rule. Immediately after your experience, the sooner the extraphysical episode is recorded, the more accurate your report will be. The more time you let pass before registering or recounting a projection, or even an ordinary dream, the fewer details you will remember and they will be forgotten, remaining indelibly recorded only in the holomemory. Forgetfulness makes reconstruction through imagination necessary and increases the possibility of inaccuracies.

Exception. Only exceptionally do experiences occur that you will never forget, as unfavorable as the circumstances toward recalling them may be, due to the psychological or emotional intensity of the events that one has witnessed or participated in.

Material. As a lucid projection practitioner, you should develop the habit of keeping at hand, on the bedside table or by your bed, a notepad or diary, pencil, ballpoint pen, or easy-to-use tape recorder, in order to record your extraphysical experiences immediately upon awakening, the ordinary as well as the bizarre ones that occur during the night.

Detail. One detail that is seemingly irrelevant at the time can be extremely important later in the panoramic analysis of lucid consensual projections. For the majority of people it takes only some weeks for the flow of memories and the annotation of lucid projections to become routine.

Occurrences. Among the occurrences that you should remember in the final record of the lucid projection, the following 10 can be singled out:

1. **Chronology.** Consult the clock and the instruments that may be in the bedroom, or the time of the end of the projection. This should include the exact minute and be as precise as possible.
2. **Data.** Other data that seem to be relevant to you for the analysis of your experiment.
3. **Health.** Your personal health.
4. **Sleep.** The time you took to fall asleep, in your opinion.
5. **Meteorology.** The exact meteorological conditions of the moment.
6. **Time.** The exact time that you wrote the report.
7. **Medication.** The use of your personal medication.
8. **Traumas.** Any traumatic experience prior to lucid projection.
9. **Argument.** An argument that you may have participated in prior to the projective experience.
10. **Routine.** A change in the diurnal routine of your existence.

Types. Within the types of final record of your lucid consensual projection the following 10 variables can be singled out:

1. **Immediate.** The immediate record.
2. **Subsequent.** The subsequent record.
3. **Manuscript.** The manuscript of the memories of the consensual projections.
4. **Recording.** The recording (tape recorder) of memories, the quickest process for emergencies.
5. **Typing.** Typing the record directly is always the best, when possible, using a personal laptop or notebook computer (diskette; recordable CD-ROM, everything at once).

6. **Shorthand.** The shorthand annotation of the recollections.
7. **Details.** A detailed report of the memories.
8. **Summary.** A telegraphic or summarized version of the experience, being a process that is less recommended.
9. **Mishaps.** The frustrating act of the memories remaining unregistered and subsequently being lost due to mishaps or accidents.
10. **Obstacles.** The overcoming of an obstacle to recording.

Preconceptions. In the immediate records of the lucid consciential projection, you should observe certain avoidances and certain inclusions, such as the following:

1. **Avoidances.** You should avoid preconceived or idiosyncratic ideas such as beliefs, skepticism, dogmatic theories and external influences of any nature.
2. **Inclusions.** You should always include unexpected events, uncommon details, the exceptional vividness of images, apparent incongruence in the sequence of time, and any possible type of anomaly that arises in the events experienced.

Quantity. The more detailed information that the experimenter records, the clearer, more accurate and broader will be the focus on the types of habits that aid or impair the intraphysical consciousness' natural sleep and lucid consciential projection.

Drawings. In the intensification of his/her studies, the consciential projector should pinpoint the main theme of each lucid projection. It is always more beneficial to draw sketches and synoptic graphic representations of that which is necessary in order to adequately register the extraphysical occurrences.

Bibliography: Butler (227, p. 74), Grattan-Guinness (626, p. 211), Norvell (1136, p. 200), Rampa (1352, p. 72), Reis (1384, p. 91).

404. DIARY OF THE PROJECTOR

Style. The registration style of memories of projective experiments should preferably be direct, clear, objective, intelligible, organized, dispassionate, informal and detached.

Information. The projector's diary should provide personal information in a synthetic and ordered manner, without attention to literary style. It should have the clarity of straight exposition, without any circumlocution involving ambiguous or obscure words, while maintaining the greatest possible freedom from excessive self-censure regarding the form, and use short phrases in the first person singular.

Journalistic. The projector's diary should be written in a journalistic style, being more informative than opinionative. The most appropriate words and expressions should be used, and the basic orientation ought to be established on the following 2 crucial points:

1. **Prioritization.** Give maximum priority to the *spectator-projector*.
2. **Minimization.** Allow a minimum of action to the *protagonist-projector*.

Embellishment. It will always be better to avoid opinionative embellishment, bombastic and florid approaches, grandiloquence, pejoratives, pseudofolklore and the rococo.

Contents. In regard to content, the projector's diary should contain at least the following 7 features:

1. **Image.** The most astonishing image (megafact) seen during the experiment.
2. **Stages.** The comprehensive memory of the pre-projective stage, the extraphysical period of the consciousness and the post-projective stage.
3. **Intraconscientiality.** The deep intimate or intraconsciential diving of the personality into him/herself.
4. **Autobiographies.** The autobiographies of two lives or two worlds.

5. **Descriptions.** The ambivalent or subjective descriptions and the objective descriptions.
6. **Experiences.** All the occurrences, information, participation, perceptions, ideas and feelings undergone during the experiences.
7. **Striptease.** Trigger a free and complete organic, psychological and extraphysical “striptease,” be it of the human body, psychosoma or mentalsoma.

Objectives. Include every detail that you can remember, without underestimating any minimal aspect of beings, personalities, facts, ideas, things, objects and scenarios, as trivial or silly as they may seem at first sight, because in later analyses each detail can have great importance for the development of lucid consciential self-projections.

Details. Human notetakers have the tendency to censure details that seem irrelevant or erroneous, avoiding them in the records that they make. Nevertheless, with respect to lucid projections, it is sometimes precisely those selfsame details – not understood at first sight and badly interpreted – that will later provide the greatest evidence and the most clarifying conclusions.

Uses. Among the uses of the projector’s diary, the following 8 can be singled out:

1. **Development.** Monitoring of personal development in lucid projections.
2. **Recall.** Effective stimulus for the improvement of the recollection of extraphysical events.
3. **Language.** A learning of the difficult *translation* – the expression in the language of the dictionary – of the psychophysical sensations.
4. **Self-critique.** Evolution of the experimenter’s self-critique.
5. **Paraprophylaxis.** Multidimensional paraprophylaxis or therapeutics.
6. **Reflection.** Production of deep reflection while in the ordinary, physical waking state.
7. **Comparison.** Analytical comparison with other personal lucid projections or with those of another.
8. **Self-awareness.** Verification of your consciential reality, consequently conveying an effort toward an increase in theoretical experience and the improved execution of the intraphysical consciousness’ existential program.

Clarification. The best and most enlightening written work on lucid projections for the projector is the diary of personal projections or the catalogue of private intraconsciential and extraconsciential occurrences.

Revision. The form, in this case of the diary of lucid projections, must genuinely help the expression of the contents and not make *translation* of the intraphysical consciousness’ sensations and the extraphysical experiments more difficult. The individual should not be excessively concerned with the written form in the act of manually writing the extraphysical experiences. Later – after the process has *cooled down* – one should think about making the definitive revision of the originals.

Concepts. In summary: in the diary of lucid projections, the formulation of the scientific contents of ideas or, in other words, the concepts, should maintain absolute predominance over the artistic form of sentences or the arrangement of words.

Margins. Periodically revise the annotations of the diary of lucid projections, also adding clarifying comments in the margins where you judge it to be convenient.

Moment. Start writing the records of your diary of lucid projections at the precise moment you awaken. Do not wait until you have had breakfast, read the newspaper, or started a conversation with someone in the house or physical base.

Manual. When composing your diary, you, as a projector, should not forget that you also write in order to read your own words, when you will analyze the diary as a manual. An effective projective technique utilized today is that of repetition, executed through the repeated performance of the psychophysical conditions and practices already used in a previous lucid projection. Besides, often a simple attentive reading of a portion of a projective report can trigger a lucid projection soon thereafter.

Scale. Consciential projections can be classified according to the decreasing order of qualitative values of the consciousness, during the experiments with lucidity, in a scale that should be used in the composition of the diary with 5 variables:

1. **Mentalsomatics.** Integral projection of the consciousness in the mentalsoma or only with 1 vehicle of consciential manifestation.
2. **Psychosomatics.** The integral projection of the consciousness in the psychosoma or with 2 vehicles of consciential manifestation.
3. **Integral.** The integral projection of the consciousness in the psychosoma with the holochakra or with 3 vehicles of consciential manifestation.
4. **Partial.** Partial projection of the consciousness in the psychosoma *at a distance* or, in other words, in a very rapid manner.
5. **Clairvoyance.** Partial projection of the consciousness in the mentalsoma or, in other words, in a very rapid manner, such as in certain cases of traveling clairvoyance.

Experimentation. It can thus be seen that traveling clairvoyance, although enabling valuable tropospheric evidence, is the weaker projection of the intraphysical consciousness, or that which presents fewer possibilities for experimentation from among all the types of projective experiences.

First. According to historical research that the author has conducted throughout projectiological literature, the first known projective diary was written, in Latin, by Emanuel Swedenborg, between 1745 and 1765. It already included the day, month and year of each short annotation, almost always organized into topics.

Themes. In his first 1,000 daily annotations, that extend up until February 25, 1748, Swedenborg refers to and analyzes various extraphysical themes including: helpers; interconsciential intrusion; intruders; parapsychotic post-desomatics; assisted consciential projection; lucid projections in series; post-projective recall; and volitation.

Bibliography: Alverga (18, p. 200), Campbell (237, p. 4), Swedenborg (1639, p. 1), Vieira (1762, p. 36).

405. TECHNICAL NOTES OF THE DIARY OF THE PROJECTOR

Curriculum. Only the diary or, in other words, the *curriculum vitae*, or the course of the lucid projector's physical-extraphysical life allows the verification and identification of the patterns and cycles that gradually characterize the phases of the intraphysical lucid projector's projective existence.

Data. There are at least 15 basic entries in the technical notes that should not be left out of the report on each lucid projection in the projector's diary. They should begin and end the report:

1. The day of the month.
2. The day of the week.
3. The hour.
4. If it is a holiday.
5. The minute.
6. If it is an atypical day.
7. The ambient temperature.
8. The ambient humidity.
9. The weather conditions.
10. The projector's physical position on the bed.
11. The projector's physical state.
12. If the projector was ill on that occasion.
13. The order of sleep.
14. The type of post-projective recall.
15. The hour and the time, to the minute, after the extraphysical experience.

Notice. Other details for the orientation of technical notes that are judged to be relevant can easily be collected from the text of this book.

Diaries. Thus we can observe that the lucid projector's technical field diary presents its own characteristics that make it unique, very distinct from other personalities' diaries and with other purposes, in the manner of a dream diary, a diary of mystical practices, literary diary, intimate romantic diary, or the diary of terrestrial journeys.

Bibliography: King (846, p. 125), Rampa (1352, p. 72), Vieira (1762, p. 9).

406. CONFIRMATIONS AFTER LUCID CONSCIENTIAL PROJECTIONS

Definition. Projective confirmation: the effect of confirming, in the human dimension, the extraphysical events experienced by the projected intraphysical consciousness.

Synonymy: evidence of the lucid projection; objective proof of the projection; projective corroboration; projective ratification.

Occurrences. At least the following 15 variables or occurrences can cooperate toward the human ratification or corroboration of experiences outside the human body.

1. Collection of more incontestable proof.
2. Location.
3. Climate, time and time zone.
4. Person or being.
5. Witness or percipient.
6. Health conditions.
7. Circumstances or situations that influence the experiment.
8. Small pieces of proof or evidence.
9. Simple or complex incidents.
10. Coherences, coincidences or synchronicities.
11. General clues in terms of inscriptions, names, signposts or posters.
12. Specific local occurrences.
13. Impression of already having seen something or the sensations of déjà vu.
14. Maps, telephone lists, telephone calls.
15. Contacts and translocations.

Types. The evidence of the occurrence of lucid projections, even with objective proof, are of extreme importance. The evidence can be voluntary or involuntary, generally being unexpected in this case, and can receive public confirmation and self-confirmation.

Self-confirmations. Self-confirmations of experiences of the consciousness outside the human body or, in other words, the evidence or definitive proof of events experienced extraphysically by the individual are accessible and easy, almost always occurring spontaneously. The projector arrives at a point where it is no longer interesting to merely collect evidence of his/her consciential projections for private use.

Universality. On the other hand, confirming experiences of the consciousness outside the human body to others is problematic and should, above all, be based on the convergence of evidence and in the universality of testimonies.

Sequence. The chronological sequence of occurrences in the human dimension, obtained by the projected intraphysical consciousness, constitute basic information for the confirmation of lucid projection.

Immediate. Confirmations or verifications that are made immediately after a lucid projection, when possible, although dramatic, are more efficient and present the possibility of collecting more substantial documentary details. There are always greater difficulties involved in making non-immediate confirmations after lucid projections.

Paratroposphere. Projections of the consciousness in the psychosoma to locations in the paratroposphere are confirmed based on the congruence of time zones of the places or human districts, weather conditions of the day and the time of the experiment, as well as other attesting elements.

Volitation. The following are 2 typical examples of confirmations subsequent to lucid projection, verified in an almost incontrovertible manner – in the first case by the projector himself, in the second case by a stranger – due to experiences of extraphysical volitation:

1. **Roof.** An elderly man from São Paulo, Brazil, upon feeling that he was flying lucidly and freely outside the human body, saw a curious opening, made due to remodeling, in the middle of a high roof of an enormous church in the city of São Paulo, Brazil. Moved by curiosity upon awakening in the morning in the physical body he went to the church but was dismayed to find that nothing inside or outside the temple looked like the opening he thought he had seen. He then dismissed the issue, attributing it to a simple ordinary dream. Nevertheless, days later, when taking a day flight from Congonhas airport in São Paulo for a business trip, upon taking off he unexpectedly saw the same church *from above*, with the opening of the roof and the characteristic signs of the remodeling construction, just as he had observed during his consciencial experience.

2. **Shoe.** A patient admitted to a large North American hospital, after suffering a cardiac arrest, underwent clinical resuscitation. The next morning, she told the social worker who was attending to her that she had left her human body while the medical team was struggling to resuscitate her and saw a tennis shoe, which she described in detail, on a windowsill in a specific wing of the hospital. Her curiosity now aroused, the social worker immediately went to the place and found the tennis shoe.

Bibliography: Blackmore (147, p. 3), Crookall (343, p. 57), Fox (544, p. 56), Greenhouse (636, p. 39), Monroe (1065, p. 54), Muldoon (1105, p. 40), Prado (1284, p. 11), Steiger (1601, p. 47), Vieira (1762, p. 58), Webb (1804, p. 80).

407. FACTORS UNFAVORABLE TO POST-PROJECTIVE CONFIRMATIONS

Realities. In the extraphysical dimension each thought or visualization becomes an immediate reality in the specific environment where the consciousness manifests itself. The ordinary extraphysical dimension and the mentalsomatic dimension are realities per se, different from the physical dimension and even from one dimension to another.

Levels. Each of these dimensions is structured upon energies that vibrate at various levels of frequency, as well as having different levels of awareness or self-lucidity.

Laws. Each existential dimension has its own laws that govern it according to its characteristics. These laws cannot be transferred or applied outside it, and much less adjusted to the laws of other dimensions.

Lucidity. The intraphysical consciousness, when projected out from the human body, enjoys a degree of lucidity (hyperacuity, sharpness) that varies from a minimum of zero to a maximum, the climax of the illumination of cosmoconsciousness, which surpasses the highest peak of lucidity attainable by the intraphysical consciousness in the ordinary, physical waking state.

Factors. The following are 9 factors that interfere negatively in the attainment of objective proof or subsequent confirmations of the experiences obtained by the intraphysical consciousness during the lucid projection:

1. **Distinctions.** Sometimes the consciousness, when it projects, does not perceive – at the moment of leaving the human body, as well as during extraphysical circumstances – the fact that it is projected. At other times, it is not able to precisely differentiate the physical dimension from the extraphysical dimension, or even these two dimensions from its own morphothosenes; or, furthermore, the telepathic emissions of intraphysical and extraphysical consciousnesses among the context of shapes and structures seen by the projector which engage his/her paraperceptions.

2. **Vehicles.** It is generally easier for the projected intraphysical consciousness, whether in the psychosoma or the mentalsoma, to perceive the mental structures of the extraphysical dimension – which seem to be more solid at that moment, depending upon the vehicle of manifestation being used – than the dense forms of the intraphysical dimension. This is because the consciousness does not employ the human body's crude senses in order to adequately see, understand and discern physical structures.

3. **Sensitivities.** We cannot discard the fact that the parapsychic intraphysical being's sensitivities are potentiated and expand in geometric proportions when he/she is projected in a vehicle of manifestation, whether the psychosoma or mentalsoma, both of which are infinitely lighter and more subtle, an aspect that dazzles and disturbs those intraphysical consciousnesses which are not used to handling them directly or using them frequently.

4. **Complications.** Everything tends to become more complicated in the following conditions: when the intraphysical consciousness manifests through the dense psychosoma laden with the energies of the holochakra, which blurs or confuses the projector's lucidity and intensifies the somnambulistic condition; when only a partial projection is performed; or even when only the phenomenon of traveling clairvoyance is produced and not an integral projection, which would involve integral displacement out from the set of coincident vehicles within the human body and the condition of the ordinary waking state.

5. **Preconceptions.** Human conditioning and preconceived ideas that the projector carries greatly interfere in the correct interpretation of extraphysical experiences. The individual who projects has to always keep the mind open and receptive to facts, forms, figures and different, strange and unknown lives, discarding all crystallized thoughts, apriorities and preconceptions about something before really seeing or experiencing it directly in the projected state with the paraperceptions. This attitude is not easy, due to misoneism or neophobia. Strictly speaking, lucid projection is the "skeleton key" or passport which facilitates the intraphysical consciousness in verifying everything that is desired without intermediaries or interference. This, however, depends on the perfect psychophysiological performance of each individual.

6. **Self-sophisms.** In many occurrences, preconceptions, rigidly orthodox or fundamentalist principles and conditioned reflexes (abdominal brainwashings) repress, subjugate and suffocate correct extraphysical observations in order to apply an intentionally affirmed falsely logical rationale or human point of view about the facts. In this case, the projector should give priority to first impressions or intuitions, that are usually the accurate and precise ones, and not the others which superimpose themselves, as if they were self-sophisms, having every apparent indication of being authentic and of incontestable reality.

7. **Illusion.** As we can see, the effect of commonplace facts of human illusion, or maya, upon the reality of extraphysical occurrences, also disturbs the mechanism of confirmations subsequent to lucid projections.

8. **Translation.** We must add here the natural difficulty that the average projector has to translate personal emotions, sensations and observations outside the human body into words in oral or written reports. This occurs as a consequence of the difficulty the human being has in expressing his/her sensations, since the individual is restricted since childhood and, in some cases, since intrauterine life. The child is not able to express verbally since the intraconscial world or cerebral minivocabulary is small or, because of emotional restraint, it is not possible to communicate personal intense pain, the strongest possible sensation. Worse still: in many cases, due to the erroneous attitudes of adults, who ignore or minimize childhood pain, the child thinks that the expression of pain is neither well-accepted nor convenient.

9. **Witnesses.** Another two-sided factor that interferes in the intraphysical consciousness' performance while outside the human body in a positive as well as negative manner are: the witnesses or co-participants of the conscial projection, who can be either an intraphysical being, also projected on the same occasion and in the same extraphysical location who later does not remember anything when in the ordinary, physical waking state; as well as the parapsychic intraphysical being in the waking state who is able to perceive the extraphysical presence of the projected projector, a fact that is always rarer.

Experiences. Based on the facts, we can conclude that only the veteran projector's repeated experiences can supply the precise criteria that allow the projected consciousness to accurately distinguish telepathic messages or extraphysical consciousnesses' subtle intuition; intraphysical consciousnesses' thoughts at a specific moment; extraphysical consciousnesses' psychospheres and the true forms of the location or extraphysical community; and finally, the structures or mental forms in regard to the reality of the physical environment.

Bibliography: Greene (635, p. 84), Martin (1002, p. 7), Monroe (1065, p. 50), Vieira (1762, p. 131).

408. ANALYSIS OF THE PARAPERCEPTIONS OF THE PROJECTOR

Types. Excluding oneiric influences and morphothosenes, there are 5 basic types of general extraphysical perceptions (paraperceptions) that the projected intraphysical consciousness can experience, which are authentic or pure in regard to the locations or environments where the projector manifests:

1. **Intraphysiology.** Pure consciential paraperception of the physical or human environment from the extraphysical dimension.
2. **Paratroposphere.** Pure consciential paraperception of the extraphysical paratropospheric environment.
3. **Extraphysiology.** Pure consciential paraperception of the extraphysical environment per se.
4. **Mentalsomatics.** Pure consciential paraperception of the mentalsomatic dimension.
5. **Joining.** Joined or mixed consciential paraperception or, in other words, a simultaneous mixture of extraphysical and physical forms that, in this case, are difficult to discern and interpret.

Judgment. It is always very difficult to analyze and judge the projected intraphysical consciousness' extraphysical perceptions. Many erroneous extraphysical perceptions occur.

Mistakes. Nevertheless, what the projector says – which in fact does not fit the human conditions that the individual affirms having experienced – is not always entirely wrong. Many times, the interference of situations and the mixture of consciential perceptions occurs. This causes an erroneous interpretation of events witnessed when one judges that which in fact is *extraphysical* to be *physical*, or vice-versa.

Case study. The following is an example of the complexity of the analysis of perceptions of a projected intraphysical consciousness: someone projects to the place where an intraphysical friend is located. There, they enter into resonance with each other and the *visitor* perceives and receives the impressions or telepathic images of the *visited* individual's thoughts at that moment, which was to call the office, and not what in fact was physically being done – changing clothes.

Disappointment. It is obvious that after seeking confirmation for the experiences of his/her lucid projection, the projector who perceived the telepathic emissions, or the exteriorized images of the friend calling the office, becomes very disappointed because the facts neither fit nor coincide, thereby not achieving the convergence of proof that he/she sought.

Mask. In the previous example, the consciential projection was authentic, although the unnoticed or unconscious telepathy for both had suffocated or masked the projector's extraphysical perceptions. In fact, the projector had auscultated, in the psychosphere of the friend's consciousness, the extraphysical formations of the environment, or the extraphysical dimension in which the friend was immersed, and not the person him/herself (the friend), in his/her human environment. More appropriately: in this case, the projector visited, perceived and auscultated the friend's mentalsoma, and not the human body of that selfsame intraphysical consciousness.

Complexity. As we can see, the extraphysical facts, which are always complex, demand interpretations according to the environment or the level of awareness where they occur.

Discoincidence. Besides all this, the fact is that the consciousness of the friend who was visited, as would happen with any one of us (intrapysical beings) when we think or wish to do something with great intensity, with strong intention and vigorous exteriorization of consciencial energies, can even leave the state of coincidence or, in other words, slightly separate the vehicles of manifestation in a nonlucid manner without perceiving it. This condition further predisposes extraphysical or telepathic syntony.

Personalities. The following is another possible example of confusion: a projected projector can see 3 people in a human environment where in fact there are only 2 visible intraphysical beings. The third individual, an unknown personality detected by the projector, may not be an intraphysical consciousness, but a simple mental projection. It can also be a visiting extraphysical consciousness, whether a friend or a stranger, or even another intraphysical being projected without the human body, who appeared there in the same manner as the projector.

Incongruous. Among sensitives and contactees (figures in UFOlogy), it has been very common to receive messages or extraphysical experiences about life on another planet – e.g.: Venus – that was verified through subsequent astronautic space research to be physically uninhabited, thus certainly correctly interpreting the message as being incongruous.

Ambiguities. Nevertheless, in many of these incongruous cases, the parapsychic reception or the extraphysical visualization was authentic and correct, not with respect to the environment of the physical surface of the planet in question, but with regard to the structures and formations of the extraphysical dimension that encircles it or, better still, with which it coexists.

Extraphysical consciousnesses. On the other hand, it is not difficult to find extraphysical consciousnesses, even quite frequently when one is projected, who consider the projected intraphysical consciousness to be an extraphysical consciousness. This demonstrates that extraphysical errors in interpretation are also easily committed by non-humans, because everything depends on the pattern or filter of the vehicle's perceptions where the consciousness is manifesting at that moment, regardless of who it is and the personal condition.

Adjustment. Each consciencial vehicle leads the consciousness (you), to actually correctly perceive only the dimension to which it is *native* or autochthonous or, in other words, its specific environment in which the vehicle is adjusted to function in an adequate and maximal manner, and not the other coexisting and interpenetrating dimensions that are undeveloped with respect to extraphysical perspicuity, or evolved in regard to the progression of consciousnesses.

Bibliography: Blackmore (147, p. 5), Greene (635, p. 85), Vieira (1762, p. 131), Yram (1897, p. 148).

XIV – The Projector and Projections

409. TYPES OF PROJECTOR

Definition. Consciential projector: that intraphysical consciousness who produces the projection of his/her consciousness, whether in an *intraphysical* or extraphysical manner, or who projects his/her consciousness (him/herself) from the human body, in the psychosoma or mentalsoma, in an accidental, assisted, spontaneous, intentional, deliberate or self-provoked (self-projection) manner, as well as that person who promotes the exteriorization of his/her consciential energies through the holochakra.

Synonymy: astral ambulant; astral explorer; astral itinerant; astral nomad; astral observer; astral projector; astral researcher; astral traveler; *astralnaut*; consciential voyager; describer of multidimensionality; explorer of transcendence; exteriorist; exteriorizer; exteriorizing sensitive; extraphysical flier; extraphysical researcher; extraphysical scrutinizer; extraphysical sentinel; healthy extraphysical insomniac; *incarnate* being who is semi-free from the human body; lucid projection executor; lucid projection practitioner; OBEer; OB-Experimenter; OOBEer; OOB-Experimenter; parapsychonaut; projectant; projectator; projectionaut; projectionist; projectist sensitive; psychonaut; receiver-generator of leading-edge ideas; self-projector; spiritual traveler; unfold; unfolding sensitive.

Characterization. It would not be correct to categorize intraphysical projectors into stereotypes because each human being possesses specific, extremely personal characteristics, which are difficult to characterize.

Differences. All human individuals are profoundly different from each other, structurally as well as biochemically. For this reason, strictly speaking, it seems to be an incorrect scientific orientation to label persons, microcosms or complex minds, elements which, in fact, are impracticable to classify absolutely.

Types. In spite of what has been written, in the interest of elementary analysis, some dominant aspects in the personality of intraphysical projectors can be listed, which result in the following types: nocturnal, diurnal; novice; veteran; empirical, technician; occasional, active; seasonal or bissexile; nonlucid erratic or “gate-crasher”; clairvoyant, precognitive, psychometric, retrocognitive, telekinetic, telepathic, bilocator; astral, mental; sensitive, communicant, clandestine; blind from birth, myopic, colorblind; amputated; pregnant-projector; child, consciousness of the fetus; tangible (*inter vivos* apparition, physical bilocation); exoprojector; and psychonaut or astralnaut.

Desoma. Through extraphysical experiments, the lucid projector gradually learns to *die in peace* or, in other words, can serenely pass through the transition of death or deactivation of the human body (desoma) when his/her time arrives.

Apprenticeship. In light of this fact, the lucid projector is the *apprentice* of death. On the other hand, the lucid projector – cooperating with the extraphysical helpers to aid those who are undergoing the biological shock of physical death, final projection – is undoubtedly an *assistant to death*.

Catalyst. The projector-catalyst is that individual who stimulates persons to lucidly project from the human body, sometimes merely with their physical or extraphysical presence, acting in an energetically positive manner, as opposed to those sterilizing human beings who are capable of inhibiting parapsychic phenomena wherever they appear and manifest themselves.

Historical projectors. The following are 7 eminent projectors, cataloged by human history in and before the twentieth century:

1. Emily Brontë (1818-1848).
2. George Eliot (pen name of Mary Anne Evans: 1819-1880).
3. David Herbert Lawrence (1885-1930).

4. Alfred Tennyson (1809-1892).
5. John Buchan Tweedsmuir (1875-1940).
6. Virginia Woolf (1882-1941).
7. William Wordsworth (1770-1850).

Cosmoethical. The facts show that an ample cultural background, profound specialization, genius, erudition and even lucid projectability – a faculty with physiological foundations – can exist in the individual in an accentuated manner without any cosmoethical connotation.

Existential recycling. A single, full, lucid projection can trigger and install the condition of existential recycling in the life of the individual, but this is very rare. Strictly speaking, only one or a few lucid projections is not always sufficient to renew a human personality, who is almost always repressed and crystallized by personal bad habits.

Awareness. Only major lucid projections, when repeated, continued, in series, can lead the intraphysical consciousness to become aware of the existence and scope of cosmoethics, its laws and consequences, by him/herself.

Writers. The following examples, from the previous observation, are 3 great historical-projector-writers who experienced lucid projection and nevertheless lamentably ended their days on earth through suicide, or self-elimination:

1. Virginia Woolf (1882-1941), the brilliant, ill English novelist.
2. Ernest Miller Hemingway (1899-1961), awarded the Nobel prize for literature in 1954.
3. Arthur Koestler (1905-1983), internationally renowned journalist and writer.

Notables. Among the self-projectors who achieved notoriety for their spontaneous and/or voluntarily provoked experiences, the following 22 should be singled out.

1. Alexander Tanous (“Alex”).
2. Alfred Lischka.
3. Anne-Marie Dinkel.
4. Dadaji (Chowdhury).
5. Douglas M. Baker.
6. Douglas Scott Rogo (1952-1990).
7. Francis Lefebure.
8. Hamilton Prado (1907-1972).
9. Hugh G. Callaway (“Oliver Fox”).
10. Ingo Swann.
11. Johannes E. Hohlenberg.
12. John Cunningham Lilly (1915-).
13. Marcel Louis Fohan (“Yram”) (1884-1917).
14. Olof Jonsson.
15. Reinhard Fischer.
16. Richard A. Greene.
17. Robert Allan Monroe.
18. Sathya Sai Baba (1926-).
19. Stuart Keith Harary (1953-).
20. Sylvan Joseph Muldoon.
21. Vincent Newton Turvey (1827-1912).
22. Yvonne do Amaral Pereira (1906-1984).

Backgrounds. It is important to highlight the universal and physiological character of the lucid projection phenomenon, which is also evidenced through disparities in the temperaments, cultural backgrounds, occupations and personal interests of the individuals who dedicated themselves to

producing and/or researching consciential phenomena. An example of this is encountered in these same well-known personalities – artists: Johannes E. Hohlenberg, Ingo Swann; scientists: paleobotanist Robert Crookall; spiritists: Sylvan Joseph Muldoon, Yvonne do Amaral Pereira; executive: Robert Allan Monroe; mystics: Sathya Sai Baba, Marcel Louis Fohan; occultists: Hugh G. Callaway, Francis Lefebure; parapsychologists: Stuart Keith Harary, Douglas Scott Rogo; politicians: Hamilton Prado – besides sensitives of various parapsychic modalities.

Blind. There are *blind experts* in all fields of human knowledge: the cold professor who spoils the subject in the mind of the students; the librarian who is opposed to lending books; the literary critic who is condescending toward poets; the botanist who is blind to the beauty of flowers; the child psychologist who makes children flee in terror. In projectiology we encounter the projector who is *self-conscientially blind*, who avoids the subject of lucid projection. Generally, the cause of this is interconsciencial intrusion (fear, phobia) or egoism (sectarianism, factiousness). This should not be confused with the *physically blind* lucid projector.

Left-handedness. In investigations performed up until now with advanced consciencial projectors, no greater incidence has been observed of left-handed individuals or, in other words, persons who evidence a deep spontaneous tendency toward a preponderant use of the left hand. The same holds true regarding left-eyed individuals, who show a tendency to use only the left eye when employing monocular vision (aiming a gun, using a monocular microscope).

Percentage. The percentage of left-handed individuals, in both aforementioned independent forms, is the same as in the general population: 10%, one in ten persons.

Parachutist. The parachutist projector is that one which leaves the human body inactive in the seat of an airplane in flight and departs in the psychosoma to have a lucid projection.

Urbanite. Undoubtedly, the *urban* (city dweller, urbanite) lucid projector in hectic daily life, is more vulnerable to projective recess than the *rural* lucid projector, who leads a calmer, simpler life, using a more tranquil physical base. With regard to this point, it is worth observing that modern city inhabitants come into contact with more persons in one week than a country person would encounter, in feudal times, in his/her entire intraphysical life.

Coexistence. The lucid projector is the only individual capable of coexisting, even if in an occasional and temporary manner, with striking personalities from anonymous or noted lives, from the recent or remote past, components of former terrestrial humanity.

Bibliography: Baker (69, p. 14), Butler (228, p. 153), David-Neel (368, p. 46), Granger (620, p. 204), Greene (635, p. 77), Greenhouse (636, p. 13), Guirao (663, p. 127), Hemingway (710, p. 53), Horia (757, p. 115), Koestler (854, p. 352), Lilly (926, p. 24), Morris (1093, p. 147), Murphet (1109, p. 142), Salley (1496, p. 157), Steiger (1602, p. 153), Vieira (1762, p. 123), Walker (1781, p. 57), Yram (1896, p. 124).

410. DAZZLED PROJECTORS

Definition. Dazzled projector: the intraphysical consciousness who has never had self-critique, or who actually lost self-critique, in the analysis of his/her own projective experiences.

Synonymy: fanatical projector; foolish projector; traumatized projector.

Attitudes. Because planet earth is simultaneously an evolutionary school and a mega-hospital for consciousnesses, we encounter attitudes which are extremely complex that overwhelm incautious, borderline, confused intraphysical and extraphysical beings, which end up constantly living at the edge, in an indefinite or mixed condition that is indefensibly ill or unevolved.

Extraphysical consciousnesses. There are extraphysical consciousnesses which are simultaneously benefactors-malefactors, morbid bisexuals or sick androgynes. For this reason, there are ambiguous lines of parapsychic practices, both good (healthy) and bad (pathological), of white

magic and black magic, of *Umbanda* and *Quimbanda*, of anti-goety and goety. We come across projector-sensitives confused by thanatophobia or the fear of death of the human body. They are intraphysical and extraphysical personalities which are profoundly parapsychic but, nevertheless, are excessively mystical and have no rationality in their practices or a more ample discernment in their priority attitudes.

Maturity. The decision for options that are mature and transparent, although non-absolute, pertaining to leading-edge relative truth and sought out with lucidity, characterizes those consciousnesses which are able to achieve a greater consciential maturity or a more ample recuperation of cons. The dazzled projector is listed among those beings who have still not achieved this greater level of consciential maturity.

Prudence. All compulsion or eagerness to communicate pleasant projective experiences to others should be seasoned with prudence, good sense and judgment by you, as a lucid projector.

Principles. We need to recognize that it is natural and human to be eager to share the happiness, enthusiasm and climate of mentalsomatic elevation inspired by certain impactful extraphysical experiences. However, the communication of these experiences to others, or to strangers, will not always be productive or successful if 4 fundamental principles are not obeyed: the person, time, location and form.

1. **Person.** The communication should be made to the right person, one who is able to understand the subject of lucid projection.

2. **Time.** The communication needs to be made at a time that is opportune for both the projector and especially for the listener.

3. **Location.** The communication needs to be transmitted in circumstances and a location that is propitious to its understanding.

4. **Form.** The communication can only be intelligible with adequate words and expressions, according to the level of the listener.

Causes. Among the causes responsible for the dazzling of certain projectors, at least the following 4 should be singled out:

1. **Extraphysiology.** Inexperience regarding extraphysical experiences.
2. **Intraphysical euphoria.** Uncontrolled intraphysical euphoria.
3. **Indiscipline.** Mental indiscipline.
4. **Self-critique.** A total lack of self-critique.

Effects. The following are 8 effects relevant to the dazzling that affects the intraphysical projector:

1. **Triumphalism.** The negative tendency toward triumphalism, which is common when the projector produces substantial extraphysical experiences by him/herself early on, in the first projections.

2. **Extraphysical euphoria.** Frequent extraphysical euphoria.

3. **Traumas.** Extraphysical traumas.

4. **Projectiography.** Difficulty in the physical-extraphysical investigation of one's own experiments.

5. **Projectiocritique.** Indifference regarding the subsequent conscientious analysis of extraphysical events.

6. **Psychosomatics.** An exacerbated sense of a presumed *personal mission*.

7. **Contradictions.** A loss of control in the management of personal *inner contradictions*, as a consciousness, in the face of rational human and extraphysical observations.

8. **Recess.** The sterilizing effects of projective bedazzlement can induce long periods of recess in the practice of lucid projections, for the projector lacking self-critique, or can inhibit them completely, especially those *projections assisted* by extraphysical helpers.

Immaturity. The material presented thus far allows the examination of the facts from another angle. Consciential immaturity regarding extraphysiology, which is responsible for the appearance of hypnotized conformists, dyed-in-the-wool skeptics, natural somnambulants and post-desomatic parapsychotics also shows itself to be a main sponsor of projective bedazzlement. There is nothing better for combating it than serenity, discernment and sincere realism in the face of personal ignorance regarding universal intraconsciential and extraconsciential phenomena.

411. TECHNIQUES FOR DEVELOPMENT OF THE PROJECTOR

Philosophy. Diverse forms of knowledge can coexist within the human being. Besides popular knowledge and scientific knowledge, philosophical knowledge and religious (theological) knowledge, for example, also exist. Philosophical knowledge is valuational, because its starting point consists in hypotheses that cannot be submitted to observation. For this reason, philosophical knowledge is unverifiable, since the enunciations of philosophical hypotheses, as opposed to that which occurs in the field of conventional science, cannot be confirmed. Aside from this, it is rational, systematic, infallible and exact.

Theology. Religious or theological knowledge is based upon doctrines that contain propositions which are *sacred*, because they have been revealed through the supernatural, or inspirational. For this reason, these truths are considered infallible, irrefutable and exact. Their evidence is not verified.

Knowledge. It is worthwhile for the more lucid intraphysical consciousness, whether scientist, philosopher, professional or ordinary person, to confront the existing attitudes, perspectives and languages between two forms of knowledge, scientific and popular or, in other words, between the objective theory of the essentially conjectural knowledge of science and the theory of knowledge based upon common sense. This should be done in order to choose the best directive to observe, explain and decide upon in any sector of day-to-day experience.

Comparisons. The following are 10 comparisons that can make any of us think about priorities:

1. **Uses.** Individuals or intraphysical consciousnesses use popular, familiar, or common-sense knowledge in a spontaneous manner, following acritical customs, which hinder more conscious and productive analysis. In the field of science, the directives are employed in an elaborated manner only after testing the research hypotheses regarding the fact under analysis and the establishment of basic concepts.

2. **Acquisitions.** Common sense is based upon intuition which is simple, lightly pondered, inner unsystematized information, or is the fruit of these casual, unmethodical, unsystematic, fragmentary and ingenuous experiences. Science puts rigor in its methods – inductive, deductive, reductive, observational, experimental, statistical, comparative – for the acquisition of information, offering plausible and rational explanations that are submitted to verification with discernment.

3. **Perspective.** Common sense uses sources of information which are not reliable because they stem strictly from the ego, or inner information, *equanimous content*. Science, which is never personal, distances personal distortions as much as possible, focusing on perspectives that are within the neutrality of universalism or interdisciplinarity.

4. **Objectives.** Common sense is based on the memory of suppositions and personal experiences which were generally not sufficiently reflected upon in order to be reduced to a general formulation. It nevertheless attempts, in this way, to achieve an understanding which is intended to be universal. Science pursues objectives that lead to an integrated and internally coherent body of knowledge.

5. **Open.** It is well known that human beings generally tend to arbitrarily seek support for the beliefs which they already have and do not consider, or are often frankly unaware of, the negative data (utilitarian myopia). Scientific knowledge maintains the sense of scrutiny as open as possible in the observer in order to avoid preconceptions in its perspectives and analyses that constantly require questioning, heterocritiques or refutations.

6. **Procedures.** Common sense respects the words of someone considered to have authority according to the common criterion of the individual observer, or the pre-critical manner of knowing. Scientific knowledge, structured upon a foundation of classified information, uses the systematic procedures of observation and experimentation that is visible to all.

7. **Formalizations.** Common sense is characteristically informal and almost always simplistic: having two negative beliefs to choose from, it opts for an arbitrary preference. Scientific, objective knowledge is based upon the formal directives of pure logic in order to evaluate the evidence encountered with differentiated treatment.

8. **Directives.** Common sense provides imprecise directives which are not always healthy, notably in the evaluation of complex questions, because it makes approximations of things and processes which are essentially different. Science creates well-thought-out techniques in order to verify its principles through research programs that the intraphysical consciousness endeavors to follow, preferably in direct experiments in the laboratory.

9. **Accumulations.** The principles of common sense tend to accumulate in a disorderly manner (fragmentariness), beyond the reach and control of the observer's self-critique. Science applies a selective process of accumulation, establishing discipline, questions and presenting hypotheses and theories – which are in perpetual mutation – in all of its research which, if not verifiable, can be *corroborated*.

10. **Rationality.** Popular knowledge, as positive as it may be, always presents weaknesses because it is self-taught, sometimes emotional, and frequently quasi-instinctive. Scientific knowledge, as it is strictly rational and based upon proofs – although being fallible, because it is not definitive, absolute or final – allows fewer misses or, in other words: more hits.

Conclusion. It cannot be denied that the existence of a grain of truth always stems from common, pre-critical good sense or from the practical concerns of daily life. Science is nevertheless unquestionably the last word in the intelligent approach to any question, phenomenon, or problem pertaining to the human being. This is why the production of lucid consciential projections customarily develops better and evolves more rapidly when exposed to the light of the scientific research of projectiology, the science of self-lucid projection.

Actions. The nature of consciential actions differs when the consciousness establishes its bases or consciential attributes predominantly in the psychosoma or mentalsoma in order to direct its existence.

Psychosomatics. The following can be expected from a psychosomatic foundation: animality, emotionalism, precipitation, indiscipline, illusion, romanticism, idealism, art, passion, form, superficiality, ingenuousness, infantilism, simplism, egocentrism or, in other words, extraphysical immaturity.

Mentalsomatics. The following can be expected from a mentalsomatic foundation: conscientiality, rationality, realism, ponderation, discipline, science, universalism, content, depth, erudition, in summary, extraphysical maturity.

Evolution. All of us, human beings, are natural lucid projectors (paragenetics), but are not all *evolved* natural lucid projectors. For this it becomes necessary to willingly pay the high price or toll in terms of time, energy, effort, training and perseverance in our projective development.

Continuation. A single lucid projection experience can induce changes in you, as an active projector, which allows you to have other projections more easily. Having begun to produce lucid projections, you can repeat it every night. After you have learned how to project, nothing can keep you from continuing to practice lucid projection.

Procedure. The ideal or most intelligent procedure for you, as a lucid projector, is to perseveringly develop your projective talents to the utmost, regardless of which positive or healthy techniques are used, and confront challenges in the extraphysical dimensions without any fear or discouragement.

Crescendos. *Phenomenic crescendos* arise within the phenomenology of projectiology. For example, the projective aura can evolve to traveling clairvoyance, which can evolve to full lucid projection, which can finally evolve to positive or balanced waking dis coincidence. These are 4 distinct, well-characterized phenomena that manifest in a natural development or succession.

Phenomenology. Phenomena have permanent independence: they neither remain fixed in their manifestations, nor do they obey theoretical systematic ordering.

Self-performance. In projective development, you, as a projector, are challenged to endeavor to achieve or conquer 15 logical goals in your performance:

1. **Density.** Increase or decrease the density of your psychosoma according to environmental needs (psychosomatics).
2. **Self-lucidity.** Deepen the sensation of being situated as a self-lucid consciousness inside a subtle body (generally the psychosoma).
3. **Hyperacuity.** Expand your own lucidity (cons and *paracons*) during the self-lucid disconnection (takeoff) at a level superior to that of ordinary, waking awareness in the human body.
4. **Holochakrology.** Learn to neutralize the energetic attractive force of the silver cord or, in other words: of the holochakra.
5. **Distancing.** Project yourself a long distance from the physical base.
6. **Chronology.** Project yourself in extraphysical excursions of long duration.
7. **Mnemosomatics.** Recall extraphysical successes in their entirety with memories which are clearer than recollections of facts from material life (intrapysicology).
8. **Self-coherence.** Maintain polymorphic, coherent activity over an extended period of time during a single lucid consiential projection.
9. **Takeoff.** Overcome the difficult phase existing between the vibrational state and the full lucid takeoff in the psychosoma.
10. **Parapsychomotricity.** Improve the available techniques for producing projection while awake and even while moving intraphysically (somatics).
11. **Self-cognition.** Know how to acquire knowledge of indisputable intraconsiential value from evolved extraphysical consciousnesses during extraphysical experiments.
12. **Projectiology.** Promote various consecutive projections by yourself in a single session, whether during the day or night.
13. **Holosomatics.** Simultaneously examine your own human body and psychosoma, which are separated from the state of coincidence of the vehicles of manifestation.
14. **Paraperceptiology.** Develop the paraperceptions of the psychosoma in order to receive the *mental waves* (holothosene) of evolved extraphysical dimensions on all necessary occasions.
15. **Subtle.** Know how to decompose the coarse substances of the psychosoma, when laden, purifying it for more elevated flights or excursions to the subtle dimensions of the consciousness.

Refinement. Besides the aforementioned, you, as a projector, can refine or hone the organization of the psychosoma (psychosomatics) with these 4 arrangements, whenever possible:

1. **Fragments.** Avoid displaying isolated fragments of the psychosoma in your extraphysical manifestation.
2. **Undefined.** Remove incoherent shapes and undefined traits from your psychosoma.
3. **Paramorphology.** Remain well-defined according to the *anthropomorphic shape* or humanoid form of the clear shapes of your psychosoma.
4. **Agility.** Operate productively, in an independent and agile manner, outside the human body, with a luminous, subtle figure.

Crowning. As a crowning of your efforts, you should gradually improve personal lucid projection techniques in such a way that you can expect effective conscious assistance in your own process of undergoing biological death, somatic self-deactivation or final self-projection (desomatics) with certainty and without fantasy, as a practical and final objective of human life.

Goal. To pass through physical walls, to sharply focus beyond the physical eyes, to visit friends without using the human body, to extraphysically and freely volitate in the open air, merely for the pleasure of enjoying the extraordinary state of temporary freedom, does not represent everything. It should also not be the full extent of what you long for or aspire to as a personal goal.

Assistentiology. You should not overlook the learning which occurs through the exercise of extraphysical assistance, as a daily evolutionary megagoal for the consciousness who is avid for knowledge, on the way of self-lucid evolution, without losing sight of the conquest of new stages within the progressive scale of projections of the consciousness, including the ample mentalsomatic projection.

Bibliography: Frost (560, p. 67), Vieira (1762, p. 141).

412. PROJECTIVE RECESS

Definition. Projective recess: the existential phase of the intraphysical consciousness which is characterized by the spontaneous cessation – almost always temporary – of lucid projective experiences, within a sequence of self-lucid and intensive projective experiments.

Synonymy: blocking of consciencial self-projectability; declining phase of projectability; intermittency of projectability; period of low projective production; projective anti-trance state; projective vacation; spontaneous cessation of projections; suspension of self-projectability.

Similarities. In the same way that the following 5 categories of similar known occurrences exist, periods of recess in the practice or production of human consciencial projection experiences also occur:

1. **Psi-missing.** the absence of extrasensory perception and physical parapsychic effects, the reverse effect, or psi-missing.
2. **Disturbances.** The effect of disturbing factors upon the parapsychic phenomena of physical effects, such as a light shining directly into the eyes of the observer-researcher.
3. **Psi-blocker.** The influence of the *sterilizing person*, the adverse sensitive or the psi-blocker, who impedes the production of the physical effect parapsychic phenomenon with his/her physical presence.
4. **Planchette.** The occurrence of the so-called *dead planchette* condition, due to the incompatibility of the vibrations, energies or powers of the parapsychic research group.
5. **Suspension.** The temporary or definitive suspension, or decline, and extinction of various types of parapsychism.

Energy. The 6 (1 + 5) above-cited categories of similar occurrences have a common denominator: the qualitative and/or quantitative alteration of consciencial energies of the producer of the animic-parapsychic phenomena, including here the lucid projection experience.

Causes. The following 14 other relevant factors, for example, can be listed as being among the obscure causes of recess in the practice of lucid projection:

1. **Alienation.** A process sponsored by the helpers in order to avoid the condition of intraphysical alienation of the human projector and his/her *human* or *psychophysical anchoring*.
2. **Nosology.** The interurrence of an illness.
3. **Intoxication.** Toxic causes (drugs, food).

4. **Changes.** A change in residence or a transferring of the intraphysical base.
5. **Trauma.** Consciential trauma of the practitioner.
6. **Holochakrology.** The ending of the condition of looseness of the holochakra with the reattachment of its energetic connections.
7. **Blockage.** Mental blockage of an indeterminate cause.
8. **Therapeutics.** The use of necessary and correctly administered medications.
9. **Accident.** Physical accident.
10. **Chronology.** Alterations in the human schedule and occupation of the lucid projector.
11. **Self-disorganization.** A predominance of indiscipline or a lack of organization in the personal habits of the intraphysical consciousness.
12. **Anticosmoethical.** The improper utilization of lucid projection experiences from the point of view of a cosmoethical life or, in other words, without the indispensable cosmoethical values.
13. **Helpers.** The healthy intervention of the extraphysical helpers due to reasons which are justifiable but unbeknownst to the projector.
14. **Pressure.** The pressure upon the practitioner – of tensions, stresses or crises, which are evolutionary and even very useful to intraphysical material life – that is not well coped with.

Swedenborg. With regard to this condition known as projective recess, which occurs after an intense series of assisted lucid projections, it is worth reading the entire item 1,166, of *Diarii Spiritualis*, by Emanuel Swedenborg – the precursor of projectiological phenomenology – namely, the pioneer of projectiology, written in Latin, the universal language of his time, more than 2 centuries ago, or precisely on March 4, 1748 (5 Volumes: Partis Primae; Volumen Primum; XIV + 450 p.; 21.5 cm.; bound.; Londini; William Newbery; 1844; p. 331):

“Cum itaque nunc paene per tres annos, seu 33 menses in eo statu fuerim, ut mens mea a corporeis quidem abducta, interesse potuerit societatibus spiritualium et coelestium, et usque fuerim sicut alius in societate hominum, absque ulla differentia, quod irat quoque sunt spiritus, sed usque dum intense inhaeserim mundanis cogitatione, ut dum curas habui de necessariis pecuniis, et hodie epistolam scripsi, sic ut in iis animum aliquantum detinuerim, tunc in statum quasi corporeum lapsus sum, ut non potuerint spiritus mecum loqui, sicut etiam dixerunt, quod quasi absentes fuerint, similiter paene quoque prius; inde scire possum, quod spiritus nequeant loqui cum homine, qui curis mundanis et corporeis impense studet, nam corporea detrahunt quasi ideas mentis, et immergunt corporeis”.

(“For almost 3 years, that is, for 33 months, I have languished lately in such a state of spirit that my consciousness, which was distanced from human matters, could be in the societies of spiritual and celestial beings and, nonetheless, I remained as though I were any other man, in the company of men, without any difference, and this surprised the spirits themselves. In spite of this, when I had to fully occupy my thoughts with mundane matters – as when I had to confine myself to subjects related to necessary expenses, and when I had to write a letter today – in a manner that kept my mind occupied with these subjects for some time, I then fell into a corporeal state, shall we say, such that the spirits could not communicate with me. They then told me that they had remained absent, almost in the same manner as before. I can thus deduce that the spirits cannot speak with a person who is excessively devoted to human and material preoccupations, because corporal cares can comparatively pull the ideas of the mind, and immerse them in corporal matters.”).

Lack. The lack or absence of lucid projection exercises is keenly felt by the intraphysical consciousness who is used to the experiences.

Effects. The following are 5 consciential effects stemming from a well-defined period of projective recess, occurring after a sequential series of intensive consciential projections:

1. **Loss.** A sensation of a loss of important existential values.
2. **Source.** Feeling as though a source of extreme significance had dried up.
3. **Marginalization.** A sensation that the consciousness is marginalized from real life, out of touch with essential issues.
4. **Sublevel.** A sensation of being at sublevel in regard to the vital productivity of the consciousness itself.
5. **Neutral.** A sensation of being “in neutral” in relation to the rhythm of life and the universe, which proceeds without interruption.

Types. In practice, projective recess can be classified into 2 types:

1. **Absolute.** A recess from projection is absolute when the projector remains for a period without enjoying the condition of extraphysical self-awareness and, obviously, without having any recall of extraphysical experiences in the ordinary, physical waking state.
2. **Relative.** A recess from projection is relative when the projector knows, intuitively, that he/she continues enjoying lucidity while projected from the human body, although not having any recall subsequent to the extraphysical events.

Cessation. Besides the aforementioned, the projective recess, whether of the voluntary or involuntary practice of lucid projections, is generally a temporary interval which ceases immediately when the unsuspected cause which produced it stops, although it can, less frequently, mark the permanent or definitive cessation of projective experiences.

Assisted. Permanent projective recess, in certain cases, clearly shows that the lucid projections experienced by the intraphysical consciousness were produced exclusively under the sponsorship of the extraphysical helpers or, in other words, were assisted projections, even when this fact is unknown to the projector.

Prisoners. In this case, the experiences cease definitively, after the helpers no longer have plausible or justifiable reasons for aiding the intraphysical consciousness to project. This frequently occurs with ex-inmates of restrictive total institutions, particularly with ex-prisoners, ex-projectors, or released prisoners.

Paraphysiology. It seems that certain sporadic periods of projective recess are paraphysiological, in view of the vehicles of manifestation of the intraphysical consciousness. In the same way that physical anchoring occurs, through a psychophysiological anchor, a certain moderation in the manifestations of the projected intraphysical consciousness occurs or, in other words, a recess, or reduction in his/her activities outside the human body in favor of its preservation and the prioritization, at that moment, of the projector’s physical life over extraphysical life.

Case study. The long-lasting recess characteristic of lucid projections occurs with young projectors who go through adolescence and reach 25 years of physical age experiencing spontaneous projections with a great frequency, for example. Later – due to essential alterations in human existence, particularly a loss of interest in extraphysical matters – they never again experience them.

Service. The phenomenon of lucid projection often involves complex implications which require sophisticated interpretation in order to be fully understood. For example, an intraphysical consciousness, upon intensifying assistential services to other evolutionary associates in human life, and therefore receiving a great number of requests from others – *intraphysical consciousnesses in lack*, as in the practices of penta when an extraphysical clinic has been installed – sometimes finds him/herself intentionally impeded, by the extraphysical helpers, from projecting from the human body with lucidity.

Appeals. This occurs because the solicitations and appeals made by others who already engage him/her in the situations of the ordinary, physical waking state can become very intense on the part of the *extraphysical consciousnesses in lack*, when the intraphysical consciousness (a minicog within a multidimensional, assistential, interconsciential maximechanism) becomes tangible in the paratopospheric extraphysical communities.

Parapopulations. These extraphysical scenarios are inevitable and are most characteristic of lucid consciencial projections produced on this planet. It should be borne in mind that wherever needy intraphysical consciences live, there are also needy extraphysical consciences. It is estimated, from the experiences and statistics of projectors, that there are 9 extraphysical consciences for every intraphysical consciousness on the earth, today at the end of the twentieth century. Of these, 3 extraphysical consciences are worse than the author and you, from an evolutionary point of view, 3 extraphysical consciences are similar to ourselves and 3 extraphysical consciences are slightly better than us.

Productivity. In this case, the penta practitioner, for example, cannot always exclusively project with lucidity in evolved extraphysical dimensions. This would hinder the psychic and parapsychic atmosphere (holothosene), installing physical alienation. It would also reduce the progress of the fraternal services – the bases of self-aware evolution – with a reduction in the individual's human assistential productivity.

Regime. In light of the above, the projector is thus intelligently kept on a severe *bread and water* diet of *nonlucid and semilucid projections*, instead of receiving a likely and perhaps well-deserved treatment of *extraphysical privileges* which, in this period of execution of his/her existential program, would be inappropriate, inopportune, dislocated and undesirable.

Prevention. In order to overcome periods of recess in the lucid experiments, the projector must maintain a certain uniformity or pattern in his/her habits, as a *preventive* measure.

Solution. If the recess is already installed, the individual should, as a *solution*, seek to identify – with self critique and without feverishness or anguish – the real cause of the recess, in order to combat it.

Abstinence. Projective recess should not be confused with projective abstinence or the act of the intraphysical being avoiding unproductive extraphysical encounters, which generates *contraprojection*.

Facts. Projective recess is based upon 2 facts: *first*, the intraphysical consciousness somehow spontaneously projects every night upon sleeping, although not enjoying full lucidity or recollection of extraphysical events; *second*, the condition of projectability constitutes, above all, an animic attribute of the intraphysical consciousness, which is natural and physiological in human life, being exclusively dependent upon the projector and no one else; as well as the act of recovering projectability or improving projective performance.

Self-motivation. In light of the facts, the following can be affirmed: all recess in the practice of lucid projection will always be overcome if the intraphysical consciousness truly wishes and is sufficiently motivated to produce new lucid projections.

Doors. The following is a rational conclusion: once the doors to the extraphysical dimensions have been opened, they will never be completely closed to the intraphysical consciousness who opened them.

Bibliography: Andreas (36, p. 95), Grosso (650, p. 186), Kardec (825, p. 250), Mitchell (1059, p. 2), Monroe (1065, p. 204), Morrell (1088, p. 341), Schiff (1515, p. 120), Steiger (1601, p. 202), Swedenborg (1639, p. 313).

413. PROJECTIVE QUESTIONNAIRE

Definition. Projective questionnaire: a series of selected questions with the aim of establishing the profile of lucid projections, or consciencial experiences outside the human body.

Synonymy: list of questions about projectiology; list of questions for statistical analysis; multi-level questionnaire for the projector; projective survey.

Collection. The classic questionnaire is an instrument of data collection, made up of an ordered series of questions which should be answered in writing and without the presence of the interviewer. The researcher generally sends the questionnaire to the informant by mail or messenger. After filling it out, the research subject returns it in the same manner.

Standardized questions. This chapter gathers a numbered list of 200 standardized questions, which are both simple and complex items resulting from consciential experiences outside the human body. They require decisive responses, being used for research favoring the improvement of projectiological methods.

Statistics. These questions can and should be answered by you, whether a beginning or veteran lucid projector, young or old. For statistical reasons, keep your answers informative and concise, in order for them to be compared with the answers of other lucid projectors.

Responses. Many responses to the general questions on the phenomenon of lucid human projection can be found in the text of this book. Avoid basing your responses on what you read here or in other volumes.

Questions. It is worth pointing out that, in the field of any science that is in continuous progression, the greater the number of responses achieved, the greater will be the number of new questions generated, thereby creating a *hornets' nest of problems*.

Uses. Responding to the projective questionnaire is always useful for the practitioner of consciential projections, as he/she can better understand the consciential phenomena and express him/herself more accurately regarding the sensations and events that are extraphysically *witnessed* or experienced.

Convergencies. It also becomes useful to studious individuals in general who are able, with these responses, to collect testimonies, establish convergencies of pieces of evidence and conceive general methods that favor the development of projectiology, as has been done with statistical public opinion research.

Frankness. The readers should give frank responses to the questions which they consider pertinent to the issues of their personal projective experiences, bearing in mind that their observations will be used to benefit humanity and the progress of science.

Introduction:

1. Did the occurrences of lucid projection come as a surprise or did you find out about them through other persons?
2. Did you read books about the phenomenon of lucid projection before having experiences?
Which books?
3. Are there any special incentives for you to lucidly project?
4. Where, when and how do you lucidly project yourself? Can you do so whenever you wish?
5. Are you a heavy sleeper or a light sleeper? Since when?
6. Can you give two reasons why you know you were projected?
7. Has the state of meditation, reflection and/or mental concentration helped you to conscientially project?
8. Have you received help in order to conscientially project? If you are in doubt, answer “no.”
9. What is the best method for conscientially projecting? Explain.
10. What was your first lucid projection like?

Phenomenology:

11. Do you produce natural (pure) lucid projections, forced (impure) lucid projections, or both?
12. Does the vibrational state exist for you?
13. Do you acknowledge the imperfect exteriorization and interiorization of the intraphysical consciousness when projected?
14. Have you ever experienced an impactful *takeoff* of the consciousness (you) in the psychosoma?
15. Have you ever experienced an impactful *interiorization* in the psychosoma?
16. What was your longest lucid projection experience? Describe it.
17. What was your most relevant lucid projection experience?

18. Have you ever experienced the phenomenon of physical repercussion?
19. Have you ever felt the condition of physical catalepsy?
20. Have you ever passed through human beings while moving extraphysically without the human body?

Xenophrenia:

21. How do you distinguish between hallucination and lucid projection?
22. How do you distinguish between daydreams, dreams and the visions of lucid projection?
23. Have you ever dreamt about the phenomenon of lucid projection?
24. Have you ever been aware of dreaming while the dream was occurring? What happened?
25. What are the differences between dreams and morphothosenes?
26. Have you ever produced lucid projections which were initiated in the ordinary, physical waking state?
27. Have you ever produced lucid projections through the hypnagogic state?
28. Have you ever produced lucid projections through dreams? How?
29. What are the differences between extraphysical somnambulism and lucid projection?
30. Is the process of acquiring information through lucid projection the same as that of telepathy or clairvoyance?

Human physiology:

31. Is there a physical, somatic constitution which predisposes one to lucid projection?
32. Were you born by natural parturition, complicated (laborious) parturition or cesarean section?
33. Do you have a monovular twin sister or brother?
34. What is your heart rate?
35. Do you have a chronic illness? Which illness?
36. Have you ever undergone general anesthesia? Why?
37. What effect does the chloroform of medical-dental anesthesia have on lucid projection?
38. Does the gender of the intraphysical consciousness or intraphysical being influence lucid projection?
39. Is there a relationship between the cerebral bulb and takeoff? Why?
40. Can a sneeze (sternutation) provoke the discoincidence of the extraphysical hand or arm of the intraphysical consciousness through psychomotor impact? Why?

Coadjutants:

41. Do you have reliable coadjutants or adjutants for the production of lucid projection? Which ones?
42. What is the greatest influence upon lucid projection? Why?
43. Does a physical base at a high altitude facilitate lucid projection? Why?
44. Does corporal physical weight interfere in lucid projection? Why?
45. Does an adequate diet predispose lucid projection? Why?
46. Does respiration influence lucid projection?
47. Do infancy and advanced age predispose or impede lucid projection?
48. Can the exteriorization of energies be a coadjutant to lucid projections? How?
49. Do the chewing muscles participate in the process of lucid projection?
50. Do the cranial muscles act in lucid projection?

Soma:

51. Have you ever seen your human body while projected?
52. Have you ever seen the inside of the human body while outside it? Why?
53. Have you ever touched the human body while outside it? Where?
54. Up to what point can someone else touch or move the inactive human body without provoking the interiorization of the psychosoma? Why?

55. What is the greatest possible movement of the inactive human body during a prolonged projection of the intraphysical consciousness (you) at a distance?

56. Have you seen the human body with the extraphysical body (psychosoma) inside it?

57. Does the human body lose weight upon the exteriorization of the psychosoma during projection? Always?

58. Have you ever projected while the soma was standing?

59. Have you ever projected while the soma was moving? How?

60. Have you ever heard sounds upon leaving or entering the soma?

Silver cord:

61. Have you ever seen the silver cord extended *distant* from the human body?

62. Do the *size*, format, potency and action of the silver cord vary according to the projector and the consensual projection?

63. Is the volume of the silver cord greater when it is contracted or extended? Why?

64. What factors influence an increase in the perimeter of the silver cord's vigorous action?

65. Where are the bases of connection of the silver cord in the human body?

66. Do you accept the possibility of a twist or a *knot* in the silver cord? Why?

67. Is there a relationship between the cerebral cortex and the silver cord? Describe.

68. How do you imagine the condition of the silver cord during brain surgery, a laparotomy or thoracotomy?

69. What prevents sick extraphysical consciousnesses from rupturing the silver cord of the projected intraphysical being during extraphysical deintrusion?

70. Does the intraphysical consciousness – now an extraphysical consciousness recently arrived at the intermissive period – remain with the *stump* or umbilicus corresponding to the rupture of the silver cord?

Psychosoma:

71. What is the holochakra?

72. Does the holochakra influence physical repercussion?

73. Is there a relationship between the silver cord and the holochakra?

74. What is the precise nature of the psychosoma or emotional body?

75. Do imperfect takeoffs and interiorizations provoke damaging consequences for the human body and the psychosoma? Why?

76. What are the consequences of projection of the intraphysical consciousness in the psychosoma from a car, train, airplane, or with the human body in a vehicle in movement?

77. Is the interpenetration of the psychosomas of 2 projectors possible, given that both are of equal density while outside the human body? Why?

78. Does the density of the psychosoma outside the human body influence the quality of recall subsequent to self-lucid projections? Why?

79. Do solar, ultraviolet, infrared and other rays influence the psychosoma when it is denser outside the human body?

80. Is it possible to shape the projected psychosoma into gigantic forms, a dirigible for example? Why?

Mentalsoma:

81. Have you ever visited an extraphysical environment or community when without a form that is visible to yourself? How?

82. Have you already seen yourself using the mentalsoma? Describe.

83. Do emotions completely disappear while in the mentalsoma?

84. Does the *density* of the mentalsoma vary according to the extraphysical environment?

85. Are there differences between the consensual energies transmitted by the intraphysical consciousness while in the human body, projected in the psychosoma, or directly and isolatedly projected in the mentalsoma?

86. How do you distinguish between the condition of being solely in the mentalsoma and the condition of partial corporification outside the human body?

87. Does the consciousness only reach another solar system in the isolated mentalsoma? Why?

88. Are there differences between the intraphysical being projected in the mentalsoma and the projected extraphysical consciousness?

89. What are the practical consequences of the existence of the mentalsoma?

90. Is there a similarity between the golden cord and a remote control? Why?

Lucid projections:

91. Have you ever had an instantaneous lucid projection?

92. Have you ever suddenly projected unintentionally?

93. Have you ever had consecutive lucid consensual projections?

94. Have you ever projected yourself many times in a single day? Describe.

95. What is the most intense period of projections in series that you have ever experienced? Where? When?

96. Have you ever had recurring lucid projections?

97. Have you ever projected yourself while your eyelids were open?

98. Have you ever projected during a storm? Describe.

99. Have you ever projected yourself while inside a vehicle? Which vehicle?

100. Have you ever had experiences with children outside the human body?

Research:

101. Have you ever had an impactful experience with morphothosenes?

102. Have you ever performed technical experiments with lucid projections? Which experiments?

103. Have you ever visited an extraphysical community?

104. Have you ever been projected on another planet?

105. Have you ever moved some physical object while projected? Which object?

106. Have you ever had a picturesque extraphysical experience?

107. How do you deal with sexuality outside the body?

108. Have you ever had an experience outside the human body that would be considered sexual?

109. How would you evaluate your level of lucidity outside the human body?

110. Can lucid projection cure certain illnesses? Why?

Extraphysical translocation:

111. How do you orient yourself outside the human body? Always?

112. What do you have to say about volitation?

113. How does volitation work?

114. Is there a relationship between human respiration and volitation? Why?

115. Are there differences between individual volitation, or self-volitation, and group volitation? Why?

116. Have you ever encountered currents of force outside the human body?

117. How do you distinguish between an extraphysical current of force and volitation?

118. How do experienced projectors behave themselves during joint projections?

119. While outside the human body, have you ever seen two extraphysical consciousnesses with their auras coupled?

120. While outside the human body, have you ever seen a large group or team of extraphysical consciousnesses?

Para-human physiology (paraphysiology):

121. When projected, do you see yourself nude or clothed? Always?

122. Have you ever perceived a difference in your weight outside the human body?

123. Have you ever perceived phosphorescence in your extraphysical form?

124. How do you conceive the nature of the extraphysical body or the psychosoma?

125. Have you ever seen centers of force or energies in the extraphysical form?
126. Have you ever seen yourself partially exteriorized? How?
127. Have you ever looked at yourself in a mirror while projected with lucidity?
128. Have you ever seen your shadow, under the sun, while outside the human body?
129. What is the greatest extraphysical trauma? Why?
130. Which extraphysical events repeat themselves more frequently in lucid projections? Why?

Extraphysical encounters:

131. Have you ever encountered a friend projected and extraphysically self-aware?
132. Have you ever encountered an extraphysical consciousness in the extraphysical dimension which has recently entered the intermissive period?
133. Have you ever seen an exotic extraphysical artifact? What?
134. Have you ever been shocked outside the human body?
135. What is the strongest emotion that you have felt during a lucid projection?
136. Has anyone ever judged you to be *dead* or deceased while outside the human body?
137. Have you ever learned lessons in the extraphysical dimension? Which lessons?
138. How do you distinguish an intraphysical consciousness from an extraphysical consciousness when outside the human body?
139. Have you already discovered any unexpected personal disability outside the human body?
140. Have you identified any impressive personal performance outside the human body?

Extraphysical activities:

141. Have you ever been the victim of, or a witness to, extraphysical abduction or kidnapping?
142. Have you ever participated in the extraphysical assistential rescue of an intraphysical or extraphysical consciousness?
143. Are there practical ways to gain entrance into evolved extraphysical environments? Which?
144. Have you ever visited a military area closed to outside access during a lucid projection experience? What did you see?
145. Have you ever visited a cemetery mortuary chapel during a lucid projection? Describe.
146. Have you ever visited a slaughterhouse in operation during a lucid projection? Describe.
147. Have you ever helped someone through lucid projection?
148. Do you count on some extraphysical company when projecting?
149. What are the differences between thought-forms (morphothosenes) and real extraphysical images?
150. Have you encountered confirmation for your extraphysical experiences in this book? Which ones?

Obstacles to lucid projection:

151. Do you aware of having suffered intrusive influence at some time? Where? When? How?
152. Have you ever served as extraphysical assistential bait? How?
153. Have you ever had confrontations with extraphysical consciousnesses? Describe.
154. What are the limitations of lucid projection for you?
155. Are there harmful factors to lucid projection?
156. What is the greatest obstacle to lucid projection? Why?
157. Are there dangers or maleficences in the practice of lucid projection?
158. Has lucid projection provoked alienation in you regarding physical life?
159. Is there a human being who cannot conscientially project? Why?
160. Have you noticed incongruities in extraphysical facts? Why?

Personalities:

161. Have you, while projected, seen a pregnant woman in the ordinary, physical waking state?
162. How does the pregnant woman-projector behave with the consciousness of the fetus during her or their projection? Always?

163. Can young people, who are still in their growth phase, frequently project? Why?
164. Do you know a person, blind from birth, who is a lucid projector?
165. Do you know a former inmate who is a lucid projector?
166. Do you know of any crew member of an intercontinental airline who is a lucid projector?
167. Do you know a lucid projector who has an amputated leg?
168. Have you ever known anyone who projected while some part of the body was in a cast?
169. Do you know any color-blind projector?
170. Have you ever seen subhuman animals outside the human body? Which animals?

Parapsychism:

171. Do you think there is any psi factor in lucid projections? Which?
172. Does lucid projection help you practice and develop parapsychism? What type or mode of phenomenon?
173. How do you distinguish animism from parapsychism?
174. Have you ever practiced parapsychism while outside the human body? Which type?
175. Have you ever communicated through an intraphysical sensitive? How?
176. Do extraphysical technicians keep and accumulate the consciencial energies that they extract? Why? How?
177. Have you ever perceived any extraphysical benefactor impeding your consciencial projection? Why?
178. Do you see any similarities between the mutants of science fiction and extraphysical consciencenesses?
179. Has lucid projection convinced you of the survival of the ego (the consciousness) after biological death (first desoma)?
180. Were you skeptical regarding the survival of the ego prior to experiencing lucid projection?

Post-projective recall:

181. Have you previously accurately examined any extraphysical phenomenon? Which one? (Be as detailed as possible.)
182. What is the best extraphysical environment, community, district or situation that you recall?
183. Have you ever had a lucid projection without consciencial blackout, from the beginning to the end of the experience?
184. Do extraphysical events develop for you naturally, rapidly or in slow motion? Why?
185. Have you ever had an impactful experience with chronological time while outside the human body?
186. Have you ever had lucid projections related to the past?
187. Have you ever had lucid projections related to the future?
188. How is your recall of the occurrences of lucid projections?
189. Do you have your own technique for remembering lucid projections? What is it?
190. Do you keep a journal of lucid projection experiences? Why?

Continuous self-awareness:

191. When producing lucid projections, have you ever experienced an entire day and night of continuous self-awareness?
192. Do you know of any intraphysical being who has enjoyed continuous self-awareness for days?
193. How do you see a world in which all the inhabitants have continuous self-awareness?
194. Does the free consciousness (FC) – an extraphysical consciousness – live in a permanent projection of uninterrupted awareness?

195. Does the free consciousness need to sleep and dream?
 196. Do you see future benefits in experiences with lucid projections? Why?
 197. Do you see any work hypothesis for lucid projection research?
 198. Have you ever participated in a roundtable discussion on lucid projection? Where? When?
 199. Do you think it is possible to create an extraphysical team composed of intraphysical lucid projectors?
 200. Does ethical conduct intervene in the processes of lucid projection? Why? (Get to the heart of the question).

Mailing list. The International Institute of Projectiology and Conscientiology (IIPC) (CEP 70.000, 22422-970, Rio de Janeiro, RJ, Brazil; *Internet: e-mail – iipc@iipc.org.br – home page – www.iipc.org*) has for many years been compiling the Mailing List of Lucid Projectors and the Register of Lucid Projectors in its database on projectors and their unprecedented experiences outside the body, signed reports and written responses to specialized questionnaires including questions similar to those posed here.

Contribution. If you wish to contribute to the research and statistical analyses, please submit your personal information and respond to the questions to which you have answers or those which relate to your experiences. This should be done in accordance with your theoretical foundation of knowledge, your theoretical models or original explanations and your intuition on some question, citing the number of each question addressed here and submitting a signed copy for the records.

Anonymity. Also let us know if you prefer to remain anonymous, your information thereby being archived in a strictly confidential manner, or if the experiences can be analyzed in public and edited into a future book.

Database. The database on projectiology of the International Institute of Projectiology and Conscientiology has been archiving the greatest possible amount of information gathered through the following means: register of active lucid projectors, using forms; written records of lucid projections; the collection of responses to projectiological questionnaires; listings of questions gathered in public projectiological debates; a specialized library on projectiology; an international bibliography on projectiology; the live recording of reports by lucid projectors on cassette tapes; a video library with movies of projectiological interest; computerized storage (CD-ROMs, diskettes) of all data pertinent to projectiology by gathering as much information on international research as possible; and the cataloging of addresses of projectiological interest. This is being done in order to enable researchers to gather data and perform searches for certain responses about projectiology within seconds, which would previously have taken months.

414. THE IDEAL PROJECTOR

Definition. Ideal consciential projector: the idealized, theoretical image of the best existing intraphysical personality for the development of lucid projectability within conscientiology research (conscientiogram).

Synonymy: exemplary projector; idealized projector; prototype of self-lucid projectors.

Prototype. The idealization of the prototype of projectors always serves to help interested individuals appraise and improve themselves through a useful comparison of personal qualities (strong traits) which are necessary for the practical evolution of self-lucid projectability.

Profile. In order to determine the physical and psychological profile of this imagined ideal projector, at least the majority of the following 27 qualities, traits or strong traits should be present.

1. **Assistentiology.** Compassion for all living things.
2. **Balance.** Calm indifference toward everything that constitutes the transitory world, accompanied by a just appreciation of it.
3. **Biomemory.** A cultivated biomemory.
4. **Coexistology.** Peaceful coexistence.
5. **Cosmoethics.** Veracity or an absence of pathothosenes.
6. **Courage.** Courage in all emergencies.
7. **Culture.** Personal humanistic culture (polymathy).
8. **Curiosity.** A healthy, innate and useful curiosity (a scientifically curious intraphysical consciousness).
9. **Deconditioning.** Religious, scientific and social deconditioning.
10. **Habits.** Good habits of intraphysical life.
11. **Health.** Adequate physical health.
12. **Holosomatics.** Physical or somatic self-control.
13. **Inclination.** An inclination toward reading, studying and researching.
14. **Intentionality.** Absolute mental purity (cosmoethical intentionality).
15. **Introspection.** Introspection with discipline in thought (mentalsomatics).
16. **Neophilia.** Fearlessness and neophilia.
17. **Patience.** Nonconformity with patience.
18. **Relaxation.** An advanced capacity for psychophysical relaxation.
19. **Respiration.** An ample thorax with a large lung capacity.
20. **Self-control.** Nervousness with consciential self-control.
21. **Self-critique.** Self-critique regarding priority thosenizations.
22. **Self-discernment.** Good sense or natural self-discernment.
23. **Self-organization.** Someone who is reasonably well organized.
24. **Self-thosenization.** An elevated capacity for psychic absorption or a deep involvement in experiences in general (self-thosenity).
25. **Solidarity.** Total cosmoethical detachment.
26. **Temperament.** A temperament that is more rational-scientific and less mystical-religious.
27. **Will.** The application of ironclad will in the practice of lucid projection.

Complete. The following 6 final, practical finishing touches of aptitude for lucid projection serve to complete the personality of the “superwoman” or “superman”, in regard to the imagined ideal projector:

1. **Bed.** Uses a single bed for projective experiments.
2. **Cardiology.** Has a low heart rate.
3. **Clock.** Practices lucid projection between midnight and 4 o’clock in the morning, or in the second half of the night (biological or somatic clock).
4. **Dorsal.** Always lies in the dorsal position on a springless mattress.
5. **Duo.** He/she is part of an evolutionary duo (daily sex).
6. **Homeostasis.** Does not present any significant psychological problem (fissure) regarding the future (intraconsciential homeostasis).

Discernment. The characteristic which perhaps is indispensable in the traits of the ideal projector is the discernment that he/she peacefully presents in regard to him/herself in a comparison of lucid projection with the diverse altered states of consciousness related to the phenomenon, such as: projection in the psychosoma; projection in the mentalsoma; semilucid projection; ordinary dreams; dreams about lucid projection; nightmares; daydreams; and the hypnagogic state. All this while still knowing how to understand and coexist with ambiguities, evolving “treading a fine line” without remaining “seated on the fence.”

Ambiguities. The concessions, or ambiguities – made with effective lucidity and maturity, and applied with individual freewill, selected and under constant observation and renovation (paying attention to *pattern-behavior* and *exception-behavior*), with the intention of diminishing their quantity and improving their quality – allow the intraphysical consciousness to conquer his/her obligations in a cohesive, *en bloc*, uninterrupted manner all at once. The individual accomplishes this without leaving undesirable traces (*smudged thosenic signatures*) in his/her conduct, unfinished tasks in his/her existential file with regard to the execution of the existential program, or a negative final balance (existential incompleteness, *intraphysical melancholy*, *extraphysical melancholy*) in the holokarmic account of his/her human life.

Seeker. The best or most effective projector will always be: the psychic, or more appropriately parapsychic, self-made individual; the transcendent athlete wishing to break his/her own records, the disciplined person seeking to be a healthy perfectionist, from an extraphysical point of view, and only for him/herself; the perseverant seeker of leading-edge relative truths who is never satisfied and never tires of striving toward self-knowledge.

Stresses. In order for you to achieve a higher degree of effectiveness in the practices which are characteristic of the ideal projector, there is nothing better than taking care of your physical, mental and consensual health through measures that can save you from stress. This can be done by following these 20 criteria, which are currently generally recommended for all individuals by conscientiotherapy:

1. **Somatics.** Maintain good health, while also keeping an eye on your vision, hearing and teeth.
2. **Nutrition.** Eat at least one hot, balanced meal per day.
3. **Beverages.** Drink less than 3 cups of coffee, tea or soft drinks per day.
4. **Alcoholism.** If you drink alcoholic beverages, always do so in moderation.
5. **Tobaccoism.** Do not smoke.
6. **Weight.** Maintain a body weight appropriate for your height (stature).
7. **Sleep.** Get seven hours of sleep at least four nights a week (sleep schedule).
8. **Exercises.** Exercise until you sweat, at least twice a week.
9. **Trivialities.** Always discuss domestic problems with those who live with you, such as: money and everyday issues.
10. **Affectivity.** Give and receive affection on a regular basis.
11. **Family.** Have at least one family member, in whom you can confide, within a minimum radius of 60 miles (100 km).
12. **Relief.** Speak openly about what you are feeling when angry or concerned.
13. **Friendships.** Maintain a network of friends and acquaintances.
14. **Economy.** Earn enough money to pay for your basic expenses.
15. **Convictions.** Be sure that your general convictions (personal principles) strengthen you.
16. **Sociability.** Attend recreation centers periodically or have regular social activities.
17. **Confidence.** Have 1 or more friend to whom you can confide personal matters.
18. **Self-discipline.** Organize your time efficiently.
19. **Freedom.** Take some time for yourself during the day.
20. **Leisure.** Have some fun at least once a week.

Summary. Regarding lucid projectability, brilliant minds do not have any apparent advantages over average minds. Briefly summarized: any intraphysical consciousness who is mentally competent, intraconsensually centered, of strong personality and perceives with acuity, thinks with clarity, plans with wisdom, acts with propriety, represses negative or morbid thoughts and rejects maladaptive emotions, will always be the best candidate for producing consensual projections with greater lucidity.

Strong traits. There are intraphysical personalities, at the one extreme, with a maximal cultural background and a minimal parapsychic sensitivity; as well as others, at the other extreme, with a minimal cultural background and a maximal parapsychic sensitivity. The ideal would be to join both maximal attributes (strong traits) in a single personality in order that the consciousness, through the

mentalsoma, completely masters the emotional impulses of the psychosoma or, in other words, rationality potentiates sublimated intuition, or the sublimated intuition manifests itself, thereby dispensing with the unnecessary crutches and excesses of mysticism.

Evolutiology. This maximal state of serene physical-extraphysical maturity will arise, more and more frequently, among the members of terrestrial humanity from now on.

Decision. It is incumbent upon you to make it more difficult to invade your consciential micro-universe, your protection or consciential self-defenses. If you so desire, will it be so or remain decided, no one will be able to reach you, much less subjugate you, regardless of whether it involves intrusive suggestions, thoughts, emotions or consciential energies (heterothosenes). You can, in this way, advance more than legions of consciential projectors in any sector of projectiology research. This depends exclusively upon you, your motivation, your decision and self-discipline.

Priority. You may be, and can even recognize yourself to be clearly less experienced, brilliant or talented, weaker paragenetically or less talented in lucid projectability. This is secondary and of little interest. It is much more important that you remain motivated, produce your lucid projections, not tire or lose motivation with that which you do, and remain active and efficient in your lucid projectability.

Theoricity. Within theoricity, experience is superior to theory. The achiever, even when lacking expressive talents, is always superior to the intraphysical consciousness who is merely an observer, as brilliant as that person may be. What, above all, is of much greater value and has much greater weight, is the final position of the ledger of your personal works, the result of the execution of your existential program. This is the number one priority.

Bibliography: Schiff (1515, p. 111), Vieira (1762, p. 123).

415. ANIMISM

Definition. Animism (Latin: *animus*, soul, the consciousness): the complex of intracorporeal (somatic) and extracorporeal phenomena produced by the individual, without external interference, or in the case of projectiology, exclusively by the lucid intraphysical consciousness, or the consciential projector as an intraphysical being.

Synonymy: animicity; organicism; personification; *personism*; psychism.

Classification. Animic phenomenology was classified by Alexander Nikolayevich Aksakof, into 4 items:

1. **Telepathy.** The extracorporeal action of the living human, involving psychic effects (the phenomena of telepathy, transmission of an impression at a distance).
2. **Telekinesis.** The extracorporeal action of the living human, in the form of physical effects (telekinetic phenomena, movement of objects at a distance).
3. **Self-bilocation.** The extracorporeal action of the living human, manifested by the apparition of his/her own image (telephanic phenomena, apparitions at a distance). Consciential projections in general are included here.
4. **Ectoplasmy.** The extracorporeal action of the living human, manifesting in the form of his/her image with certain attributes of corporeity (teleplastic phenomena, formation of materialized bodies).

Characterization. It is always very difficult to characterize a lucid consciential projection which is entirely animic or devoid of interference from extraphysical consciousnesses, due to the intangibility of their presence and their nonassessable action.

Animists. Those who exercise the pure practices of animism are animists, or adepts, according to ancient empirical terminology. They are their own intermediary or bioenergetic catalyst.

Phenomenology. The intraphysical consciousness who is able to operate through the para-organs of the psychosoma while still in his/her human body, produces the majority of parapsychic

phenomena exclusively through animism, dispensing with the services of the extraphysical consciousnesses. The following phenomena thereby arise: projective ectoplasmy; projective parapyrogenesis; projective pneumatophony; projective poltergeist; projective psychography; projective psychophony; projective raps; projective telekinesis; self-psychophony and traveling clairvoyance.

Analysis. In the analysis of these occurrences, factors such as conscious and unconscious fraud and mystification are obviously neither pertinent nor of interest. These phenomena are *deliberately provoked* through the force of the intraphysical consciousness who is self-sufficient and the master of his/her own parapsychic powers. They cannot be attributed to the cosmoethical or uncosmoethical responsibility of another. This posture summarizes the entire world of lucid projectability or LPB.

Discoveries. Those who conduct a detailed research of the intricacies of the mechanisms for obtaining inventions and scientific discoveries will naturally – like it or not, consciously or unconsciously – be analyzing the nature and conditions of the animic and parapsychic faculties of the human being.

Conscientiology. On the other hand, one of the best ways to maintain, without recess, the continued and fruitful practice of animic and parapsychic faculties, as well as the development of personal animic (restricted sense) and parapsychic (ample sense) attributes, including the establishment of the physical-extraphysical self-defense of the intraphysical consciousness is for the animist-parapsychic to study or research the positive and transcendent themes of the science of conscientiology.

416. PARAPSYCHISM

Definition. Sensitive: the individual who exercises parapsychism (in this case human) or the parapsychic psychophysiological faculty of sensing, perceiving or detecting influence directly from the extraphysical dimensions and extraphysical consciousnesses, including intraphysical consciousnesses projected from the human body or soma.

Synonymy: agglutinating person; carrier of extrasensory perception; carrier of parapsychism; channel; channeler; *donkey of the spirits*; extralucid; extraphysicality sensor; extra-sensor; extrasensory percipient; gifted interceptor; *horse of the spirits* (man); human link; interconsciential apparatus; interworld intermediary; interworld mediator; mediumist; mesmeric clairvoyant; metagnome; *metérgico*; *miko*; *mule of the spirits* (woman); *paragnomo*; parapsychic bridge; parapsychic guinea pig; parapsychic subject; psychic engine; psychic; psychodynamo; receiver of leading-edge ideas; sensitive; theocrat; *transmission band*; transnormal; ultra-sensitive person.

Parapsychism. Parapsychism is also called: contranormality; extrasensory perception; mediumism; mediumistic faculty; mediumistic sensitivity; mediumship; metagnomy; metanimic faculty; paranormality; parapsychic cognition; parapsychic sensitivity; parapsychodynamics; sixth sense; supersensorial perception; transphysical capacity; ultraperceptive faculty; ultraphany.

Projections. The animism pertaining to the lucid projection phenomenon, as with parapsychism, is evidently a faculty inherent to the intraphysical being. The lucid projection phenomenon can occur spontaneously with the individual, without any intervention from external intelligences. On the other hand, it is estimated that 5% of terrestrial humanity presents more or less developed parapsychic talents, and that 1% of this selfsame humanity has already projected lucidly from the human body.

Complex. Bearing in mind, however, the phenomenological complex which, in and of itself, makes up the occurrences of lucid projection, it becomes difficult to separate parapsychism from the manifestations of the lucid projector, notably due to assisted lucid projections or those directed by extraphysical helpers, which occur with great frequency.

Parapsychic-projectors. The following are 27 parapsychic-projectors who became more well-known: Elwood Babbitt; Douglas M. Baker; Eurípedes Barsanulfo; Annie Brittain; Geraldine Dorothy Cummins (1890-1969); Andrew Jackson Davis (1826-1910); Anne-Marie Dinkel; Elisabeth d'Espérance (Theodore Heurtley Hart-Davies: 1855-1919); Marcel Louis Fohan (Yram); Eileen Jeannette Vancho Lyttle Garrett (1893-1970); Daniel Dunglas Home (1833-1886); Olof Jonsson; Caroline D. Larsen; Gladys Osborne Leonard (1882-1968); Einer Nielsen (1894-1965); Yvonne do Amaral Pereira; Raphael Américo Ranieri; Cora L. V. Richmond (1840-1923); Zilda Giunchetti Rosin; Frederick C. Sculthorp; M. Gifford Shine; Ingo Swann; Emanuel Swedenborg; Attila Von Szalay; Alexander Tanous; Vincent Newton Turvey; Ena Twigg.

Polyvalence. Every sensitive, every animist, as well as every lucid projector, is a parapsychic polyvalent. Greater performance in a certain parapsychic line or in an area of extraphysical exploration is dependent upon the intraphysical consciousness due to *parapsychic polyvalence*.

Orthodoxy. The orthodoxy of the intraphysical sensitive's convictions influences the quality and nature of his/her paraperceptions.

Case study. The clairvoyant, for example, if an orthodox umbandist, tends to mostly see extraphysical consciousnesses such as former *pretos velhos*, *pombas-giras* and *exus*; the orthodox clairvoyant spiritist tends to see more European-looking extraphysical consciousnesses with evolved, luminous appearances; the universalistic clairvoyant tends to see warriors in ceremonial dress, former physician extraphysical consciousnesses, former turban-wearing Orientals and exotic extraterrestrial extraphysical consciousnesses. Orthodoxy – regardless of which type – is the sepulcher of intelligence.

Energy. The visual appearance, the form or the “work uniform” of the extraphysical benefactor varies according to its own will, due to the phenomenon of self-transfiguration of the psychosoma. The name, label and sometimes even the appearance of the communicant extraphysical consciousness become secondary. What is important, of value and of interest for the sensitive to detect – in the ordinary, physical waking state, as well as when projected in extraphysical communities or environments – is the positive and healthy quality, or the negative and ill quality, of the energetic irradiation of each consciousness, whether intraphysical or extraphysical.

Exclusions. Certainly, the parapsychism considered here refers to genuine phenomena with authentic sensitives. All hypotheses and the extremely high risk of error – with regard to hallucinations or illusions, self-mystification, fraud, pathothosenes, unconscious autosuggestions, intentional charlatanism, fanaticism or the consequences of a lack of self-critique, heteromystification or magic tricks – have been satisfactorily excluded from the sphere of its manifestations.

Session. In any type of parapsychic session, we are merely in the proximity or surroundings of the extraphysical dimensions. If we wish to know its inhabitants, or its environments, its undeveloped and evolved communities, its events, its *parageography*, and its *para-sociology*, we need to enter and live, even if temporarily, in these selfsame environments. There are no package tours for this purpose. Therefore, there is only one resource or alternative: promote lucid self-projection in those who already demonstrate effort and disposition in continued attempts and endeavors.

Conservatism. The condition of parapsychic passivity (when blind or unreflected) predisposes the installation of evolutionary complacency (conservatism, orthodoxy, religion and fossilization regarding self-discernment) or, in other words: submission to the situation of conformity.

Vanguardism. The condition of lucid animic activity predisposes the installation of evolutionary impulsion (vanguardism, heterodoxy, science, cosmoethical and constant renewal) or, in other words: the questioning of the nonconformist opposition.

Self-awareness. For this reason, the healthiest and evolutionarily most profitable condition, in the parapsychic realms, is for the intraphysical consciousness to simultaneously employ his/her composite animic-parapsychic perceptions in the quest for mastery of multidimensional self-awareness.

Comparisons. The following are 4 comparisons, based on the facts, which deserve our logical, mature reflection:

1. **Psychoanalysis.** Psychoanalysis (1 century of existence), *devoid* of the theory of existential seriation or successive intraphysical and intermissive lives, merely studies the intraphysical consciousness from intrauterine life to desoma, within the exclusive limits of somatics.

2. **Yoga.** Yoga (30 centuries of existence), *devoid* of parapsychism, only produces animism, in order for the intraphysical consciousness to achieve the *siddhas*, not dealing with interconsciential deintrusion.

3. **Spiritism.** The spiritist movement (15 decades of existence), *devoid* of animism, merely practices the parapsychism of exchanges between intraphysical consciousnesses and extraphysical consciousnesses in a factionalist, Christian or evangelical manner, like the evangelical exorcist sects and charismatic Catholicism.

4. **Projectiology.** Projectiology (2 decades of existence) employs animism and parapsychism, or the broad parapsychic faculties, including pangraphy, in the ample practical implantation of self-lucid multidimensionality in the micro-universe of the individual wishing to evolve cosmoethically through applied universalism. Everything in life evolves.

Contacts. Based on the unshakable premise that the more evolved an extraphysical consciousness is, the more difficult it becomes to remain in the unevolved existential dimensions and to communicate with the inhabitants of the paratroposphere. It can thus be concluded that it is extremely problematic for a parapsychically developed extraphysical consciousness – from a functional, energetic and cosmoethical point of view – to have prolonged, direct contacts with intraphysical beings in intraphysicality or human life.

Serenissimi. This is why the majority of communicant extraphysical consciousnesses in parapsychic sessions are and will always be relatively undeveloped from a consciential point of view. These facts reaffirm and lend extraordinary value to the intraphysical consciousness being able to project from the human body with lucidity and, on his/her own, meet with evolved extraphysical beings, the *serenissimi*. It will always be much less difficult for them to help us go there occasionally than for them to consider living and remaining here for a somewhat extended period of time.

Mentalsomas. Mentalsomas and the mentalsomatic dimension are the agents involved in these illuminating extraphysical encounters.

Amimia. The condition of inner peace of the *serenissimus* can be represented as a condition of amimia, or an absence of facial expression, although in a natural or non-pathological state. This condition should not be confused with the *amimia* readily found in stuporous states, in catatonia, or – obviously – in the condition of robots, statues and mannequins.

Euthymia. In everyday human life, this condition of perfect tranquility of the consciousness, inner peace and serenity in fact receives the name of *euthymia*.

Approach. The reality of the *serenissimus* is always very difficult to understand using a simple approach from a strictly human perspective. He/she no longer suffers from shyness, an illness that is a type of fear which is generally not treated and is left unresolved. He/she is *un-humble*, which is amoral according to the intraphysical moral concepts of this still pathological intraphysical society. He/she practices a love devoid of mysticism that is always strong in sentiments (rationalized emotions), thoughts and consciential energies. He/she is extremely self-supported in his/her thosenology by cosmoethics.

Prosthesis. The human or intraphysical body is nothing more than a temporary prosthesis for the liberated extraphysical consciousness – which already possesses an *extraphysical* body – when it manifests in the intraphysicality of the earth. *Mediumship* is a system of interconsciential communication that is precarious and not very reliable. This is because it constitutes the lending of a prosthesis – the human body – intended for personal use by the intraphysical consciousness to be employed by a stranger, the extraphysical consciousness. Its productive results require a high degree of continued, exempt heterocritique and self-critique on the part of any individual.

Objects. Everyone knows that, in daily life, objects geared for personal use do not always conveniently adapt, adjust and operate to the use of another individual. It is practically impossible, for example, for someone to adapt and efficiently use somebody else's dentures, glasses or artificial leg.

Projection. Lucid consciential projection constitutes the temporary recuperation of the extraphysical body – a much more evolved body – of the extraphysical consciousness that *lost* it upon undergoing resoma in a soma.

Facts. The facts allow for the elaboration of diverse frameworks that show the historic, or chronological, progress of the altered states of consciousness, animic-parapsychic, or physiological, psychological, parapsychological, projectiological and conscientiological phenomena.

Spiral. Starting along lines of manifestation that are different but interdependent within the same context – or phenomenological complex – and returning almost to the starting point in order to resume the initial steps and start off once again through another opening before us, it can be seen that human manifestations follow the evolutionary spiral, which is inherent to all things.

Manifestations. These manifestations move forward, fall back slightly and continue on ahead, always with small gradual alterations which are more evolved or amplified with other perspectives, with a new look, or new names. All of this occurs according to the trend or the more universal consensus of each period or stage. This ranges from the natural phenomenic appearance of the beginning – or apparent spontaneous generation – up to the new phase of the conquest of technique through an improvement of the performance of the consciousness.

Framework. The following, for example, is a framework of 4 lines of development of interdependent manifestations which interact and clarify the facts within the parameters of the evolutionary spiral, within the last 2 centuries of human history:

1. **Animism:** animal magnetism (mesmerism), energy, suggestion, hypnosis, hypnology (medicine), sophrology, exteriorization of sensitivity, aura, bioplasmatic body, *Kirlian photography* (psychotronics), telekinesis, metal bending, physical effects (physics).

2. **Physical effects:** table turning, telekinesis, materializations (metapsychics), ectoplasm, ectoplasm, energies, parasurgery, parapsychism.

3. **Paraperceptiology:** intellectual effects (psychology), psychophony, psychography, telepathy (parapsychology), clairvoyance, precognition, prophecy, animism.

4. **Acquisition:** physical self-bilocating, bicorporeity, unfolding of the personality, lucid consciential projection, extraphysical parabody, experience outside the human body, second body, OBE (projectiology), psychosoma, *animism-parapsychism*.

Understanding. The phenomena are obviously not altered with more correct words or more pompous labels (semantics). It can be seen that there is *nothing new under the sun*, except for the human consciousness who feels more aware of the interworld or multidimensional realities and is more open to understanding immutable universal laws.

417. COMPARISONS BETWEEN THE SENSITIVE AND THE PROJECTOR

Differential. Although, in practice, it is difficult to separate the performance of the projectionist and the sensitive of any type – given that even a projection assisted by helpers is a well-defined type of parapsychism – 8 radically opposed characteristics that are different between the performance of the sensitive and the projector, as an animist or adept, should be singled out in order for them to be better understood:

1. **Activity.** The sensitive needs to have the receptive, docile, self-aware (without blind subjugation), non-resistant attitude of a *passive* instrument in order to submit him/herself to the communicant extraphysical consciousnesses that communicate through him/her. The projector needs to maintain an *active attitude* of determination in order to control him/herself, remain balanced in the face of the influences of extraphysical and intraphysical consciousnesses, and produce lucid projections by him/herself.

2. **Mediation.** The sensitive performs the same role between extraphysical consciousnesses and intraphysical beings as that performed by an interpreter between the interviewee and the interviewer; by the intermediary between a salesperson and a purchaser; by the contact between a publicity agent and a client; and the public relations agent (contact) between a corporation and the public. The lucid projector dispenses with the qualities of these agents of mediation and performs all tasks directly (eliminating the service of intermediation) and, with his/her presence, goes, sees, experiences and returns, all by him/herself, reporting everything about the extraphysical dimension firsthand, being the reporter, commentator and interpreter all at once. The projector is not necessarily a mediator.

3. **Dimensions.** The sensitive simply operates from the physical dimension to the selfsame physical dimension, because if he/she goes directly to the extraphysical dimension, he/she transforms into or operates as a projector. The projector, in a more complex manner, operates in the extraphysical dimension to the same extraphysical dimension and, from there, to the physical dimension.

4. **Manifestations.** The intraphysical (non-projected) sensitive does not manifest through the projector. The projector can manifest through the intraphysical sensitive.

5. **Relationships.** Parapsychism only allows the individual to speak with extraphysical consciousnesses like speaking with a human (a consciousness in the physical waking state). Animism (human lucid projection) allows the individual to speak to extraphysical consciousnesses as one of them or, in other words, just as an extraphysical consciousness when in the condition of a lucid, projected intraphysical consciousness.

6. **Performance.** The intraphysical sensitive, merely as an intermediary, is sometimes not able to perform the tasks of the extraphysical mentor or helper. The projector can, in part, perform the tasks of the extraphysical helper.

7. **Assistance.** The intraphysical sensitive, aided by the extraphysical mentor, communicates together with it in the physical dimension. The projector, aided by the extraphysical helper, works in the extraphysical dimension.

8. **Parapsychism.** The sensitive is always merely an intraphysical sensitive. The projector can be: a projector-sensitive in the physical body, in the case of traveling clairvoyance, for example; a projector-sensitive in the extraphysical dimension, upon functioning as a sensitive outside the human body; and a projector-communicant upon manifesting through the intraphysical sensitive.

Self-service. By means of lucid projection, the consciousness or the *self of the projector* dispenses with the sensitive who provided the service of contact with the extraphysical dimension in order to thereby perform self-service, making everyone's life easier. In the same way, the intraphysical consciousness gradually frees him/herself from the tyranny of machines, including the human-body-machine, through lucid projection.

Simultaneity. The wiser intraphysical researcher will always be the one who knows how to simultaneously utilize animism (e.g.: voluntary lucid projection) and parapsychism (as with semilucid psychophony) in order to intensify his/her know-how regarding extraphysical realities, playing the role of the psychophone-projector, exteriorizer-projector or ectoplast-projector.

Self-awareness. No one is sensitive of only one type of parapsychism, or an animist of only one animic phenomenon. The intraphysical being develops his/her awareness of the mobilization of consciencial energies. For this reason, the majority of sensitives and animists ignore, repress and block the true extent of their parapsychic potentialities. Through a self-awareness of this problem their development occurs in all directions without barriers or limits of manifestation.

Hetero-insecurity. Mediumship of any type is, by its very nature, less evolved, very unstable and more problematic. It presents highs and lows in its manifestations, which always depend, at the very least, upon two energetically attuned consciousnesses in order for it to occur. This, therefore, transmits an unavoidable and unresolvable hetero-insecurity.

Self-assurance. Animism, with regard to any phenomenon, is, by its very nature, more evolved, far more stable and much simpler. It presents a greater uniformity and stability in its manifestations which depend – purely and invariably – upon the performance of the animist’s consciousness in the mobilization of consciencial energies in order to occur. This thereby offers the guaranty of constant self-assurance.

Bibliography: Greenhouse (636, p. 162), Steiger (1601, p. 106).

418. COMPARISONS BETWEEN LUCID PROJECTION AND PARAPSYCHIC TRANCE

Definition. Parapsychic trance (Latin: *transitus*, passage): the psychophysiological or altered state of mind with marked characteristics, such as reduction in lucidity, suspension of voluntary activity and dissociation of the consciousness which becomes passive to the manifestation of another consciousness through the use of its vehicles of consciencial manifestation.

Synonymy: medianimic trance; mediumistic state; mediumistic trance; mediumization; psychophonic trance; semi-oneiric state.

Types. While the consciousness (or the *self*) of the sensitive travels projected in the psychosoma in a lucid projection, while simultaneously in a parapsychic trance state – which occurs more frequently than imagined – the human body of the sensitive-projector can temporarily be occupied by a benefactor extraphysical consciousness that speaks through the vocal cords, in the case of common psychophony (benign possession), or by an ill consciousness, in the case of assistential experiments in deintrusion. The human body can also remain temporarily emptied (empty brain) with the departure of the projector and benefactor together, within or distant from the physical base. The trance can be spontaneous or induced.

Differential. Among the differences between the conditions of parapsychic trance and lucid projection, the following should be singled out: amnesia, the discontinuity of memory and the partial annulment of the intraphysical consciousness’ defense mechanisms, characteristic of the parapsychic trance.

Experiences. Consciencial projectors generally tend to report other types of parapsychic experiences that occurred with them, either together with or separate from lucid consciencial projections.

Projective. Incidentally, it should be recorded here that a true *projective trance* sometimes also occurs in certain consciencial projections that are not always parapsychic, but in some cases, are entirely animic and positive, as in traveling clairvoyance.

Personalities. Exhaustive scientific tests involving certain physiological concomitants associated with the trance state have been applied to a great variety of personalities while in trance: the *cavalos* (“horses”) of Umbanda; Turkish dervishes; Egyptian fakirs; African witch-doctors; Hindu yogis; Spiritist mediums; Buddhist monks; Voodoo practitioners; the sensitives of parapsychology; the somnambulants of hypnology; and Siberian shamans.

Hybridism. The condition of the projected intraphysical consciousness, or the projective state, allows the projector to be entirely him/herself, with his/her full or integral personal manifestation.

Besides this, it allows the projector to meet extraphysical consciousnesses which are also fully themselves. Strictly speaking, during the parapsychic trance an inseparable mixture of personalities or a parapsychic hybridism occurs: the sensitive intraphysical consciousness is not him/herself, but merely a part of the total hybrid personality that is manifested; the extraphysical consciousness is also not itself, but merely the other part that completes the total hybrid personality which the sensitive allows to manifest. This parapsychic hybridism is the most fragile aspect of the general parapsychic processes. In other words: it is a fleeting benign possession which, like it or not, temporarily alters the two personalities, one based in this dimension and the other based in the extraphysical dimension.

Evolution. Sensitives and intraphysical projectors will inevitably become extraphysical consciousnesses with time. Extraphysical consciousnesses, according to the course of evolution of the consciousness, will become intraphysical consciousnesses and projectors at the appropriate time.

Resomatics. If the extraphysical personality were to manifest itself totally through the sensitive, in an integral and satisfactory manner, in a psychophonic trance, for example, it is possible that many consciousnesses would no longer have any need to pass through resoma. If the extraphysical life of the consciousness were to completely satisfy the dictates of consciential evolution, no average extraphysical consciousness would need to go through resoma, be it an intraphysical projector, or a human sensitive.

Imitation. In summary: the parapsychic trance is a temporary imitation of the upcoming or future resoma for the extraphysical consciousness, just as the lucid human projection phenomenon is an imitation (preview) of the deactivation of the projector's human body (desoma) or his/her inevitable biological death, a future event.

Conditions. With regard to animic and parapsychic conditions, lucid consciential projections can be classified into 3 categories:

1. **Animic.** Animic projections: with an absolute predominance of the lucid projector's will, without any interference from extraphysical beings. Although these can still be spontaneous or paraphysiological, without the lucid interference of the projector's will, they do not cease to be animic.
2. **Parapsychic.** Parapsychic projections: with the ostensive or intangible support of one or several extraphysical consciousnesses, which may be extraphysical helpers (assisted projections) and, in sporadic cases, extraphysical intruders (*intrusive projections*).
3. **Mixed.** Mixed projections: those having varying percentages of animism and parapsychism. In practice, the majority of lucid projections are of this type.

419. PARAPSYCHISM AND LUCID PROJECTION

Parapsychism. Parapsychism is still a providential *psychophysiological crutch* sustaining the acquisition of experiences on the part of consciousnesses. Nevertheless, the more lucid consciousness ends up dispensing with this *crutch* after it no longer needs it – neither for itself nor for others – *the fireworks of ostensive phenomena*, self-promotional shows, audience seductions and religious demagogies that involve other consciousnesses besides itself.

Projection. On the other hand, lucid projection cannot rationally be considered as a simple *crutch* to be discarded at the appropriate time, because it does not constitute a process of mere intermediation, like parapsychism. It is, instead, 1 of 3 basic states of the consciousness in evolution.

States. The consciousness can manifest itself in 3 basic states of existence:

1. **Extraphysical consciousness.** Extraphysical life or that of the extraphysical consciousness, which is lasting and essential.

2. **Intraphysical consciousness.** Human life or that of the intraphysical consciousness, which is ephemeral and segmented.

3. **Projectability.** The life of the projected consciousness, which can be an extraphysical consciousness as well as a human being, being even more transitory.

Fusion. Besides these 3 states of existence, there is the state wherein they are fused or, in other words, the evolved state of continuous self-awareness.

Intervalllic. The intervalllic state of the projected consciousness exists because it opens spaces in 1 of the 2 other basic states of existence, whether extraphysical life or human life. The state of the projected consciousness represents a brief and discontinuous period. It nevertheless occurs together with the other 2.

Coadjutant. In light of the above, it is not, strictly speaking, lucid projection that is a coadjutant to parapsychism, but, on the contrary, parapsychism that represents a coadjutant to lucid projection, the main manifestation for the consciousness.

Power. Parapsychism is a condition, not a power. Lucid projection, besides being a consciential state, also incontestably constitutes a power for the consciousness.

Percentages. In the majority of lucid projections produced nowadays by the intraphysical consciousness, the existence of an animic component and a parapsychic component can be detected. Thus, for example, a projection can have 80% animism and 20% parapsychism, and another can have 30% animism and 70% parapsychism. These percentages vary from projection to projection and from projector to projector.

Evolution. It can be affirmed that, as consciousnesses evolve, the percentage of parapsychism gradually decreases over time, thereby enabling a current estimation of average coefficients (percentages).

Window. The efficient animism of lucid self-projectability – lucid projections performed by the interested individuals who personally experience them – are gradually replacing the process of parapsychism, eliminating intermediaries and dispensing with the messages of third parties. It is not, however, a new means of communication, banishing the other, which is already outdated or antiquated. Each means of perception or expression, human as well as consciential, is its own open *window* to the cosmos. One cannot replace the other.

Duration. Projectability, a parapsychological attribute of the consciousness, must always have existed beyond a certain evolutionary level. Parapsychism must have existed, in the same manner, from the beginnings of the self-awareness of the consciential or intelligent principle. As a consciential state, projectability suggests that it will last much longer, evolutionary speaking, as a consciential resource. Both, however, should continue together throughout history and the string of evolutionary experiences of every intraphysical consciousness who goes through desoma and is reborn again, while bound to the multi-existential cycle of resomas/desomas/intermissions.

Raison. The *raison d'être* of parapsychism as a process of intermediation for oneself or for others disappears with the evolution of the vehicles of manifestation of the consciousness. On the other hand, lucid projection will continue to exist as long as the consciousness utilizes these same vehicles of manifestation.

Conclusion. From the above facts, it can rationally be concluded that lucid projection, besides having an animic origin or being different from parapsychism, will also survive after parapsychism in the evolutionary progression of the consciousness.

Mentalsoma. It is worth stressing that parapsychism is also exercised between extraphysical consciousnesses in extraphysical communities or environments. In this case, the looseness of the mentalsoma of the extraphysical-sensitive-consciousness occurs relative to the extraphysical head (parahead) of the psychosoma, because this consciousness has neither a human body nor a holochakra in that situation (after the second desoma).

Bibliography: Gomes (612, p. 20), Leaf (905, p. 142), Vieira (1762, p. 193).

420. GENERAL CLASSIFICATION OF CONSCIENTIAL PROJECTIONS

Categories. There are a great many shades of lucid projection, depending upon the standpoint from which the experience is classified.

System. Every system of classification is open to doubt, because events which are exceptions to the rule always occur. There are at least 18 different types or categories of projections in general, when specific factors are considered, albeit with some aspects which are evidently redundant:

1. **Quality.** The quality of the perceptions: pure or natural consciential projection; impure or forced consciential projection.

2. **Magnitude.** Magnitude of the projected consciousness: lucid projection; semilucid projection or lucid dream; nonlucid projection, common to all lucid intraphysical beings; projection with continuous self-awareness; pseudoprojection (dreams; simple vision; hallucination; errors in thosenic interpretation); projection with amplified awareness (cosmoconsciousness); mild consciential projection; prosaic consciential projection.

3. **Physiology.** Physiological nature: animic projection (the consciousness projects itself, through its own means); parapsychic projection (with interference from a second consciousness); mixed projection.

4. **Will.** The will of the projector: unintentional projection; programmed or experimental projection; test of capacity; espionage projection (anticosmoethical); voluntary self-projection (active, animic); projection with a predetermined target; crash-projection (unknown target, lost or disoriented projector without a destination).

5. **Participation.** External participation: directed consciential projection (passive, parapsychic); assisted projection (mixed or oneiric-parapsychic); interconsciential assistential projection; educational projection; deintrusive projection or one of assistential solidarity.

6. **Company.** Extraphysical company: solitary consciential projection; joint projection (more than 1 projector); double, triple or group projection; junior projection (infantile); gathering of projected intraphysical consciousnesses.

7. **Process.** Nature of the process: natural consciential projection (spontaneous, fortuitous, occasional); technical consciential projection; empirical consciential projection.

8. **Vehicle.** Vehicle of manifestation or holosomatics: consciential projection in the integral psychosoma alone (without the holochakra); projection in the psychosoma with the holochakra; projection of the holochakra or paraphysiological looseness, without transporting the consciousness (energetic); projection in the partially configured psychosoma, semi-separation; projection in the mentalsoma; projection in the psychosoma and in the mentalsoma, or vice versa, without interiorization or physical awakening of the intraphysical consciousness.

9. **Healthfulness.** Healthfulness of the experience: natural projection; strange projection; intrusive projection; nightmarish projection; ill or pathological projection; depressive projection; stressful projection; feverish projection; sexual or sexosomatic projection; medicinal or pharmacological projection; projection caused by accident; medico-surgical anesthetic projection; odonto-surgical anesthetic projection.

10. **Field.** Relationship with the physical space or proxemics: contiguous projection or one in the physical base; projection in the extraphysical dimension per se; projection in the mentalsomatic dimension; projection without space (mentalsomatic); nearby or *low-flying* projection; distant or *long-range flight* projection.

11. **Coloration.** Coloration of the extraphysical environment: black-and-white consciential projection; multicolor projection (color projection); monochromatic projection or one having a predominance of one color; neutral color projection.

12. **Hour.** With regard to the hour or the timing: matutinal conscial projection; vespertine conscial projection; nocturnal conscial projection; rest conscial projection; conscial projection of nappers.

13. **Time.** The chronological time of the extraphysical events: retrocognitive conscial projection or one referring to a past intraphysical life; previous conscial projection or one which is relative to the past of this human life; conscial projection which is current or simultaneous with the present time; premonitory conscial projection or one referring to future facts. There is a non-uniformity in the passage of time regarding that of the projected state and the human body. In most cases, however, the clock of the projected consciousness runs much more slowly than the clock of the human body. It is worth asking the following question: “Is this related to the speed of the thoughts and actions of the projected consciousness or is it related to physical time, as forecast in the theory of relativity?”

14. **Duration.** Duration of the projective experience: extremely brief conscial projection; brief projection; prolonged conscial projection; conscial projection of an imprecise duration.

15. **Chronology.** Chronology of lucid projections: first conscial projection; sporadic conscial projection; previous conscial projection; consecutive conscial projection; recurring or repeating conscial projection; conscial projection in series.

16. **Rarity.** In increasing order of relevance and, consequently, of rarity of the projective experiments, the following can be classified: nonlucid physiological projections, being the most frequent because they involve all of humanity, without exception; semilucid projection or lucid dream; semiprojection or partial projection; first lucid projection, sometimes the only one in the entire lifetime of the intraphysical consciousness; projections with continuous self-awareness, in series, being the rarest.

17. **Involuntary.** Spontaneous or involuntary projections divided into 7 types: conscial projections occurring while the person is sleeping; projections occurring during surgery, during dental surgery, during childbirth (obviously if the individual is a woman); projections occurring during a violent accident; projections occurring when the person is in intense pain; conscial projections occurring during a serious illness; resuscitative conscial projections occurring in near-death crises or experiences, with the resuscitation of the patient; semifinal projections occurring at the moment of the death of the soma.

18. **Causes.** There are 3 types of conscial projections, according to their causes: spontaneous, voluntary and forced. The *spontaneous* conscial projection is more common and occurs naturally, such as when the person is sleeping; the *voluntary* conscial projection is one which is produced intentionally, generally according to the individual’s own technique; and the *forced* conscial projection occurs due to traumas to the human body which force the intraphysical consciousness (*me*, *you*) to project. In this last type are included impure projections provoked by illness, anesthesia, asphyxia, unconsciousness due to an accident, or the use of psychedelic drugs.

Critical. The critical conscial projection is that which occurs during a crisis, whether an accident, disaster, war or armed conflict, or a catastrophe. Do not confuse the critical projection with projectiocritique.

Exoprojection. The consciousness that projects itself to the extraphysical dimension, but to another celestial body beyond the planet earth, produces an exoprojection, cosmic projection, extraterrestrial projection or one in outer space. Photos of other planets, obtained through space research aid the projector in exoprojections, because these heavenly bodies thereby cease to be merely imaginary mental targets (see fig. 420, p. 1,149).

Immediate. The immediate conscial projection is the variety that occurs without any introduction, preparation, transition or intermediary altered state of consciousness. The individual, in this case, lies down and his/her consciousness (*you*) immediately leaves the human body with total lucidity, directly from the ordinary, physical waking state to the extraphysical dimension. This occurs in instantaneous lucid projections and the escape-projections of intraphysical consciousnesses.

Microprojections. Conscial miniprojections, or conscial microprojections, are discreet, mild experiences of the consciousness which leaves the human body for tenths of a second or for only

1 to 3 seconds. This can even occur while the human body of the projector is in movement, in the ordinary, physical waking state, and does not affect his/her intraphysical existence or physical and mental health.

Microsleep. Conscial microprojection, a natural, paraphysiological state, should not be confused with microsleep, a pathological state which occurs with patients having a tendency toward sleepiness, those who suffer from hypersleep, narcolepsy (hypnolespy), excessive sleep attacks, or sudden, fleeting sleep crises.

Mnemosomatics. The difference between one state and the other is easy to establish: conscial microprojection is generally an isolated fact that allows recall of extraphysical events; microsleep is not accompanied by recall and often occurs dozens of times in a single night's sleep.

Violent. Violent, impure conscial projections are those experiences which are forced by the dramatic circumstances of human life, notably accidents on roads, on mountains, in the air, in the water, through electrocution or asphyxiation.

Circumstances. Due to human attitudes, occupations or circumstances, conscial projections can be divided into 8 categories relating to the moment of their occurrence: the conscial projection of natural sleep; conscial projection from the waking state, in conditions of heightened reasoning (lucidity); conscial projection during surgery, childbirth or tooth extraction; conscial projection due to a violent accident; conscial projection due to excruciating physical pain; conscial projection during a serious illness; conscial projection during near-death experience, in cases of clinical resuscitation; conscial projection at the moment of the deactivation of the soma.

Bibliography: Baumann (93, p. 23), Chaplin (273, p. 210), Crookall (343, p. 15), Flammarion (524, p. 39), Frost (560, p. 113), Imbassahy (782, p. 9), Montandon (1070, p. 227), Muldoon (1105, p. 56), Sparrow (1587, p. 61), Tart (1660, p. 188).

421. BASIC CATEGORIES OF LUCID PROJECTION

Options. The intraphysical consciousness projects him/herself from the human body following different and well-defined actions, according to the vehicle of manifestation, the condition of lucidity and the existential dimension in which he/she operates. The following is a summarized list of the six basic options that are most often encountered:

1. **Holochakra.** The intraphysical consciousness (you) can project his/her holochakra by itself, in the ordinary extraphysical dimension. It is common knowledge that the holochakra is not the seat of the consciousness.

2. **Density.** The intraphysical consciousness can project him/herself in the psychosoma *with* the holochakra, in the ordinary extraphysical dimension, transported *in* and *by* the mentalsoma.

3. **Rarefaction.** The intraphysical consciousness can project him/herself in the psychosoma *without* the holochakra, in the ordinary extraphysical dimension, transported *in* and *by* the mentalsoma.

4. **Coincidence.** The intraphysical consciousness can project him/herself in the mentalsoma, leaving the psychosoma coincident in the human body, dislocating itself only in the mentalsoma, in the mentalsomatic dimension.

5. **Discoincidence.** The intraphysical consciousness can project him/herself in the psychosoma and, soon thereafter, leave the psychosoma discoincident from the human body, in the ordinary extraphysical dimension, dislocating itself solely in the mentalsoma, in the mentalsomatic dimension.

6. **Intermingling.** The consciousness can project him/herself conjugating different types of vehicles, in the various levels of existential dimensions, in an intermingled manner, whether voluntarily, spontaneously without trauma, spontaneously with trauma, alone, assisted by a helper, in an integral manner or in a partial manner. The conditions can vary even further according to the influence of many other factors, such as degree of lucidity, discontinuity, blackout, duration and intraconscial balance. Many different types of projectiological phenomena can thereby be understood: projection in general, traveling clairvoyance, physical bilocation and others.

Levels. It should not be forgotten that the ordinary extraphysical dimension, as well as the mentalsomatic dimension, present different levels of *density* and are reciprocally joined to each other in an instantaneous manner, according to the attributes and performance of the projected consciousness, which may or may not be able to promote its passage between dimensions or frequencies.

Specific. The following are 6 more technical categories of specific consciential projections:

1. **Edaphoprojection:** consciential projection in subcrustal areas.
2. **Nephoprojection:** consciential projection in the psychosoma produced by the intraphysical consciousness.
3. **Oligoprojection:** consciential projections of an extremely short duration, some seconds at most.
4. **Pedoprojection:** consciential projection of the miniprojector or, in other words, of a child.
5. **Podoprojection:** partial projection wherein only one parafoot or one paraleg of the psychosoma leaves the human body.
6. **Chioprojection:** partial projection wherein only one parahand or one para-arm of the psychosoma leaves the human body.

Ample. The rare *broad-spectrum* consciential projection is the variety in which the projected intraphysical consciousness has various basic extraphysical experiences at the same time, such as: seeing his/her own inactive human body on the bed; analyzing the silver cord; meeting a helper; volitating; lucidly visiting another extraphysical environment distant from the physical base; encountering extraphysical consciousnesses besides the helper; having a prolonged lucid projection, in the extraphysical dimension, for longer than a half-hour. All this occurs spontaneously and naturally, without the use of any drugs.

Bibliography: King (845, p. 117), Steiger (1601, p. 4), Vieira (1762, p. 218).

422. EXTRAPHYSICAL LUCIDITY-SUBSEQUENT RECALL BINOMIAL

Definition. Extraphysical lucidity-subsequent recall binomial: the set of two basic conditions that are indispensable for the intraphysical consciousness in order for it to obtain a fully satisfactory lucid projection outside the human body.

Synonymy: experience-recall consciential condition; indispensable projective conditions.

Classification. From the perspective of extraphysical lucidity-subsequent recall binomial, human lucid projection experiences can, both in theory and in practice, be classified into 3 well-defined categories: the lucid, recalled consciential projection, the lucid, unrecalled consciential projection, and the nonlucid, unrecalled consciential projection.

1. **Lucid recalled.** The lucid, recalled projection of the intraphysical consciousness – whether projected in the psychosoma or the mentalsoma – is the variety in which the consciousness enjoys full extraphysical lucidity and later presents a reasonable recall of the extraphysical events that he/she witnessed and/or participated in.

Types. The lucid, recalled consciential projection can be of 2 types: the projection with consciential blackout, which is the most common; and the projection with continuous self-awareness, which is the least common, or the rarest.

2. **Lucid unrecalled.** The lucid, unrecalled projection of the intraphysical consciousness – whether projected in the psychosoma or the mentalsoma – is the variety in which the consciousness enjoys full extraphysical lucidity, but subsequently does not recall the extraphysical events that occurred during the period he/she was absent from the human body. This is a lucid projection only in the extraphysical dimension.

Intuition. In the case of lucid, unrecalled conscial projection, extraphysical experiences can, exceptionally, blossom with the passage of time in the ordinary, physical waking state, through the providential channels of common intuition.

Predisposition. Intuition operates, in many cases, like a simple *mnemonic predisposition*. The intraphysical consciousness, having had experience with the object-theme in focus – while projected from his/her human body, for example – keeps his/her integral archive fed with ideas on this same theme. Later, if the pointer of the consciousness tunes into the frequency of that same theme, this predisposition serves to modulate and prepare the mnemonic reflex, like an enrichment. If this reflex occurs all at once, *en bloc*, then the discovery – the *eureka*, the flash of the *new* or *original* idea – blossoms abruptly. In most cases, however, the recall flows in installments, slowly, gradually, piece by piece, fragment by fragment and does not generate so much emotional impact.

Experiences. Not only do we *know more* than we think: we have already had *more experiences* than we perceive and we store many *more memories* (holomemory) than we ordinarily recall.

Serenissimi. Extraphysical facts indicate that even *serenissimi* are not yet able to recall all of the events collected in their integral memories or holomemories as evolutionary conscial principles that have even passed through the subhuman phase.

Option. The extraphysical helpers affirm that, at a certain point in the intraphysical projector's conscial development – of natural, non-forced projections – with regard to aiding (assisted projections) the extraphysical experience (lucidity)-subsequent recall binomial, they must almost always opt, through extraphysical energetic exteriorizations, in favor of one condition or the other, thereby sacrificing one of them.

Mnemosomatics. It becomes very difficult for the consciousness to have both conditions interwoven or, in other words, to always simultaneously use two memories, which are healthy and clear, of two different existential dimensions. In this case, the extraphysical helpers generally prefer or give priority to the condition which is more important, wherein the intraphysical being has his/her full experiences outside the human body and ceases to have clear recollection of those same experiences, or even forget them completely.

Evidences. This reaffirms 3 well-known projectiological evidences, given that the *first* of them is in the deep, indispensable interrelationship that exists between the experiences of the projected consciousness and the condition and nature of the subsequent post-projective recall.

Confirmations. Clarification performed by the extraphysical helpers also confirms a *second* evidence: recall of the lucid projection experience gradually becomes more difficult for the veteran projector when he/she spends more than 60 minutes and, many times, even spends over 30 minutes of condensed extraphysical experiences with full awareness in a single, continuous lucid departure. The same clarification also confirms a *third* evidence: if it becomes so difficult for the intraphysical consciousness that remains outside the human body (microcosm) and the dense physical dimension (physical universe or macrocosm) for only one or a few hours to simultaneously interconnect two basic conscial dimensions, the extraphysical and the physical, how difficult will it be for the extraphysical consciousness to communicate when it spends weeks, months, or even worse, entire years, distant from the terrestrial crust without a human body and even without the silver cord or the holochakra? Experiences indicate that this fact has some influence on the process of forgetting the past, which is inherent to the resoma of the extraphysical consciousness.

3. Nonlucid unrecalled. The nonlucid, unrecalled projection is that in which the consciousness projects from the human body – even being able to participate as an energy donor in extraphysical assistential tasks – although not obtaining adequate, functional extraphysical lucidity. It obviously does not, for this reason, have subsequent recall. This category, strictly speaking, is not a lucid projection.

Unconscious. Nonlucid, unrecalled conscial projection is the same common, unconscious conscial experience that occurs, for example, during the condition of natural sleep, which happens to the entirety of humanity every night, in which every intraphysical consciousness leaves the state of coincidence of the vehicles of conscial manifestation. Nonlucid conscial projection creates the

extraphysical zombie. Nonlucid consciential projection, or projection without recall, is traveling clairvoyance.

Awakening. Because of nonlucid projections, a paraphysiological occurrence that affects all members of humanity, the following is a rational, decisive recommendation for neophytes interested in projectiology, whether youths or adults: *Awaken the lucid projector that sleeps within you.*

Bibliography: Vieira (1762, p. 145).

423. FIRST LUCID PROJECTION

Definition. First lucid projection: initial experience of the projector's lucid consciousness outside the human body, an occasion in which he/she enters into *projectiocracy*.

Synonymy: first semiphysical projection; once-in-a-lifetime-projection; primoprojection; projective initiation; projector's debut; shock-projection.

Initiations. According to the principles of social anthropology, it can be affirmed that there are, for example, 9 different, basic categories of real initiations that are available to the intraphysical consciousness, depending upon whether the individual has a male or female soma:

1. Circumcision (boy) or the removal of the prepuce.
2. The first emission of sperm (young man).
3. The first shave (man).
4. Menarche (young woman).
5. Deflowering (woman).
6. Conception (pregnant woman, primigravida).
7. The first parturition (primipara).
8. The first parapsychic trance (sensitive).
9. The first lucid consciential projection (projectionist).

Importance. Of all the types of human initiations, or rebirths to a new social status, the most important, without a doubt, as it is the most decisive or the most important for knowledge of oneself, is lucid consciential projection.

Rarity. Up until this point in human history, the majority of intraphysical beings pass through the first 7 animal initiations with ease; few experience the eighth initiation; very few go through the ninth and last test on the list. Unfortunately.

Last. In most registered cases, lucid projection occurs only once during the entire intraphysical life of a person who is not accustomed to parapsychism, simultaneously constituting the first and the last experience or, in other words, the once-in-a-lifetime-lucid-projection.

Characteristics. Not all characteristics of consciential projections are the same with regard to the experience of each debuting-projector. Nonetheless, the following 3 somewhat frequent points can be highlighted:

1. **Desoma.** The thought of having gone through desoma.
2. **Thanatophobia.** Excessive fear (thanatophobia).
3. **Extraphysicality.** The incontestable sensation of being outside the human body.

Inexperience. The following are extraphysical actions that show the inexperience of the projected intraphysical consciousness and commonly occur in the first lucid consciential projection:

1. **Furniture.** Feeling that movements are impeded because of the physical presence of furniture and human constructions.
2. **Parahands.** Attempting to use the extraphysical hands (parahands) to transport objects.
3. **Parafeet.** Using the extraphysical feet (parafeet) when moving.
4. **Walking.** Walking directly on the ground, pavement and floor, without gliding or volitating.

5. **Stairs.** Descending or ascending a flight of stairs just like an ordinary person.
6. **Walls.** Stopping at walls and fences.
7. **Doors.** Attempting to open doors in order to go to another room.

Lucidity. The abovementioned attitudes, which illustrate the inexperience of the projected intraphysical consciousness and his/her ignorance regarding the capacities of the vehicles of manifestation of the intraphysical consciousness can, in many cases, indicate a reduction in the quality of extraphysical lucidity in the situations of experiences outside the human body.

Phenomenon. No one needs to deeply understand a phenomenon in order to experience it. In other words: the individual can experience it in an unconscious or semiconscious manner. Generally speaking, we all breathe without thinking deeply about this fact. Consciential projection is also included in this reality: there are legions of projectors who are completely ignorant of their first spontaneous lucid projection.

Relief. In the first unique lucid projection experience, the individual is almost always lost, confused, searching for words to describe the extraphysical experiences, endeavoring to understand and explain the observations and experiences based on the familiar. The person feels relieved upon knowing that his/her experiences are not unique, and have been told and retold in various parts of the earth, in different times, civilizations, societies and languages.

Acceptance. Due to the extremely individual nature of lucid projection, it is sufficient – in certain cases – for a person to have a single major lucid projective experience in order to convince that individual about extraphysical realities, thereby enabling a reduction of the phase of opportunistic explanations regarding the full acceptance of the phenomena, as has occurred in different scientific fields with so many phenomena that are now readily accepted. The following are 5 examples:

1. **Circulation.** The reluctance and controversies that initially arose regarding the acceptance of the theory of blood circulation.
2. **Heliocentrism.** The hypothesis of heliocentrism.
3. **Hypnosis.** The reality of hypnosis.
4. **Meteorites.** The existence and the falling of meteorites.
5. **Microbiology.** The fact of the existence of bacteria that cause illnesses.

Quality. A single high-quality lucid projective experience can nevertheless have definitive results and deeply mark the intraphysical consciousness for the rest of his/her human days on earth. This can even make overall changes in the way that he/she perceives human existence and the cosmos. This fact demonstrates that the number of lucid projections is relatively unimportant, the quality of the consciential experience always being of greater value.

Causes. The first lucid projection can be classified into 3 categories, according to its causes:

1. **Spontaneity.** The first spontaneous lucid projection.
2. **Assistentiology.** The first lucid projection assisted by an extraphysical helper.
3. **Volition.** The first lucid projection provoked by the will of the novice projector.

Primer. The first projection can serve as a primer or basic handbook of projectiology research for the more intelligent novice projector. It can also function as an efficient stimulating or triggering factor for other lucid projections. For example: brief general anesthesia during minor dental surgery can motivate the projector-patient to become an active projector.

Triumphalism. The first lucid projection can generate a compulsive interest regarding the issue and sometimes generates a spirit of triumphalism in the adult projector, notably when it is produced voluntarily, bringing sterilizing consequences and even an early recess to his/her experimentations. For this reason, primary, irrational triumphalism should be avoided and substituted with the intraphysical consciousness' sincere desire to improve him/herself in new experiences, maintaining an open mind.

Freedom. The *prisoner's profession* is freedom or, in other words, freedom is automatically placed at the forefront of everything that he/she thinks. This also occasionally occurs with the

intrapysical lucid projector (*a human prisoner*). After the first impactful lucid projection, now that this freedom has been discovered and identified, the intrapysical consciousness automatically places extrapysical projective freedom – which he/she just became aware of – at the forefront of everything he/she thinks about, thereby desiring escape from the physical restriction imposed by human life.

Uterus. Strictly speaking, the uterus is the first intrapysical base of the human consciousness in his/her initial projection, or the first pre-biological projection, soon after embryonic conception, prior to parturition. There are, however, first lucid projections that only occur after parturition, in the initial months of human existence or in the first years of ordinary physical life.

424. DOUBLE CONSCIENTIAL PROJECTION

Definition. Double consciential projection: projection of the intrapysical consciousness in 1 vehicle of manifestation and, soon thereafter, in another, either the psychosoma or the mentalsoma, or vice versa, without the interiorization of that selfsame consciousness in the human body for the duration of the experiment.

Synonymy: 2-stage projection; biprojection; extrapysical bilocation; multiple projection; physical-extrapysical trilocation; projection by 2 vehicles.

Types. Double projection can be produced through two different extrapysical operations, each one having 2 distinct stages: direct double projection and inverse double projection.

1. **Direct.** In direct double projection, the intrapysical consciousness (you) projects from the human body in the psychosoma and silver cord, in a first exteriorization or first stage. Then, leaving the psychosoma *emptied of the consciousness* outside the human body, you leave in the mentalsoma and golden cord, in a second exteriorization or second stage.

2. **Inverse.** In inverse double projection, or double projection through coupling, in the first stage, the intrapysical consciousness (you) projects in the mentalsoma and golden cord, leaving the psychosoma emptied and the silver cord *inside* the human body. Then, in the second stage, the exteriorization of the psychosoma and the silver cord occurs or, in other words, the isolated psychosoma quickly leaves the human body and couples with your already projected mentalsoma through the force of the golden cord.

Passport. It is worth observing that when the mentalsoma is projected in an isolated fashion, by itself, you remain in the mentalsomatic dimension (with the consciousness, obviously). The act of the psychosoma joining with the mentalsoma through the golden cord, in these conditions, shows that the golden cord is the passport of the consciousness, allowing it to always pass from the extrapysical dimension, per se (the paratropospheric dimension, for example), to the mentalsomatic dimension, and vice versa (see fig. 424, p. 1,150).

Possibilities. In double projection, instead of the 2 vehicles – the psychosoma and mentalsoma – being integrated into a coincident whole, both temporarily remain separated and isolated. The direct or indirect, conscious or unconscious general command is always maintained by you, or your consciousness (hyperacuity).

Consciousness. It should not be forgotten that you, the consciousness, invariably remain in the mentalsoma during *all* operations, stages and categories of the fully lucid, semilucid or nonlucid consciential projections of intrapysical beings, whether exteriorizing your vehicle of manifestation by way of the silver cord or the golden cord.

Impossibilities. When the consciousness reaches the second stage of the direct double projection, it becomes almost impracticable for it to touch or command the physiology of its own human body because a discrepancy, break in continuity, hiatus or interpolation is established in conditions that are

completely different in their nature, thereby not allowing direct contact. In this case, the consciousness temporarily lacks its *bridge* or its connecting elements – the psychosoma and the holochakra – remaining *bound* to the parabrain (of the psychosoma) by way of the golden cord.

Dimensions. In double projection, the consciousness not only operates with 2 vehicles of manifestation, but also transfers itself through more than 2 existential dimensions, or vibrational gradations. In other words, it passes from the physical dimension through the extraphysical dimension per se all the way to the mentalsomatic dimension in a successive manner, sometimes in tenths of a second, mobilizing its energies during these operations until resuming the state of normal coincidence of all vehicles of manifestation inside the human body.

Helpers. The occurrences of double projection, whether semilucid or completely lucid, are mostly projections which are assisted by extraphysical helpers. In instances of direct double projection, the extraphysical helpers make themselves visible at a vibratory or dimensional level corresponding with the frequency or density of the psychosoma that is isolated and *emptied of the consciousness*.

Sensitive. The phenomenon of double lucid projection occurs with relative frequency, but is not always well understood or conveniently interpreted due to the unawareness or inexperience of the intraphysical projector. The majority of reports on this phenomenon comes from psychophonic sensitives or consciential energy exteriorizers during the performance of extraphysical assistance. In this case, the assistance can even be intended for the sensitive him/herself who, remaining in the state of punctiform consciousness, observes the intervention or direct treatment performed by helpers upon his/her isolated psychosoma, which is emptied of the consciousness, aiming to cleanse energetic alterations that are provoking disturbances (energetic blockages or imbalances) in his/her human body.

Holochakra. In the extraphysical phenomena of exteriorization of the consciousness in the mentalsoma, in the exteriorization of the isolated psychosoma, in the coupling of the psychosoma with the mentalsoma and in the final interiorization of a projective session, the psychosoma – which is always the intermediary vehicle in double lucid projections – can be more or less dense, laden or unladen with the energies of the holochakra.

Trilocation. Double consciential projection is also called *physical-extraphysical trilocation* because, while the intraphysical consciousness remains headquartered, active and lucid in the mentalsoma or, in other words, in the mentalsomatic dimension, the empty psychosoma remains in the paratropospheric dimension or extraphysical dimension per se, and the inactive human body remains in the physical dimension with an *empty brain*.

Trilocators. The consciousness, in this case, does not divide into 3, but simultaneously has 3 of its vehicles in 3 different consciential *locations* or environments. Many bilocators also operate as trilocators (trilocation projectors).

Isolation. In summary, the following two complex conditions occur in this context:

1. **Holochakrology.** The holochakra can project itself alone, in an isolated manner, always without the consciousness. The consciousness remains in the human body or projects itself in the psychosoma or in the mentalsoma.

2. **Psychosomatics.** The psychosoma can be left alone and isolated outside the human body. But in this case, the consciousness remains projected in the isolated mentalsoma, never staying in the human body without the psychosoma and mentalsoma.

Biprojector. The individual who produces double consciential projection is called a *consciential biprojector*.

Note. Lucid, double consciential projection or physical-extraphysical trilocation should not be confused with physical multilocation or physical translocation, two phenomena perfectly distinct from each other, which are analyzed in other chapters of this book.

425. EDUCATIONAL CONSCIENTIAL PROJECTION

Definition. Educational consciential projection: an extraphysical experience sponsored by one or more extraphysical helpers in order to transmit instructions or teachings to the projected intraphysical consciousness.

Synonymy: class-projection; didactic consciential projection; extraphysical initiation; extraphysical test; ideogenetic consciential projection; ideogenetic consciential projection; pedagogical consciential projection.

Helper. In the educational consciential projection the helper can be present and act visibly or invisibly to the projected projector. Sometimes it is only heard or its presence is sensed, without being identified by the projected intraphysical consciousness, because it does not show itself in a tangible or ostensive manner in that extraphysical dimension of manifestation.

Adept. As a parapsychic occurrence, the educational consciential projection speaks in favor of the actual existence of the psychophysical relationship between the active, intraphysical adept and the extraphysical mentor, which is referred to in ancient occult, esoteric or parapsychic texts.

Class-projection. The class-projection, aided by a teacher-helper – which may or may not be visible and generally instructs the *student-projector* on themes regarding exchanges between consciential existential dimensions – is common to sensitive-projectors that have intense and evolved paraperceptive capacities.

School. Upon acquiring a greater body of extraphysical experience, the projector can eventually attend schools in extraphysical communities on a regular basis, during certain periods of his/her human existence, according to the similar testimonies of multiple experimenters with advanced knowledge and extraphysical agility.

Symbolic. In order to improve recall, the projector often receives extraphysical classes through an exteriorization of morphothosenes or symbolic consciential projections and thinks that he/she has had dreams that require interpretation.

Recesses. According to the extraphysical helpers, those who study lucid projection with perseverance or promote extraphysical assistance with dedication – such as penta practitioners – need to project frequently in order to maintain correct trains of coherent, firm, unswerving thought. In these cases, the extraphysical helpers cooperate in order for the periods of recess of lucid projections to be rarer and/or shorter.

Purposes. The purpose of class-projections is to instruct us and increase our body of knowledge about the structure of the universe, the nature of existential realities and the manifestation of natural laws. This is done in order for researchers of truth to free themselves from the chaos of specific concepts stemming from great amounts of the most contradictory or idiosyncratic information and ideas that exist in the traditions, reports and texts (ancient and modern) of the cogitations and lucubrations of human thought.

Mentalsoma. Class-projections, when occurring while the intraphysical consciousness is projected in the mentalsoma, are superior to others and have greater positive results. In these cases, however, recall is scattered, arriving gradually over time, almost always intuitively.

Hemispheres. The contemporary individual's cerebral hemispheres still do not permit the direct, integral, *en bloc* mnemonic filtering of a great volume of ideas belonging to the registers of the holomemory or our holobiography from the mentalsomatic dimension all at the same time.

Bibliography: Crookall (343, p. 99), Crouzet (344, p. 107), Leadbeater (901, p. 306), Monroe (1065, p. 131), Muldoon (1105, p. 148), Schul (1524, p. 84), Sculthorp (1531, p. 26), Sherman (1551, p. 195), Steiger (1601, p. 123), Vieira (1762, p. 137), Yogananda (1894, p. 307).

426. THEORY OF INTERMISSIVE COURSES

Definition. Intermittive course: the set of subjects taught in classes, according to programs planned in series, adapted to the different levels of the students of *materiology*, or *holoresomatics*, during the intermissive periods (intermissions) of desomant consciousnesses.

Synonymy: multiexistential certification course; interexistential course; pre-resomatic course; intermissive research internship; previous mini-resoma; intermissive training; resoma entrance examination.

Paragenetics. According to the theory of existential seriation, every human personality, in this evolutionary phase of *Homo sapiens*, on earth, is already reborn with a respectable stock of (innate) knowledge through paragenetics.

Aptitudes. What distinguishes one person from another is one's deficient or enriched stockpile of pre-science or innate aptitudes resulting from conquests achieved prior to rebirth. This is valid for all consciential principles, even subhuman or pre-human intraphysical beings (simple consciousnesses), to a lesser degree, such as: dogs, horses, elephants, chimpanzees, dolphins, whales.

Pre-science. A greater level of pre-science of the extraphysical consciousness that undergoes resoma signifies a greater freedom from the rigidities of genetics, the determinism of the basic laws of the universe, the influence of mesology, all types of inner needs and many powerful variables that act upon the consciousness which is restricted in the resoma process, being stripped of its major cons.

Intermission. Intermission is the extraphysical interval occurring between two consecutive human lives of the same extraphysical consciousness. Every intraphysical consciousness has already experienced as many *pre-somatic* intermissions as his/her previous human lives. He/she will inevitably go through another *post-desomatic* intermission upon leaving the human body in the final projection or desoma.

Visits. Human and lucid projectors, in the most diverse times and locations, describe their occasional visits to intermissive courses as auditing students. These educational extraphysical excursions give the consciousness an overall vision of consciential life and the existential program with the perspective of *that side*, in a multidimensional manner.

Reports. The visiting lucid projectors mention the existence of multiple extraphysical realities, such as the following 6:

1. **Schools.** Paramaterial educational establishments in communities of like-minded beings.
2. **Faculty.** Faculties of helpers, petifree consciousnesses, evolutiologists and even *serenissimi*.
3. **Para-students.** Student bodies of *resident* para-students.
4. **Rehearsals.** Extraphysical consciousnesses preparing for resoma, which are personifying *simulated* lifetimes, in the manner of theatrical rehearsals and simulated juries.
5. **Morphothosenes.** Transcendent works made from the morphothosenes of evolved mental co-creators.
6. **Replicas.** Installations of exact replicas or living, functioning maquettes of varied human environments.

Objectives. There are various levels of intermissive courses. Four basic objectives can be singled out in the advanced intermissive course:

1. **Evolution.** They maintain self-motivation in the acceleration of the individual's own consciential evolution.
2. **Lifetime.** They use the upcoming human life efficiently, eliminating repetitive experiences or dispensable self-mimicry.
3. **Tasks.** They perform enlightening, predetermined tasks, dynamizing areas of personal, group and collective research.
4. **Planning.** They fit personal intraphysical existences together, according to a retrocognitive perspective, in a single continuous evolutionary line that was previously technically planned in agreement with the directives of the evolutiologist of the karmic group, as well as the individual's existential program relative to the existential programs of evolutionary colleagues.

Characteristics. The candidate to resoma, having been admitted to the advanced courses of specialized *para-education*, presents 4 meritorious characteristics or prerequisites regarding its evolutionary competence:

1. **Holomaturity.** The candidate has achieved para-adulthood or the extraphysical holomaturity that is feasible, neither being in nor presenting the condition of *parachildhood* or infantilization.
2. **Desomatics.** The candidate has passed through the shock of *second desoma*, or deactivation of the holochakra.
3. **Self-discoincidence.** The candidate no longer experiences *locked* human lives or those devoid of lucid consciencial projections.
4. **Migrations.** The candidate does not have a *critical*, decisive human life, or one which is subject to imminent, mutilating, interplanetary extraphysical migrations or life with the impositions of *thosenic ruptures* between kindred extraphysical consciences in the evolutionary group. This is a process that is still active and uninterrupted on this planet.

Explanations. The hypothesis of attempted intermissive courses serves to amplify educational philosophy, challenging contemporary educational theories. It explains various occurrences, such as these 3:

1. **Students.** The following were students of intermissive courses: the majority of precocious children or child prodigies; an extensive number of superendowed youths in general, who have specific innate aptitudes in many areas of knowledge; those referred to as being *illuminated* by the condition of cosmic consciousness or cosmoconsciousness; sensitives with various kinds of parapsychism; and a variety of the greatest benefactors of humanity since the seventeenth century.
2. **Teachers.** The most outstanding students, after very successful lives, as existential completists (existential completism), become teachers of intermissive courses.
3. **Echelon.** The first echelon of pre-serenissimus workers, who go through resoma aiming toward the general improvement of the collectivity, is composed of former teachers of the intermissive course.

Didactics. Education is the basic tool for conquering evolution. The facts indicate the improvement of intermissive courses with a more complete methodology. A greater number of the better students are coming to dense matter.

Mandates. There are advanced workers with existential programs or mandates that are executed over 3 consecutive human lives, there being a connection between the 3 experiences.

Generations. The degree to which this will positively influence humanity in the near future can be forecast when the *tenth generation* of former students and former teachers, for example – arriving from intermissive courses which are correlated, active and interwoven – are operating unflinchingly, with and among themselves (intrapysical consciences).

Curricula. The following are 26 themes of classes and pararesearch that are included in the curricula of advanced intermissive courses, listed in alphabetical order by subject:

1. **Clarification task.** The consolation task versus the clarification task.
2. **Conciliations.** Experiences with more heteroforgiving justifiably cosmoethical self-sacrifice, in view of the group existential programs.
3. **Cosmism.** Temporary, *parascientific* excursions to other inhabited planets.
4. **Cosmoethics.** Cosmoethics which is applied or experienced in any consciencial dimension.
5. **Derepression.** The derepression and *debrainwashing* acceleration technique.
6. **Evolutiology.** Multiexistential self-awareness regarding prolific lifetimes.
7. **Experimentology.** Extraphysical approaches versus intraphysical approaches.
8. **Extraphysical clinic.** Fundamental reasons and causes for opening an active extraphysical clinic.
9. **Extraphysiology.** Lucid and useful projectability (animism) in the intermissive period.
10. **Freedom.** Maturation of personal free will within the karmic group.
11. **Genetics.** Healthy coexistence with genetics in relation to one's own paragenetics.

12. **Holochakrology.** Consciential energetic self-mastery in intraphysical life.
13. **Hyperacuity.** Holomaturity when immersed in dense matter (cons).
14. **Intermissiology.** Useful parapsychism in the intermissive period.
15. **Intraphysiology.** Lucid and useful projectability in the intraphysical state (pangraphy).
16. **Megafraternity.** Prodigality versus pure, exemplified megafraternity.
17. **Mentalsomatics.** Improvement and deepening of fundamental self-reflections.
18. **Mesology.** Healthy self-control of mesology (environment or ecology).
19. **Mnemosomatics.** Acceleration or dynamization of self-retrocognitions.
20. **Multidimensionality.** Interdimensional self-awareness.
21. **Panoramic.** Multimillenary panoramic vision and multiexistential retrocognitions.
22. **Penta.** The daily practice of penta with cosmoethical naturality.
23. **Polykarmology.** Healthy predisposition toward polykarma (holokarmology).
24. **Projectiology.** Parapsychism which is useful while the intraphysical consciousness is in the projected state.
25. **Serenology.** Applied serenology stemming from the petifree condition.
26. **Theorice.** Many types of pre-somatic theorice exercises.

Failures. The above notwithstanding, a high percentage of operational losses and failures is assumed, on the part of the workers that took intermissive courses. This affects $\frac{3}{4}$ of the various echelons of mandates which are designated or existential programs which are articulated prior to resoma.

Disturbances. The rigidity of genetics, the power of hereditariness, the consciousness outfitted with an entirely new cellular body, the draconian amnesia of physical infancy, the multifarious animal affectionate involvements and the illusion-temptations (*maya*) of material life, regrettably disturb or annul our efforts at renewal as resomants.

Self-mimicries. We end up repeating past, inefficient, instinctive experiences *ad nauseam* in a senseless vicious circle (the law of least resistance), retarding our personal evolution relative to our respective karmic groups or evolutionary colleagues.

Obstacles. The following are 10 common obstacles to the realizations which are predetermined by the elementary presomatic courses. They arise in the first, preparatory phase of human life and reflect upon the second, executive phase. They are listed here in chronological order:

1. Schooling.
2. Profession or job.
3. Karmic group of the *nuclear family* (mother, father).
4. Marriage.
5. Children (progeny).
6. Profession or job of your mate or the partner in your evolutionary duo.
7. Karmic group of the *extended family* (in-laws).
8. Trips.
9. Financial conditions.
10. Human or social interests in general.

Promises. The entire 100% of intermissive course students and student-workers make promises to themselves and are dispatched to resoma with salutations and pompous titles, such as: “messengers of justice”; “pioneers of the ideal”; “ambassadors of peace”; “sculptors of the spirit”; “leaders of renewal”; “messengers of good”; “ministers of truth”; “missionaries of redemption”; “workers of knowledge”; “priests of love”; and many others. Nevertheless, the majority remain merely in this initial poetic promise. A million words are worth far less than a single fact.

Retrocognitions. Your retrocognitions of previous intraphysical lives are less relevant than the recollections of your *intermissive predispositions* or, in other words: that which you studied in your pre-somatic course, even when it is rudimentary.

Conscientiocentrolgy. The International Institute of Projectiology and Conscientiology (IIPC) – a school of conscientiocentric and universalistic consciential research – endeavors, through a projectiological educational system, to develop teachers who employ theoretical and practical approaches using their mentalsomas and bioenergies, serving as *retrocognitive agents* for intraphysical consciousnesses.

IIPC. The aim of the IIPC is to reactivate – without hypnosis and with self-critique and heterocritique – the deep, integral, causal (holomemory) extracerebral memory of their own intermissive courses, starting from the students' mentalsomas. This makes their *pre-curricular science* or innate ideas, which are preserved through paragenetics, blossom in the present.

Self-analysis. If you wish to become familiar with your potential intermissive course, you should analyze, with great self-critique, whether or not at least 5 of these 10 personality traits (strong traits) are present in yourself and verify their degree, extent, vigor and quality:

1. **Doubts.** An inner absence of mortifying philosophical doubts during adult life.
2. **Self-conscientiality.** The certainty of immortality, the awareness of the eternal nature of your life as a human consciousness.
3. **Use.** A deep inner aspiration to make full use of intraphysical life, regarding personal evolution, seeking discernment and knowledge.
4. **Conscientiality.** A natural acceptance of the theory of existential seriation, or the continued alternation of intraphysical life-intermissive life, as a given which is incorporated in daily existence.
5. **Inspirations.** A sense of illuminating inspirations about the meanderings of personal destiny, your professional or subsistence career, in other words: human life itself.
6. **Assistentiology.** Spontaneous self-motivation for the research and performance of beneficial parapsychic practices (self-lucid cosmoethical solidarity).
7. **Parapsychism.** Animic-parapsychic self-perceptions through phenomena which may even be sporadic or rare, but are convincing or unforgettable for oneself.
8. **Existential program.** Undefined though persistent intuitions about an existential program that you are to realize, whether alone or in group (group karma).
9. **Self-retrocognitions.** Self-retrocognitions which are coherent, enriching and not compulsive or mortifying.
10. **Self-awareness.** General self-aware identification regarding the cosmos, life and the natural order of the universe.

Will. If, however, you do not identify even 5 of these 10 strong traits within your consciential micro-universe and nevertheless insist on participating in an extraphysical course in your next intermission, do not be discouraged. Take the first steps toward achieving this objective. Intermissive courses are accessible to all motivated consciousnesses. Improve what you can in your existence while you still direct a human body with lucidity, relative health and freedom. Apply maximal willpower in the correction of personal errors, starting immediately.

Right. The right to know ourselves and act upon ourselves is nontransferable and completely our own or belongs to each of us.

Shock. As an advanced idea that is completely surrealistic at first glance, the hypothesis of the intermissive course collides with the mechanistic Newtonian-Cartesian paradigm of conventional science, as well as with the reader who is fearful regarding human ambiguities. This attitude makes it so that the individual ends up becoming entrenched within his/her ego defense mechanisms. However, if the individual goes more deeply within him/herself, in a consciential self-examination, he/she will discover the logical bases of this set of concepts, which are practically inevitable considering the basic premise of evolution of the consciousness over a long series of existences or lifetimes.

Inexperience. The individual who, in principle, does not accept this theory has obviously not yet attended an advanced intermissive course.

Logic. Intermissive courses have clear, indisputable uses, with relation to consciential evolution. The practical reality of intermissive courses is a question of logic and a simple awakening of the intelligence. If there is extraphysical life, there must be educational courses. There is no life without education.

Anticosmoethical. In fact, the projected human projector ends up finding intermissive courses through educational consciential projections. Further more: this same veteran, lucid projector also comes across the extraphysical training courses of extraphysical hypnotist-intruders, which even include the satellites of intruders (not to mention extraphysical blind guides), in crustal, paratropospheric, anticosmoethical, or shadowy dimensions. From this arise the inspirations of lawless gangs and schools of organized crime (*societas sceleris*).

Question. If there are courses of pathological or sick education in extraphysical dimensions, why would there not also be healthy extraphysical educational courses?

Bibliography: Vieira (1762, p. 22).

427. NATURAL CONSCIENTIAL PROJECTION

Definition. Natural consciential projection: dis coincidence of the vehicles of manifestation of the human consciousness occurring in a spontaneous manner, without provocation on the part of the lucid practitioner or, in other words: without external stimulation.

Synonymy: habitual projection; natural dis coincidence; N-OBE; self-generated lucid projection; spontaneous projection; unforced lucid projection; unintentional lucid projection.

Classification. Natural consciential projection can be classified into two primary or basic categories:

1. **Nonlucid.** *Nonlucid* natural projection, occurring more commonly at night, during sleep, affects all members of humanity.
2. **Lucid.** Spontaneous, lucid natural projection, experienced only by a microminority (still in 1998) of individuals.

Characteristics. The following are 5 of the essential characteristics of natural consciential projection:

1. **Spontaneity.** Spontaneity regarding the manifestation.
2. **Amenity.** Gradation of occurrences or personal trauma-free experiences.
3. **Simplicity.** Lack of a need for projective effort or exercise by the intraphysical consciousness.
4. **Imperceptibility.** Absence of perceptible, evident or defined objective (goal), purpose of the lucid projection or a predetermined and established consciential target.
5. **Agility.** The general development of the consciential projection without any control or command by the projector's self-critiquing judgment.

Frequency. Natural consciential projection is more frequent than forced consciential projection. It occurs gradually, in conditions such as illness, psychophysical exhaustion, near-death experience (NDE), natural sleep and the individual's normal states.

Categories. The following are 5 categories or types of occurrences which are *more common* regarding spontaneous consciential projections, according to the personal research of the author, conducted on his person and other international projectors, over 3 decades:

1. **Blind.** Blind projection, close to the human body without the consciousness seeing, but sensing the paratropospheric extraphysical dimension.
2. **Abrupt.** Projection in which the intraphysical consciousness (you) does not perceive the takeoff of the psychosoma and suddenly finds him/herself aware in an environment distant from the physical base.
3. **Somatics.** Projection with the awakening of the intraphysical consciousness inside the bedroom of the physical base, contemplating his/her own human body, which is inactive on the bed.
4. **Extraphysiology.** Projection in which the intraphysical consciousness sees various extraphysical consciousnesses running down shadowy streets.

5. **Volitative.** Projection in which the intraphysical consciousness, through volitation, (almost always) feels him/herself volitating over a countryside environment without encountering any extraphysical consciousnesses.

Predisposition. A spontaneous, lucid projection occurring effortlessly and naturally, can predispose the individual toward a willfully provoked lucid consciential projection more easily, in a shorter period of time and, sometimes, promote projections in series (consecutive experiences).

Taoism. Natural or automatic consciential projection is found in the studies of Chinese Taoism.

Bibliography: Alvarado (17, p. 11), Blackmore (139, p. 51), Crookall (338, p. 3), Holzer (745, p. 163), Montandon (1070, p. 228), Pearce-Higgins (1214, p. 67), Reis (1384, p. 50), Rogo (1444, p. 58), Vieira (1762, p. 111), Wang (1794, p. 198).

428. FORCED LUCID CONSCIENTIAL PROJECTION

Definition. Forced lucid consciential projection: discoincidence of the vehicles of manifestation of the human consciousness provoked by the will of the practitioner or unwittingly by stressful factors, wherein the projector becomes aware of extraphysical occurrences.

Synonymy: E-OBE; forced discoincidence; mechanical exteriorization; mechanical takeoff; toxic consciential projection.

Characteristics. Forced lucid consciential projection is less frequent than natural lucid consciential projection and can occur through the willful action of the intraphysical consciousness or even suddenly (unexpectedly and surprisingly).

Factors. The following are 15 common stressful factors capable of triggering the mechanical projection of the consciousness (you) from the human body. They are listed in alphabetical order of occurrence:

1. Automobile accident or one involving some type of equipment (machine, apparatus).
2. Cave-in (building collapse).
3. Drowning.
4. Effects of medications, anesthetics, narcotics, stupefacients or toxins in general.
5. Emotional syncope.
6. Explosion in a battlefield or an armed conflict.
7. Falling (somatics).
8. Great immanent danger, whether fire, shipwreck, train wreck, battlefield combat, or surgical intervention.
9. Hetero-hypnotic trance.
10. Influence of taking light or heavy drugs (intoxication).
11. Moral shock to the individual.
12. Physical shock to the human body.
13. Suffocation (cardiochakra).
14. Violence in general, such as the knockout of a boxer (anticosmoethical and anti-physiological radical sport).
15. Violent physical accident.

Voluntary. The will of the consciential projector also produces lucid projection which is intentionally forced, or self-induced voluntary lucid projection.

Purity. On the other hand, not all forced consciential projection is totally *impure*, as seen with the production of lucid consciential projection using the mental saturation technique and the carbon dioxide technique, already presented in other chapters of this book.

Bibliography: Alvarado (16, p. 11), Battersby (92, p. 51), Bayless (98, p. 124), Carton (252, p. 311), Crookall (338, p. 118), Currie (354, p. 86), Greenhouse (636, p. 271), Pearce-Higgins (1214, p. 72), Rogo (1444, p. 58), Vieira (1762, p. 190).

429. COMPARISONS BETWEEN NATURAL AND FORCED CONSCIENTIAL PROJECTION

Differential. There are at least 6 basic differences between natural consciential projection and forced consciential projection, in terms of projective facts:

1. **Dimensions.** In a natural consciential projection, the intraphysical consciousness more easily enters the better, more agreeable and more attractive extraphysical dimensions, which are different from intraphysical life on earth. In forced consciential projection, the intraphysical consciousness reaches the extraphysical dimensions featuring more nebulous environments or ambivalent holothosenes.

2. **Encounters.** In natural consciential projection, the intraphysical consciousness encounters former relatives and former friends (extraphysical consciousnesses) more easily. In forced consciential projection, it becomes more difficult for the projected intraphysical consciousness to see or approach extraphysical consciousnesses, except in consciential projections (in this case, traveling clairvoyance) generated through hetero-hypnosis.

3. **Self-lucidity.** In natural consciential projection, the phenomenon of expansion of the consciousness or self-lucidity occurs more frequently. In forced consciential projection, there is a greater alteration in the lucidity of the projected intraphysical consciousness, with a greater interference of oneiric images in extraphysical perceptions occurring (self-paraperceptions).

4. **Pathology.** In natural consciential projection, there is never any factor which can characterize the phenomenon itself as pathological. The forced consciential projection can occur simply due to a fully or indisputably identified illness.

5. **Interference.** In natural consciential projection, there is no interference by extraphysical helpers or extraphysical intruders in the takeoff process. Forced consciential projection can be sponsored by an extraphysical intruder and can even be commanded by an extraphysical helper, in certain positive (healthy) cases.

6. **Inducement.** In natural consciential projection, the projector does not practice any exercise prior to projecting from the soma. Forced consciential projection can be laboriously induced, after great effort by the intraphysical consciousness.

430. ESCAPE-PROJECTION

Definition. Escape-projection: that experiment in which the intraphysical consciousness endeavors to escape from the human body, which has been physically injured in some manner, especially in the psychosoma, being moved or forced by external agents.

Synonymy: consciential escape; projective escape; sudden unfolding.

Categories. The following are 5 of the more frequent categories of escape-projections, according to the predisposing or inducing situations of the phenomenon:

1. **Casualties.** Imminent drowning, for example.
2. **Bellicosity.** The stressful circumstances of war or armed conflicts.
3. **Extremism.** Major physical accidents in caves, caverns, mines, mountain climbing (radical sports) and trenches.
4. **Pathology.** Conditions of illness or psychophysical exhaustion.
5. **Prisoners.** Depressing or extremely stressful situations of incarceration.

Causes. The causes, essential motivations or triggering factors of escape-projection are pain, suffering, a physical trauma or an intense stress factor that provoked the mechanical takeoff or forced ejection of the entire psychosoma from the human body, obviously transporting the consciousness.

Helpers. In addition, this type of lucid consciential projection can be sponsored by an extraphysical helper.

Relationship. There must evidently be some physiological relationship between these instantaneous lucid projections, which feature the continuation of body movements with the cases of people who are able to combine sleeping while standing, and even while on a horse, maintaining their balance while asleep without falling off, or the well-documented case of the excellent pianist who played a passage of music while sleeping.

Note. Escape-projection should not be confused with instantaneous lucid consciential projection, addressed in the next chapter.

Bibliography: Carton (252, p. 311), Crookall (338, p. 33), Frost (560, p. 19), Green (632, p. 63), Greenhouse (636, p. 135), Gurney (666, p. 227), Holms (735, p. 462), Johnson (807, p. 221), Morrell (1088, p. 55), Smythe (1578, p. 277).

431. INSTANTANEOUS CONSCIENTIAL PROJECTION

Definition. Instantaneous consciential projection: lightning-fast takeoff, within tenths of a second, or some seconds, with or without the appearance of the immediate extraphysical lucidity of the projected intraphysical consciousness.

Synonymy: automatic projection; instantaneous separation; interdimensional expressway of the intraphysical consciousness; surprise-projection.

Causes. The true causes of instantaneous consciential projection are still very unclear. This phenomenon does not even occur constantly with the advanced and more dedicated projector. In instantaneous consciential projection, both immediate takeoff and immediate interiorization can occur without the intraphysical consciousness being aware of it. In this occurrence, the intraphysical projector can even be erect (soma) or standing up.

Impact. The sensation of impact of the profound difference between the two consciential states – the ordinary, physical waking state and extraphysical lucidity – achieved without transition or interruption in the continuity of lucidity, which sometimes occurs in cases of instantaneous projection, makes it extraordinary, unforgettable and indescribable.

Way. Instantaneous consciential projection constitutes the expressway of the intraphysical consciousness momentarily transferring him/herself to the extraphysical dimension, based upon 3 occurrences:

1. **Technique.** A reduction in the technical efforts of the projector.
2. **Chronology.** A minimized sensation of the duration of the consciousness' departure trajectory to a temporary base or a mobile point outside the human body.
3. **Holochakrology.** It does not allow the viewing of the silver cord.

Surprise. The more common instantaneous consciential projection is spontaneous and provokes surprise, overwhelming the unprepared consciousness (the projector), which has no defined mental target. This instantaneous projection therefore does not always end up being well utilized.

Provoked. Instantaneous consciential projection can be provoked. However, even in these circumstances, the projector never knows with certainty whether or not he/she will have an instantaneous lucid takeoff.

Note. Instantaneous consciential projection – which is apparently healthy and is devoid of any negative or pathological consequence – should not be confused with epileptic absence or petit mal. If, on the one hand, these 2 phenomena are similar in certain aspects, they are, on the other hand, quite different in their causes, sensations and consequences.

432. CONSCIENTIAL PROJECTION OF THE COMPOUND DOUBLE

Definition. Consciential projection of the compound double: that projection produced by the intraphysical consciousness when he/she manifests extraphysically in the psychosoma laden with part of the holochakra or, in other words, carrying a discardable weight.

Synonymy: consciential bariprojection; consciential projection in the psychosoma with the holochakra; consciential projection of 3 bodies; consciential projection of the composite double.

Characteristics. When projected in the psychosoma, accompanied by a high percentage of the crustal energies of the holochakra, the intraphysical consciousness should prepare him/herself to confront various characteristic, specific extraphysical conjunctures, most notably the following 21:

1. **Ballast.** The consciousness finds the psychosoma to be dense, quite heavy (lucid bariprojection) and complete in its humanoid forms, more laden with the *ballast* (charge or equipment) of the holochakra.

2. **Paratroposphere.** In this condition, the intraphysical consciousness inevitably projects to more paratropospheric extraphysical environments, the *planetary floor*. In these circumstances, the projected intraphysical consciousness often has difficulty going through fences, walls and closed doors or, in other words: he/she encounters problems with extraphysical permeability.

3. **Intraphysiology.** When the intraphysical consciousness undergoes the vigorous intensification of the influence of the physical factors of terrestrial life, it makes this projective modality the *most human* and *least extraphysical* of consciential projections. He/she can sometimes move physical objects or, in other words, produce extraphysical telekinesis, whether consciously or even unconsciously.

4. **Chronology.** In this consciential experience, chronological time seems to pass slowly. In consciential projection of the compound double, 5 minutes of extraphysical experience give the false impression of an hour's absence from the soma and the physical base.

5. **Slow motion.** If projected in this way, in the extraphysical sphere of consciential energies of the intraphysical consciousness, or even in the environment of the physical base, the consciousness can easily move him/herself in slow motion, or mechanically repeat movements that are identical to those of the human body.

6. **Gravitation.** The intraphysical consciousness can unquestionably perceive the influence of the ambient gravitational force. This makes it difficult for the projector to achieve major levitations and full volitation of the psychosoma, which is loaded with energies, which seems contradictory or paradoxical. In order to ascend the height of a twenty-floor building, for example, the projector will seem to have spent the same consciential effort required to circle the entire planet.

7. **Discontinuity.** Upon projecting, on this occasion, the projector is urged to pay attention to his/her lucidity in order to not let him/herself succumb to a discontinuity in lucidity and involve him/herself in a whirlpool of oneiric images during the natural development of extraphysical events. The almost irresistible tendency imposed by extraphysical circumstances will always be to transform the lucid projection into a semilucid projection.

8. **Psychosomatics.** The holochakra, when in tow, potentiates, or more appropriately, maximally exaggerates the emotions that the psychosoma (emotional body) allows the consciousness to feel. For example, any superficial error in interpretation appears to be a world of mistakes. This explains the post-desomatic disturbances and parapsychoses of certain extraphysical consciousnesses which have recently arrived at the intermissive period. They have merely gone through the first desoma – only the deactivation of the human body – and still have part of the holochakra with them. They experience, for some time, profound solitude or isolation, self-guilt and lack of affection that they suppose or that seem, in their intraconsciential micro-universe, to be immense, definitive, eternal and devastating (the illusions of inferno or hell).

9. **Desomatics.** It can be concluded that consciential projection in the psychosoma, laden with a part of the holochakra, gives the intraphysical consciousness a preview of the exact sensations the projector will be feeling during the inevitable shock of first desoma or deactivation of the human

body. The projector will, in this way, definitively understand, by feeling at first hand, a small sample of the inner state of the ill communicants in parapsychic sessions of psychophony and deintrusion.

10. **Traumas.** The above-mentioned predisposition toward emotionality and dramatization predisposes the intraphysical consciousness to extraphysical traumas and repercussions.

11. **Crutch.** There is an insistent and contradictory propensity for the intraphysical consciousness to occasionally remember the human body and the momentary circumstances of the consensual projection, as though this recollection serves as a *parapsychological* crutch for maintaining lucidity. It actually does help, on the one hand, but can also impel the psychosoma to suddenly return to the human body.

12. **Mnemosomatics.** A spontaneous inner reaction arises to fit the extraphysical occurrences, as they unfold, beyond the framework of the *emotional memory* of the current human life. An example of this is the image of trees being cut to clear a space for a tall building. This, seen from an extraphysical point of view, at that moment, leads the projector's consciousness to try to fit it into the scene of deforestation for road construction, witnessed during childhood and still stored in the physical memory bank (cerebral memory of the current brain).

13. **Duration.** Due to all these determining factors, consensual projection in the psychosoma laden with part of the coupled holochakra or, in other words, with a portion of its *operational energetic batteries*, tends to be shorter. Perhaps one of the greatest psychophysical feats available to the intraphysical being must be the act of projecting in these conditions for 3 straight hours, while maintaining full, continuous, imperturbable lucidity, without incurring any secondary pathological connotation or effect.

14. **Shower.** Upon the interiorization of the intraphysical consciousness, after a projection of over 15 minutes in the psychosoma with a portion of the holochakra, a spontaneous, continuous *energetic shower* will inevitably occur upon physical awakening in an apparent overflowing of consensual energies.

15. **Stockpiling.** In light of the above-mentioned fact, it can be inferred that the *defensive energetic armor* that the holochakra represents, in certain physical-extraphysical circumstances, opens and helps to increase the capacity of the projected psychosoma to provide itself with cosmic vitality (immanent energy, volitation).

16. **Discoincidence.** Consensual projection in these specific conditions predisposes temporary, post-projective waking discoincidence of the vehicles of manifestation of the consciousness, as well as the phenomenon of double awareness.

17. **Self-permeability.** In consensual projection of the compound double, the capacity of extraphysical self-permeability (self-penetrability) – a characteristic of the projected intraphysical consciousness – diminishes considerably.

18. **Vision.** In the same way that lucidity becomes diminished and self-permeability becomes restricted, in many cases of consensual projection of the compound double, the extraphysical vision of the projected projector also exhibits reduced acuity or sharpness.

19. **Semi-intraphysical.** The projector, when projected in this manner, almost being *semi-intraphysical* or even materialized, will always be more capable of appearing to sensitive human beings, clairvoyant sensitives (apparition of intraphysical beings) and even to people in general (physical self-bilocation).

20. **Sensitive.** The active, middle-aged, developed sensitive of any type of parapsychism is more capable of producing these consensual projections with impressive lucidity, as they have more experience, even being unaware of coexistence with the projected holochakra. This, however, does not mean that non-sensitive youths do not produce them.

21. **Helper.** Often, the presence of a helper, *at the projector's side*, with the use of transmental dialogue, or extraphysical telepathy, extraordinarily facilitates the maintenance of the extraphysical lucidity and prolongation of this type of consensual projection experience. It is the same with a sleepy person who someone endeavors to keep in the ordinary, physical waking state.

Ectoplasm. Consciential projection of the compound double that achieves greater density or, in other words, is more *materialized*, is that in which the psychosoma receives, through the silver cord – as well as the energetic resources running from the human body up to the psychosoma – ponderable elements of ectoplasm, or biological components, from the structure of human cells (cytoplasm) that compose ectoplasm.

Load. In general, the holochakra constitutes a load of fuel (a jettisonable load or a consumable weight) to the projected and laden psychosoma.

Obesity. An obese person, or one with a high excess of corporal weight, carries considerable organic dead weight, a static charge or an empty burden for living the human experience. This, however, does not apply to the compound double, which is directly related, not to the human body, but to the energetic parabody or holochakra.

Bibliography: Crookall (333, p. 34), Vieira (1762, p. 168).

433. POST-NATAL, REGRESSIVE, SEMILUCID CONSCIENTIAL PROJECTION

Definition. Post-natal, regressive, semilucid consciential projection: the natural dream that transforms into a semilucid, consciential projection derived from the specific target-place of the prior human history of the projector.

Synonymy: discontinuous, historical consciential projection; extraphysical consciential return to origins; post-natal extraphysical progression; projective regression; semilucid, historical consciential projection.

Causes. The following are 4 isolated or even convergent causes or factors which come together and predispose the intraphysical consciousness to spontaneously produce semilucid consciential projections stemming from *historical dreams* of his/her personal experience:

1. **Intraphysiology.** A change of residence in life, being a change in street address or district within the same city, as well as a move from one location to another.
2. **Pharmacology.** The use of certain medications that affect the central nervous system, notably in the mnemonic area.
3. **Gerontology.** Mature intraphysical age.
4. **Pathology.** Arteriosclerosis or Alzheimer's disease.

Case study. For example, a person dreams about a certain period of his/her prior personal history, which occurred one, two or more decades before. The physical setting of his/her historical dream, which still exists, predisposes his/her projected consciousness to semilucidly go to the place where he/she lived and had agreeable or traumatic experiences. In this case, it functions as an unconscious evocation of the human target-place, with a vigorous power of attraction. This ends up characterizing a type of *haunting by a living person*.

Places. The places revisited by semilucid projectors in post-natal regression can vary greatly. The following 4 are examples:

1. **Education.** The elementary school from childhood (education or cultural background).
2. **Youth.** The residence where the individual lived during his/her youth.
3. **Freedom.** The place where the individual had unaccompanied or free experiences as a bachelor.
4. **Profession.** The place where the individual lived when he/she began professional life.

Consequences. The following are 5 basic consequences resulting from semilucid, historical projections:

1. **Disconnection.** The semilucid projector sometimes feels even more disturbed in his/her recollections, endeavoring to repeat the simulacrum of the act inspired by his/her monoideism, or vainly

fit the old experiences into the rooms of the current residence, or the current existential circumstances of that night's dream. These circumstances generally do not allow adaptation with the extraphysical activities of his/her semilucid projection which are profoundly disconnected, incoherent, or even absurd.

2. **Invasion.** When the current residents of the former domicile – generally being houses which are still in the same place – have a certain degree of extraphysical lucidity during their sleep period, which is almost always at night, it can happen that both the visiting projector and the visited projectors are simultaneously sleeping and the residents are able to detect the presence of the semilucidly projected projector through a dream and the fact that it is invading the visited projectors' privacy, trying to penetrate the intimacy of their home. The consciousness of the invading projector still considers the residence to be the same, and often his/her own property, trying impossibly to melancholically exhume, or longingly revive experiences which remain in the past, in different circumstances, albeit having occurred in the same human surroundings.

3. **Encounters.** Those who reside in houses or other old well-conserved properties should not be surprised if they sometimes encounter an aimless former resident outside the human body, having returned to that location through his/her semilucid projections, walking like a somnambulant throughout the rooms of the residence, conducting an *extraphysical midnight inspection*, often as though he/she were still the incontestable owner of that environment, the legitimate current inhabitant of that place, or the true owner of the property.

4. **Extraphysical consciousnesses.** Many individuals who have recently become extraphysical consciousnesses through desoma, often still disturbed by some post-desomatic parapsychosis, or posthumous monoideism, return to the terrestrial locations where they had unforgettable impactful experiences. In many cases, these facts are simple repetitions of their historical semilucid projections that occurred during human existence.

5. **Poltergeist.** Some cases of historical poltergeist phenomena should be included here which involve consciousnesses that are now extraphysical. It is, nevertheless, not impossible for this to even occur with the manifestations of intraphysical consciousnesses. Both cases constitute types of *haunting ghosts*.

Recurrence. Due to the same causal factors presented here, the semilucid historical projection can transform itself into a recurring consciential projection, or one that repeats itself frequently, due to the convergence of propitious triggering circumstances.

Bibliography: Vieira (1762, p. 155).

434. SONOROUS CONSCIENTIAL PROJECTION

Definition. Sonorous consciential projection: exteriorization of the consciousness from the human body in the psychosoma, with or without its *sonorous* physical apparition, or at least its speech, which becomes audible to other people, or the characteristic sound of itself, in a location distant from the physical base.

Synonymy: audioprojection; echoic consciential projection; invisible consciential projection; itinerant clairaudience; projective direct voice; resonant consciential projection; sonorous consciential apparition; speaking consciential apparition; traveling clairaudience.

Accidental. The most common sonorous projection of the consciousness is spontaneous or accidental, occurring in cases of highly stressful physical accidents, occurring most frequently during floods and drowning.

Drowning. An almost drowned individual, in the physical and mental agitation in which he/she finds him/herself, without apparent means for escaping the critical situation, uses all of his/her mental energy in agonized screams of desperation, fighting to save him/herself. These calls for help sometimes become physically audible, extraphysically echoing to other persons, relatives and friends, who are distant at that time, even being on other continents.

Projection. In many occurrences such as these, listeners or spectators even witness the humanoid manifestation of the projected projector at the exact moment of the accident.

Images. Although their study has been neglected, *auditory images* have a real existence in time and perform an important role in human life. In the ordinary, physical waking state, they are invoked through a temporal succession or, in other words: with regard to the development of chronological time.

Psychopathology. Psychopathology has proven that *auditory hallucinations* are richer, more frequent and much more relevant than classic visual hallucinations.

Predominance. In the acquisition of information, auditory memory predominates over visual memory. This is naturally due to the capacity for retention of auditory perceptions and the ease with which their images are produced.

Invisible. In most cases of sonorous consensual projection, an invisible projection occurs, namely a projection of the consciousness in the psychosoma wherein the density of this parabody does not reach a level that becomes visible to the percipient or percipients, thus constituting the phenomenon of physical bilocation of the consciousness. This only allows the consciousness to make its presence known through touch or sound.

Density. Thus, it is shown that – from the perspective of the psychosoma's density – the sonorous consensual projection is situated between the common, integral projection of the consciousness, in a rarified form, and the traditional phenomenon of physical bilocation, with a densified form.

Monologues. There are reports of rare occurrences of short monologues by the projector or agent-projector, sketches of dialogue between this consciousness and the percipient, who is even able to *audibly* identify the communicant, although not distinguishing it with the eyes of the human body.

Poltergeist. There are occurrences of effective connection between intraphysical intruders and poltergeist manifestations, which are presumed to be mere sonorous projections of intraphysical consciousnesses.

Direct. There have been registered cases of intraphysical consciousnesses who communicated through the direct voice phenomenon in parapsychic physical effect sessions. In these cases, the person of the communicant neither appeared nor used the sensitive's speech mechanism in order to express him/herself.

Mechanism. The mechanism for producing sonorous consensual projection still remains extremely obscure. For example, in this case would there be a densification of the vocal apparatus of the projector or projector-agent's psychosoma? Would this densification be governed by the extraordinary impulsion of the will of the superlatively stressed consciousness?

Word. Within the scope of auditory images, the inner word, or the *mental word*, presents important significance. It has no objective existence, being entirely foreign to the intraphysical dimension because it refers to a state of self, and therefore only to a psychic or mentalsomatic fact of the intraphysical consciousness. This occurs when the individual thinks about an abstract thing and silently pronounces the word that represents this same thing to him/herself. People who frequently experience the common phenomenon of hearing mental words are more predisposed to be recipients, in occurrences of sonorous consensual projections.

Musicians. Musicians in general, and especially conductors and composers, as they have a more developed ability to hear words and sounds mentally, are also physiologically better able to operate as percipients in sonorous consensual projections.

Hypothesis. A statistical survey has still not been performed of the percentage of conductors and composers among the percipients of sonorous consensual projections. This is a valid, projectiological work hypothesis.

Hyperacuity. There are registered phenomena of auditory hyperacuity (hyperacusia) in which the person acting as a percipient, or clairaudient sensitive, can hear sounds generated by an apparition

better than if it were a real person. The same has been occurring with lucid projectors that hear extremely quiet sounds while projected and, nevertheless, in the ordinary, physical waking state are completely deaf or can only hear when using a hearing aid.

435. EXTRAPHYSICAL VISUAL PROJECTION

Definition. Extraphysical visual projection: the act wherein the projected intraphysical consciousness sees, hears, senses and, in some ways, even participates in coherent and well-coordinated scenes which are somehow projected by and for the projector, either with or without tangible interference from an extraphysical helper.

Synonymy: extraphysical audiovisual system; extraphysical ideoplasty; illustrated thoughts.

Similarities. Extraphysical visual projection is reminiscent of the occurrences of panoramic vision, recollection of past intraphysical existences and intensely vivid, colored dreams. However, they are different from each other because of the full awareness of being in the extraphysical dimension and the voluntary participation involved in the processes of visual projection.

Symbology. Extraphysical visual projections are not always practical or immediately applicable, clear or fully intelligible, nor are they literal in their messages. They sometimes appear in symbolic form or are mixed with the common facts of physical-extraphysical reality.

Bibliography: Vieira (1762, p. 41).

436. JOINT LUCID PROJECTIONS

Definition. Joint lucid projections: extraphysical experiences in which there is a simultaneous participation of two or more intraphysical consciousnesses who are projected from the soma and manifest with lucidity (see fig. 436, p. 1,151).

Synonymy: consensual projection *à trois*; consensual projections of encounter; extraphysical interconsensual connections; flock of extraphysical fliers; flock of projectors; mutual lucid projections; reciprocal lucid projections; shared consensual projections.

Opportunities. The mechanism of successive intraphysical lives allows extraphysical consciousnesses to physically live in the school-hospital of earth in order to serve (fraternity) each other. This is the major goal of human life. Mutual assistance is logically performed through encounters (coexistology) between intraphysical consciousnesses (humanity). A single resoma in the twentieth century, in the *global village*, or the intensified coexistence of modern intraphysical society, in this era of acceleration of history, allows more encounters between persons, in one week, than during an entire human life in the Middle Ages.

Children. The children that are now beginning their first year of primary education have already lived various existences, compared with their grandparents. This means that our current human life, in its evolutionary usefulness, is *worth dozens of our past intraphysical lives*, even recent ones. This is because it allows an incomparably greater number of encounters with other human beings, thereby affording greater opportunities for mutual assistance between us.

Projectiology. Lucid projections, through *extraphysical* encounters with para-humanity, exponentially increase the possibilities for mutual assistance between intraphysical consciousnesses in general, projected intraphysical consciousnesses and extraphysical consciousnesses.

Types. Joint lucid projections can occur intentionally, with the participating projectors being previously aware, having arranged the experience beforehand, and even taking off from the same physical base. They can also occur spontaneously, through occasional extraphysical encounters sponsored by extraphysical helpers, without the prior knowledge of the human participants. The more frequent type of lucid projection, nowadays, is the one having romantic motives.

Sweethearts. The persons most indicated for tests of joint lucid projection are pairs of young sweethearts, because they are more motivated to be together.

Beginning. In the beginning of the experiments, mere joint *semilucid* projections can occur, instead of joint *lucid* projections.

Lucidity. Besides, the projectors do not always have an equal level of extraphysical lucidity in joint consensual projections. This is natural and the reason why mild discrepancies or apparent conflicts can arise in their reports. Nevertheless, in joint lucid projections, the basic lines of extraphysical events are perceived and registered in a similar and convergent manner, clearly confirming the common experiences.

Assistentiology. Joint consensual projections allow mutual extraphysical assistance between projectors, beginning with the act of leaving the human body, or extraphysical hetero-awakening, and even during lucid and extraphysical volitation. This is because consciousnesses do not present identical levels in their attributes. Degrees of perception, vitality and mastery in the extraphysical dimension vary from projector to projector and even from projection to projection with the same practitioner consciousness.

Confusion. It should also be remembered, if you are endeavoring to produce a lucid projection together with other persons, to take care in order to avoid making noise or creating confusion upon returning from the extraphysical experiences, in order not to interfere in the experiences of other intraphysical consciousnesses which have not yet returned to the area.

Contacts. The projector who is fully aware of having encountered either known or unknown intraphysical consciousnesses, while projected from the human body, should try to contact them personally, giving his/her human address. This is because there is always a chance of meeting someone who also clearly remembers the same extraphysical experiences in identical environments and locations. This allows analysis, study and observation of inestimable corroborative or phenomenological value.

Interiorization. Contact with the projected colleague should be made before it *disappears* in interiorization and moves the human body. Afterwards, it is always very difficult to reestablish any effective understanding of the occasion. You have to leave it for another time, should this arise.

Animism. When 2 or more projected intraphysical projectors encounter each other in the extraphysical dimension there is no parapsychic phenomenon, nor is there interference from another projector nor from an extraphysical consciousness. There is only a purely animic phenomenon between intraphysical consciousnesses, utilizing the extraphysical dimension and their perceptions, without requiring the participation of any extraphysical consciousness.

Categories. Extraphysical encounters can be classified into two categories, with respect to the lucidity of the projected consciousness:

1. **Mutual.** Mutual encounters or those in which two intraphysical consciousnesses meet each other while lucidly projected, thereby having a mutual encounter and interconsensual communication becoming possible.

2. **Unilateral.** Unilateral encounters or those in which only one consciousness is lucid, thereby allowing a unilateral encounter wherein extraphysical communication becomes impracticable.

Assistential. The unilateral extraphysical encounter is common during assistential consensual projections conducted under the auspices of extraphysical helpers wherein one intraphysical consciousness, the assistant, encounters another intraphysical consciousness, the assisted, given that the latter does not exhibit extraphysical lucidity.

Sessions. The projective session is that one in which a group of persons endeavoring to leave the human body together, at the same time, in the same physical base, follow the same inductive

factors or use the same psychophysiological crutches. Projective sessions in Brazil (spiritist meetings, *apometria*), are called “unfolding sessions.” These sessions operate under the orientation of a president, which also allows the participation of novice animist-sensitives who observe – without projecting – the veteran consciencial projectors who are endeavoring to project in that environment.

Rescues. In these works, lucid projectors endeavor to cooperate in extraphysical assistance provided to ill intraphysical and extraphysical consciousnesses, even performing extraphysical rescues of needy extraphysical consciousnesses which have been kidnapped by others individually or by groups of extraphysical intruder consciousnesses. They also help governors and those governed, assist patients in hospitals, and perform psychic and parapsychic cleansing at a distance.

Currents. Aside from the president, projectors and beginners, individuals serving as energetic supports – persons who are donators of consciencial energies and positive thoughts – also participate in these private sessions that aim to produce lucid consciencial projection, thereby forming so-called “fluidic currents”.

Mystifications. These meetings are considered to have a high degree of mystification, fraud and occurrences of the phenomenon of personification by any researcher who studies them. They are mostly directed with mystical intentions and, although having much good will and evident good intention, they lack a greater universalistic, evolutionary self-discernment, and constantly attempt personal and group manipulations of corporatist or fanatic consciousnesses. This allows the unscrupulous influence of intraphysical and extraphysical blind guides, usually simultaneously.

Team. Joint lucid projections permit the dynamization of extraphysical research teams, or projectiological research teams. They are composed of various veteran projectors that may or may not know each other. The members endeavor to perform studies together or independently in order to later compare perceptions, observations and results of the experiments.

Patterns. The evidence and confirmation achieved by the members of the extraphysical research team allows them to establish patterns and averages of scientific techniques and observations, in many cases even before the official research and discoveries of conventional science. The author has always endeavored to arrive at conclusions regarding the study of projectiology, included in this book, through research performed by teams of projectors (intraphysical consciousnesses).

Individualization. The doorway to the extraphysical dimension, whether through a routine lucid projection or through final projection (desoma or biological death), is invariably extremely individual.

Case study. Regardless of whether a team of projectors can project together, at the same time, leaving from the same physical base, or whether a group of intraphysical consciousnesses can undergo desoma at the same instant, in the same place and through the same group accident, the characteristics of regaining extraphysical awareness will always occur individually, one by one, consciousness by consciousness. This observation is valid and applies to all beings or intraphysical consciencial principles, as long as they have achieved intraconsciencial and evolutionary individualization.

Exclusive. It should not be forgotten that: for all the team spirit (or teams of consciousnesses) that can be obtained with the maximal technical improvement of joint lucid projections, lucid projection will always, inevitably, above all, be a solitary, extremely individual excursion of the consciousness, resulting from personal merits, efforts and performance.

Vehicles. There are joint lucid projections in the psychosoma of 2 or more intraphysical beings; joint lucid projections in the mentalsoma of 2 or more intraphysical beings; and joint lucid projections in the mentalsoma of 2 or more intraphysical and extraphysical beings at the same time.

Pregnant women. There are at least 6 different modalities in which the consciencial projection phenomenon manifests during the period of human pregnancy:

1. The pregnant woman’s consciousness projects alone in the psychosoma.
2. The pregnant woman’s consciousness projects alone in the mentalsoma.
3. The pregnant woman’s consciousness projects in the psychosoma while the resonant consciousness simultaneously projects in the psychosoma: joint projections in the psychosoma. Might this happen more frequently at the end of pregnancy?

4. The consciousness of the resonant projects alone in the psychosoma.
5. The consciousness of the resonant projects alone in the mentalsoma.
6. The pregnant woman's consciousness projects in the mentalsoma while the resonant consciousness also simultaneously projects in the mentalsoma: joint mental projections. Might this happen more frequently at the beginning of pregnancy?

Different. There is apparently no instance of, or at least a low incidence of, simultaneous projections of the consciousness of the pregnant woman and the consciousness of the fetus in different consensual vehicles. This is a research hypothesis.

Pediatrics. Pediatrics explains that when the (nursing) mother sleeps or rests together (auric coupling) with the child (newborn), the sleep cycles of both become synchronized and she operates like a type of respiratory pacemaker for the child. This has prevented sudden infant death syndrome (*crib death*), a disturbance that impedes the child from returning from a very deep sleep. It is characterized by frequent respiratory stoppages during sleep, notably in the early mornings of the winter months, between one and six o'clock in the morning. It is therefore also reasonable to suppose that mother-child joint consensual projections are facilitated in this period.

Conflicts. Smaller or greater conflicts can arise in the reports of joint lucid projectors due to differing degrees in lucidity and differing standpoints of analysis on the part of each projected consciousness.

Helpers. Joint consensual projections can be sponsored by extraphysical helpers, as *pre-programmed* joint consensual projections are extremely rare and difficult without aid from the helpers.

Couplings. Kindred intraphysical beings who are always predisposed – even when unconsciously or without their perceiving it – to mutually trigger the auric coupling phenomenon, exhibit a greater facility for projecting together and with lucidity. Examples of this are found between mother and daughter, or father and son. This predisposition will always be greater if *consanguineous resomas* are occurring between these persons.

Final. Deviating from the norm, there are reports of joint final consensual projections, which differ from ordinary joint consensual projections. In a way, they merely represent cases of concomitant desomas with instances of farewell consensual projections.

Future. All indications are that, in the future, with the technical improvement of projectological processes, joint, lucid consensual projections, which are currently rare, will become common and accessible to all types of intraphysical consciousnesses in any part of the earth.

Evolution. The following are 7 themes and provisions that will inevitably be encountered with the evolution of projective techniques and practices:

1. **Personal.** Greater technical development of projected personnel (team).
2. **Activities.** Simplification and rationalization of extraphysical activities.
3. **Co-projectors.** Enhancement of lucid consensual *co-projectors*.
4. **Functions.** Evaluation of extraphysical functions in projected projective groups.
5. **Leadership.** Leading projected projective groups.
6. **Dynamic.** Group dynamics in joint, lucid consensual projections.
7. **Methodology.** Organization and methods for joint, lucid consensual projections.

Extraterrestrials. A likeness of these provisions can be seen extraphysically with *extraterrestrial*, lucid consensual projectors.

Bibliography: Andreas (36, p. 29), Becker (102, p. 403), Boswell (174, p. 139), Castaneda (258, p. 131), Corvalán (306, p. 72), Crookall (343, p. 42), Denning (391, p. 182), Digest (399, p. 282), Donahue (407, p. 98), Farrar (496, p. 192), Frost (560, p. 145), Garrett (571, p. 44), Greene (635, p. 109), Greenhouse (636, p. 214), Lilly (927, p. 74), Redentor (1378, p. 83), Rogo (1444, p. 181), Shay (1546, p. 101), St. Clair (1593, p. 153), Vieira (1762, p. 121).

**437. COMPARISONS BETWEEN CONSCIENTIAL PROJECTION
IN THE MENTALSOMA AND IN THE PSYCHOSOMA**

Differential. The following are 12 basic differences that are characteristic of projections of the consciousness in the psychosoma and in the mentalsoma:

1. **Emotions.** In consciential projection in the psychosoma, the consciousness uses a semiphysical vehicle, the emotional parabody. In consciential projection in the isolated mentalsoma, the consciousness manifests in the mentalsomatic dimension, distant from tropospheric emotions, in the vehicle of rationality and balance or the *parabody of self-discernment*.

2. **Ballast.** In consciential projection in the psychosoma, the intraphysical consciousness manifests with greater ballast or *weight*, because he/she is laden with the holochakra, namely the connection of the silver cord and the entire human body, including the physical brain. In consciential projection in the isolated mentalsoma, the consciousness is only linked to the head of the psychosoma and is therefore separated from the physical body and the physical dimension.

3. **Likeness.** The psychosoma can be considered to be an improved likeness of the human body. The mentalsoma has no such likeness.

4. **Action.** In consciential projection in the psychosoma, the intraphysical consciousness acts directly upon the human body. In consciential projection in the mentalsoma, the intraphysical consciousness only acts indirectly upon the human body, with the inevitable intermediation of the psychosoma.

5. **Sensations.** In consciential projection in the psychosoma, the intraphysical consciousness experiences extraphysical sensations and emotions in a constant reciprocal relationship, or in both directions (two-way), with the human body. In consciential projection in the mentalsoma, the sensations of the consciousness are diminished and, in certain cases, even disappear, as we normally understand it.

6. **Telekinesis.** In consciential projection in the psychosoma, the consciousness can produce the phenomenon of extraphysical telekinesis and, when conditions are favorable, act upon dense matter. In consciential projection in the mentalsoma, it is not easy for the consciousness to produce the phenomenon of telekinesis.

7. **Case study.** In consciential projection in the psychosoma, the consciousness has parahands and parafingers for touching and grasping, and para-eyes for reading a book, for example. In consciential projection in the mentalsoma, the consciousness has neither arms, hands, fingers, nor ordinary eyes for reading a book, but instead grasps its contents – its thoughts, ideas, energies, morphothosenes or the mental forms recorded or written in the material volume – all at once, *en bloc*.

8. **Entirety.** When in the psychosoma, the consciousness operates in a manner similar to the human body, in a retail manner, little by little, part by part. When in the isolated mentalsoma, the consciousness operates with a preference toward a wholesale approach, spontaneously, in entirety, in universal ways of manifestation that are common to all.

9. **Magnitude.** Consciential projection in the mentalsoma allows the state of cosmoconsciousness, on the one hand, and the state of *punctiform consciousness*, on the other hand. Both of these states are far more highly evolved and of a much greater magnitude than the manifestations occurring while in the psychosoma.

10. **Procedures.** Upon manifesting in the psychosoma, in the lucid interworld or interdimensional procedures of the intraphysical consciousness, both takeoff and interiorization affect the human body as a whole, from head to toe. In consciential projections in the mentalsoma, these procedures are circumscribed to the parahead (parabrain) of the psychosoma.

11. **Deintrusion.** Projections of the consciousness in the psychosoma still allow interconsciencial intrusion and deintrusion. Both of these processes become impossible in the evolved consciential projections of the consciousness in the mentalsoma. Generally speaking, the evolved mentalsomatic

dimension is inaccessible to those consciousnesses that nourish anticosmoethical impulses or energivorous conditions, which are characteristic of pathological interconsciential intrusiveness.

12. **Forms.** In projections of the consciousness in the psychosoma, general human forms, the mechanism of speech and other manifestations characteristic of the human being are still operative for the projected intraphysical consciousness. In advanced consciential projections in the isolated mentalsoma, even these material, instinctive, vegetative or animal manifestations disappear.

Bibliography: Greene (635, p. 49), Vieira (1762, p. 73).

438. SERIATED LUCID CONSCIENTIAL PROJECTIONS

Definition. Seriated lucid consciential projections: experiences of the intraphysical consciousnesses projected with lucidity from the human body with intensive sequences over a certain period.

Synonymy: consecutive lucid projections; consciential projectionrrhea; frequent lucid projections; sequential lucid projections.

Intraphysical consciousness. Any individual who is intelligent, creative, self-confident, hardworking, persistent, determined, fearless, self-motivated with what he/she does is undoubtedly able to produce lucid projections in series and projections with continuous self-awareness through the force of his/her disciplined will. This is dependent only upon the intraphysical consciousness wishing and suitably motivating him/herself to do so. One example is the use of the daily, abnegated practices of penta.

Types. Seriated lucid projections can occur daily, every other day, or weekly, and can last for long periods, months or years.

Periodicity. Both the periodicity of the lucid projections and the average frequency of this incidence are dependent upon the intensive, assistential, extraphysical tasks which occupy the consciousness of the projector (you) – a minicog within an interdimensional, assistential maximechanism – when projected. This also depends upon your human and existential conditions, without becoming overcome by alienation toward intraphysical life and the reasonable completion of your existential program.

Frequency. In 1968, the frequency, in this case, the incidence of lucid projections, was surveyed in a public opinion poll in England. The following percentages were found among those projectors polled: one lucid projection = 60.9%; two = 8.9%; 3 = 5.3%; 4 = 2.3%; 5 = 1.7%; 6 or more lucid projections = 20.9%.

Factors. A single, preponderant projectiogenic factor produces an impactful lucid projection or can even sporadically produce diverse extraphysical experiences. The simultaneous joining of various influencing projectiogenic factors produces lucid projections in series, repeatedly or over time. Conclusion: lucid consciential projections in series are very rarely produced from a single projectiogenic factor but from a combination of various factors.

Effects. On the other hand, lucid projections in series produce 9 distinct, cumulative effects in the projector's personality:

1. **Motivation.** They help to motivate the projector in his/her research, through the renewed stimuli which are naturally provided by new discoveries, investigations and questionings.

2. **Awareness.** They deepen the projector's awareness of sedimented verifications through repeated experiences and through the same phenomena being seen from new angles.

3. **Coherence.** They definitively eliminate the incoherent nature of the set of extraphysical trajectories that the novice lucid projector may, perchance, be having with some frequency.

4. **Universalism.** They increase the healthy detachment of the intraphysical consciousness to human life, naturally leading him/her toward the derepressing, emancipating principles of consciential universalism, without sectarianism or factiousness.

5. **Alienation.** They can lead the unwary projector to pathological alienation regarding his/her commitments with material, family, professional and social life.

6. **Recess.** In order to avoid physical alienation, and ultimately personal *existential incompleteness*, the polyvalent extraphysical helpers not only aid the intraphysical consciousness in projecting lucidly, but they also promote appropriate anchoring in the human body. In certain critical occasions, this prevents projection with lucidity and good subsequent recall, thereby triggering phases of recess in the series of lucid consciential projection. This can even completely extinguish the experiences up through the end of the individual's physical existence, as has happened in many reported cases. This does not prevent the consciousness from continuing to work extraphysically and assistentially, albeit without recall.

7. **Quality.** With time, the projector finds him/herself obliged to implant a quality control system in his/her cosmoethical intentionality and production of lucid projections.

8. **Rested.** The state of being rested after several hours of sleep in the early morning (from 5 to 7 o'clock in the morning), generally predisposes the projector having a period of seriated consciential projections to spontaneously produce amenable consciential projections and traveling clairvoyance phenomena. This may be due to the *lightness* of sleep in these conditions, which permits neither an enhancement of self-lucidity outside the human body, nor a greater condensation of the structures of the exteriorized psychosoma.

9. **Passivity.** Consciential projections in series sometimes give the clear impression that the projector, when in a phase of perfect syntony with the extraphysical helper, is in a continuous animic-parapsychic session that lasts for several days and even for weeks. On these occasions, the consciousness of the projector (you) experiences a condition of continued passivity, with an agreeable sensation of potency, under the ambivalent influence of the animic-parapsychic nature of the succession of events. These periods are also characterized by a state of healthy waking dis coincidence.

Agreeable. When the experienced lucid projector reaches the phase of self-lucid consciential projections in series, he/she finds him/herself becoming aware of remaining lucid during the physiological exteriorizations of nightly, ordinary, natural sleep. In other words, it becomes almost habitual to have simple, spontaneous, agreeable, consecutive, lucid projections in the physical base with lucid takeoffs and interiorizations without major consequences that precede major projections (self-lucid megaprojections), in the manner of previous consciential projections, or prolonged, unrecalled consciential projections, or even periods of natural sleep.

Integration. The veteran, lucid projector only develops seriated consciential projections with balance and without recess upon deciding to keep his/her projective resources permanently integrated, always monitoring – simultaneously, with rationality and without mysticism or psychophysical crutches – the subtle and coarse aspects as a whole, which seem to be more disparate, but with which the following 7 indispensable variables, for example, relate and interact:

1. **Holothosenology.** The positive personal conscientiological atmosphere or personal holothosene, observing your own lasting, useful materthosene.

2. **Holosomatics.** The carefully nurtured physical health of the soma, which reflects in the holosoma, or maintenance of reasonable holosomatic homeostasis.

3. **Intraphysiology.** Favorable domestic, professional and recreational environments.

4. **Holochakrology.** Self-lucid control of reception and donation of consciential energies.

5. **Assistentiology.** Habitual extraphysical assistance to other intraphysical and extraphysical consciousnesses, such as through the daily practice of penta.

6. **Projectiology.** Constant self-motivation for projecting from the soma with lucidity and with valid purpose.

7. **Cosmoethics.** The rigorous observance of personal conduct within the unshakeable principles of cosmoethics.

Usefulness. Lucid projections require valid objectives or valid mental targets in order for them to be maintained without interruption. No one maintains the production of seriated lucid projections that are amenable or comfortable for the consciousness in a mode of extraphysical uselessness.

Alternations. Instead of occurring on consecutive days, seriated, lucid consciential projections can be coordinated in succession, on alternate days, or every 3 days, keeping the quality of extraphysical perceptions at a high level due to at least the following 4 factors:

1. **Somatics.** Metabolism of the soma or human body.
2. **Neurology.** Replenishment of the nervous system as a whole.
3. **Habits.** Specific human habits of the lucid projector.
4. **Helpers.** Intraconsciential assistance sponsored and coordinated in detail by extraphysical helpers, even when not directly or ostensibly detected.

Chronology. On the other hand, because of an unconscious tendency, the intraphysical projector can psychologically inhibit the development of lucid consciential projections in series. This occurs, for example, when producing a lucid projection one day and thinking he/she should produce the next lucid projection only after skipping a day, or on alternate days, in order to avoid conscientially or energetically harming him/herself. With this refusal or reluctance to use a parapsychological process of extraphysical life, he/she blocks the production of the lucid projective phenomenon through autosuggestion.

Analogy. The human projector can produce several lucid consciential projections daily, whether in the morning, during the day or during the night, without suffering any harm. This negative, chronological, psychological effect – a fruit of multidimensional inexperience – is analogous to the “effects of position” which occur in laboratorial telepathy experiments.

Set. With lucid consciential projections in series, it is common to have a sequence of very lucid, interrelated projections in a single night that ultimately form a set of similar experiences. Their objective may be extraphysical assistance (intraconsciential assistential projection), a useful trip to a certain extraphysical environment or community, or the specific study of a certain advanced theme within evolutiology.

Facts. Given the fact that everyone dreams every night, and that the absolute majority of dreams are bad dreams, nightmares or semi-nightmares, it can be concluded that any period of lucid projections in series, as amenable or superficial as they may be in terms of their results, always constitute a source of relief, of positive, healthy enjoyment and an incontestable evolutionary factor for the intraphysical consciousness, at any time, place and under any existential conditions.

Incidence. Intensive, seriated, lucid consciential projections not only occur with veteran consciential projectors who are aware and experienced regarding the problems or basic themes of projectiology. They can also occur, in a healthy manner, with novice consciential projectors, sometimes uninterruptedly over a period of consecutive months, and can even include the interoccurrence of traveling clairvoyance, consciential projections in the mentalsoma, exoprojections or lucid consciential projections while the human body is in motion.

Extraphysiology. Lucid consciential projections in series can, by themselves, potentiate the repetition of new projective experiences. This occurs through the repetition of experiences, as well as through the resources of absorption of extraphysical energies obtained directly in extraphysical dimensions by the intraphysical consciousness in the psychosoma, now temporarily freed from dense matter.

439. THE PROJECTED CONSCIOUSNESS AND CHRONOLOGICAL TIME

Definition. Time: the succession of phenomena and the duration of mutable things, established through the relationship of cause and effect.

Synonymy: the fourth dimension; geophysical time.

Unsettling. Chronological time is one of the most unsettling and disorienting factors within the framework of manifestations of lucid projections. For this reason, the more the individual can study it, the better it will be for the development of lucid projectors in general and for projectiology itself.

Characteristics. The following are 11 conditions which are relevant in the qualitative and/or quantitative analysis of chronological time by the consciousness of the intraphysical projector:

1. Measured time (quantity).
2. Sensed time (quality).
3. Perceptible time.
4. Subjective time.
5. Objective time.
6. Imperceptible time.
7. Indifferent time.
8. Normal time, slow time or rapid time.
9. Contraction or dilation of time.
10. Lesser or greater time.
11. Past time, present time or future time.

Chronometry. Physics is the science that studies time in all of its aspects. Chronometry, an experimental science, should test its forecasts.

Unit. It is currently admitted that space and time do not exist separate from matter, these 2 concepts being considered as an indissoluble unit.

Events. It becomes difficult to characterize chronological time, the velocity of extraphysical translocation and projection in each body, in relation to the time of the physical base. These events can have the following time-related characteristics: instantaneous, tachyonic, at and below the speed of light. These relationships should be objects of future research involving a temporal generalization of the phenomena.

Computation. Regarding this subject, it is pertinent to remember that scientists using coarse terrestrial computation have already experimentally measured times including those on the order of nanoseconds or 10^{-9} seconds, or 0.000000001 seconds. Theoretically, they have, through simple calculations, obtained results of up to 10^{-22} seconds, or 0.1 thousandth of an attosecond (attosec. = 10^{-18} sec.).

Properties. The metric and topological structure of space-time can be modified during psychic (mental) and parapsychic activities. Mainly in the extraphysical environments analyzed, during the formation of morphothosenes, the topological properties of observed space can be: curved bidimensionality, plane tridimensionality, curved tridimensionality; continuity, extension. Topological properties of time: unidimensionality orthogonally coupled to space, continuity, regulation of temporal flow, unidirectionality. The topological properties reflect the integrity or qualitative aspect of space and time. For every rule of symmetry there is a corresponding law of conservation; the law of conservation of energy arises by virtue of the homogeneity of time; the homogeneity of space leads to the conservation of linear *momentum*; the conservation of angular *momentum* manifests connected to the isotropy of space; it is presumed that the law of conservation of electric charge seems to be connected to the invariance of the probability of occurrence of a quantic process, when its amplitude varies by one phase.

Concepts. There currently exist already established concepts on gravitational, electromagnetic, atomic, thermodynamic and entropic time. Time also has its polymorphic and isomorphic series. The property of time that differentiates the future from the past is the directionality or the passage of time. Another property of time is the irreversibility of its flow from the past to the future, which is also related to the increase of entropy or disorganization of the universe.

Space-time. Prior to Isaac Newton (1642-1727), people viewed the world as being bidimensional, the two dimensions in which they could walk. Newton's vision showed that the vertical direction was symmetrical to the other two, through gravitational forces, changing from a bidimensional symmetry to a tridimensional one. Albert Einstein (1879-1955) then changed the view of three-dimensional symmetry to a four-dimensional plane, in restricted relativity, and a four-dimensional curve in general relativity, where it curves to another unknown dimension, and where the greater the gravitational field is, the more curved space-time is and the slower is the flow of time. If one of 2 identical clocks is placed inside a gravitational field and the other outside, after awhile, the clock inside the field will be running late.

Fascination. Time and space have a power of fascination that is generally difficult to escape in our temporary condition as intraphysical consciousnesses who express themselves through a soma.

Distances. *Distance in time* ennobles things, conferring a grandeur to past events, an attractiveness and beautification that they lack in the present. *Distance in space* simply adds a touch of the picturesque and the exotic, favoring the development of dreams, daydreams, idealizations and myths.

Loss. Time which is lost is lost forever. The act of reliving through memory (recollection) is not living fully or thosenizing at the highest level of our potentialities. Intraphysical consciousnesses (human mentalities) relative to space constitute sequences of knowledge in constant mutation.

Types. There is 1 physical time that suffers interference from the environment, modifying the velocity of its flow upon encountering in different reference systems, or in the presence of matter-energy fields or in certain consciential states. Consciential time can penetrate precognitive and retrocognitive phenomena, still ignoring the basic laws involved. This is probably due to an analysis made by the mentalsoma, which is able to penetrate and reach the consciousness of the individual (you) through intuition.

Differences. The system of serial time, divided into seconds, minutes, hours, days, weeks, months, years, centuries and millennia is somehow different and still incomprehensible to us, when considered in the evolved extraphysical dimensions. The differences of chronological time in the pure mentalsomatic dimension, and consequently for the mentalsoma, trigger a series of facts in physical life that are not always well understood because they are still difficult to interpret.

Apparent. The differences of chronological time generate *apparent concomitances* in the agents and conditions of the phenomena which are difficult to analyze because the consciousness operates at a velocity beyond all patterns, *faster than the speed of light*.

Relativity. The intraphysical consciousness can experience a 1-minute projection and need at least half-an-hour to present everything that he/she experienced, saw and heard during that minute, due to the relativity of time connected with the physical sensations.

Velocity. A projector can experience a lucid projection in which he/she goes past various planets and stars, even beyond our solar system, as well as seeing atoms dispersed throughout space, given that this entire consciential projection lasts only 10 minutes at most. It is well known that the light from the sun takes 8 minutes to reach the earth. It can thus be concluded that the projected consciousness was extraphysically operating at a velocity greater than that of light.

Hypothetical. An increase in the "frequency" of all bodies of manifestation of the consciousness may be what produces a hypothetical antigravity state (negative gravity). This increase in frequency may also contribute to a very subtle state of the fields of the bodies of the consciousness, as well as a change of the consciousness' reference system. This enables flights (volitation) with great ease at any speed through space and a dilation of time, relative to the time in the perspective of the human body. This is foreseen in general relativity, due to the action of the gravitational field and the relativity of movement.

Factor. The sensitive in deep trance sometimes *seems* to parapsychically receive various extraphysical consciousnesses, or extraphysical personalities, at the same time. In traveling clairvoyance and successive (it is perhaps better to say: subintranant) lucid projections, the consciousness *seems* to duplicate itself, at first sight manifesting itself in 2 places at the same time, in the physical base and in the scenario being witnessed or visited. Nevertheless, this only apparently occurs because the human

body cannot be controlled, in its entirety, by more than 1 central command simultaneously, and the consciousness does not subdivide itself. The time factor cannot be included where, in fact, it does not participate in the origination of the phenomenon.

Retrocognitions. Time is important for everyone. Retrocognitions allow the intraphysical consciousness to avoid falling into the same *cattle guards* (dispensable self-mimicries) that he/she has previously succumbed to. For example: fighting the past or trying to escape it will always be foolish and a waste of consciencial energies.

Past. Consciencial retrocognitive return, or to the past, is an inevitable fact in the development of the intraphysical consciousness' future, due to 4 fundamental reasons:

1. **Panorama.** Somatic deactivation sponsors the panoramic vision of the recently-ended existence of the intraphysical consciousness that recently became an extraphysical consciousness.

2. **Reencounters.** Extraphysical reencounters occur between the extraphysical consciousness and consciences which underwent desoma before it.

3. **Intermissiology.** The extraphysical or intermissive consciencial condition of the extraphysical consciousness depends upon its previous intraphysical existence as an intraphysical being.

4. **Cycle.** The study of the personal lifetime and the immediately preceding, deactivated retrosoma, and even of other more remote personal intraphysical existences (multi-existential cycle), is an indispensable part of the programming of the upcoming life of every consciousness after the intermissive period.

Clock. A clock is associated with the concept of intervals of equal time without alteration. The heartbeat, the taking of the pulse, the rhythm of the metabolism, or the subjective sensation of psychological time (the so-called *biological clock*, or the psychic clock), are not currently suitable as standards for material time for humankind. This is because they do not pertain to the so-called absolute time of periodic phenomena that have a minimum of irregularities. Periodic patterns such as the earth's rotation evolved to precision such as the atomic clock, which is accurate to 1 second in 30,000 years, thereby establishing humankind's basis of time on the planet. Nevertheless, Newton's absolute time, or time that flows uniformly without any relationship to external objects, is defined through physical objects – clocks – which are subject to physical laws. Experimentally speaking, conditions such as travel at velocities approximating the speed of light or the presence of intense gravitational fields alter the passage of time. These conditions are derived from equations of special and general relativity. For this reason, time can no longer be considered an absolute, but a new variable that depends upon the reference system.

Questions. Is it possible that persons with tachycardia, accelerated metabolism or tachypsychism live in a more accelerated manner relative to the basic chronological time of the vibrations of our planet's atomic clocks? What are the patterns, what are the degrees of modifications, and which parameters are more important in relation to the vibrations of the atomic clocks on the planet's surface, upon entering the extraphysical world in the psychosoma or mentalsoma? Does time become variable and modifiable in relation to the patterns of the will? These conclusions with regard to time make the following paradox lose all value: "If God (Allah, Brahma, Elohim, Jehovah, *Tupã*) is the *primary* cause of all that exists, what is the *nature* of God?" The term *primary* is temporal, however time is not absolute, but merely one variable among the innumerable other dimensions of these planes, without parameters of comparison with our ordinary senses, which are characteristic of this planet.

Dimensions. From everything that has been scientifically researched up to now, it is known with certainty, as a provisional synthesis, that time amalgamated to tridimensional space constitutes a fourth dimension. This fourth dimension opens human understanding to comprehend the many other consciencial dimensions that exist, including the complex phenomena of the projected human consciousness.

Bibliography: Baumann (93, p. 83), Dolis (405, p. 36), Forman (538, p. 154), Frost (560, p. 10), Guéret (659, p. 163), Miranda (1050, p. 17), Muntañola (1108, p. 67), Pushkin (1342, p. 248), Vieira (1762, p. 122).

440. EXTRAPHYSICAL EVENTS

Definition. Extraphysical event: extraphysical fact or phenomenon experienced by the projected intraphysical consciousness and, therefore, detected by his/her paraperceptions outside the human body.

Synonymy: extraphysical event; extraphysical fact; extraphysical occurrence; extraphysical phenomenon.

Non-material. It is worth pointing out that quantum mechanics and recent observations regarding the quantum interconnection clearly indicate that, at least within the scope of science, the exclusion of non-material facts is no longer a desirable posture.

Experiences. Extraphysical events can be influenced by at least the following 8 types of experiences that the projected intraphysical consciousness can have:

1. **Sanity.** Positive, agreeable, or negative uncomfortable.
2. **Evolutiology.** Enriching evolved or depressant underdeveloped.
3. **Visualizations.** Black and white, colored or with neutral coloration.
4. **Psychosomatics.** Surprise, trauma or extraphysical attack.
5. **Parageography.** Extraphysical *geography* or parageography.
6. **Extraphysiology.** Extraphysical community.
7. **Specialization.** A specialized extraphysical institution, e.g.: feminine.
8. **Assistentiology.** Assistance to resomants.

Environments. Extraphysical environments and events that occur in the extraphysical dimension are intimately related, being mutually dependent.

Thoughts. *Mesological* influences in dimensions having a vital influence upon thoughts are greater than in the human sphere.

Characteristics. Within the characteristics of extraphysical events experienced by the projected intraphysical consciousness, the following can be singled out: quietness, intense activity, incessant wandering; extraphysical meditation or reflection; simple episodes, disparate extraphysical circumstances, complex facts; surprises, mishaps, traumas; extraphysical visual projection.

Speed. The following factors should be observed regarding the speed of extraphysical events: slow motion; chronological time; tachyonic velocity; the velocity of thought; unawareness of the transpiring of extraphysical events.

Sequence. In the sequence of extraphysical events, the following can be highlighted: single scene; multiple scenes; series of interrelated events; abrupt changes; intermission; paralysis; coherent continuation; a change only in the scenario; change of scenario and the consciousness; events in a single dimension; events in more than one dimension; voluntary participation of the projector (protagonist); non-participation of the projector (spectator); key moments; climax; final scenes (recall).

Repetitive. Among repetitive extraphysical events, the following are common patterns: dislocation up to the ceiling of the residence; sensation of weightlessness; sensation of falling; pass through human residences, entering through the front; volitate halfway up from the floor; contemplate human landscapes; cooperate in assistance to ill intraphysical and extraphysical consciousnesses; suffer extraphysical traumas (novice projector).

Bibliography: Vieira (1762, p. 140).

441. IMPACTFUL EXTRAPHYSICAL EVENTS

Classification. Extraphysical events that are impactful to the projected consciousness can be classified into two categories:

1. **Private:** experience the retraction of the silver cord; contemplate your own inactive human body; analyze the silver cord; change your own extraphysical clothing; encounter projected intraphysical

projectors, recent-extraphysical-consciousnesses, lycanthropes, extraphysical animals; visit extraphysical communities; be suddenly carried along by a current of force; participate in an extraphysical celebration; come upon an extraphysical artifact; make a positive extraphysical evocation; have a picturesque experience; help in an extraphysical rescue; serve as assistential bait with full lucidity; be impelled to an extraphysical confrontation in view of a reconciliation; suffer direct extraphysical attack; perform extraphysical mimicry; observe yourself in a large ordinary mirror; see your own reflected shadow; participate in the aiding of someone's desoma; examine a waking pregnant woman.

2. **Public:** appear to an intraphysical being; produce telepathy with an intraphysical being; promote physical self-bilocation; affect film emulsion, whether photographic, movie or videotape.

Pregnant woman. The pregnant-woman-projector, in particular, can perform an extraphysical self-examination.

Bibliography: Vieira (1762, p. 120).

442. EXTRAPHYSICAL TRAUMAS

Definitions. Extraphysical trauma: an afflux of excitations that exceed the tolerance of the projected intraphysical consciousness and his/her capacity to parapsychically control and metabolize these excitations; a consciential alteration caused by any factor outside the human body that destabilizes the balance and lucidity of the projected intraphysical consciousness.

Synonymy: consciential shock; extraphysical disturbance; extraphysical shock; extraphysical stress; extraphysical traumatism; projective trauma.

Psychosoma. Extraphysical trauma seems to only arise, or more pronouncedly so, in the intraphysical consciousness who is projected in the psychosoma, or the parabody of emotions. It occurs more frequently to the novice projector, due to the quick experience, surprise or an unknown element which increases the excitation to the projected consciousness that is unprepared to liquidate or assimilate it, thereby provoking ephemeral intraconsciential disturbances.

Causes. The extraphysical trauma is characterized by a specific triggering agent, almost always spontaneously identified; a specific degree of intensity; susceptibility of the consciousness; and extent of the projected consciousness' incapacity to respond adequately to the trauma, either by absorbing it, sublimating it, or overcoming it with naturality, as soon as it occurs.

Trac. The extraphysical trauma that affects the lucid projector, notably when experiencing the first lucid consciential projection, is sometimes reminiscent of *trac*, that paralyzing emotion, pathological state of anguish or irrational fear that the actor, musician or singer feels when appearing on stage. This is different from *panic syndrome*.

Agents. The most common traumatogenic or triggering agents permit the division of extraphysical traumas into 2 basic types: microtraumas and macrotraumas.

1. **Microtraumas.** Microtraumas are small extraphysical shocks produced by the inexperience of the projected intraphysical consciousness: pass the extraphysical hand (parahand) through the structure of physical objects; go through walls and closed doors with naturality; pass through the bodies of human beings (self-permeability); contemplate the inactive human body "face-to-face" (self-bilocation); see your psychosoma reflected in an ordinary mirror (self-reflection); take off abruptly in the psychosoma from the human body (extraphysical escape); hear the sound of sudden interiorization; examine the silver cord in detail; perceive the exact moment that respiration is lost; experience the state of extraphysical euphoria.

2. **Macrotraumas.** Macrotraumas are greater extraphysical shocks that generally interrupt the natural continuity of the experience of the consciousness projected from the human body: strong emotion; sexual impulse with extraphysical reflections; extraphysical encounter or reencounter with extraphysical consciousnesses that are acquaintances, friends or relatives; extraphysical retrocognition; a surprising, unexpected extraphysical event; the act of suffering a violent extraphysical attack from

an ill extraphysical consciousness; rapid accumulation of various excitations which are tolerable when isolated, but intolerable when gathered in a short extraphysical period of the intraphysical consciousness' experience; the extraphysical act of becoming aware of unquestionable truth; an engrossing task of extraphysical deintrusion.

Effects. The most common extraphysical traumas to the projected intraphysical consciousness can produce: extraphysical effects and physical effects.

1. **Extraphysical.** The extraphysical effects of extraphysical traumas occur in the intraphysical consciousness while still projected in the extraphysical dimension: premature ending of the extraphysical experience; unforeseen return of the projected consciousness to the physical base; sudden conscial interiorization.

2. **Physical.** The physical effects of extraphysical traumas are emotional or *mechanical* and occur later, in this human dimension, when the consciousness is already in the ordinary, physical waking state: simultaneous and instantaneous return-interiorization-physical awakening; physical repercussion; sudden physical awakening; lapses in awareness which provoke brief amnesia, whether retrograde (rarer) – wherein it is impossible to recall events that occurred before the trauma – or anterograde (more common), or the inability to remember events subsequent to the trauma.

Soma. Extraphysical experiences evidence that, for the courageous projector, greater, subsequent, lasting negative effects do not occur as a result of extraphysical traumas. This is because the soma, or human body, and human life itself, act as natural trauma neutralizing or discharging (dissipation) agents, much like a ground wire.

Traumatotherapy. In fact, extraphysical trauma works therapeutically for the consciousness (you) of the projector, vaccinating him/her, or curing him/her with respect to the aspects of the extraphysical dimension of which he/she was unaware or had never experienced.

Evolution. Extraphysical traumas are actually inevitable and indispensable for the individual development of lucid projections and the veteran projector's extraphysical evolution. Nevertheless, there are countless obscure aspects regarding this subject of physical-extraphysical emotions requiring enormous amounts of advanced research in order for them to be better understood.

Extraphysical consciousness. The extraphysical emotion stemming from an extraphysical dialogue between the projected intraphysical consciousness and that familiar intraphysical consciousness that recently became an extraphysical consciousness (e.g.: a former relative that recently passed away), sometimes even after 2 years of extraphysical or intermissive life, provokes an extraphysical trauma that, for its part, causes the following 5 clearly evident characteristic effects, among others:

1. **Imbalance.** The emotional impact, often merely owing to an *extraphysical phrase* spoken by the projected intraphysical consciousness, produces an energetic imbalance or loss of control of the extraphysical consciousness' individual conscial energies.

2. **Off-balance.** The extraphysical consciousness, thereby weakened and still in a *very humanized* attitude, tries to lean on or to support itself on surrounding physical-extraphysical objects, such as a piece of furniture or a window.

3. **Irradiations.** Sudden and visible alterations occur in the colors of the extraphysical aura of the extraphysical consciousness with the weakening of the luminous irradiations of its psychosoma, which appears to become more opaque.

4. **Aging.** There occurs an instantaneous process of aging in the visual appearance (paratransfiguration) of the psychosoma of the same deceased interlocutor corresponding to the physical age at which it left human life.

5. **Disappearance.** The combination of the abovementioned effects predisposes the phenomenon of extraphysical disappearance, which happens in an abrupt and forced manner or, in other words, against the will of the extraphysical consciousness, which desires to continue with the nostalgic dialogue. Upon changing the energetic frequency and the environment, the traumatized extraphysical consciousness leaves the projector's projected consciousness behind, *planted* in the physical-extraphysical environment, without even allowing time for the projector to help it with some exteriorization of conscial energies.

Case study. Just such a fact happened in precisely this manner with the author, due to a casual observation, clearly lacking any negative intention. This occurred with a friend with whom the author had lived for approximately 3 lustrums. The following conversation with him transpired in the physical base: “See how lucid I am outside the human body, just like you, and afterward I can remember everything that is happening now.” He responded: “All of this is really absurd.” The author added: “You never accepted anything I used to tell you about it, right”? And he responded: “Actually, no.” He shook the parahead of the psychosoma. So, joking with naturality, the author made the imprudent observation that ended up generating an impact: “You really insisted on ignoring all these facts”! That was all it took, as it appeared that he sensed the observation to be a reprimand or a mild rebuke. In light of this, the author returned to the human body without knowing where he went, probably being impelled by extraphysical melancholy.

Attention. It can be seen that it is necessary for us to be attentive in order to help in the works of extraphysical assistance to energivorous extraphysical consciousnesses. A comment that, for us, is simple and inexpressive, can trigger an extraphysical trauma greater than those occurring with the lucid projecting intraphysical consciousness when projected.

Bibliography: Castaneda (258, p. 132), Monroe (1065, p. 155), Vieira (1762, p. 120).

443. FACTORS FAVORABLE TO LUCID PROJECTION

General. The most diverse general catalytic factors can predispose, precipitate or even produce a lucid projection: hypnagogic state; natural sleep; ordinary dream; nightmare; hypnopompic state; state of relaxation; autosuggestion; deep concentration; strong emotion; intense motivation; extreme fear; daydream; parapsychic trance; hypnotic trance; yoga practice; awakening of the *kundalini* or the energies of the sexochakra; *Ganzfeld* stimulation; training; physical exercise; physical stress; sensory deprivation; repression of physiological needs; weak or strong drugs; chronic or serious illness; surgical anesthesia; shock; childbirth; accident; indeterminate cause.

Classification. There are various factors that are favorable or specifically predisposing to lucid projection. They are classified according to their nature into 4 categories:

1. **Psychological:** good intention; sense of spontaneous fraternity; optimism; carefreeness; *mental unwinding*; open and relaxed mind; fearlessness; healthy and fertile curiosity; have time; self-critique; self-discipline; motivation, interest; sincere wish to project, the most reliable coadjutant of projection; vocation as a courier; self-knowledge of your own human body and the self; autosuggestive procedures; hypnosis; state of divagation, daydream; trust in the capacities or attributes of the psychosoma; think about lucid projection; read about lucid projection, as long as you do not suffer from insomnia.

2. **Physiological:** go to bed as soon as you become sleepy; natural sleep; sleepiness; habit of sleeping on your back; position of laying on your back on the bed; relative tiredness; emotional self-control; psychophysical relaxation; remain relaxed during the day, avoiding conflicts; balanced sexlife; relaxation period subsequent to the experiences; sex act with neither negative connotations nor *sexual or energetic hangover*; low heart rate; specific illnesses; organic detoxification; fasting; prolonged dysentery due to consumption and physical weakening; certain types of developed parapsychism; precedent of being aware of dreaming during a dream; frequent previous physical repercussions; habit of projecting; maintenance of the image of the intraphysical consciousness him/herself projected.

3. **Physical:** good weather (meteorology); environment favorable to lucid projection; familiar environment used as a physical base; darkened physical base; friend sleeping close to the inactive human body; minimal sleeping attire.

4. **Extraphysical:** cosmoethical conduct; serenity during lucid projection; positive extraphysical relationships; not doubting yourself and your extraphysical capacities.

Aggregations. Pure or natural lucid projection is executable by discarding all psychological, mystical or scientific aggregations coming from external, artificial or occasional sources.

Within. Everything that healthfully leads a person within him/herself, although maintaining the constant will to leave his/her own human body, favors the practice of lucid projection. This is why projective practices are recommended to all religious persons, or all faiths, and those that enter into psychological seclusion, motivated by any noble and just intention.

Age. Physical age can influence the individual's lucid projections. Due to immaturity in understanding their sensations, lucid projections occurring in infancy sometimes differ from lucid projections produced in adolescence, which can even mark the intraphysical personality. They can also differ from those occurring during maturity, which are more difficult and rarer, and definitively reveal the consensual panoramas.

Resomatics. The resonant extraphysical consciousness generally manifests itself in the adult form of the previous personality, up until one day prior to rebirth. It is even possible to have a projection of the consciousness of the fetus up to that point.

Activities. On the other hand, the fact of the projector maintaining him/herself involved in healthy day-to-day activities, or those related to physical survival – as surprising as it might seem – aids in the development of his/her lucid projections. The exchange in impressions, the gathering of ideas and dialoging with other projectors sustain the projector's motivation and prevent prolonged recesses in the series of experiences.

Intelligences. Cognition is a complex mixture formed by the perception, analysis and comprehension of information received. The more elevated the manifestations of the projector's independent and intercommunicative talents of intelligence – whether the intelligence is linguistic, mathematical, relative to the human body itself, intelligence regarding interpersonal relationship, musical intelligence, or spatial intelligence – the greater will be the possibility for him/her to amplify the extraphysical periods of his/her projected consciousness, increase the quantity of his/her projections in series, and expand the average quality of extraphysical perceptions (paraperceptiology) and lucid projections (projectiology) in general.

Case study. The intellectual competence of the projector in any field can favor his/her projectiological practices, e.g.: intelligence regarding language will easily lead him/her to conscientese; intelligence demonstrated relative to his/her human body permits an understanding and better use of the vehicles of manifestation of his/her consciousness; his/her intelligence regarding correct relationships provides better opportunities for extraphysical contacts; spatial intelligence helps in the grasping and application of extraphysical orientation.

Childbirth. Certain disturbances and accidents related to childbirth seem to positively predispose lucid consensual projection or, in other words, potentiate the projectability of the resonant extraphysical consciousness, a quality that will fully manifest later in the phase of adulthood or maturity. However, the physiological act of rebirth itself has no relationship with the subsequent performance of the consensual projector (see Susan J. Blackmore).

Concepts. Awareness of the basic differences between the concepts of sensation, instinct, self-awareness, emotion, reason, sentiment, postures, conduct and its consequences, are factors which are favorable to the production of lucid consensual projection. The individual can begin to reflect upon these factors, beginning with the following 6 points:

1. **Sensation:** lucid sensory process that is correlated to a physiological process and provides humans and so-called superior animals with a knowledge of the external world. Examples of types are: cold, heat, the 5 basic senses.

2. **Instinct:** forces having a biological origin, inherent to humans and the (larger) higher animals that generally act unconsciously, without exercising reason, although with precise purpose and independent of any learning. Types: life instinct, instinct of gregariousness or herd instinct, sexual instinct, maternal instinct.

3. **Self-awareness:** the consciousness that acquires the capacity for reflecting upon itself (awareness of self). Effects: notion of that being who knows who it is, where it is, what it does.

4. **Emotion:** intense, brief reaction of the organism to an unexpected event, which is accompanied by an affective state having a painful or agreeable connotation, depending upon the diencephalic centers and normally displaying manifestations of a vegetative order, devoid of any greater rationalizations. Types: ordinary love, passion, disgust, jealousy, grief, hate, anger (rage), surprise, embarrassment, sadness, happiness, fear, anxiety, remorse, ecstasy, repugnance (revulsion). It becomes very important to know that an individual's emotional expression constitutes the assemblage of revealing visible manifestations of a patent emotional state, mainly the following 9: vascular reactions: blushing or pallor of the face; respiratory reactions: sighs; expiratory reactions: laughter; mixed reactions: hiccups; glandular reactions: tears, sweat, salivation; generalized muscular reactions: trembling; facial reactions: grimaces or smiles; phonetic reactions: screams; pilomotor reactions: goose bumps and hair standing on end. There are exciting emotions (happiness, anger) and depressing emotions (pain, fear).

5. **Reason:** the faculty that humans have – distinguishing them from other animals – to establish logical relationships, to know, to understand, to reason, which leads them to original ideas. Effects: judgment, logic, discernment, prudence, good sense.

6. **Sentiment:** affective disposition relative to things of a moral or intellectual order, constituting the rationalization of emotions. Types: fraternity, renunciation, abnegation, fearlessness, inner peace. Positive sentiments lead the consciousness to balance, mental and emotional equilibrium, and to physical and extraphysical self-control.

Functionality. The functional development of the consciousness is one of the main objectives to be achieved by projectiology. Once the basic consciential operations and all of their manners of processing are known, lucid consciential projections are achieved through logical thoughts and a scientific sense, like an acquired good habit.

Techniques. In order for the functional development of the intraphysical consciousness to occur, the methodological procedures of projectiology, or logical projective techniques, are necessary (hence the reason for this book). This thereby definitively discards: disconnected pre-logical thoughts between ideas, judgments and reasonings, which are filled with omissions or false declarations, typical of the infantile or immature minds of adults lacking a greater rational development and the uncultured intelligences that precipitately confuse *the identical with the analogous*, without precisely discerning the degree, type, species, the causal succession, occasional succession, and the primary and secondary succession that is involved in the object under analysis.

Defects. This is why, on this point, projectiology eliminates: the defects of thought (correction of self-thosenity); conjunctive pre-logical thoughts; ideas having inappropriate emphases regarding that which is respectful; sacred concepts; thoughts which are magical, mystical, mythical or deficient in regard to perception within the rigor of the principle of sufficient reason.

Correlations. The intimate connections between emotions and the viscera, or somatic correlations, are a subject of common experience. Emotional awakening affects the heartbeat. Fear stimulates the sudoriparous glands; sorrow affects the lacrimal glands. The respiratory and digestive systems are involved in the experience of emotion. Irrational beliefs are based upon emotion. Beliefs or thematic presuppositions are *felt* to be real. Believing has been described as *knowing your own viscera*. On the other hand, the functions of the viscera do not cease to also be reflections of the psychosoma, the emotional parabody.

Expressions. In the same way that children understand a much greater number of words than they can say, adults experience a much greater number of sensations than they are able to express in words, in the ordinary, physical waking state as well as during lucid consciential projections.

Aviators. Emotions, even subhuman, *animal* motions, always have their uses in the evolution of the consciousness. The following is a negative example: *to kill proficiently*. During the Second World War (1939-1945), bomber pilots assigned to delicate missions were selected from among emotional individuals. It was effectively proven that non-emotional aviators were incapable of evaluating the danger to which they were exposed, underestimated the power of the adversary's anti-aircraft

batteries and had less chance than the others of reaching the set objective or, in other words, they were not *good killers*. Emotional intelligence is characterized by a profound infantilization and paralyzation of the self-discernment of the mentalsoma.

Scale. In an overall analysis, the following 4 basic manifestations regarding the evolutiology of the consciential principle (the consciousness) can be considered on a scale of increasing complexity:

1. **Somatics.** Human sensation: the complex form of genetic-vegetative animal instinct of that resonant extraphysical consciousness which still merely presents rudimentary paragenetics.

2. **Psychosomatics.** Human emotion: the complex form of energetic human sensation, or that which is influenced by the holochakrology – which is always temporary – of the intraphysical consciousness.

3. **Mentalsomatics.** The individual's elevated sentiments: the complex form of human emotion having a discernment that reaches even the evolved extraphysical communities.

4. **Holomaturology.** The consciousness' extraphysical maturity: the complex form of the individual's sentiments within the realm of the phenomenon of cosmoconsciousness.

Bibliography: Blackmore (140, p. 229), Denning (391, p. 6), Morris (1089, p. 1), Muldoon (1105, p. 197), Roll (1466, p. 230), Vieira (1762, p. 123).

444. PERSONAL USES OF LUCID PROJECTION

Use. Although the experience of lucid projection is a fact prevalent throughout human history, with a great number of cases already registered, this unusual experience is unfortunately still not perceived, not applied adequately, not used in daily life, nor is it used in a healthy manner by the majority of terrestrial humanity. On the contrary, there are still many people going to psychiatrists, notably youths taken by insistent relatives, due to the fact that they are seeing their own physical body – during healthy, spontaneous lucid projections – when they find themselves fully lucid while outside it. Sadly, this is an attitude of complete general ignorance of parapsychical realities. Hopefully this book can somehow contribute to the reduction of this obscurantism of our contemporary civilization and our sciences which are dedicated to the area of human health.

Indication. Lucid human projection can basically be applied to everything that favors and improves the life of the intraphysical consciousness, as it is a means for obtaining intraconsciential knowledge which could not be obtained in another manner. Lucid human projection offers an unlimited scope for the individual who lives in the hideaway of intraphysical existence (*bastion of the mega-ego*).

Self-image. Lucid projection allows the human personality to achieve the following 8 extremely personal victories: clarify things, facts or experiences with respect to yourself; change your mood; eliminate personal insecurity; gain self-confidence for living; deal with personal emotional problems with greater realism and success; amplify the individual sense of competence; restore the psychophysical self-image; restructure a new self-concept, with which you can live a better and more productive life.

Types. Among the personal purposes of lucid projection, 5 types of revolutionary basic uses that can benefit humankind should be singled out: therapeutic uses, psychological uses, educational uses, parapsychic uses, and specific practical uses.

Therapeutic Uses:

1. Cure of interconsciential intrusion through extraphysical deintrusion, which can even be sponsored by and for the same lucid projector.

2. Elimination of thanatophobia, or the overwhelming fear of physical death, or the deactivation of the soma (desoma), through recognition of the existence of other consciential dimensions and the vehicles of manifestation of the intraphysical consciousness.

3. Elimination of pneumatophobia, or the fear of seeing or encountering extraphysical consciousnesses, through direct coexistence with the helpers.

4. Elimination of projectiophobia, or the fear of lucidly and temporarily leaving the human body, through the routinization of lucid projective experiences.

5. Elimination of acrophobia, or the fear of high places, and of aerophobia, or the fear of flying (in airplanes), through the practice of unencumbered volitation in extraphysical dimensions.

6. Use of lucid projection as a spontaneous, natural adaptive recourse of the human organism to disasters, surgery, accidents, or emotional stress.

7. Application of the lucid projection experience as a positive and powerful psychological aid in cases of fatal illness or suicidal tendency.

8. Assistance to the pregnant woman-fetus duo by the selfsame pregnant woman-projector.

9. Achievement of a state of supernormal health, because it deepens relaxation, eliminates tension, increases and focuses concentration, enhances memory, improves reflexes, increases self-confidence, and intensifies the desire to live productively.

Psychological uses:

10. Achievement of emotional balance through the practice of extraphysical serenity.

11. Encounters with loved ones while outside the human body.

12. Direct reconciliation with extraphysical adversaries, whether from the projector's past or present.

13. Annihilation of all types of hypocrisy or demagoguery.

14. Possibility for extraphysical leisure, or *extraphysical mini-vacations*, through instructive trips taken by the consciousness.

15. Opening of horizons of another broader, richer and more definitive life with an understanding of cosmoethics, thereby affording the control of terrestrial life and solutions to everyday problems.

16. Enjoyment of the incomparable sensation of unfounded happiness and life that is devoid of time.

Educational uses:

17. A shortcut in the progressive route through the acceleration of consciential self-knowledge.

18. Ideal method for educating the consciousness through the acquisition of a profound awareness of personal identity.

19. Derepression of the integral consciousness (holomaturology).

20. Amplification of the extension of the consciousness through the mentalsoma (mentalsomatics).

21. Freedom of the consciousness from the prison of human forms.

22. Gathering of extraphysical opinions with answers to many enigmas or unknowns regarding intraphysical life.

23. Extraphysical acquisition of original ideas, the foundation of evolutionary research.

24. Uncovering of universalistic coexistology (megafraternity).

25. General substitution of beliefs through the transformation of the theory of infantile rationalized faith, which is amplified with direct, practical, experienced, unquestionable and definitive self-knowledge.

26. Self-affirmation of healthy, heuristic curiosity.

27. Gradual elimination of the need for the extraphysical consciousness to be reborn. This is the main purpose of lucid projection or, in other words, its anti-existential-seriation function.

Parapsychic uses:

28. The only process allowing the individual to take advantage of the one third of conscious life, which is routinely wasted by almost all of the terrestrial population under the Draconian demands of natural sleep.

29. Personal incontestable proof of the existence of the psychosoma, silver cord, chakras, mentalsoma and survival of the consciousness after the death of the human body (desoma).

30. Acceleration of the practical development of paraperceptibility or animic-parapsychic capacities in all their modalities and manifestations.
31. Achievement of extraphysical retrocognitions, with definitive proof of the individual's own existential seriation.
32. Acquisition of skill in extraphysical experiences.
33. Means of contacting friends and loved ones who have already resumed their status as extraphysical consciousnesses.
34. Improvement in the silver cord's action (holochakrology).
35. Extraphysical absorption of extraphysical energies.
36. Visits to all types of extraphysical environments.
37. Visits to human locations which are physically inaccessible or inhospitable, such as: deserts, closed forests, frozen regions, caves, depths of the earth, seabeds, mountain ranges and canyons.
38. Visits to human locations closed to strangers, such as: military areas, industrial zones, police establishments, secret organizations and libraries closed to the public.
39. Research performed on other heavenly bodies through exoprojections.
40. Consultation of a veritable database of transcendent information that is beyond all calculations and forecasts.
41. Anticipation of the possibility of the intraphysical being performing tasks using projection of the consciousness in the mentalsoma, that await him/her subsequent to desoma.
42. Personal verification of the existence or nonexistence of extraphysical intruders influencing the projector.
43. Avoidance of crazed acts such as those who kill themselves due to the mere curiosity of feeling and knowing what desoma or death of the human body is, because lucid projection is a *preview* of death.

Specific practical uses:

44. Anticipated strengthening of the individual who will be exposed to the risk of death or deactivation of the human body (soma).
45. Performance of extraphysical actions that are positive to invalids and persons with various general deficiencies, including blind and deaf-mute individuals.
46. Enjoyment of temporary extraphysical freedom by prisoners.
47. Overcoming physical distances through extraphysical processes.
48. Effective use of human time by those who are available, retired and suffer from intraphysical loneliness or forced isolation.
49. Finding an exit when lost in a dark cave (speleologists).
50. House hunting, for purchase, in a distant district or location.

Objectives. The scientific methodology and the various techniques of science which are applied in projectiology have the objective of improving humankind's knowledge (cognitive objective), increasing the individual's well-being, and expanding the individual's power (useful objectives).

Bibliography: Baumann (93, p. 95), Denning (391, p. 1), Frost (560, p. 19), Greene (635, p. 93), Greenhouse (636, p. 118), Leadbeater (901, p. 306), Malz (992, p. 97), Mittl (1061, p. 5), Rigonatti (1401, p. 14), Rogo (1444, p. 166), Vieira (1762, p. 5).

445. PROJECTIVE EXISTENTIAL RECYCLING

Definition. Projective existential recycling: change for the better of the entire course and perspective of the human life of the consciousness – caused by the impact of lucid projection – which therefore adopts a new set of values regarding the universe.

Synonymy: consciential recentralization; consciential reorientation; enrichment of the value system; instantaneous ideology; intraphysical about-face; intraphysical new perspective or new perspective regarding the existential program; projective existential moratorium; projective revival of the existential program; sudden intellectual conversion; turnaround of the existential program.

Reflection. The phenomenon of lucid projection, with an elevated degree of lucidity, challenges the individual's reason, generates an inevitable increase in his/her mental reflection and makes the individual *stop and think*, pay more attention to surrounding life issues and really rethosenize his/her view of the cosmos. These effects end up making greater or lesser individual changes in opinion and behavior. This is one more evident use of lucid projection or the lucid projectability of the intraphysical consciousness.

Effects. Among the effects triggered by existential recycling of a projective origin, at least the following 6 can be singled out:

1. **Self-awakening.** Psychological revival.
2. **Mentalsomatics.** Sudden intellectual conversion.
3. **Existential moratorium.** Existential moratorium.
4. **Intraconsciential recycling.** Intraconsciential illumination.
5. **Redefinitions.** Generalized redefinitions applied to human life.
6. **Turnaround.** Demarcation of the human existence into 2 distinct periods: before and after the impactful projection or the turnaround of one's own destiny, created by the individual him/herself.

Past. In the past, projective existential recycling blossomed after visions, mystical ecstasies, and diverse states of expansion of the consciousness or self-transcendence. As a result, sects and religions arose everywhere among the most diverse people.

Complement. Projective existential recycling can be preceded by an existential moratorium, which generally arises after a deep physical trauma, serious illness, near fatal accident, or existential crisis. It is frequently accompanied by the near-death experience (NDE), in this case being a resuscitative consciential projection wherein the consciousness receives – often fully aware – a complement of chronological human time for his/her human life in order to complete a task, perform obligations or execute an egokarmic or groupkarmic rescue, within the directives of his/her existential program.

Moratoriumist. The individual who receives the responsibility of an intraphysical moratorium or the responsibility for accomplishing the existential program is a *moratoriumist*.

Dislocation. Existential recycling through lucid projection is a sudden dislocation – apparently occurring without warning – of the intraphysical consciousness' center of organization in the mentalsoma. This is a fact within the field of mentalsomatics.

Trauma. The abrupt dislocation of the center of consciential organization requires meticulous self-study in order for the new lucid projector to avoid a traumatic or negative personal recentralization, reorientation or new perspective.

Paravisceral. Existential recycling of a projective origin is often more vigorous, deep, sophisticated, far-reaching and paravisceral than any other possible consciential reorientation in human life which is generated by an impetus stemming from privation, illness, ideological adhesion, religious conversion, the persuasive words of a professor or the revolutionary ideas of a book.

Characteristics. The following are conditions and characteristics which are peculiar to the majority of instances of full projective existential recycling:

1. **Rarity.** The rarity of the occurrence, in light of the total planetary population.
2. **Leap.** Existential recycling constitutes a sudden leap in consciential development.
3. **Center.** The occurrence emphasizes the complexity of the center of consciential organization (mentalsoma).
4. **Self-growth.** It illustrates the mobility of the upper limits of the possibilities for consciential self-growth.
5. **Specifications.** Above all, it has particular, personal specifications.

6. **Lability.** It is dependent upon the lability of the personal process of consciential organization.
7. **Capacities.** It is directly related to the capacity for personal reflection, objectivation and education.
8. **Enrichment.** The degree of consciential enrichment from the occurrences is far greater than the degree of trauma arising from them.
9. **Transcendence.** In theory, the new projective perspective transcends all other possible existential recycling.
10. **Triumphalism.** It exhibits a certain emotional gratification tending toward triumphalism, which should always be avoided.

Bibliography: Blackmore (145, p. 309), Portela (1275, p. 127), Vieira (1773, p. 5).

446. PUBLIC USES OF LUCID PROJECTION

Categories. Among the public uses of lucid projection, 18 can be divided into 3 categories: therapeutic uses, parapsychic uses, and specific practical uses.

Therapeutic uses:

1. Anonymous or visible (apparition of the projected projector) assistance to intraphysical and extraphysical consciousnesses.
2. Extraphysical rescue of a projected intraphysical being within the interconsciential processes of intrusion and possession.
3. Extraphysical diagnosis or projective telediagnosis.

Parapsychic uses:

4. Proof of the existence of the human consciousness to another (apparition of the intraphysical projector or *inter vivos* apparition).
5. Proof of the existence of the psychosoma (physical bilocation phenomenon).
6. Programmed experiments of lucid projections in the laboratory.

Specific practical uses:

7. Establishment of *holothosenic cartography*, including the specific identification of the local materthosene, physical and extraphysical environments (thosenology).
8. Historical research through projective retrocognition (history).
9. Extraphysical tracking of persons missing due to kidnapping or abductions; plane crashes; boating accidents.
10. Extraphysical tracking of persons who have committed antisocial acts (criminology or police investigation).
11. Extraphysical location of shoals of fish (primitive survival technique).
12. Extraphysical location of fossils and antiquities (archeology or archeological research).
13. Extraphysical location of mineral deposits (geology or geological research).
14. Extraphysical exploration of natural cavities in the earth: grottos; caverns; springs (speleology or speleological research).
15. Anatomy research; histology research, including cells, genes, DNA; general microbiology research; research of atoms and sub-atomic particles through projections of the mentalsoma (mentalsomatics).
16. Spying or investigation through extraphysical espionage. A resource which is obviously negative or anticosmoethical for the lucid consciential projector to use.
17. Extraphysical space probing through consciential probes (astronautics).
18. An impelling factor for space research, given that lucid projection is the most practical means for space travel.

Surveillance. An immediate practical application of the phenomenon of lucid projection, and one which becomes a firm obligation for the veteran lucid projector, in favor of him/herself, others and the environment in which he/she lives, is the *service of extraphysical defense and surveillance*. With the development of projectiology, this service will one day be continuously executed everywhere.

Technique. Through the service of extraphysical defense and surveillance, the awakened, projected, lucid projector controls the physical-extraphysical environment of his/her physical base, expelling all possible intrusive, energivorous, invasive, inconvenient and ill extraphysical consciousnesses that appear. This is accomplished through the practices of penta, conscientiotherapeutic encapsulation and the extraphysical clinic. The following are 14 categories of these personalities:

1. Conscious and unconscious extraphysical invaders of residences.
2. Conscious and unconscious hangers-on of the residents.
3. Extraphysical somnambulists, in this case, energivorous extraphysical consciousnesses, frequently having no ill intentions, although being vampirizers.
4. Extraphysical or intraphysical somnambulists, in this case, projected and needy intraphysical consciousnesses.
5. Object-consciousnesses serving as interconsciential assistential bait for the consciential epicenter who already works with an extraphysical clinic.
6. Classic stubborn extraphysical intruders, including mega-intruder leaders of groups.
7. Those *demanding* satisfaction regarding extraphysical assistential work or extraphysical groupkarmic creditors of intraphysical consciousnesses, which can be the projector, relatives, friends or colleagues of the evolutionary group.
8. Extraphysical *trespassers* of all types and categories.
9. Innocent pawns used as *cannon fodder* by intruders or satellites of extraphysical intruders (intraphysical and extraphysical consciousnesses).
10. Ill extraphysical sentinels.
11. Extraphysical assailants commonly found in the troposphere and the paratroposphere.
12. Extraphysical, paratropospheric, curious ill consciousnesses.
13. Extraphysical children which are “apparently lost”.
14. Extraphysical blind guides of all types, which are vampires that are readily encountered in all types of sectarian human doctrinaire groups, whether mystical, religious, sociological, political, artistic, athletic, philosophical and even scientific, when dedicated to anticosmoethical acts (bellicosity, militarism, martial policies, armed conflicts, hostilities).

Security. Spontaneous lucid consciential projection sometimes serves as a physiological security mechanism for the intraphysical consciousness to prevent excessive shock or trauma and allow the individual (with assistance from extraphysical helpers) to transcend pain and fear (thanatophobia) and understand (holomaturity) what is actually happening to him/her (achievement of hyperacuity or recuperation of the major cons). This occurs through intra and extraconsciential, intra and extraphysical, multidimensional mutations.

Self-mutations. The following are examples of 10 postures, procedures or behaviors. They are listed in the logical, sequential order of renovating, or mutational, events triggered by the practice of lucid and cosmoethical consciential projection, as well as the inevitable consequent acquisition of transcendent knowledge attained directly in evolved extraphysical communities:

1. **Growth.** Intra and extraconsciential growing crises.
2. **Evolution.** Positive stress: *the touchstone of evolution*.
3. **Self-turnaround.** Consciential self-turnaround or self-mutation per se.
4. **Intraconsciential recycling.** Intraconsciential recycling (consciential micro-universe).
5. **Existential recycling.** Existential recycling.
6. **Existential moratorium.** Existential moratorium within the existential program.
7. **Penta.** Beginning of the practices of penta or the personal, daily, energetic task for the rest of the current intraphysical existence.

8. **Consciential epicenter.** Acceptance of the condition of consciential epicentrism.

9. **Extraphysical clinic.** The opening of a busy assistential extraphysical clinic derived from your holothosene, which increases your interdimensional responsibilities.

10. **Minicog.** Self-lucid and comfortable recognition of your personal transformation into a lucid minicog of a maximechanism of interconsciential and multidimensional assistance.

Future. In the future, projectiology will allow a surveying of the *holothosenic chart* of every intraphysical city, indicating the gravitations of consciential energies and thosenes (materthosenes) which are positive, healthy, more subtle or better, as well as those which are negative, pathological, heavier or worse. It will also be possible to plot an *extraphysical map* of the environment around conglomerations of humans. Within the factors thus far detected in this sense, the following are included: extraphysical currents of energy; extraphysical assistance service sectors; open extraphysical vampirism in slaughterhouse environments; and others.

Probes. In the technological applications of lucid consciential projection, lucid projectors will be used in the future as consciential probes to investigate other stars and planets distant from the earth, especially using projections in the mentalsoma. This is because distances disappear and chronological time does not have the same magnitude in the mental dimension as it does in the ordinary, physical waking state. Lucid projection will also be employed to research the microcosm of matter, its field interactions, dipoles and multi-poles of electromagnetic waves, nuclei, electrons and neutrinos, using only the pure hyperacuity of the consciousness and thereby avoiding interference from interactions with equipment.

Bibliography: Brittain (206, p. 53), Greene (635, p. 93), Greenhouse (636, p. 89), Leadbeater (901, p. 306), Murphy (1111, p. 58), Steiger (1601, p. 124), Targ (1651, p. 169), Vieira (1773, p. 5).

447. FACTORS UNFAVORABLE TO LUCID PROJECTION

Classification. The factors unfavorable or inhibitory to lucid projection can be classified into 4 categories, according to their nature:

1. **Conscientiological** (or psychological): panic; unquietness; anxiety; indiscipline; scattered thoughts or unstable self-thosenity; obsessive ideas (monoideism, fixed ideas); be worried about an appointment; have expectations about the following day; maintain the psychophysiological, corporal, biological clock out of sync with the day-night cycle (circadian rhythm); laziness, depression, mental apathy or intellectual fatigue; staying in bed beyond the natural, healthy number of hours of sleep; pessimism or defeatism; misoneism or neophobia; erroneous tradition; feelings of resentment, grief, susceptibility, disaffection or malevolence; reprehensible or anticosmoethical intentionality; anticosmoethical or bad habits; ignorance of lucid projection; technical unpreparedness for even a primary lucid consciential projection; watching an engrossing movie at the theater, on TV or on tape shortly before preparing to project.

2. **Somatic** (or physiological): emotional lack of control; lying in the prone position in bed; disturbance due to the digestive process, it thus being recommended that heavy meals be eaten two hours prior to predisposing yourself to lucid projection; ingestion of alcoholic beverages prior to attempting a projective experience; organic intoxication; intestinal constipation due to the accumulation of used matter inside the human body; prolonged intellectual activity that uses cerebral or emotive excitation, working late into the night, whether with discussions about ideas, controversies and family disputes, and others; high heart rate; tobaccoism; sexual dissatisfaction or deprivation.

3. **Physical** (or mesological): atmospheric disturbances in the physical base; muggy weather; a very high or very low temperature in the bedroom (energetically shielded chamber); an unfamiliar environment used as a physical base; background music in the physical base (for most veteran

projectors); noises close to the human body; a person awake near the practitioner's human body; heavy sleeping attire; certain drugs, even when correctly prescribed for indispensable therapy, such as stimulants that enhance the physical waking state.

4. **Extraphysical** (or parapsychic): fear (thanatophobia, projectiophobia) during the projection; apprehension of not returning to the human body; extraphysical fear causing involuntary return, physical repercussion and physical catalepsy; extraphysical emotionalism; extraphysical invasion or intrusion, with negative or anticosmoethical intentions, of the privacy of the intraphysical or extraphysical consciousness; the extraphysical tracking of terrestrial or paratropospheric interests; the extraphysical sexual impulse destabilizing the freed psychosoma, which ends up being pulled back to the human body by the silver cord, as well as other consequences that attract extraphysical consciousnesses which have the same category of those.

Stimulants. It is also not recommended to ingest beverages that stimulate the brain, up to 4 hours before going to bed. This is especially true for those containing caffeine, such as coffee, tea, hot chocolate and soft drinks, like colas. The human body begins to feel the stimulating effect of caffeine from between thirty minutes to one hour after ingesting any of these drinks. Depending upon the individual, a simple cup of coffee can excite the cerebral cortex up to 7 hours after it is ingested.

Interpretation. Certain erroneous observations made by individuals arise from a complete absence of specialized, technical knowledge. There are authors who intellectually endeavor to give a new twist to the interpretation of the concept of lucid consciential projection or its practice. This leads those authors' readers to a narrow-mindedness which ends up prohibiting, restricting, castrating and annulling their creative inquiry and, consequently, their resources for lucid projectability (LPB).

Trash. There is an immense amount of omnipresent *mental trash* offered everywhere at *bargain-basement prices*, with *superattractive* products that *cannot be passed up*, often using multimillion dollar self-promotions. Among these are included professing, militant, mercantilist *New Age* authors, and even those who perform specialized tasks of primary consolation or clarification. They are inducers of dispensable self-mimicries in incautious intraphysical consciousnesses, all being the components of the unthinking human masses regarding cosmoethical self-conscientiality, as well as being victims of existential robotization, the *multidimensionally blind* leading those who are even blinder.

Insomniferous. All sleep blockers, or insomnia provokers (agrypnotics), regardless of their nature, work against projective experiments: allopathic drugs, stimulants, such as those which extend the individual's period of wakefulness; homeopathic pain medication, such as *Paulinia sorbilis*; the guarana beverage, when made from powder obtained by grating the block of dried fruit paste, commonly recognized as a recourse against sleep.

Psychomotricity. All of this happens because lucid projection becomes much more difficult when the human body is active or in movement (brain, psychomotricity, muscular mass) and easier when in a state of relaxation or natural sleep.

Purpose. Many intraphysical beings neither seek out extraphysical realities beyond diuturnal human life, nor do they lucidly project themselves. This is because they have no motivation to do so as they are unconcerned with seeking a transcendent purpose for their lives or existential programs, a concept about which they are often unaware. They think they have attained this objective, being well situated, busy, productive, satisfied and somewhat self-realized with their own destinies or their own misleading social conditions.

Existential miniprogram. It is important to consider that, in certain cases, the evolutionary stages of certain intraphysical consciousnesses (including those closer to us), or the execution of their existential miniprograms, does not really require much more than this. It will nevertheless be intelligent to bear in mind, as a *relevant orthothosene*, that no intraphysical consciousness escapes *final consciential projection*, the intermissive period, or the nuances of extraphysical euphoria or extraphysical melancholy.

Fear. Other intraphysical beings are not able to project lucidly because they find themselves to be possessed and truly enslaved by a fear which is intense, preexisting, unfounded and deep-rooted in their psychisms (paragenetics) well before becoming familiar with the subject and possibilities of lucid projection.

Disturbances. Two very distinct parapatological facts occur: interconscial intrusion of an extraphysical or human origin, or even self-intrusion; and the disturbance characteristic of the parapatology of the holochakra, in which conscial energies are easily and continuously lost, thereby not replenishing it with vitality.

Conscientiotherapy. Before considering lucid conscial projection, these intraphysical consciousnesses first need to remove fear from their life or, in other words, achieve relief from intrusion (conscientiotherapy), balance their capacity for mnemonic retention (mnemosomatics) and the circulation of conscial energies within their system (VSs).

Bibliography: Fortune (540, p. 162), Steiger (1601, p. 202), Stokes (1625, p. 23).

448. LUCID PROJECTION AND FEAR

Definition. Fear: the sentiment of great unease when faced with the notion of a real external danger or a reaction when faced with a danger having no real object, a mere imaginary threat.

Synonymy: animal terror; fright; irrational dread; panic; phobia; terror; unjustified apprehension.

Superstitions. One of the most common sources of errors of the consciousness is fear, whether acting directly (e.g.: rumors of disasters at critical times or occasions) or indirectly (e.g.: the idea of hell). The most common fears in daily life are: fear of death (desoma); fear of the dark; fear of the unknown; fear of crowds. Fear generates deep-rooted superstitions.

Illness. Before considering fear in relation to conscial projections, or making references to existential anguish and certain clinical manifestations, it is worth recalling that the *panic syndrome* (fear attack, inner panic, or the fear of being afraid) has been well-characterized through epidemiological, neurophysiological, biochemical and therapeutic investigations.

Self-restriction. In theory, no one is immune to fear, a basic aspect of the human being: an extraphysical consciousness that, while temporarily in the condition of an intraphysical consciousness, continuously suffers a high degree of imposed conscial self-restriction that is still inevitable at our current evolutionary level.

Phobias. Anxiety and panic come and go in waves. Phobias are also more advanced forms of fear and affect up to 1% of the population in various countries. According to psychology, a phobia is behavior acquired through experience; it is neither hereditary, nor is the individual born with it. However, contrary to these opinions, retrocognitions triggered by projective techniques and conscial regressions performed in the field of parapsychology provide the first evidence that certain phobias can have their origin in traumas that occurred in previous human lives (retrosomas) of the consciousness. There is currently an inestimable number of phobias, but they are curable.

Characteristics. The panic reaction, defined as intense fear that arises suddenly, without warning, without apparent cause, or from a cause which does not justify the intensity of the fear, is characterized by at least 4 of the following phenomena: dizziness, tachycardia, palpitations, darkening of the vision, fainting sensation (vertigo), profuse sudoresis (over the entire body), nausea, lack of air (dyspnea), tremors, alternating waves of hot and cold, derealization, pain or discomfort in the chest (“tightening in the heart,” “knot in the throat”), fear of dying (thanatophobia), fear of change, fear of the unknown (panophobia) or fear of going crazy.

Feed. It is important to remember that fear feeds on itself.

Biopsychiatry. Besides the above-cited symptoms having a psychological cause (psychiatry), the panic reaction, identified as an illness in 1980, occurs due to a biological dysfunction (biopsychiatry). Noradrenaline is ordinarily released by the central nervous system in order to maintain the soma's automatic activities, such as respiration and heartbeat. If the dosage of noradrenaline becomes excessive, it provokes a breakdown in the human organism and can thereby produce strong phobias, such as: a disproportionate fear of leaving the house, fear of taking an elevator and fear of being in closed, crowded spaces.

Stress. This attack of unfounded fear reaches its greatest intensity in less than 10 minutes, almost always after a major stress attack – for example, either by the loss of a loved one, postpartum, or loss of a job – that acts as a precipitating factor of biological vulnerability, thereby triggering the crisis.

Center. Fear, or a *cold chill running down the spine*, arises from thoughts and these come from terrible things that the intraphysical consciousness imagines or anticipates. The individual is urged to break this chain of mental elaboration, imagination and unfounded forecasts, in order to eliminate the fear. Researchers in neurophysiology and biopsychiatry are attempting to identify the fear center – the region that triggers the panic reaction – in a miniscule cerebral nucleus situated in the fourth ventricle, called the *locus ceruleus*, the element responsible for 50% of the noradrenaline activity of the 2 cerebral hemispheres.

Immunity. A negative clinical aspect of fear is that it ends up depressing the organism's immune system, as it provokes tension and this winds up diminishing the fearful person's organic defenses.

Reactions. In an immediate or retarded reaction to inner fear and external danger (the symptoms of fear), the majority of intraphysical consciousnesses, including hypersophisticated persons, manifest an abnormal, inadequate and often dramatic behavior when under pressure. This behavior falls into 1 of the following 4 basic patterns:

1. **Regression.** In a regressive, psychophysical reaction of encystment, there is a loss of acquired behavior by the consciousness or the habits of civilization, or formal poise, with a return of irresponsible, infantile behavior, the primitive refuge of long ago.

2. **Camouflage.** In camouflaging and masking, reactions of the intraphysical consciousness' protective artifice (dissimulation) occur or, in other words: the fainting and mental paralysis of the passive, indifferent and submissive person.

3. **Panic.** Great explosive panic, or frenetic disorientation, running, trampling and the thoughtless fury of mass hysteria, or *everyone for himself*, which manifests as a defense by way of attack or escape. The panicked person spreads panic.

4. **Conditioning.** In psychosomatic conditioning (organic and psychological, in this case), the denser consciencial vehicle, the soma, suffers the consequences, thereby resulting in multiple physical symptoms: perspiration; frequent urination; heart palpitations; nausea; diarrhea (functional colopathy); high blood pressure; excessive eating (bulimia).

Occurrences. The fears that overwhelm the intraphysical consciousness regarding lucid projection have various origins: the anguish of the projected consciousness not being able to return to the human body; apprehension when faced with an unknown world, or the extraphysical dimension (fear of the unknown, neophobia, can be a fear of death); the fact of confronting (extraphysical) regions uncharted by human beings; the shock felt by the consciousness projected with lucidity for the first time (self-lucid primoprojection), and thinking that he/she has deactivated his/her soma (biological death); fear of encountering strange monsters, exotic beings never seen before.

Self-murder. Fear can initiate real physiological changes that can literally lead to the death of the human body or desoma by unconscious self-murder.

Distance. Controlling fear is half the distance for someone to project with lucidity.

Climax. Fear is more inconvenient for the consciential projector precisely during the perception of the moment at which the consciousness leaves the human body or, in other words, at the exact final climax of the projective stage of lucid takeoff in the psychosoma.

Barrier. At this time, fear – panic outside the human body – causes the instantaneous paralysis of the psychosoma's takeoff process. This extraphysical emotional trauma truly frustrates the experience of lucid projection and creates a *barrier of fear* that can reappear during other projective attempts by the consciousness and last for a long time afterward. Besides, many projectors do not see the departure of the soma, although they remain lucid during the projective experiences.

Takeoff. The fear that the consciousness feels at the beginning of a lucid takeoff in the psychosoma is very similar to the fear of flying, for those who are afraid of airplanes or dying in an airplane crash and who simultaneously suffer from aerophobia (fear of floating) and claustrophobia (are terrified of being in closed spaces such as tunnels, theaters, formal meetings). This occurs precisely during the takeoff of the aircraft, the most stressful stage of the airplane flight which, incidentally, paradoxically only lasts for 40 seconds. All this occurs after the person has left the house, his/her secure environment and familiar surroundings.

Controlling. Even extremely controlling persons – those who cannot tolerate to sit in the back seat of a taxi and, when in a car, only feel good when driving – may experience fear at the precise instant of lucid takeoff in the psychosoma.

Hypoperception. Hypoperception is characterized by an exaggerated reduction in consciential activity, provoking a reduction of sensitivity and perception. One of the main determining factors of hypoperception is fear.

Projection. Fear is the emotion which troubles most and is the main obstacle to the production of lucid, consciential projection. This is because, strictly speaking, lucid projection represents: the greatest antidote to fear; the greatest psychological self-conquest; the subjugation of matter; the mastery of biological death; the definitive annihilation of consciential insecurity; the control of the consciousness in the mentalsoma over the psychosoma. Without fear, everything is absolutely possible for the projector's consciousness; with fear, there is no individual development of lucid, consciential projections. Fear keeps the consciousness tethered by the dominating emotions, a slave to the psychosoma, imprisoned in the human body (*locked human life*).

Types. Within the world of projectiology research, the infantile or immature reaction of any type of fear does not always arise ostensibly or suddenly. Fear often appears, dominating the consciousness slowly and subtly, or camouflaged by other emotions which are the main origin. They arise more or less in the following order, in a complex, ascending scale of manifestations: weight; pressure; worry; restlessness; insecurity; intense disturbance; shock; fear; panic; open dread; animal terror.

Thanatophobia. Fear is the most negative or inhibiting factor – fed by the intraphysical consciousness – in the production of the lucid projection experience. Whether it is fear of the unknown, a morbid dread of dying (deactivation of the soma), fear of the fatality of death (thanatophobia), fear of solitude, or pre-projective fear (projectiophobia), these conditions generate a *sterilizing predisposition* toward projective phenomena. This is due to unconscious negativism or *refractory monoideism*, which does not allow the practitioner to develop the production of lucid projections.

Elimination. Those who experience an ordinary lucid projection, but a fully lucid one – or even a lucid consciential projection during a major near-death experience (NDE) – definitively eliminate the pathological fear of biological death.

Disfigurement. The emotions of the consciousness projected from the human body can predispose the appearance of diverse fears. They end up producing spontaneous morphothosenes related to strange monsters that finally cause an equally spontaneous disfigurement of the psychosoma's humanoid form, since the consciousness is hypersensitive to thoughts and emotions.

Warning. On the other hand, certain declarations made by some authors generate fear in many novices, readers and students of lucid projection. Certain warnings lacking an indication of corresponding techniques for specialized betterment and improvement should not be made. This is because they, on the contrary, become negative and anticosmoethical, creating insecurity and misunderstandings, and have no constructive practical result. This bulky volume, which the reader holds in his/her hands, containing details and exhaustive minutiae, was therefore compiled in order to avoid these inconveniences.

Helpers. The extraphysical helpers and their functions should be perfectly understood by the fearful individual in order for him/her to lose any type of fear. Every consciential projector should operate based upon the following principle: the extraphysical helpers always remain alert and do not let the projected intraphysical consciousness (you) get lost in an unknown extraphysical dimension or let the human body suffer an attack while inactive during the occurrence and development of lucid projection experiences.

Case study. If an intercurrent disaster occurs – such as an unexpected fire in the physical base of the intraphysical consciousness (you) when projected, precisely where the inactive human body is resting – the extraphysical helpers make you return and interiorize in time to rid yourself of the disaster. This obviously happens if the individual is not experiencing his/her final, exact, just and inevitable holokarmic moment of desoma, which is forecast and even often clearly announced.

Desomatics. The probability of becoming ill or even physically dying – deactivating the soma – largely depends upon our inner disposition. The sentiments of depression, despair or feeling abandoned do not cause illnesses, but make persons somehow vulnerable.

Reason. Fear is an *emotional issue* and is not related to an individual's intelligence or education. It therefore essentially stems from the energies of the psychosoma used upon the consciousness and can actually be eliminated with applied reason. This is because – according to thosenology – it is generally easier to control thoughts (*tho*) than emotions (*sen*).

Desensitization. The best *medical technique* for controlling fears and phobias is progressive desensitization, which generally takes 4 to 8 weeks. In the case of a phobia regarding wounds and blood, for example, the patient looks at photos of accidents or surgeries; handles hypodermic needles; holds flasks of blood; visits emergency clinics; and has his/her blood taken with a small prick on the finger.

Solution. There is, therefore, only one way to overcome the immaturity of fear: firstly, confront any type of fear, doing so gradually, with wisdom and patience, in an educational manner. Start by reading and researching the projective experiences of other lucid projectors, obviously those who did not undergo desoma during the lucid projection experience. Next, trust in the continued assistance of the cosmoethical extraphysical helpers – during consciential projections having cosmoethically productive objectives – even when they are not perceived in the extraphysical dimension. Finally, rationalize emotion – in this case, fear itself, characteristic of the consciousness when manifesting in the psychosoma – until it is completely eliminated, conscientially situating yourself at the level of the mentalsoma, in evolution toward the conquest of full consciential maturity or holomaturity.

Understanding. That which is not understood is always feared. The intraphysical consciousness overcome by fear of parapsychic experiences needs to endeavor to acquire a deep understanding of projectiology. All of his/her fears, as great as they may be, will thereby disappear. Your healthy curiosity of the unknown (unknown: the fruit of ignorance) will always be able to overcome your fear through this selfsame unknown.

449. RELATIVE INHIBITING AGENTS TO LUCID CONSCIENTIAL PROJECTION

Minority. Diverse psychological factors, or relative inhibiting agents, make a small minority of intraphysical consciousnesses instinctively avoid relating their lucid experiences outside the human body. This serves to impede the expansion of projectiology and conscientiology research.

Factors. The following are 12 anti-projective factors common within this still pathological intraphysical society:

1. **Animism.** There are uninformed projectors who avoid addressing the theme of their own authentic lucid projections. This is due to the purely animic or intraconsciential aspect of their experiences which, by all indications, are produced solely by their efforts, without the visible aid of an extraphysical helper or any concomitant resource. This actually does occur, but it is a mistake not to perceive that the conditions of animism and parapsychism have always coexisted and still coexist in the majority of evolved parapsychic manifestations, given that they themselves – the intraphysical projectors – are also immortal or *deathless* consciousnesses, the same as the extraphysical consciousnesses. The great, important projections or king-size projections are still invariably animic-parapsychic in this earth school.

2. **Time.** Some spontaneous projectors, owing to a sense of guilt, avoid making any references to lucid projections which they have in the daytime during working hours, during which, according to them, they should somehow be working like everyone else and not sleeping, without producing something useful. They do not, on the other hand, take into account the transcendent usefulness of these same lucid projections, their dissemination in favor of clarifying others, the existence of retired persons and that these lucid projections produced during daylight hours are even less frequent.

3. **Inexperience.** Many adolescents inadvertently, because of their ingenuousness, do not confront the subject of lucid projections because they consider them to be natural to human beings. They do not perceive the need to refer to day-to-day facts that affect and are known by everyone, like ordinary dreams.

4. **Danger.** There are still those – almost always having good intentions and following the affirmations of authors from the past – who maintain a maximum of secrecy and discretion regarding everything related to lucid projections. They do this in order to avoid the creation of supposed fictitious evils and dangers for credulous and unprepared individuals. This pretext has been distancing a multitude of persons from the practice of lucid projection throughout the millennia of human history, up until approximately 5 decades ago.

5. **Ridicule.** Shy individuals lacking a deep knowledge of the subject often maintain an instinctive unconfessed and repressed fear of being ridiculed. They fear the incredulity of their peers, or being considered insane or untruthful by their relatives, friends, colleagues and neighbors if they openly present the details of their lucid projections. They actually recognize these experiences to be authentic but nevertheless do not talk about them or allow their real names to be mentioned in specialized publications on the subject because they still do not consider projective practices to be socially acceptable conduct.

6. **Anomaly.** There are also ingenuous individuals who fear becoming anomalous human beings or *boogeymen* with lucid projection, which allows the projector to invade the privacy of others and probe the depths of persons' minds in certain cases.

7. **Semilucidity.** The majority of semilucid projections in the individual's assemblage of experiences frequently leads the novice projector to feel incapable of satisfactorily distinguishing real lucid projections from ordinary dreams, although they are very vivid. The intraphysical consciousness ends up being convinced that he/she does not project and therefore does not develop, projectiologically speaking.

8. **Sexuality.** There are social beings who evade the theme of lucid self-projections – that they doubtless consider to be genuine – because they involve experiences having some extraphysical sexual connotation which, at first sight, are difficult to interpret or are capable of causing social embarrassment for themselves and other persons.

9. **Underestimation.** Making the mistake of underestimation, certain individuals judge their experiences to be overly insignificant, as compared to average lucid projectors, to merit reporting and studying. They forget the extremely important factor of the convergence of proof through the universality of identical, repeated and repeatable testimonies.

10. **Overestimation.** There are likewise those individuals who produce lucid projections but withhold any information in this regard, as they mistakenly consider themselves to be very elevated or evolved – above the average of “poor mortals” – incapable of making such a transcendent subject accessible and popular, feeling it is too *sacrosanct* or *intramural*. They are unable to address it without taboos, with naturality and equanimity, in favor of the common good.

11. **Superstition.** There are also those who worship ancient superstitions and confess nothing regarding their projective experiences, which they consider a “special blessing.” They base this on the single groundless fear that these revelations, if made public, would definitively paralyze their lucid projections through the automatic loss of their capacity to project, as though their “special blessing” would be revoked if they did not know how to keep the secret or keep up their guard.

12. **Dreams.** Dreams, as altered states of consciousness, affect everyone and are as common as the state of natural sleep. This is why they are easily accepted, receiving a ready, general, *urbi et orbi* approval. Thus, there are those who are less inclined to relate their lucid projection experiences and more likely to interpret or, more precisely, disguise, their lucid projections as dreams so that the declaration of their extraphysical experiences are better accepted without social repudiation.

Relativity. In fact, the action of these inhibitory agents is very relative, as it is entirely dependent upon the quality of the experiences. If the projector has a lucid projection of great importance, even if it be singular, with an elevated degree of lucidity, characterized by impactful extraphysical events, neither these psychological factors nor any other taboos, manias, repressions, brainwashings, conditionings and inhibitions will have a force capable of suffocating the frank exposition of the events or impede the individual’s undisguised manifestations regarding the reality of the facts in which he/she participated, experienced or witnessed directly. The greatest definitive proof of this fact is the existence of the international bibliography at the end of this volume.

Rationalization. As great as the projector’s *rationalization of protection* may be – who, although personally convinced, desires to remain in the good graces of his/her peers by avoiding confronting extraphysical facts – he/she ends up surrendering to the evidence and accepting the experiences when they are repeated with a greater intensity, and when self-lucid projections occur in a series of consecutive experiences.

450. HARMS OF LUCID PROJECTION

Definition. Harm: the act of producing damage, hurt or injury to someone or something.

Synonymy: damage; inconvenience; obstacle; danger; loss.

Types. The following are harms that stem from lucid projections. They are, in theory, possible and real, but are very rare in projectiological practice: deep extraphysical trauma; negative influence of one intraphysical consciousness upon another; alienation regarding material life, family, profession and friends, or a feeling of distance and indifference regarding the human projector’s surroundings.

Inflation. The following are latent dangers and probable harms stemming from lucid projections, according to the incredible-sounding and insistent declarations of certain studious individuals, with whom the author evidently does not agree: aneurysmal rupture; cardiac arrest; cerebral hemorrhage; confused aura; disintegration of the psyche; dizziness; emotional disturbances; encounters with unfamiliar hostile beings; faintings; final projection; friendly but harmful extraphysical encounters; *getting sucked into a black hole*; hallucinations; harmful physical repercussion; headaches; hypochondria; hysteria; interconsciential intrusion; madness; morbid dis coincidence; mortal wounding by a pointed metallic instrument or blades in general; nightmares; panic; paralysis; pathological disturbances of the psychosoma; permanent interconsciential influences; physical accidents; physical alienation; possession; premature burial of the still active soma; profound amnesia; psychic shock; reoccupation of the human body by another intelligence; rupture of the silver cord; stigmatization; twisting of the silver cord; and unbearable sensations.

Withholding. No human activity is entirely free of danger. Even complete inactivity and sedentary life present real, indisputable harms. However, this inflation of risks regarding consciential projection has been quite exaggerated and was created, in part, with the intention of maintaining a systematic intentional withholding of information from the general population – or the unthinking human masses – regarding parapsychic or *initiative* practices, since ancient times, continuing through the Middle Ages, and lasting up until 5 decades ago.

Manipulation. The purpose of this posture was an egoistic defense of temporal religious, mystical powers or, in other words: the manipulation of individuals (*cannon fodder, satellites of intruders or intraphysical and extraphysical blind guides*) belonging to small social groups.

Hygiene. The author, during decades of investigation, has never identified a single one of these inconvenient disseminations as being real obstacles to lucid projection. The obstacles that he has encountered have only contributed to the technical improvement of the processes of the detachments, which bring immense personal happiness. Good intention, inner tranquility, self-critiquing consciousness and a slightly developed parapsychism naturally remove these and other risks that may perchance occur in some phase of the development of consciential projection. There is, in fact, no serious restriction regarding its practice as long as ordinary precautions with physical, mental or consciential hygiene are maintained.

Possession. Over the last 4 decades of more intense projective activities, the author has not encountered any incident that could be classified as irreparable possession, something destructive or uncontrollable by the intraphysical consciousness. When this occurs, it is because that selfsame intraphysical consciousness subjects him/herself to lucid submission to another through his/her empathy.

Super-assimilation. Alienation toward physical life is an inconvenience that can appear when there is a super-assimilation of extraphysical experiences in the consciousness of the projector (you). All excess is harmful in this case. If the use of elevated extraphysical perception or paraperception is difficult, the maintenance of two simultaneous lives – physical and extraphysical – will be much more problematic. The facts caused by destructive PK occur in this context.

Control. It should be emphasized that even the intense series of self-lucid projections, including spontaneous ones, always remain under the control of the consciousness of the intraphysical projector (you). Lucid projections only become uncontrollable – which is quite possible – when a process of interconsciential, subjacent, prior, paragenetic or mesological (current cultural background) intrusion is involved.

Dangers. There are always dangers everywhere. There are those who only walk steadily with both feet firmly planted on the ground. Others skate on thin ice; come and go on a *motorbike* (a high-speed vehicle prone to physical accidents); glide while dangling from a hang glider; balance themselves on a loose cord over an abyss in order to enjoy their 15 minutes of *glory*; walk on hot coals; or run on a razor-edge by practicing countless *radical sports (borderline suicide)*.

Test. Self-lucid projectors are those who go on excursions between various consciential dimensions, in *previews* of desoma or lucid projections of the consciousness. Between these two

categories of personality – the excessive and the reflexive – it is pertinent to ask: “If everyone will eventually have their human body deactivated, who prioritizes his/her acts with greater intelligence in view of the execution of the existential program?”

Real. The only real harms, dangers or obstacles to lucid projection are: ignorance; fear; doubt; passion; illicit plans or anticosmoethical intentionality; the interference by someone in the intimate, physical or multidimensional life of another in a negative manner; the harmful thoughts of the practitioner, whether an adult or youth, or his/her damaging instinct for revenge upon or mistreatment of another.

Avoidances. The practice of lucid projection is not recommended for the following 4 categories of personalities having well-defined characteristics. On the contrary, these individuals should really avoid provoked consciential projections:

1. **Imprudent.** All those who nurture less dignified intentions and are eager to obtain a new negative source of power, which runs contrary to the rights of others, through departures from the human body. This is because they will end up being the victims of their own imprudences and immaturities.

2. **Pusillanimities.** All types of cowardly, pusillanimous and fearful persons, because this will increase their intraconsiential apprehensions, fears and instability. The courage to confront the unknown (neophilia) and new experiences are *sine qua non* conditions for maintaining the constructive aspect of lucid consciential projections.

3. **Unsatisfied.** Those sexually unsatisfied social beings, regardless of age, gender or condition because, upon their consciousness temporarily leaving the human body, projected in the psychosoma (emotional body), they will be overcome by their continued sensual appetites (sexaholics), which are suffocated or repressed without respite, like monoideisms. They will end up being overrun by vampirizing extraphysical company (energivorous extraphysical consciousnesses) that they extraphysically attract in the paratropospheric environments.

4. **Ill.** Ill persons with emotional and/or mental imbalances, as well as those with serious illnesses or in a critical phase of some illness that requires inner peace and complete rest.

XV – Relationships of Lucid Projection

451. LUCID PROJECTION AND ACCIDENTS

Need. In the same manner as with many other parapsychic phenomena, lucid projection seems to develop better when there is an urgent need for the individual to use the subjacent powers or potential of the mind, or of the consciousness which, in many ways, is forcibly restricted within the cranial cavity of the human body during ordinary terrestrial existence.

Sudden. The main seat of the intraphysical consciousness is located in the human brain, which reflects the parabrains of the psychosoma and, therefore, the seat of the consciousness – the mentalsoma. Critical situations, borderline situations and the greatest diversity of physical accidents, which provoke violent stimuli that are uncustomary and highly significant for the consciousness, generate its sudden projection from the human body in the psychosoma, temporarily freeing the parabrains and, consequently, predisposing exceptional consciential manifestations.

Types. The following are the most common factors that induce involuntary lucid projection: violent, physical accidents, especially involving the head (encephalic lesions); accidents involving cars, motorcycles, bicycles and other vehicles; falls endured while mountain climbing; explosions; domestic accidents; electrical discharges; collapses and mudslides; certain types of torture; threats of violence: being a victim of rape, kidnapping or terrorism, as well as being a hostage or prisoner of war.

Disconnection. Frequently, in the case of a physical accident, the projector's consciousness is freed during the extraphysical period, not feeling connected with the human body wounded in the disaster or accident. The body is often examined in a serene manner, without involvement, as though the consciousness were a mere indifferent, dispassionate spectator.

Seriated. In certain cases, physical accidents also predispose the intraphysical consciousness to the production of seriated lucid projections, or projections in series, as explained in a previous chapter.

Childbirth. For over 3 decades, the author has verified that a high number of advanced projectors suffered some type of trauma to the head during childbirth, with subsequent fetal cerebral hypoxemia, e.g.: difficult childbirth; hypoxic child; birth by forceps; umbilical cord coiled (entangled) around the neck; cesarean operation; prematurity; cranial traumas with hematomas.

Gifted. On the one hand, the referred to accidents somehow later predispose the departure of the psychosoma from its coincidence with the vehicles of manifestation. On the other hand, in certain instances, they stimulate the intensification of the memory or recall of extraphysical events, through an improvement in the mutual, inter-hemispheric, energetic communication of the human brain, making the individual into a gifted parapsychic, in this case, projectively gifted.

Chakras. We should not, then, discard the interference which occurs in the profound relationships of the energetic mechanism between the manifestations of the mentalsoma – which is headquartered in the parabrains of the psychosoma – and the 2 cranial chakras, the coronachakra and the frontochakra, which are strongly reflected in the human body-psychosoma connection (holochakra or energetic body).

Infancy. Cases have been registered in the projectiological literature of traumas to the head in early infancy that generally stimulate parapsychism in general and projectability in particular, in the adult phase, due to the subsequent intense, simultaneous use of the 2 cerebral hemispheres and a consequent gradual predominance of the manifestations of the right hemisphere. That is why diverse personalities who lived with depressions of a parietal bone or with greater cranial alterations became renowned sensitives or, in other words, parapsychically or bioenergetically gifted individuals. The following are 4 well-known examples: Eusapia Palladino (1854-1918); Mollie Fancher (1848-1894); Peter Hurkos (1911-1988); Edgar Cayce (1877-1945).

Hypothesis. The relationship between encephalic accidents of all types and projectability is a relevant working research hypothesis for those interested in projectiology. The pattern of the encephalic factor acting upon projectability can manifest in 3 very distinct circumstances, in terms of their occurrences and age periods:

1. **Childbirth.** During childbirth.
2. **Resomatics.** In early infancy or in the beginning of intraphysical life
3. **Maturity.** In a singular accident, when already mature or in adult life.

452. LUCID PROJECTION AND CHILDREN

Definition. Miniprojector: the child who projects the consciousness from the human body with some lucidity.

Synonymy: child-projector; infantile projector.

First. The majority of advanced projectors, who have already had multiple projections, experienced their first lucid departure while still in infancy, although in this period no one was sufficiently mature to judge and precisely evaluate the extraphysical events experienced or witnessed outside the human body.

Recollections. The recollections of the miniprojector tend to be more symbolic and mixed with fantasies – such as flights in airplanes (levitation) and others of this type – without discarding any retrocognitions about recent volitations in the intermissive pre-resomatic period. This is due to the short attention span which is characteristic of the biological growth of the human body and the gradual development of the cortical cells or, in other words, the cerebral hemispheres.

Joint. Children like to go on trips with their parents, even those which are extraphysical and not physical. This circumstance thus represents a powerful motivation for the joint projection of parents and children, which are more common than one might think, especially in homes in which the subject of consensual projection is routinely discussed.

Sensitivity. Children, especially up until 7 years of physical age, accept their parapsychic experiences as being natural. They are more receptive to extraphysically seeing a projected projector, or even an extraphysical helper, as well as the extraphysical telepathic emissions produced by these personalities in the extraphysical dimension.

Extraphysical consciousnesses. Besides child-projectors, the projected intraphysical consciousness encounters positive extraphysical consciousnesses in the extraphysical dimension that look like children, although they think like mature personalities. He/she can also be helped by extraphysical child-helpers, as well as contacting assisted-child-consciousnesses, together with which he/she is called upon to cooperate in assistential tasks outside the soma.

Confirmations. The consensual projections of miniprojectors are important when the children reveal aspects of extraphysical occurrences that agree with and are confirmed by those observations made by adult intraphysical consensual projectors, bearing in mind that children generally cannot obtain details of observations regarding books, articles or other reports of lucid consensual projections about which they have not read.

453. LUCID PROJECTION AND SUBHUMAN ANIMALS

Definition. Animal or subhuman projector: the being that is evolutionarily below the human level and projects its evolving consciousness from its cellular or physical body.

Synonymy: animal-projector; subhuman-projector.

Extraphysical consciousnesses. Lucid projection permits one to encounter subhuman animals that are real extraphysical consciousnesses in the extraphysical dimension. This shows that animals which are evolutionarily inferior to ourselves possess parabodies or extraphysical vehicles, emit light, present an aura and, in certain circumstances, project in a manner similar to the consciousness of humans.

Types. In the extraphysical dimension we can encounter domestic and wild animals; subhuman extraphysical consciousnesses that are known and unknown on earth; and, less often, projected intraphysical animals.

Occurrences. There are subhuman animals – extraphysical consciousnesses in a primitive state of evolution of the consciential principle – which visit their former owners from their latest intraphysical life; others cooperate with assistential extraphysical consciousnesses in their extraphysical activities; and there are also subhuman intraphysical animals which are currently used to detect the presence of the projector projected in the laboratory.

Intraphysicals. Lucid projection of intraphysical consciousnesses allows them to see subhuman intraphysical animals that are in the waking state in the extraphysical dimension. This confirms the existence of their parabodies or rudimentary extraphysical vehicles of manifestation and other evolutionary characteristics.

Extraterrestrials. The intraphysical consciousness projected in the psychosoma should be prepared to encounter extraphysical subhumans, extraterrestrial living plants in certain evolved extraphysical dimensions which are not directly influenced by the earth, having forms and manifestations which are neither similar to those in intraphysical life on this planet, nor do they have similar beings among humans.

Telepathy. According to the evidence collected through projectiology, beings or organisms can be divided into intraphysical: aquatic, amphibious, terrestrial, aerial; and extraphysical: para-aquatic, para-amphibious, and others. The author has extraphysically seen and analyzed a type of very delicate domesticated animal, 14” (35 cm) tall, that was reminiscent of a miniscule giraffe with a certain degree of intelligence and unhesitatingly responding with a somewhat incipient lucidity to extraphysical telepathy.

454. LUCID PROJECTION AND INTERPERSONAL UNIONS

Definition. Interpersonal union: the act or effect of the junction or connection of two persons, in most cases of different sexes, generally legitimized by civil and/or religious certification.

Synonymy: concubinage; consortium; espousal; joining; marriage; matrimonial bond; matrimony; nuptials; wedding; wedding anniversary; wedlock.

Importance. An intimate interpersonal relationship can be something more serious than the pleasure that two persons receive from each other’s company. It ends up being an institution that – given that it generates children (human gestation) in most cases – is part of the intimate structure of the still pathological intraphysical society and has an importance which goes far beyond the personal emotions of the components of the couple.

Appeals. There are infinite types of relationships between human beings, compatible and incompatible marriage contracts and unions. All imply confidence, concessions and mutual interest. Nevertheless, the affinities, unions, marriages and interests between intraphysical consciousnesses lead to the establishment of the fact that there rationally exist 4 basic *appeals* – 2 sexual and 2 consciential – which impel human beings to live and remain together intimately more than others:

1. The reciprocal sexual appeal.
2. The unilateral sexual appeal.
3. The reciprocal consciential appeal.
4. The unilateral consciential appeal.

Sexual. The 2 types of sexual appeals are characterized by a preponderant action upon the consciousness by the human body (soma), the holochakra (sexochakra, *kundalini*), the psychosoma (emotional parabody), and the emotions which are untamed by the consciousness. They frequently result in the unilateral or reciprocal explosion of passions, impassioned states and the intense puppy love of adolescents, youths and even adults.

Ideal. Mutual passionate love, while it lasts, annuls the emotions that generate rudeness and arrogance in men, and whining and continuous complaining in women, generating a new temporary being, composed of 2 in 1. However, the ideal will always be a relationship between 2 social beings who possess a strong psychic element, with a greater dose of the personality of the lovers influencing their development and maintenance, rather than another purely physical one.

Consciential. The 2 types of consciential appeal (deep-rooted affection between the consciousnesses) are characterized by a preponderant action upon the ego by balance and discernment (consciential maturity), the golden cord, the mentalsoma and the sentiments, or rationalized emotions, which are tamed by the consciousness. They can sometimes result in platonic love, an amorous connection without sexual closeness.

Scale. Using these listed, numbered appeals, a descending scale can be made of the level of excellence of the *unions* between intraphysical consciousnesses, which is composed of 8 categories:

1. **Stable.** The interpersonal unions born of the joint action of sexual and consciential appeals (1 + 3). They are friendlier, more harmonious, stable and lasting bonds that produce fewer divorces and occur less frequently, being composed of consciousnesses who have already lived together intimately for a greater number of human lives, over longer periods of intraphysical and multiexistential contemporaneity. In some cases, the greater level of consciential maturity predisposes the couple to reach the so-called *golden anniversary* (5 decades of duration) or the very rare *diamond anniversary* (6 or 7½ decades of duration). The human beings making up these unions are, from a literary point of view, literally characterized as being *soul mates*, or beings who are naturally destined to live together.

2. **Sister.** Interpersonal unions born from the junction of a unilateral sexual appeal with a reciprocal consciential appeal (2 + 3). These bonds tend to be lasting between human beings inclined to reach at least the so-called *silver anniversary* (5 lustrums of duration). The components of these unions are literally characterized as being *sister souls*.

3. **Disconnected.** Interpersonal unions born from disconnected impulses of preponderant reciprocal sexual appeal with unilateral consciential appeal (1 + 4).

4. **Unilateral.** Interpersonal unions born from impulses of unilateral sexual and consciential appeals (2 + 4). From this point on, the interpersonal bonds of the scale, being progressively less stable, begin to increasingly lead the pair of intraphysical consciousnesses to separation or divorce.

5. **Platonic.** Interpersonal unions characterized only by reciprocal consciential appeal (3), practically platonic.

6. **Common.** Interpersonal unions characterized only by reciprocal sexual appeal (1). These are the most common and animalized types of bonds. They are generally accompanied, or sustained over time, by obvious diverse interests, including mercantile interests, which are also reciprocal.

7. **Self-seeking.** Interpersonal unions characterized only by unilateral consciential appeal (4). Strong human mercantile interests also frequently *begin to operate* here in the formation of bonds.

8. **Unstable.** Interpersonal unions characterized only by unilateral sexual appeal (2). These are more unstable, brief bonds which result in the greatest number of divorces. They are composed of consciousnesses who lived together intimately for only a small number of human lives, or for shorter periods of time. These beings are predisposed to experience only temporary adventures, generating tragedies and groupkarmic debts for the orphans of living parents. Human interests operate still more vigorously in the formation of these typical *patrimonial* unions, in some countries with the bride being bought, or even with the groom being bought. They often involve impressive ceremonies, ostentations and public solemnities (marriages of convenience).

Honeymoon. Unstable interpersonal unions may end with the honeymoon (or even before it) within the first month, or in the first few days after the wedding, which are usually utilized for greater intimacy between the components of the pair.

White. One type of unstable interpersonal union is the so-called *unconsummated marriage* or, in other words: without sexual intercourse having even occurred.

Coupling. Projectiology offers a valuable resource that can greatly help the interested individual to verify for him/herself and more accurately foresee the quality level of an interpersonal union that is under consideration: self-aware *auric coupling* with the target-person requiring exteriorizations of consciencial energy and the detection of possible intervening intruders in the affective relationship, notably when realized from the extraphysical dimension. This can be realized, even if only by one of the candidates of the union, the lucid projector of the couple.

Retrobiography. Another resource is retrocognition which – while being difficult to execute – allows one to relive the joint *retrobiography* with the target-being, the interpersonal relationships which they had in one or more previous intraphysical existences.

Initiation. There are marriage processes that are initiated outside the human body through lucid consciencial projections.

Vampirization. Marriage between intraphysical consciousnesses brings with it the normalization of the sex life of the partners. It generally physically and parapsychically resolves the cases of extraphysical vampirizations that were installed due to the sexual (sexochakra) attraction of the longing persons, who previously lived in continual sexual dissatisfaction or in sexual privation.

Duo. All that has been reconstructed here regarding age-old interpersonal unions and sexosomatics aims solely to emphasize the formation of the *evolutionary duo* for the accomplishment of the existential program of both partners, which are integrated through the clarification task, existential inversion, existential recycling, penta, consciencial epicentrism, extraphysical clinics and even the accomplishment of joint group existential programs within polykarmality, according to the principles and techniques of projectiology and conscienciology.

Test. What does the reader aspire to regarding his/her intraphysical life: the age-old *business of marriage* or the advanced formation of the evolutionary duo?

Bibliography: A recent work by the author on the subject: *Evolutionary Duo Manual* (in Portuguese).

455. LUCID PROJECTION AND CHILDBIRTH

Definitions. Childbirth: the set of physiological phenomena which lead to the departure from the maternal cloister of a normal fetus and its appendages; the act or effect whereby a woman gives birth to a child or infant.

Synonymy: birth; giving birth; delivery; parturition.

Blocks. Childbirth is a traumatic event for many women who have psychological blocks due to fear of the unknown and a lack of discussion on certain taboo subjects – such as sexuality and human birth – during childhood. These psychic factors, aside from known physical causes, can affect the natural process of childbirth.

Complicated. There are dozens of registered cases of lucid projections of the consciousness of parturients, especially when forced by accidents, hemorrhage, general anesthesia or the stress of the work involved in complicated, delayed, laborious or traumatic childbirth.

Cesarean. Cesarean childbirth, by cesarean section – the freeing of the fetus through incisions in the abdominal and uterine walls – as well as difficult, laborious deliveries that require emergency medical care, are those which more greatly predispose the lucid projection of the parturient during labor.

Process. Regardless of its cause, childbirth is sometimes stressful for the pregnant woman-parturient, thus resulting in the liberation of the psychosoma in an *unconscious* process which the consciousness undergoes without awareness in order to escape pain, suffering and anxiety, thereby creating a pause in the traumatizing crisis. Outside the human body, in the extraphysical dimension, all pain disappears, giving way to an indescribable sensation of well-being for the consciousness.

Puerperal-projectors. The most diverse types of puerperal-projectors exist: primoparas; multiparas; youths; adults; those aware or ignorant regarding the subject of consciencial projection; and with or without previous lucid projective experiences.

Self-bilocation. There are documented cases of projector-parturients whose consciousness was projected with lucidity during the work of laborious or complicated childbirth. They observed self-bilocation – or, in other words, their human body emptied of its consciousness but partially occupied by the fetus – and witnessed the exact moment of the birth of their child, perfectly distinguishing the infant's gender, being in an exotic position as observers, located outside their own physical body.

Odontology. This occurs naturally wherein the consciousnesses of other persons who, while under general anesthesia in the dentist's office, saw the dentist extract a tooth while located outside the surgery room.

Unborn. Up to this point, childbirth has been analyzed relative to the lucid projection of the parturient. Let us now analyze childbirth relative to the lucid projection of the unborn child, who will later become an adult.

Head. The fetal head is composed of diverse independent osseous parts which are separated from each other by wide, or simply linear, membranous strips (the sutures) and by equally membranous surfaces, of a greater or lesser area (the fontanelles), located at the intersection of the sutures.

Bones. The bones of the fetal head vary in plasticity. They give way to pressure, like celluloid, when their malleability is at the maximum. They are otherwise resistant, like a block of cement, in the absence of this attribute.

Hypertension. The brain of the fetus can be directly compressed by the cranial osseous parts, in the work of a complicated childbirth, and are accompanied by great cephalic deformations, due to the effect of excessive malleability. The compression of the fetal head, the osseous parts of which are still independent from each other, is reflected onto the brain and its involucre. The rachidian fluid flows back from the compressed region, which generally coincides with the equator of the presentation, to the respective poles, the base of the brain and the cerebral pallidum, where it provokes the state of hypertension.

Potentialiation. Through cephalometry – the cephalic measurement of the fetus – the very large fetal head presents a great difference between the occipitofrontal (O.F.) diameter and the biparietal (B.P.) diameter, thus possibly resulting in innumerable problems during childbirth. These problems *seem* to potentiate the individual's projectability as an adult, due to fetal cerebral hypoxemia, the consequent simultaneous intense use of the 2 cerebral hemispheres and a gradual predominance of the right cerebral hemisphere.

Alterations. The following are 8 complications or alterations from normality which can occur during laborious childbirth, anomalies or deviations from the normal, dystocia or maximal abnormalities, and accidents or events related to the blood, shock and convulsion, which predispose or potentiate the individual's subsequent lucid projectability in the adult phase:

1. Fetal gigantism or macrosomia of the fetus with a large head.
2. Sometimes large serosanguineous bulges (*caput succedaneum*) and hematomas in the fetus.
3. Cephalic deformations of the head or face.
4. Traumatizing instrumental rotation of the fetal head.
5. Traumatizing traction of the fetal head performed by forceps.
6. Coiling of the umbilical cord around the neck (dystocia of the umbilical cord, entanglement).
7. Fetal hypoxia (cerebral hypoxemia, fetal suffering).
8. Eclampsia.

Cesarean section. On the other hand, according to reverifications made by the author, the cesarean operation does not inhibit the individual's projectability, because innumerable veteran projectors have come into this intraphysical dimension (extraphysical consciousnesses which became intraphysical consciousnesses) by cesarean section. What needs to be performed, however, is an indispensable statistical survey of the evidence (working hypotheses) regarding the aspects of the relationship between lucid conscial projections, childbirth, the parturient, the fetus, and lucid conscial projectors.

Near-birth. Based on the birth-lucid projection association, the parapsychologist Barbara Honegger in Washington, United States of America, proposed the hypothesis that lucid conscial projections are merely lucid dreams or, in other words, "near-birth" experiences, wherein the imagination is dependent upon the birth experience. In this case, the sensations pertaining to the experiences of the consciousness outside the human body would all be imaginary, similar to the natural conscial conditions of the fetal period. If this hypothesis were correct, the lucid conscial projection of adults should be more frequently reported by individuals who were born through natural childbirth, and not through cesarean section, which reduces fetal stress.

Analogies. In fact, there are 4 basic analogies between lucid conscial projection and the birth experience:

1. **Departures.** Both experiences somehow constitute departures from the human body.
2. **Cords.** In both experiences, the consciousness is united to the human body during the event by a cord, namely the silver cord or the umbilical cord.
3. **Vibrations.** The sensations of the vibrational state (VS) of the conscial projector are similar to the tremors and vibrations generated, in the fetus, by uterine contractions pertaining to childbirth.
4. **Tunnel.** The sensations of going through a tunnel can be closely compared to the passage of the fetus through the natural canal, which leads him/her to see light.

Test. The English parapsychologist Susan J. Blackmore tested Barbara Honegger's hypothesis with a long, exhaustive questionnaire submitted to adult psychology and parapsychology students in Bristol, England. The questionnaire was answered by 234 persons and the results of the research did not support Honegger's hypothesis, because they did not find a significant relationship between the manner of birth and having experiences of leaving the human body or traveling through a tunnel. Those who had been delivered by cesarean section were shown to have lucid departures from the human body in a slightly higher proportion than those who had natural deliveries. They also showed a greater capacity for controlling their dreams or creating agreeable dreams and a lesser tendency to have dreams of falling, compared to those who underwent normal birth.

Conclusion. It can thus be concluded that the comparison of lucid conscial projection (OBE) with the human birth experience is merely a superficial analogy, but is useless as an explanatory supposition for lucid conscial projection.

456. LUCID PROJECTION AND ERECTION

Definition. Erection: the condition of distention, elongation and rigidity of the penis (in a man), or of the clitoris (in a woman), through the inflow of blood to the cavernous tissue of these organs.

Synonymy: genital intumescence; penile tumescence.

Men. Spontaneous erection can occur at any age, with either male or female projectors, being more common among male projectors (penile). This is evidenced by the intraphysical consciousness as a physical reaction upon interiorizing, after returning from a brief or prolonged extraphysical period. This erection is not present before projecting or, more precisely, before sleeping.

Analogy. There is a direct, analogous relationship between the physiological cycle of penile erection, or nocturnal penile intumescence, that is synchronized with the period of REM sleep or, in other words, during rapid synchronous bi-ocular movements, and lasts until the end of this period, and the penile erection that the projected consciousness encounters upon interiorizing in the human body after a lucid projection.

Interiorization. Interiorization of the projected consciousness does not always occur due to an erection. The human body can remain motionless, temporarily *emptied of the consciousness*, and in a state of erection, with a man as well as with a woman. In women, the periodic lubrication of the vagina can even occur.

Frequency. Erections which occur during lucid projection are more frequent than it might seem, as they are reported less often due to the inhibitions or repressions of Victorian or puritanical social morals, and call for more accurate studies within projectiology.

Causes. Among the various causes that may exist for the occurrence of the penile erection during projections, including psychological ones, the following 4 physical and organic causes can be cited:

1. **Physiology.** Physiological predisposition of the projector who is sexually deprived.
2. **Clothes.** Tightfitting nightclothes which, upon being used by the projector, provoke blood stasis.
3. **Soma.** The position of the human body on the bed that favors intumescence of the sexual organ through the inflow of blood to the cavernous tissues.
4. **Emunctory.** Vesical repletion or the condition of a full bladder.

Effects. Among the effects of penile erection during the lucid projection which should be listed, at least the following 3 can be singled out: extraphysical repercussion; abrupt interiorization; and abrupt physical awakening.

Viagra. While on the subject, in May 1998, *Viagra*, the *superpill* against impotence or erectile dysfunction, was launched with great fanfare, provoking controversy throughout the planet. This can be verified through cosmogram research, or clippings from periodicals of that period. The following are 15 examples, listed in chronological order:

1. “**Ereções Diretas: a Pílula da Impotência está Criando Confusão nos EUA**” (“**Continuous Erections: the Impotence Pill is Creating Confusion in the USA**”) (Ruy Castro; *Manchete*; magazine; weekly; 1 illus.; Rio de Janeiro, RJ, Brazil; 5/16/98; p. 39).

13. “**Viagra, Effetti Anche Sul Cervello**” (“**Viagra Also Affects the Brain**”) (Alberto Oliverio; *Corriere della Sera*; newspaper; daily; section: *Corriere Scienza*; Milan; Italy; 9/23/98; p. 19).
14. “**Pesquisas que levaram ao Viagra ganham o Nobel**” (“**Research that Led to Viagra Winning the Nobel Prize**”) (*O Globo*; editorial staff; daily; year LXXIV; N. 23,785; section: *Science and Life*; 3 illus.; Rio de Janeiro, RJ, Brazil; 10/13/98; first page (lead story), p. 25).
15. “**Viagra registra Queda de 66% nas Vendas**” (“**Viagra Shows a 66% Drop in Sales**”) (Marcelo Diego; *Folha de S. Paulo*; newspaper; daily; year 78; N. 25,399; São Paulo, SP, Brazil; 10/17/98; first page (lead story), p. 1-12).

Warnings. Many authorities warn against the use of Viagra by men with general heart disease, notably hypertensive individuals. This medication should only be used under medical prescription.

Bibliography: Monroe (1065, p. 195), Salley (1496, p. 159), Vieira (1762, p. 45), Walker (1782, p. 132).

457. LUCID PROJECTION AND BLINDNESS

Definition. Blindness: the condition that affects a person who is totally destitute of physical vision and has no perception of light.

Synonymy: amaurosis; blind state; deprivation of the sense of sight; sightlessness; typhlosis; visual deficiency; visual incapacity.

Typhology. Typhology is the biological science of ophthalmologic analysis that studies blindness.

Dreams. Persons who are blind at birth, or *sightless* individuals, have dreams which are replete with sounds and not full of visual images. Only those individuals who have already seen at some time have visual dreams.

Hallucinations. Intraphysical consciousnesses who are congenitally blind, upon becoming sick with a psychosis, do not have visual hallucinations, even during deliriums.

Clue. Blind persons have psychophysiological rhythms that differ from those of sighted persons. For example, they are immune to the chronological clues of light for sleeping.

Psychosoma. Nevertheless, many blind persons affirm that they see during their lucid projections, including their experiences of volitation while their consciousnesses (they themselves)

are entirely lucid. This demonstrates that they see with the extraphysical visual perceptions of the psychosoma or, in other words, with *the extraphysical eyes*, or para-eyes, sometimes while still in adolescence. This fact shows that the psychosoma already existed prior to the resoma of the consciousness. Regarding this point, the phenomena, well-known since the beginning of this century, called *transposition of senses* and so-called *dermo-optical vision*, greatly studied by Russian parapsychologists, should not be overlooked.

Hyperacuity. There are registered phenomena of visual hyperacuity in which the person acting as a percipient, or clairvoyant sensitive, can clearly see the images of an apparition better than if it were a real, living person in the ordinary, physical waking state. The same has been occurring with consensual projectors that see with extreme clarity when projected and, nonetheless, when in the ordinary, physical waking state, are blind or can only see with the use of strong corrective lenses.

Evidence. The first extraphysical evidence of the experiences of the lucid, but physically blind, projector, are at least the following 5:

1. **Dynamic.** Dreams of flying.
2. **Luminosity.** A misty light.
3. **Colors.** Bright colors.
4. **Catalepsy.** Temporary projective catalepsy.
5. **Shadows.** Living shadows walking before you.

Compensations. The vision of the intraphysical consciousness while projected from the human body and the illumination of the extraphysical environment constitute two inestimable parapsychic or projectiological compensations for any human being who is visually incapacitated.

Hypotheses. So far, reasonable, detailed, consensual projective experiments have still not been performed either with blind persons of all types, or with deaf-mutes. These facts suggest excellent work hypotheses for projectiology researchers.

458. LUCID PROJECTION AND PHYSICAL PAIN

Definition. Physical pain: the painful impression experienced by an organ, or a part thereof, transmitted to the brain by the sensory nerves.

Synonymy: painful sensation; physical suffering.

Algology. Algology is the biological science of physical-chemical analysis that studies pain.

Involuntary. An intense spasm of pain, from various causes, acting upon a psychophysiological condition of violent emotional stress, can lead the consciousness out from the human body in the psychosoma, in an involuntary lucid projection.

Types. Various types of intense pain, when bringing deep despair and agony, can provoke lucid projection, in the manner of these 7, among others:

1. **Gastroenterology:** intestinal colic.
2. **Hepatology:** hepato-biliary colic.
3. **Nephrology:** renal colic.
4. **Neurology:** headaches or cephalalgias.
5. **Obstetrics:** colic of childbirth (gynosomatics).
6. **Pneumology:** thoracic pains.
7. **Sociology:** physical torture of a prisoner (political science).

Change. The intraphysical consciousness temporarily moves from one seat, vehicle, or body to another or, in other words, from the human body in the physical dimension to the psychosoma in the extraphysical dimension, thereby escaping the intense physical pain.

Psychosoma. The psychosoma does not produce the sensation of pain which operates only through normal channels of sensory communication belonging to the sensory nerves of the human body. This, however, does not exclude the occurrence of false pain in the case of parapsychotics and other types of personalities, for example.

Return. The alleviation of the great discomfort of the intense pain, which is obtained through lucid projection, can predispose the involuntarily projected intraphysical consciousness to wish not to return to the human body, which is an immense deception. On this occasion, an intangible extraphysical helper – or, less frequently, one which is perceived – interferes, promoting the also involuntary interiorization of the consciousness that is in the psychosoma.

Paradox. The alleviation from the critical pain can lead the projected intraphysical consciousness to the singular, paradoxical, shocking experience of knowing that his/her human body is undergoing the physiological or pathological condition of intense pain, but he/she feels nothing in the psychosoma, as though he/she were two distinct personalities, experiencing different conditions.

459. LUCID PROJECTION, THE HEART AND THE HEART RATE

Mistakes. Not everything written about projections of the consciousness is totally correct and should be treated with circumspection. Repeated mistakes and exaggerations have been occurring regarding subjects related to conscial projection for over a century.

Heart patient. The existing mistakes regarding the approach toward conscial projection is well-exemplified by the dissemination, over decades, of an excessive, unnecessary prohibition of the practice of lucid projection for persons who possess circulatory irregularities – heart patients, in general, and hypertensives, in particular. This has been repeatedly recommended, sometimes with incredible vehemence, by past and current authors, some having become classics, from countries such as the United States of America, Great Britain, France, Spain and Brazil. This can be found in works in the specific bibliography of this chapter.

Personal. If the author were to listen to these warnings, he would never have voluntarily produced lucid projection experiences, as he has been a hypertensive for approximately four decades, using strong medication for two decades on a continuous basis.

Hygiene. The correct approach would be for the lucid projection practitioner not to exaggerate in the exercises or in anxieties, because all excesses jeopardize in this case. In fact, however, under normal conditions of physical and mental hygiene, the induced lucid projection experience does no harm to anyone, as it is a simple physiological process of the intraphysical consciousness – similar to the altered conscial states of sleep and dreams – recommended to all well-intentioned persons.

Frequency. The heart rate, or the cardiac rhythm, the number of heartbeats, normally remains between 70 and 80 beats per minute, when measured by the pulsations which are perceived by touching the pulse, in the ordinary, physical waking state.

Slowness. Bradycardia, a slow heart rate, a low cardiac frequency which oscillates between 40 and 50 pulsations per minute, predisposes the human body, when at rest, to greater passivity, allowing the freeing of the psychosoma before the person loses consciousness.

Acceleration. Tachycardia, an accelerated heart rate, with 120 or more beats per minute, represents the natural response of the organism to psychophysiological tension. It acts against organic incapacity, impeding muscular relaxation and psychic calming, frequently making the exteriorization of the psychosoma more difficult.

Indexes. Strictly speaking, the average pulse for men is considered to be between 70 and 72 beats per minute; 78 to 82 for women; 100 to 120 for children.

Tachycardia. Bradycardia is considered to be 60 beats per minute or below, tachycardia as being above 120 beats. In parapsychic trance, for example, the pulse raises up to 130 beats in sensitive women and 230 beats in male shamans.

Verifications. The author has made the following verification, on many occasions, as his own guinea pig, in self-experiments or participative research: under the influence of medication, with a higher arterial pressure, in this case, between 140 and 100 mm of mercury (Hg) (systole and diastole), and the cardiac frequency remaining low, at 48 beats per minute, was able to produce lucid projections with relative ease, including instantaneous projections and those with continuous self-awareness, with a high degree of extraphysical lucidity.

Bradycardia. The above facts demonstrate that arterial pressure – even arterial hypertension – does not influence the production of lucid projection, as long as the heart rate is low, or in bradycardia. An obvious conclusion can be drawn from these experiments: bradycardia is one of the most effective factors for predisposing the intraphysical consciousness to project from the human body with self-awareness.

Exercises. Among the physical exercises that contribute considerably toward the maintenance of bradycardia, the following can be singled out: long-distance walks; swimming; yoga breathing exercises (*pranayama*).

Control. On the other hand – still with regard to the relationship between lucid projection and the heart – there are those who unadvisedly recommend exercises of voluntary control of heart rate, through the mind or the impulse of the will, in order to immobilize the human body and predispose it to the freeing of the intraphysical consciousness in the psychosoma.

Self-desoma. These processes of intentional control of the heart are nevertheless potentially dangerous – for the person with a heart problem, as well as for the person with a healthy cardiocirculatory system – because they can, even unconsciously, cause self-desoma due to an unexpected, unnecessary and undesirable cardiac arrest. This fact, according to the extraphysical observations of the author, has been occurring more frequently than one would imagine.

Thought. Thought is a powerful force which is not always well controlled that can cure or perturb, create or destroy, bend spoons, inflict burns on the arm of another, kill the human body of the very individual, or even the body of another person.

Asystole. According to existing studies, the heart of a healthy person can stop beating during REM sleep. This pattern of nocturnal asystole, or of the non-beating heart, can even be responsible for the sudden death of normal youths and adults.

Arrhythmia. In cardiac arrhythmia research conducted on human beings, Russian parapsychologists – maintaining a rigorous materialist-dialectical posture and within the framework of their profound interest in so-called consciential warfare – demonstrated that the emotional reactions of one person (the inductor, in this case) systematically influenced the heart rate of another (the percipient, or victim). The figures obtained from a computer analysis of the data of the simultaneously registered electrocardiograms of both individuals in the experiment indicated that, for 5 minutes, the changes in the percipient's heart rate remained completely dependent upon the reactions of the inductor's heart, which was located 6'7" (2 m) away. The reactions were more accentuated in percipients (victims) who had heart problems.

Intrusion. This clearly corroborates the author's research on the dangerous influence of the consciousness upon the heart. In this particular case involving experiments conducted by the Russians, namely the creation of a fully conscious intraphysical intruder, engaged in the installation of purposeful

hetero-intrusion, it merits noting that, between two consciousnesses – in this example, two intraphysical beings or intraphysical consciousnesses – the installation of the energetic phenomenon of auric coupling occurs in which the predominance of the energetically more potent intraphysical consciousness almost always prevails over the energetically weaker intraphysical consciousness.

Case study. The author has also already observed other examples of this fact, in detail, in interconsciential intrusions between an intraphysical being (victim) and an extraphysical consciousness (intruder), and between one intraphysical consciousness (intruder) and another (victim).

Energies. This is why it is relevant to insist on the following point: everyone should learn to be aware of, distinguish and control their own consciential energies (vibrational state or VS) as much as possible, which can help and cure (self-remission), as well as inflict illnesses, or even surreptitiously assassinate oneself (conscious or unconscious suicide) or other persons.

Respiration. The ideal that one should technically strive toward, in this area of research, is to control the respiration, without excess. For example: by practicing rhythmic respiration, up to a certain efficient or functional level, however without threatening the physiology or parapsychology of the vehicles of consciential manifestation. The direct action upon the heart muscle through concentrated thought should be avoided.

460. LUCID PROJECTION AND ILLNESSES

Definitions. Illness: incapacity of the adaptive mechanisms of an organism to conveniently neutralize the stimuli from demands to which it is subjected, resulting in the disturbance in the function or structure of any part, organ or system of the organism; lack or disturbance of health; chronic or intense alteration or failure of the physiological state in one or several of the parts, organs or systems of the human body; reaction to a lesion, malady or infirmity.

Synonymy: ailment; indisposition; infirmity; malady; organic disturbance.

Predisposition. An ill state can predispose the departure of the consciousness (you) from the human body in the psychosoma. However, this particular condition is neither the ideal, nor is it a dependable coadjutant for inducing a pure lucid projection, through which advanced extraphysical knowledge can be obtained in high quality experiments. This is only achieved through the application of natural, simple and physiological projective methods.

Psychosoma. Chronic and serious illnesses, physical disturbances or those of the human body, psychic disturbances or those of the mind, and intraconsciential or parapsychological disturbances of the intraphysical consciousness alter the psychosoma for the worse, with respect to the prolonged performance of consciential projections in general. It initially affects the extraphysical attributes of the consciousness and interferes in the perceptions of the projected intraphysical consciousness.

Exceptions. In spite of everything, there are cases of expressive exceptions of sporadic, lucid consciential projections, registered during serious illnesses, which have provided valuable explanations about the mechanisms of parapsychic and projectiological phenomena.

Fatigue. The coexistence of illness and fatigue, in the same person, weakens the connections of the silver cord, predisposes the looseness of the holochakra and allows the consciousness to more easily leave the condition of coincidence of its vehicles of manifestation in search of extraphysical energy, in the psychosoma.

Conditions. The condition of illness thus tends to predispose the consciousness toward performing involuntary lucid projections, and the condition of full health facilitates the consciousness in producing voluntary lucid projections.

Mini-illnesses. Repeated experience demonstrates that mini-illnesses or minor indispositions – such as physical indispositions, psychic asthenia, ephemeral scintillating scotomas, minor neuralgias, simple luxations – affecting the individual are practically self-cured by lucid self-projection when produced in series for a certain intensive period. This is due to the well-known fact that consciential projection allows the intensification of the acquisition of extraphysical energies.

Mechanism. The circulation of the consciential energies which enter and leave or, in other words, are received and exteriorized more vigorously by the consciousness in the psychosoma projected many times in a row, keeps it *cleansed* and *in good shape*, like a continued *extraphysical warm-up*. On the other hand, this greatly stimulates the natural physiology of the human body, consequently performing an efficient prophylaxis and increasing the organic resistance to mini-illnesses.

Extraphysical. The veteran consciential projector inevitably has constant contact or a direct relationship with ill, insane, exacerbated, extraphysical patients in cases of extraphysical interconsciential deintrusion. These are extraphysical intruder consciousnesses that the projector either voluntarily or involuntarily ends up encountering in the extraphysical dimension, upon leaving the human body for brief periods on certain occasions. Consciential energies are indispensable on these occasions.

Bibliography: Baumann (93, p. 53), Bayless (98, p. 114), Bord (170, p. 37), Boswell (174, p. 132), Bozzano (184, p. 126), Crookall (338, p. 20), Greenhouse (636, p. 145), Jung (812, p. 320), Leaf (905, p. 147), Oxenham (1179, p. 1), Ring (1406, p. 27), Sabom (1486, p. 38), Steiger (1601, p. 33), Vieira (1762, p. 108), Walker (1781, p. 82), Wang (1794, p. 173).

461. LUCID PROJECTION AND PSYCHOPATHOLOGY

Definition. Psychopathology: that part of human pathology which involves mental infirmities, their origins, symptoms and nature.

Synonymy: mental pathology.

Questionnaire. In light of the extensive number of individuals who affirm to have been consciously outside the human body, it becomes valid to ask and respond: Can it be that we are dealing with a phenomenon in which all these persons suffer from temporary insanity, cerebral dysfunction or neurotic privation at a certain moment, which has occurred neither previously nor subsequently? Rationally, the response can be no.

Physiology. Lucid projection is a physiological resource, a frequently occurring natural phenomenon which should be excluded from the field of human psychopathology, because it neither represents nor stems directly from mental disturbances. However, it is worth clarifying further that the lucid projection phenomenon can *also* occur with patients who suffer from mental disturbances, which does not imply the same thing. Also, moral and physical aggressions and the mental disturbances that come from them can generate the lucid projection phenomenon in complacent persons who do not have sufficient will to produce it for themselves.

Index. Nevertheless, a greater incidence of psychopathies has still not been evidenced in practitioners of lucid projection in comparison with other xenophrenic states or altered states of consciousness.

Average. The identified cases of the relationship between consciential projection and psychopathology lie within the average of occurrences. Important maleficent physiological effects have not been encountered as being derived from projective activities.

Differences. In the areas of psychopathology, there are phenomena or states which are similar to lucid projection, including depersonalization, dissociation of the personality, the *multicleaved* self, the distortion of the human body's image, and pathological autoscopy. However, all of these admitted forms of pathology differ from lucid projection in diverse and very evident important manifestations, just as each dissociation of the consciousness presents fundamental differences from the others.

Case study. Depersonalization – the sensation experienced by the person in which his/her human body feels strange or seems to belong to someone else – can involve anxious sentiments of loss of personal identity, as well as those of unreality in relation to the physical environment, a condition not occurring with lucid projection, which is usually tranquilizing, evidencing a transcendent experience.

Aura. The projective aura is positive, benign, and very different from the epileptic aura, or the aura of the migraine. The same is the case with projective catalepsy, when compared with pathological catalepsy.

Psychosomatics. Self-transfiguration of the psychosoma can be induced by the consciousness itself.

Predominance. Another element which perfectly distinguishes psychopathy (in general) from lucid projection is in the relative predominance of the first occurrence, which is common to humanity, and the rarity of the second occurrence among individuals, when of an impactful nature.

Standpoint. It must also not be forgotten that, just as the processes of medicine cannot be correctly evaluated in terms of the doctors' health, and all of psychoanalysis cannot be evaluated in terms of the psychotic experiences of some analysts, the phenomena pertaining to projectiology cannot be evaluated in terms of the projectors' health. This would be no less than to proceed from a biased standpoint. The possibility of a lucid projector being mentally ill is the same as for any psychiatrist. Just because some doctors are mentally ill, does not imply that *all* doctors must be so.

Parapsychism. Parapsychic facts are not pathological facts. Extrasensory phenomena, not being symptoms of illnesses, occur as much in healthy persons as in psychopaths. Parapsychism is a natural attribute of the personality and it would not be correct to associate it with mental abnormality, identify it as a symptom of illness or a process pertaining to the area of psychopathology, although both it and parapsychology have much in common, because the phenomena of both are deviations from the normal, in the sense of being exceptional.

Rarity. Animic, parapsychic and projective states are not pathological phenomena. They are, without a doubt, altered states, or abnormal phenomena, in the sense that they are rare, but rarity does not signify morbidity.

Projectability. It would always be erroneous to consider projectability as a morbid state of the mind, just as it would be an error to consider menstruation, human biological conception, gestation and natural childbirth as being diseased states of the organism or of the woman's gynosoma.

Angles. On the other hand, an individual's psychiatric disorder does not definitively constitute a prerequisite to his/her promotion to the role of an active lucid projector. According to sociologists and anthropologists, this does not even occur with shamans, medicine men who are prophetic diviners in exotic cultures. There are no shamans who are neurotic or paranoid in daily life. If they were, they would be classified as lunatics and would not survive as respected priests.

Shamans. It should be stressed that shamans are the true rustic, primitive projectors, the precursors of the modern lucid projectors of projectiology. This indicates that projectiological phenomena cannot be connected to psychopathology because they are an integral part of the natural physiology of humans since they appeared on earth.

Normality. Finally, why are lucid projections normal, daily occurrences, with no intrinsic pathological connotation? Simply because they do not produce any negative physiological changes in

the individual and can occur in anyone, with the person having a healthy mind, just as with the mentally ill person; with the clairvoyant as well as the blind person; the healthy individual and the invalid; the youth and the elderly person (eighty-five years of age and over).

Evolution. Another fact reaffirms the relationship of lucid projections with the healthy condition of the projector as a human being. The practice of the voluntary, lucid takeoff, or inducement by the intraphysical consciousness when temporarily leaving the human body, presents itself at the current evolutionary level of humanity as an event which is contrary to the rule. This does not imply pathological involution, however, but salutary evolution, being an above average consciencial condition in regard to the intraphysical population, and one which is proof of intraconsciencial giftedness.

Interviews. In order to corroborate these affirmations, public research projects were performed on lucid projection through interviews administered in Kansas, in the United States of America, under the supervision of clinical physicians, psychiatrists and psychologists. This research, conducted from 1976 to 1981 confirmed the existence of groups of projectors who were healthier than average, demonstrating that lucid projection, as a state of consciousness, per se, does not present itself as being unnatural or pathological, according to the basic affirmations of psychiatrists Glen O. Gabbard, Stewart W. Twemlow and Fowler C. Jones.

Universe. In light of the above, within the field of projectiology, hallucinations, psychopathies and mental aberrations should remain outside the realm of the statistics of pure cases of lucid projection, scattered throughout the entire population, and which really merit being analyzed as recently discovered phenomena, despite the fact that they have always existed.

Realities. Lucid projections do not constitute aberrant experiences, nor are they products of the disturbed mind, but are normal human experiences which combat the individual's anxiety and annihilate the fear of physical death (thanatophobia). They also encourage the practitioner to admit to a continuing life after the human stage, bring profound satisfaction to the physical and intraconsciencial existences of the social being, and are psychologically advantageous to those who experience them.

Alarm. Based upon the above-cited rational evidence, the author sends an alarm signal from here to esteemed psychiatrists, neurologists, psychoanalysts, psychologists and psychotherapists in general, as health professionals, in order for them to endeavor to conscientiously distinguish ordinary pathological processes from genuine cases of lucid projection, without confusing the two, in favor of the patients and their intraconsciencial states.

Losses. The author has been receiving reports of individuals' experiences, with disastrous results, wherein they, after seeking specialists for help in understanding instances of spontaneous, natural, lucid departures from the human body, began to take the powerful narcotics that they were erroneously prescribed. These pseudotherapeutic resources irreversibly impaired their physical and mental health.

Psychopathology. The following are some real projectiological phenomena – among many or almost all that exist – for which similar psychopathological occurrences are reported, and with which they should not be confused: bradykinesis; duplication of a part of the body; elongation; panoramic vision; partial projection; phantom member (certain cases); projection of the complete double; projective autoscopy; projective déjà vu; self-bilocation; vibrational state; waking dis coincidence. In summary: the experience of the lucid consciencial projection does not have a pathological impact upon the intraphysical consciousness (human personality).

462. LUCID PROJECTION, SURGERY AND ANESTHETICS

Definition. Surgery: the branch of medicine and odontology that treats infirmities or accidents, either totally or in part, by manual and operative procedures.

Synonymy: surgical intervention; surgical operation.

Torpidity. In a surgical operation, the anesthetic begins its action by installing the state of physical torpidity in the anesthetized region. It is a basic precept in projectiology that physical torpidity is the first sign of dis coincidence of the vehicles of manifestation of the consciousness.

Anesthetics. Surgery, in medicine as much as in odontology, has a special function in the field of projectiology due to the torpifying effects of anesthetics known as “dissociatives”. During a certain period, the following were used more often as anesthetics: nitrogen protoxide, nitrous oxide, or laughing gas; ether; chloroform; trilene; halothane; and ketamine. Since 1844, anesthetics made the human body pass into unconsciousness, elevating the level of carbon dioxide in the organism, thereby predisposing the lucid departure of the consciousness to the extraphysical dimension in sporadic, artificial, forced consciential projections. Thus arose the so-called *anesthetic revelations* in the nineteenth century. Currently, an elevated level of carbon dioxide in the circulatory system represents a risk during the anesthetic procedure. Nowadays, when anesthetics are being applied, a saturation of O₂ is maintained at 100% with supplementary oxygentherapy. Nevertheless, general anesthesia is one of the greatest risk factors in surgery. Nowadays, countless near-death experiences (NDEs) occur during surgeries.

Environment. On the other hand, other powerful physical and psychological factors create a dramatic environment (hospital holothosene), having an intense significance that is propitious for the production of projection of the consciousness in individuals who are sensitive or projectiologically predisposed. The following 6 factors serve as examples:

1. **Infirmary.** The hospital infirmary with the strong smell of chemical substances.
2. **Desomatics.** The sensation of illness and physical death (thanatophobia) in the air, in the hospital environment.
3. **Dynamic.** The gentle comings and goings of medical personnel in the hospital environment.
4. **Mysticism.** The religious figures and images which are also in the hospital environment.
5. **Isolation.** The sensation of isolation and distance from the house, or home, on the part of the sick inpatient.
6. **Analgesic.** The effects of the anesthetic applied during surgery.

Surgeons. Surgeons in general, especially those who are indifferent to parapsychic phenomena and who have still not experienced spontaneous lucid projection, judge the narratives of their postoperative patients to be mere hallucinations provoked by anesthetics during general anesthesia. However, competent parapsychology researchers and some medical researchers now know that the profound state of cerebral unconsciousness, due to the effects of general anesthesia during operation, encourages the consciousness to enjoy some type of lucidity outside the body, in certain cases.

Near-death. Lucid projection during the period of anesthesia, or in the state of sensory deprivation, above all constitutes an efficient process whereby someone is removed from the discomfort of the ill, wounded or traumatized human body, from the physical pain and trauma provoked by the surgeon’s scalpel. In certain cases, the alteration of the consciential state is so rapid and impressive that the projected intraphysical consciousness becomes indifferent to his/her own anesthetized human body, whereupon extraphysical helpers appear and convince or compel a return to intraphysical life, thereby bringing on the typical near-death experience (NDE).

Confirmations. The lucid projection experienced while under anesthesia – whether during minor or major surgery, exodontia, alveolotomy, cesarean, appendectomy, tonsillectomy – allows irrefutable confirmations of the extraphysical excursion of the *patient's* consciousness in the surroundings through the testimonies of the medical personnel who work in-between the human-helper-anesthetist, who is unaware of the extraphysical occurrences, and the lucid projector-patient outside the human body.

Inverse. Conversely, and more rarely, reports can be collected of *surgeons* and *nurses* who irrefutably saw the exteriorization of their patients, sometimes on top of the operating table, describing the person's extraphysical double, the face enveloped in fog, or even the silver cord, using the same terms as the projectors themselves, thus confirming the projective experiences.

Professionals. Today there are hundreds of physicians and psychologists who produce their own lucid, consciencial projections.

Takeoff. The takeoff of the consciousness in the psychosoma, leaving the human body incapacitated under the action of the anesthesia, often occurs abruptly, in a spiral or zigzag manner.

Unconsciousness. Lucid projection can occur during natural sleep, a self-induced trance, upon fainting, while in a coma, or during the unconsciousness generated by physical or mental trauma. In the state of deep unconsciousness provoked by anesthesia, the consciousness finds itself forced to leave the human body – either in the psychosoma or even directly in the isolated mentalsoma – leaving the physical form, on the operating table, in a much deeper state of unconsciousness than that of natural sleep or any type of trance state.

Comparison. The levels of deep unconsciousness produced by pathological states generate forced projections through abrupt takeoffs, which become disadvantageous in comparison with spontaneous projections wherein the projector is healthy and more apt to make high quality, detailed observations of the extraphysical experiences. However, projections produced under general anesthesia – an experiment of applied pharmacology – offer more impressive and dramatic experiences than the spontaneous projections which occur during natural sleep, or those provoked by the intraphysical consciousness through self-induced trances.

Advice. With the conscious patient merely under a *local* anesthetic, professionals need to pay attention to what is said, and many physicians consider this an inconvenience. Nevertheless, these colleagues are still not aware that projectiology cautions surgeons, assistants, anesthesiologists, nurses, paramedic teams and health personnel – when working professionally – to avoid speaking inappropriately among themselves during surgery, even when the patient is under *general* anesthesia.

Sentence. While under general anesthesia, when the patient is presumed to be unconscious, his/her consciousness – projected from the inactive human body due to the effect of the anesthesia – much more frequently than imagined, clearly *sees, hears* and perceives everything that is said and done in the operating room, including the operation itself. The patient often hears him/herself declared dead or indiscreet details of the technicians' appropriate and inappropriate attitudes, and even facts that occur in the immediate area of the surgical centers. Countless postoperative patients either keep to themselves or report everything they experienced during this period soon after the general anesthesia has worn off.

Risks. It is worth mentioning that the heralds of medicine caution against the risks of general anesthesia. General anesthesia is essential, frequently inevitable and always dangerous. It leaves all persons, especially physicians, uneasy. Anesthesiology is, to a certain extent, an imprecise science. Many persons who undergo surgery under *general* anesthesia still fall victim to cardiorespiratory arrest. The majority of surgical operations can be performed with the patient awake. Only one in eleven thousand persons who undergo surgical intervention with *local* anesthesia (where the patient is awake) becomes a victim of cardiac arrest. This proportional difference is impressive and makes one think.

Note. The subjects addressed in this chapter, relative to the relationships between lucid consciential projection and surgery and anesthesia should not be confused with the relationships of lucid projection and parasurgeries, performed by sensitives.

463. LUCID PROJECTION AND PARASURGERY

Definition. Parasurgery: the branch of paramedicine and the subdiscipline of conscientiology that treats infirmities and accidents, either totally or in part, by manual, operational procedures and methods of parapsychic origin.

Synonymy: alternative surgery; extramedical curative process; extramedical surgical intervention; free surgery; heterodox surgery; logurgy; marginal surgery; metasomatic surgery; parallel surgery; parapsychic operation; parapsychic surgery; popular surgery; public surgery; spiritual surgery; supersurgery; surgical telekinesis; unorthodox surgery.

Invasion. Over the past few decades, international news agencies – through printed and verbal journalism, including shocking cinematographic documentaries and disturbing penal processes – have been reporting on the increasing diffusion of atypical and clandestine surgical interventions which are being realized on human bodies, invading the domain of classic surgery.

Observers. Many observers affirm that, in these unusual operations which have no precedent in medical history and which lie entirely outside conventional rules, healers with no medical training execute the introduction and use of precarious instruments into vital organs, such as: stilettos into the heart and lungs; knife into the eyes and ears; scalpel into the cranium and abdomen; incisions up to 16” (40 cm) long; together with the sudden appearance of medications and the instantaneous healing of large surgical incisions. Paradoxically, all of this is practiced without conventional asepsis and without causing infection; without conventional anesthesia and without pain; without conventional hemostasis and without hemorrhage.

Comparison. Aberrant interventions, based only upon mystical-empirical evidence, have neither been recognized and classified by orthodox science, nor incorporated into surgery, nor addressed by the teachings of official and para-official medical schools. Being facts which cannot be made academic, considered to be heretical in the cultural world of our century, just like all that which does not fit within the list of accepted ideas, they have been included in the study of parallel sciences, alternative therapies or specifically within so-called *parallel medicine*.

Opposition. Apparently without explanation in conventional scientific foundations, these surgeries have encountered strong opposition from medical, scientific and industrial bodies, and have been the object of direct criticism, bitter hostility, skepticism and continued controversy. Polemic has resulted in misinformation. The majority of commentators – visionaries as well as realists – have distorted ideas about interviewees brought together in sensationalistic news programs that detract from the respectable support which research into the subject requires, resulting in spontaneous antagonism toward the subject, which other persons also reject, as they cannot explain it.

Expressions. Aside from the synonymy above, many expressions have been coined to define heterodox surgery, according to extreme, moderate and neutral heterocritical appreciation with regard

to its psychological, sociological, legal and medical aspects: “antisurgery”; “social assistance to indigents”; “erudite charlatanism”; “folkloric surgeries”; “social surgery”; “popular beliefs”; “faith healing”; “spectacles of illusionism”; “exploitation of public credulity”; “phenomena of underdevelopment”; “systematic religious proselytism”; “science fiction”; “pithiatism”; “public health problem”; and “suburgery”. These opinions are almost always expressed some distance from the events, without prior investigation but, instead, aprioristically.

Interest. There are many inquiries and controversies surrounding the matter and they will continue for some time to come. There are conflicts of information and analysis, but there seems to be at least one unquestionable reality: the enormous power of popular attraction of these operations grows and is always in evidence. It is common knowledge that any public interest, in this technotronic age, cannot be ignored, arriving at a point at which scientific judgment and good sense come to demand complete investigation, because modern, universalistic experimenters invalidate neither spontaneous phenomena nor personal cases.

Observation. Common news cannot be used as scientific evidence. Equidistant from the confusion and moving toward the direct, cold, cautious observation of heterodox surgeries, any impartial researcher – upon comparing and discussing the methods used by its practitioners, its efficiency or uselessness, when taken as a research hypothesis – will arrive at the conclusion that real parasurgical phenomena actually do exist, in a number of cases.

Scientificness. The objective presentation of the fundamental problem, in this case, should be the scientific examination of the phenomena, without distorting implications, the dramatic aspect, and the entire emotional or corporatist charge which involves it. This is because reports of the facts are always suspect when highly charged with emotion, longing and strictly human interests or those of the clan.

Approaches. The irrefutable evidence of the occurrences defies analysis and imposes new approaches to the questions. This is because – besides faith healing and charlatanism – it has authentic interventions in its manifestations which exhibit a set of processes that are still unknown to science and technology.

Questions. Scientific investigation rigorously begins with the formulation of questions. The following are some pertinent questions: What are the main factors that cause the extraordinary explosion in heterodox interventions? What are their real causes? Where does the power of attraction of parasurgeries come from? Can the practitioners of parasurgery give correct diagnoses, operate and make the ill person feel better with these clandestine operations? Where would the conclusions of a comparative study between modern surgery and heterodox surgery lead us? What would the consequences of this be?

Characteristics. Although various techniques exist, there are 11 common, basic and even curious characteristics which pertain to all authentic parasurgeons:

1. **Responsibility.** The parasurgeon is responsible for all that occurs in the operations that are planned and executed, as well as for the ensuing consequences.

2. **Qualification.** Although some parasurgeon-physicians have appeared upon occasion, the parasurgeon is generally not legally qualified to practice medicine, much less to practice surgical intervention. They therefore practice outside the law.

3. **Benefit.** The authentic parasurgeon does not obtain any material benefit from his/her parapsychic aptitudes, mercantilist charlatans and their *money-oriented company* notwithstanding.

4. **Personality.** The parasurgeon is the indispensable central personality of the parasurgery, without whom there is no intervention.

5. **Backup team.** The parasurgeon does not have a backup team for the preoperative, asepsis, anesthesia, hemostasis and technical assistance in the operative and postoperative processes.

6. **Tactics.** The parasurgeon is the only one to intervene in the surgical area, to use the available equipment and make necessary tactical decisions during the parasurgeries.

7. **Assistants.** The parasurgeon generally has neither a first nor second assistant – the surgeon’s assistant, anesthesiologist or colleague-technician – to directly assist in the interventions, exchange ideas or give opinions.

8. **Substitutes.** There is no one to substitute the parasurgeon, in case it is needed, nor is there someone who can reduce preoperative tension.

9. **Meeting.** The parasurgeon does not have medical meetings in order to delegate responsibilities.

10. **Evaluation.** The parasurgeon neither possesses the normal resources for making a preoperative evaluation, nor does he/she request laboratory results in order to assess the risk involved.

11. **Individualism.** The parasurgeon cannot be classified – in the same manner as conventional physicians or surgeons – according to known specialties; being, by nature, an individualist, polyvalent, versatile polysurgeon who practices interventions featuring extremely personal technical procedures.

Energy. Immanent energy, when transformed into consciential energy and used or transmitted by the consciousness as a revitalizing agent, is able to explain countless phenomena in detail, among which are the following 9:

1. Parasurgeries or parasurgical techniques with and without instruments (subdiscipline of conscientiology).
2. The use of the fingers and hands as instruments which work like conductive wires.
3. Para-anesthesiology (subdiscipline of conscientiology).
4. Para-asepsis (subdiscipline of conscientiology).
5. Parahemostasis (subdiscipline of conscientiology).
6. Instantaneous paracicatrization (subdiscipline of conscientiology).
7. The appearance and disappearance of stitches.
8. Definitive remission in certain cases.
9. Power over organic and living things, or the faculty of manipulating biological systems, as evidenced by parasurgeons.

Phenomena. The effects of creation, dis-creation and re-creation in parasurgical phenomena seem to run counter to the laws of physics, with the appearance and disappearance of small and large objects in matter-space-time, through systems having a velocity which is apparently greater than the speed of light.

Hypothesis. There is a hypothesis that in parasurgical operations – whether public, secret, instrumental or manual – there may be a discoincidence of the parasurgeon’s vehicles of manifestation. In other words, there is a partial or complete projection, a temporary extraphysical migration of the parasurgeon’s consciousness, which performs the cure directly. Nevertheless, according to parasurgeons, it is more common and traditional that an extraphysical consciousness takes responsibility for the operations.

Impartiality. Based on the existing prosaic opinion that a new scientific truth is unable to convince its opponents, making them see the light – but because its opponents eventually pass away and a new human generation grows up, familiarized with this truth – it is hoped that young physicians who are appearing will be able to examine both sides of the subject of parasurgery under consideration with impartiality from now on.

464. LUCID PROJECTION AND THE MUTILATED PERSON

Definition. Mutilated person: the person who experienced the test of patience and courage of having one or more physical members of the human body amputated, by way of accident or surgical operation, the member or members having been circularly cut to and through the bone or bones.

Synonymy: amputee.

Necessity. The need for amputation arises due to trauma to a member – whether a finger, leg or arm, in the majority of surgical cases, generally by an accident, automobile accident, work-related accident or event in a battlefield – as well as aiming to preserve the survival of the remaining healthy organism.

Restriction. Physical mutilation generally intensifies the process of psychophysical restriction, which keeps the consciousness confined within the human body, controlling the individual's life from the 2 cerebral hemispheres.

Analysis. In the analysis of the relationships between the phenomenon of lucid projection and the amputee, 7 correlated facts merit examination: the general experiences of lucid projectors; the experiences of lucid amputee projectors; the experiences of clairvoyant mediums; the phenomena of the sensations of integrity of amputees; the relationship between phantom pains and visions; *Kirlian photographs* or photos of the energetic emanations of living beings; and those suffering from certain cerebral problems.

1. **Projectors.** Veteran projectors know that, upon projecting in the presence of an intraphysical being who has recently had a member amputated, they will see him/her anthropomorphically *intact*, or whole, as though he/she still possessed the complete member. In a manner similar to other self-aware projectors, the author has already personally proven, with impressive extraphysical observation through lucid projection, the form of the phantom member of a recently amputated individual.

Continuation. The coherence (or cohesion) of the extraphysical substance of the psychosoma – the biological organizing agent (together with genetics) of the human body – acts more strongly than its attraction to the portion which was amputated from the same human body. This is why the extraphysical counterpart of the amputated member is not immediately retracted, nor does it go along with the segment that was amputated during the accident or surgery. The amputated part extraphysically continues to retain the shape or original mold of the integrity of the member for some time, until – according to the new mental self-image that is created by the accident victim – it is retracted into the boundaries of the mutilated form.

2. **Amputees.** There are amputee-projectors who clearly perceive the entirety of their own physically mutilated member upon seeing themselves projected, conscious and free in the extraphysical dimension.

Sensation. There is even a recorded case of a person who had a leg severed in an automobile accident, and whose soma was thrown a distance from the car. The person's consciousness immediately floated outside the human body, over the accident site. It observed the rescue team and even saw its own human body, which was missing one of its legs, but nevertheless retained the extraphysical sensation that its body was intact and whole, including the lost leg.

Self-materialization. We mention here, for information purposes, references to rare facts, which some affirm to be valid, although, unfortunately, still not scientifically proven, in which 1 amputee, for example, whose leg was removed just above the knee, demonstrated the ability to walk normally through self-materialization of the segment of the missing foot and leg.

Obstinacy. This occurs due to the obstinate determination of the individual – obviously predisposed to the exteriorization of ectoplasm – who, still clearly and parapsychically feeling the presence of the member, concentrates his/her ectoplasmic powers and self-materializes the foot and leg for a few instants.

Recomposition. In this case, the amputee, briefly recomposing the lost member and its function of sustaining the human body, walks firmly, without hesitation, with a firm and purposeful stride, as though in possession of two intact legs, although having only one visible leg with the foot in the shoe, and the other part of the pants folded back, held with pins, without a prosthesis or the aid of crutches or any other means of support.

3. **Clairvoyants.** Many clairvoyant mediums affirm, while in the ordinary, physical waking state, seeing the phantom member of the recently amputated person.

4. **Phantom.** Complaints by amputees are well-known to neurologists and psychiatrists, especially in the period of surgical convalescence, wherein they affirm continuing to strongly feel the *sensations of wholeness*, the phantom limbs: the amputated leg; both legs amputated; an amputated hand; an amputated arm; removed ribs or portions of ribs; a partially removed nose; a removed mamilla, in the case of the ablation of the female breast; a pulled tooth; an amputated penis; and also phantom pains which speak in favor of the existence of the double of all living beings, the psychosoma, or the biological organizing model. According to modern neurology, these pains in amputated members have their origin in the thalamus.

5. **Relationship.** The evidence of a suggestive relationship between 2 similar phenomena analyzed here leads to the following inference: the more pronounced the phantom pains of a recently amputated person are, the more visible, or parapsychically perceptible, the amputated portion of his/her human body will be.

Self-image. Phantom limbs only appear after the patient's fifth year of physical age or, in other words, after the development and establishment of the concept of a mental self-image of the human body. In many cases, after some time and the use of a prosthesis by the patient, the phantom limb seems to disappear while the prosthesis is being used, but reappears when it is removed.

6. **Kirlian photographs.** For the sake of illustration, it is worth remembering that certain *Kirlian photographs*, electrographs, bioplasmographs or photos of fields of radiation obtained in Russia, Brazil and the United States of America, suggest an effect of summary parabiological and parapsychical importance and which, perhaps for this or other motives, has been extremely controversial: plant leaves which have *previously* suffered the amputation of a part, appear with the energetic designs still whole, as though still possessing all of their components intact, with the specific exact form of the cut segment. This gives rise to the lost leaf phenomenon, phantom leaf phenomenon, cutaway phenomenon, or phantom effect. There is also the supposition that the phantom body should be able to be better observed with *Kirlian photography* of a human hand with a recently amputated finger.

Fabrication. It has so far not been possible to authentically reproduce the phantom effect in the laboratory in order to obtain the *urbi et orbi* consensus of experimenters with regard to it. Quite to the contrary, the phantom-leaf electrograph can be easily *fabricated* in the following manner: the leaf is pressed with a roll of rubber against the surface of the film located in the Kirlian apparatus or bioplasmograph. Then, one of its parts is sectioned and carefully removed, leaving a clear mark of humidity on the film. The high voltage of the apparatus, which is applied to the remaining portion of the leaf, plus the remaining humidity of the cut portion, produces a photograph with the so-called *phantom portion*. Many individuals make diagnoses with electrographs.

7. **Brain.** For decades, occurrences have been known of persons who have lost part of their brain, for diverse reasons, without any apparent harmful effect upon their mental life. This has corroborated the allegation of the existence of an extraphysical vehicle of the consciousness and the abovementioned facts regarding amputees.

Self-transfiguration. These affirmations do not imply that *all* amputees always remain with the intact extraphysical portion of the physical limb that they lost. This does not necessarily need to occur. If the awakened mind, with the passing of time, after the period of convalescence, surmounts the mental reflection upon the physical deficiency, it is most likely that the individual, after some time, will be seen not to have the extraphysical member, due to the well-known phenomenon of self-

transfiguration of the psychosoma which, in this case, is sponsored by the consciousness itself. This, however, is not the rule.

Psychosoma. The psychosoma, whether of an intraphysical consciousness or an extraphysical consciousness, does not always need to obey the humanoid form in order to present itself, make its presence felt or act freely as a vehicle of manifestation of the consciousness.

Disappearances. Accidental cuts, amputations and mutilating surgeries executed directly upon the human body neither affect the para-anatomy of the psychosoma, nor do they interfere in the parapsychophysiology of the psychosoma and much less in the structure of the mentalsoma. That is why organic deficiencies completely disappear in the set of impressions of the consciousness projected with lucidity in the extraphysical dimension.

Repression. If the influence of some physical deficiency still remains in the sensations of the projected intraphysical consciousness during the extraphysical period, this is exclusively due to excessive conditioning, repression, inculcation or erroneous psychological predisposition in its tendencies, namely its *parapsychology*.

Conclusions. Stemming from the comprehension of the associated phenomena presented here, and in the interest of his/her own well-being, the reader with any physical deficiency resulting from amputation should be aware of 4 intelligent attitudes:

1. **Vehicles.** Deficiencies and mutilations of the human body, regardless of which they may be, neither reach nor are reflected in the extraphysical vehicles of manifestation of your consciousness. This only occurs if your consciousness (you) wishes it, whether consciously or unconsciously. This indication can be followed by all those having physical deficiencies, including those with chromosomal alterations.

2. **Condition.** Firstly, upon projecting from the human body, deliberately forget your condition as an amputee. Think of yourself as being whole and intact.

3. **Prosthesis.** Further, upon consciously projecting, forget the existence of the prosthesis or artificial limb that you may use to correct the physical deficiency. Strictly speaking, unimpeded volition in the extraphysical dimension dispenses with any crutch-like resource, whether physical or extraphysical.

4. **Motivation.** These logical arguments, based upon evidence, obviously constitute a powerful motivation for you to endeavor to produce lucid consciential projections voluntarily. This can only enrich your personal experience through a type of compensation that offers a greater freedom to your consciousness, which is confined within the soma, thereby manifesting beyond all psychophysical restriction.

Regeneration. Based upon the existence of the holochakra, the organogenic function of the psychosoma and on the survival of these consciential vehicles, even after the amputation of the physical limb, it is important to consider that the regenerative capacity of the living limbs of the human body – identical to that occurring in salamanders – will be the next conquest of human biology. The human body already recuperates vital parts that have been cut with new growth, as in the regeneration of skin and even the liver. It is thus worthwhile to predict that this same human body will come to recuperate amputated or defective parts, making them grow again through tissue regeneration, such as a fingertip from lesioned nerves, especially in children.

465. LUCID PROJECTION AND HEMIPLEGICS

Definition. Hemiplegic: that person suffering from paralysis of one side of his/her human body.

Synonymy: collateral paralytic; homolateral paralytic; ipsilateral paralytic.

Hemiplegia. Hemiplegia is a disturbance in motility characterized by a partial or total lack of ability to effect voluntary movements. Common hemiplegia simultaneously affects the members of half of the human body and half of the face of the same side. It stems from damage to the corticospinal pathways in the opposing cerebral hemisphere. The cephalic manifestations are ipsilateral in *alternate* hemiplegia due to the damage of the cerebral trunk at diverse levels.

Section. Some hemiplegics perceive, and even see next to them, on the paralytic side, a longitudinal section of their own psychosoma and affirm that this section has the sensorial integrity that they lack in physical movement due to paralysis.

Explanation. Hemiplegics display a suppression of kinesthetic sensations. Thus, the kinesthetic theory does not explain the existence of this longitudinal section with sensorial integrity. Only the incipient, or partial, projection from the human body – of the psychosoma in this case – can explain this occurrence.

Amputees. The phenomenon occurring with hemiplegics is correlated to phenomena which occur with amputees and blind persons. These are explained by the existence of the psychosoma and its attribute as the organizing model of human forms, constituting a valuable compensation for the physical incapacity of the individual, whether a child or an adult.

Bibliography: Bozzano (184, p. 120; 188, p. 19), Lukianowicz (957, p. 212).

466. LUCID PROJECTION AND DRUGS

Definition. Projective drug: medication (or substances that are intoxicant, torporific, hallucinogenic, psychomimetic, phanero psychic, phanerothymic, psychedelic, stimulant, unconscious-expanding) used in order to transitorily alter the state of the intraphysical consciousness through systematic practice destined to modify the chemistry of the human body and which may be considered projectiogenic by some researchers.

Synonymy: chemical key; consciential medicine; ecstasy medicine; unconscious-expanding; experimental drug; hallucinogen; hallucinoid; magic drug; metagnomic reactant; mind alterer; mind molder; mythical drug; narcotic; phanero psychic; phanerothymic; pharmacological crutch; projectiogenic drug; projectiotoxin; projective medicine; projective pharmaceutical ingredient; psychedelic toxin; psychedelic; psychic energizer; psychodyslectic; psychogenetic; psychomimetic; psychophane; psychotomimetic.

Antiquity. For millennia, persons in many intraphysical societies have made use of substances that alter awareness, lucidity or elaboration of thought. There are descriptions of the use of opium dated 40 centuries before Jesus of Nazareth.

Mechanism. Mind-altering drugs disturb the system of enzymes that regulate cerebral functions, reduce cerebral efficiency and permit certain types of mental activities to enter the consciousness that are normally excluded because they do not have immediate survival value, bringing a state of psychic imponderability. These drugs, always having unpredictable results, lead the psychedelic tripper to ascendant (positive) self-transcendence, or to descendent (negative) self-transcendence, because one never knows with certainty which direction the experience will take. Drugs can lead to endless nightmares.

Lethality. At a highly elevated dose, any of the existing hallucinogens can be lethal. In this case, hallucinogens and sacred poisons can be doorways to delirium, even of an extraphysical nature.

Dependency. Hallucinogenic drugs are not addictive, that is, they do not establish a *physiological* dependency; nevertheless, some individuals become *psychologically* dependent upon drugs and, in this sense, develop a “habit”, with suicidal, psychotic outbursts.

Process. When evaluating the possible uses and abuses of hallucinogens, the considerable body of knowledge and disparate disciplines should not be disregarded, such as: anthropology, biochemistry, pharmacology, psychology and psychiatry. Various tranquilizers are called “happy pills” because they offer a “free gift”. Besides this, many of them can actually be of enormous, instantaneous benefit to the individual. A process that can take 5 years of psychoanalysis, for example, happens and is resolved in one hour, in a considerably less expensive manner, through one *trip, when ascendant*, happy, or positive.

Forms. There are 4 basic forms of light and heavy drugs that can cause damage or be inoffensive to the human organism, whether isolated, in self-experimentation in scientific parapsychism research centers, or having biochemical, medical, psychological and anthropological interests, in an approved experimental program. They can also have additives, in the rituals of sects and primitive, empirical, religious practices: smoked as cigarettes; ingested as seeds; chewable; and synthetic drugs or the product (injections, pills, tablets, capsules) of psychopharmacological research with so-called prophetic, metagnomic plants, magic herbs (addictive or treacherous pharmacological substances).

1. **Cigarettes:** *Cannabis sativa* (grass, pot, hash, weed, marijuana, maryjane, hash oil), the main active ingredient of which is *tetrahydrocannabinol* or THC; *Genista canariensis*; *Spartium junceum*. Marijuana is considered *devil weed*.

2. **Seeds:** *Banisteriopsis caapi* (*Ayahuasca*); *Banisteriopsis inchisus*; *Ipomoea pursativa*; *Ipomoea violacea* (*tlitliltzen*); *Rivea corymbosa* (*bejuco, manto, nosolena, uliliuqui, piule, trepadeira*). The papoula bulb (opium, heroine) was discovered by humankind over 7 millennia ago.

3. **Chewables:** *Amanita muscaria* (fly agaric, magic mushroom); *Lophophora williamsii* (thaumaturgic cactus, *hicuri*, peyote, devil root; mescal buttons from which mescaline is derived; *anhalonium*); *Psilocybe mexicana* (agaric, God’s flesh, *teonanácatyl*).

4. **Synthetics:** Lysergic acid diethylamide (LSD 25), which is derived from ergotinine (*Claviceps purpurea*, or ergot), in this case a fungus which grows in grains such as rye and wheat; Ketamine (dl 2 – (o-chlorophyll – 2 (methylamine cyclohexane hydrochloride); *escopocloralose* (an association of scopolamine and chloralosis); amital; caffeine citrate; Ecstasy, XTC.

Others. Besides these, other so-called psychedelic substances with metapsychic effects – chemical keys or agents of *samadhi* therapy – are used in order to empirically obtain self-transcendence through chemical means. They are used by Indians of Central America, the southern region of the United States of America, the Amazon region, Africa, Siberia, among which are included: *Atropa belladonna*; *Cereus peruvianus* (*huachuma*); *Datura arborea* (*huanto*); *Datura inoxia*; *Datura stramonium* (devil weed, stramonium, devilfig or hellfig); *Hyoscyamus niger*; *Liptadenia peregrina* (*Yopo*); *Mandragora officinarum*; *Tabernanthe iboga* (ibogaine); *Mimosa hostilis* (*jurema*). Among the worst are: cocaine, crack, *merla* or cocaine paste.

Term. Marijuana has been generating toxicomania – marijuana mania – characterized by the habit of smoking or chewing Indian hemp or hashish. This drug provokes a state of beatitude accompanied by hallucinations and, at times, furious, sanguinary delirium. From this originated the term *assassin*, derived from the word *hashish*. This fact deserves deep reflection on the part of new generations. The simple inhalation of the air where marihuana has been smoked can cause symptoms of intoxication. In 1998, Amsterdam, Holland was named the *Marijuana Capital*.

Purposes. These substances, plants of knowledge, drugs and *plants of power*, are used: for divining purposes; to discover lost, hidden or stolen objects; in order to find distant, lost or deceased persons who have not been heard from; as an empirical, alternative therapeutic agent and even in miniparasurgeries; in the undertaking of *aerial journeys* to unknown regions; to produce a *trip* through

a previous consciential life; to *visit* uninhabited locations and distant cities (intoxicant lucid projections or *iatroprojections*); and with the purpose of extracting confessions (“truth serum”).

Daimé. The hallucinogen *ayahuasca* or *aiuasca* (*caapo*, *cadána*, *kahi*, *natema*, *pinde*, *yajé*), also called *daimé*, *wine of the soul*, or *divining wine*, prepared by the intense, prolonged infusion or cooking of the stalk, branches and leaves of *Banisteriopsis caapi* (*jagube*, *jugube*, *mariri*, *banistério*), Amazonian vines and leaves of the *Psychotria spruce* species (*chacrona*, *mesela*, *queen*), also an Amazonian climbing plant, is the result of the fusion of these 2 plants.

Alkaloid. The alkaloid resulting from the mixture (boiled by cooking with a wooden fork) of these plants (plus water) is identical to harmine (*telepatina*, *yagéina*, or *banisterina*), isolated from a shrub from the Middle East, *Peganum harmala*.

Degrees. Depending upon the combinations and the number of times the mixture is cooked, it is called 1st, 2nd and 3rd grade (or higher) *daimé*.

Root. The strongest or most potent *daimé* is that which is made from the root of the *jagube* vine.

Business. The ritualized consumption of *ayahuasca* (the name of the Inca sage) is a millenary practice of the Incas since ancient times and occurring more recently in indigenous ceremonies in the Amazon. Unfortunately, the drug trade is recognized as the *business of the twentieth century*.

Daimists. In the last quarter of the twentieth century, approximately 800 thousand persons, many of them “daimists” along the Acre state (Brazil) border that is shared with Bolivia and Peru, have made regular use of this hallucinogen or psychic energizer. This has been generating “visions,” lucid projections, the phenomenon of internal autoscopy and psychophony in some individuals, including collective or group “visions”. However, in high doses this hallucinogenic drink provokes delirium, intoxication and can seriously harm the nervous system of the practitioner because, according to some research, it results from the combination of quinine and scopolamine. In 1986, the Federal Drug Council (Conselho Federal de Entorpecentes) in Brazil, removed *aiuasca* from the list of psychoactives and drugs of the Division of Medical Inspection of the Ministry of Health (Divisão de Fiscalização Médica do Ministério da Saúde) (decriminalization).

Children. Unfortunately, in Brazil, for example, there has been decriminalization of the use of drugs derived from *daimé*, cigarettes (tobacco in its many forms) and alcohol, which currently afflicts even children and adolescents of the new generations in great numbers, annulling the execution of their existential programs. It is hoped that, in the near future, something more consistent will be done in order to reduce this deplorable condition stemming from the immaturities of the unthinking human masses, of the authorities appointed without political will and the great number of badly drafted laws which are in force.

Therapy. Lysergic acid has been administered to terminal patients with the intention of alleviating their physical suffering, especially those with malignant, or metastatic illnesses, which, besides pain, present deep depression, anxiety, terror of death and destabilized relationships with their family members. This extreme psychedelic therapy offers positive psychological effects in these cases, precisely due to the production of forced lucid projections. However, it is not an ideal therapeutic process.

Leader. The administration of psychotomimetic, or psychedelic, drugs is performed under the attentive supervision of a leader, psychedelic companion, or master of ceremonies of the “psychedelic session.” The effects of the drug vary greatly, depending upon: when the drug is taken; where the drug is taken; in whose company; in what dosage; and – perhaps most important of all – by whom it is taken; regardless of which drug is involved.

Technique. The leader of the psychedelic session should not take the drug; has to discard personal preconceptions; put aside the tendency to be judgmental; avoid labeling or depersonalizing the person under the influence of the drug; remain open-minded; not keep secrets from the psychedelic tripper, giving up any attempt at masking. All this is done in order to efficiently accompany the vulnerable drugged individual, who cannot even, for example, cross the street alone without the risk of being run over due to the state of absorption, ecstasy or abstraction in which his/her consciousness is immersed.

Contact. The leader of the psychedelic session almost always ends up feeling a light effect from the drug – whether through the breath of the drugged individual or by the transference of

consciential energies, sympathetic assimilation or empathetic communication, the capacity to mentally perceive the emotions of the other being – characterizing the phenomenon of the *contact high trip*, thereby behaving as though also being under the influence of the hallucinogen.

War. Some people claim that, in 1966, the United States Air Force dropped so-called “happy bombs” over Vietnam, explosives filled with gaseous lysergic acid, intended to make the enemy soldiers take long *trips*, thereby becoming temporarily and subjectively absent, and being physically annulled on the battlefield.

Frog. Other authors also affirm that much earlier, in the early eighteenth century, the secretions of the *Bufo marinus* frog, were added to explosive cannonballs. If the cannonball did not liquidate the adversary, the toxins of the frog would. It can be seen that human nature is extremely creative and imaginative with respect to bellicosity.

Effects. The use or ingestion of several of these drugs and plants can generate, at the very least, some of the following 10 negative effects:

1. Intoxication. There are clinics and therapy groups (mutual support).
2. An ephemeral sensation of autism. Interference in personal relationships.
3. Diuresis.
4. Dysentery.
5. Mydriasis, double vision.
6. Increased vision, provoking brilliant ornamental effects.
7. The illusion of a rapid change in the size of persons and objects, or microscopy and macroscopy.
8. Psychological dependence. Obsession with the drug. Many undergo *desoma* at this point.
9. The archeology of infancy. Complete deterioration of personal and professional life.
10. Tyrannical desires.

Observation. It can be seen that lucid projections induced by intoxication with these magical drugs, mythical drugs, projectiogenic drugs, dream herbs, prophetic fungi, or magic plants, also considered sacred, are always imbued with hallucinations, due to their potent alkaloids and psychoactive properties. They are therefore not recommendable for rational reliable projectiological experiments. A drug has not yet been invented that instills intelligence and talent to the person who lacks them. However, the author hereby pays a tribute of gratitude to all the passive patients, sacrificed victims or human guinea pigs of drugs, being authentic, anonymous explorer-heroes of *consciential space*, in the hope that future research can offer effective, innocuous drugs for the expansion and lucid projection of the consciousness. *In the final analysis, hope is the last to undergo desoma.*

Types. It is worth clarifying that barbiturates impede the individual from dreaming, while tranquilizers, on the contrary, make the person dream. Other drugs can be listed which impede sleep and, therefore, the production of lucid projections: anorectics or appetite suppressants taken without medical supervision; xanthines (caffeine and its derivatives); some psychotropics (antidepressants); cortisone; amphetamines taken to stimulate intellectual capacity; bronchodilators, derivatives of ephedrine, aminophylline and noradrenaline, used in the treatment of asthma.

Pattern. The majority of medications modify the pattern of altered states of consciousness, whether sleep, dreams or lucid projections. Some of these medications actually provoke nightmares. Therefore, in summary: *the fewer medications that are used, or consumed, in any area, the better.* The UN recorded the existence of 13 million cocaine users in 1997.

Experimenters. The ingestion of diverse drugs has been generating alterations in the extraphysical perceptions of certain parapsychology experimenters, thereby resulting in countless perspectives and temporary conclusions based on false, artificial premises. Included in this group are self-researchers or investigators of participatory research, as well as authors who write on projectiological themes. These attitudes can be included among *multidimensional faux pas*.

Difference. When in the ordinary, physical waking state, our consciousness can, on the one hand, learn a lesson in a class in an optimal condition, while we enjoy the fullness of our intellectual

perceptions. On the other hand, we can be medicated, drugged or drunk, whereupon our reflexes, concentration and powers of thought deteriorate, often annulling our intellectual perceptions to zero. We can thereby clearly understand the basic difference between a pure, physiological, lucid projection produced naturally by the will and an impure lucid projection, artificially induced by the use of drugs.

Decline. The intensity and quality of the extraphysical perceptions of the projected consciousness deteriorate while under the influence of the drugged organism. The extraphysical experiences and lessons become distorted, masked by mental images, oneiric interference and symbolic forms, being marked by erroneous interpretations. Healthy and ideal conscial expansion does not occur through drugs.

Ecstasy. The synthetic drug *MDMA (methylenedioxyamphetamine)*, also called “Ecstasy” (XTC, Adam), is not a hallucinogen, does not interfere with thoughts and does not alter the individual’s perceptions. It does, however, present similarities with amphetamines and mescaline, and has been used, experimentally, to help individuals relate to their own emotions, increasing euphoria, energy and personal disposition. It is not indicated for those with heart or circulatory problems. It comes in gel caps or powder, to be mixed with juice. It does not predispose the individual to lucid conscial projection. The commercialization of this euphoriant was prohibited in the United States of America at the end of 1985.

Happiness. *Biochemical happiness* does not exist.

Beta-blockers. Beta-blocker medicines are currently much used in the treatment of arterial hypertension and other problems. Upon reducing the heart rate, they increase the human body’s predisposition to allow projection of the consciousness. They are, however, dangerous drugs which should be prescribed with great caution, specifically for certain disturbances and not exclusively in order to facilitate lucid projection.

Arteriosclerosis. Medicines that prevent arteriosclerosis, senility and Alzheimer’s disease, improve cerebral vascularization and increase alertness, but hamper lucid projection because they reduce the period of sleep. Nevertheless, in this case, when the intraphysical consciousness is able to project, he/she enjoys greater extraphysical lucidity and better recall of the extraphysical events that occur in the lucid projection.

Insomnia. The term *insomnia* refers to various interrelated problems: to take a long time to sleep, to awaken many times, or very early, or have light, unsatisfactory sleep. There are at least 23 known types of insomnia.

Projectability. Any type of insomnia – whether at the beginning of the night, during sleep, or in the early morning – hampers the production of lucid projection. Insomniacs should not be confused with healthy hyposomniacs, who need only a few hours of natural (delta) sleep every night, or within a 24-hour, sunrise-sunset, day-night, asleep-awake period.

Sleep-inducers. Narcotics, somniferous pills sold by medical prescription for insomniacs, which depress the central nervous system, act directly upon the brain and leave the person unconscious. No somniferous agent shows effective results for more than 28 days. These drugs are also not recommended for the production of lucid projection because, on the one hand, they reduce the heart rate, arterial pressure, respiratory rhythm, general reflexes and muscle tonus; on the other hand, they inhibit part of natural sleep including the REM cycles, related to dreams and projective predisposition. They thus do not allow refined, high-quality extraphysical perceptions.

Natural. Until now, besides the increase in the problems of insomnia in all countries, a natural somniferous substance that is risk free, powerful but innocuous has not yet been discovered, namely one which reactivates natural sleep without producing side effects or dependency. All insomnia drugs, including the weakest ones on the market, are not completely innocuous. They can lead the consumer to so-called *semitoxicomania*, or the less perceived condition of quasi-addiction, semidependence. They are also unable to provide individuals with sleep that is identical to natural sleep. Drinking coffee at night hampers the quality of sleep.

Alcohol. Alcoholic beverages – wine of the gods or holy wine – generally do not help the projective process. Alcohol facilitates sleepiness but distorts the normal sleep pattern. It suppresses

important aspects of the individual's psychophysiology, including dreams, and can provoke early awakening. In other words, it can make people wake up before completing their individual, habitual period of natural sleep. All these factors impair the 3 fundamental aspects of the projective experience: takeoff of the psychosoma; the extraphysical achievement of lucidity of the projected consciousness; and the subsequent recall of the projective experiment.

Imagination. Alcohol tends to further reduce the control of the consciousness over the imagination or, in other words: it allows the imagination to dominate the consciencial perceptions or the elaboration of pure thoughts. Ethyl alcohol is therefore a seductive and corrosive liquid that depresses the CNS.

Adverse. Besides the aspects already analyzed, it is still possible that some drugs – which normally do not generate collateral effects for most individuals – may cause adverse, unexpected effects for certain patients, including occasional hallucinations which can confuse the person who is inexperienced regarding the subject. The individual can thereby erroneously conclude that he/she experienced the phenomenon of lucid projection.

Interactions. The noxious interactions of drugs between themselves, or upon their simultaneous use, should not be forgotten. The following 3 are examples:

1. A projective drug and prescribed medications due to clinical problems.
2. A projective drug and other drugs which act upon the central nervous system (CNS).
3. Ingestion of alcoholic beverages in the hours prior to a psychedelic experiment.

Joint. Experiments have not yet been performed on the joint application of various projective techniques along with unconscious-expanding drugs. For example: hypnosis as a preparation for the administration of a drug; hypnosis as an inducer of reexperiences, or the recapturing of an entire psychedelic experience, after the administration of the drug and the experience of the trip; or even hypnosis as a resource of post-hypnotic suggestion for the individual, after the psychedelic experience, to enter into the altered state of consciousness at will. These working hypotheses have not offered conclusive results to date.

Hypnosis. It is important to remember that we should, first and foremost, avoid hypnosis of any type or manifestation, because the still pathological intraphysical society is full of spurious suggestions and hypnoses of all conceivable types, producing the *existential robotization* of millions of intraphysical consciousnesses. There are torpors that are enslaving, legal and dangerous, chemical and *reported* everywhere.

467. COMPARISONS BETWEEN DRUGS AND HYPNOSIS

Differential. In the induction of lucid projection, besides autosuggestion, concentration and other special exercises, it is worth singling out drugs and hypnosis as processes that are prescribed by many enthusiasts. This is why it will be of great value to establish the similarities and differences between the former and the latter.

Contraindications. In the field of parapsychology, in general, and in the area of projectiology, in particular, drugs are frequently contraindicated. This is because they present negative physical

aspects, almost all of which relate to the human body, and negative extraphysical aspects, relative to the projected consciousness.

Physical. The following are negative physical, or physiological, aspects that drugs provoke in the individual's human body:

1. **Induction.** The inevitable time required for a drug to take effect.
2. **Side effects.** Undesirable side effects or simultaneous effects upon using a drug.
3. **Convalescence.** The time needed for the individual to subsequently rest, an actual convalescence, wherein the organism endeavors to promote its own detoxification, eliminating the residues of the drug, because it acts like a toxin, a foreign body to the organic environment, creating an artificial illness.
4. **Delayed.** Disagreeable, unpredictable, delayed effects, or those subsequent to the use of the drug.

Extraphysical. Negative extraphysical aspects which light and heavy drugs provoke in the projected consciousness: a reduction in the level or the clarity of the extraphysical perceptions; interference from hallucinatory and oneiric images in the development of actual extraphysical images; reduction in the quality of the performance of the consciousness regarding subsequent recall.

Hypnosis. In a rational comparison of drugs and hetero-hypnosis, namely hypnosis provoked by another to induce lucid projection, the latter is seen to present immensely superior advantages because it can have almost instantaneous results, has no side effects and, when induced by a competent and responsible hypnotist, has no delayed or secondary effects. Besides, the hypnotized person always feels much better after the hypnotic trance.

Ideal. The ideal is that the intraphysical consciousness, whether a youth or an adult, should at all times dispense with the use of drugs, as well as hypnosis, as far as possible. Evolutionarily speaking, it is important for the consciousness to maintain a maximum level of natural lucidity in any dimension in which he/she manifests, or multidimensional self-awareness.

Bibliography: D'arbó (365, p. 133), Grof (647, p. 25), Steiger (1601, p. 127), Vieira (1762, p. 172).

468. LUCID PROJECTION AND PSYCHOLOGICAL CONTAGION

Definition. Psychological contagion: transmission of the attitude of one individual to another through mental influence, instinct of imitation or direct, immediate, psychological contact.

Synonymy: contagious propagation; epidemic suggestion; imitative contagion; imitative propagation; mental contagion; mimetic behavior; psychic contagion; psychic mimicry; psychological propagation; sympathetic contagion.

Think. Ordinary intraphysical consciousnesses generally still do not know how to relate in a healthy manner with their extraphysical sphere of consensual energies (energetic field) in human daily life, because they eat, feel, breathe and think inadequately. Ordinary individuals do not even think (or thosenize) for themselves in a free and independent manner. Their minds, lacking control, become integrated into the collective mind of the group to which they pertain. They thus relinquish their ability to discern among those who can be of greater use to them. This gives rise to fads – often including those that are extremely ridiculous and irrational – and to post-desomatic parapsychoses.

Types. Certain forms of the phenomenon of live, psychological contagion are well-known to psychiatrists, psychologists, sociologists and conscientiotherapists. For example, if someone yawns, sneezes, laughs or cries in a room full of people, this attitude can soon be transmitted, in a reflexive manner, to other spectators who are present. Nothing is more contagious than someone fainting in a crowded place.

Zoology. Mimetic behavior is even seen in subhuman animals, e.g.: a horse that shakes its head is soon imitated by those nearby.

Delirium. From a negative or psychopathological point of view, the participation of 1 or more individuals in the delirium of 1 ill person (delirium inducer and delirium induced) is well-known. The mental or psychic contagion of induced advanced madness, of the psychic epidemic and waves of suicides are also well-known. Unfortunately, even suicidal ideas can be implanted and transferred from person to person in a superexcited crowd.

Fads. Besides this, customs, fashions (fads, manias) and social trends are just as much a contagion of ideas, an aping of customs or imitative actions.

Contagiousness. Based on the premise that lucid consciential projection, as a natural, physiological attribute of the human consciousness, can be induced through suggestion or even through autosuggestion, it can be concluded that this consciential attribute receives the influence of certain motivating psychological factors, including *projective contagiousness*. In other words: lucid consciential projection is an experience that is transmittable through psychological contagion. However, there is generally no psychopathological connotation in these spontaneous, consciential projective occurrences.

Idea. Although having only sporadic individual consequences, the idea of lucid consciential projection can evidently be diffused by word of mouth and be communicated in a contagious manner from one individual to another or, more precisely, pass from one consciousness to another.

Gathering. Persons who are gathered together reciprocally influence each other. In the field of projectiology, the most easily detected psychological contagion occurs in a meeting or gathering where someone relates a personal projective experience. An unexpected consequence is the first spontaneous lucid projection by 1 of the listeners, a person who is more sensitive or has a greater latent level of lucid projectability, upon leaving the gathering and lying down routinely to go to sleep that night at home.

Reading. Frequently, the first reading about lucid projection, whether a simple newspaper article or a short chapter in a specialized book, motivates and induces the uninitiated reader who, because of this, ends up producing his/her first lucid projection and – dazzled, or sometimes surprised, by the uniqueness of the occurrence – recounts the experience verbally or in a letter (e-mail, fax). The author has various signed reports on this type of phenomena on file. The newspaper article (cosmogram) or book chapter (library) serve as catalysts for the emergent reaction of potential projectability.

Interferences. From the abovementioned observations, 4 basic inferences appear:

1. **Natural.** Psychological contagion represents an operative factor that sponsors the production of natural, involuntary, spontaneous, lucid projection without the application of any technique or methodology. Lucid projections, in this case, are not mere suggestions or induced hallucinations, but are real and unquestionable extraphysical experiences for the consciousness itself.

2. **Ease.** Psychological contagion highlights the ease which a minority of individuals – who have a greater predisposition (or a more developed projectability) compared to the average members of the population – possess in producing projections. They repeat the *conscious* phenomenon in an *unconscious* manner, without training, method or practice, but only by hearing about it. The majority of individuals achieve this level of performance only after much discipline, perseverant repetition and exhaustive training. It would be an error to disregard the clear evidence represented by this fact in favor of the existence of previous, preexisting experiences by the intraphysical consciousness or, in other words, a confirmation of the theory of successive lives and the existence of paragenetics.

3. **Center.** The evidence demonstrates that the veteran lucid projector is a focal point or *center of irradiation* from which the projective contagion emanates at its highest intensity. Therefore, those who have already produced impactful lucid projections can be certain that, in certain circumstances, the relating of their experiments, even verbally, depending on how it is said, the wave of energetic irradiation of the communication and the charismatic presence can be very positive and useful in the sense of stimulating other persons to produce their first lucid projective experiences.

4. **Current.** The facts also indicate that the centers of projectiological studies, public debates on consensual projection research and the gathering of ideas in meetings of veteran and novice lucid projectors, can form an actual positive *projectiogenic current* in certain areas, social circles or specific locations.

Joint. In fact, imitation – whether fad-imitation, habit-imitation, spontaneous imitation, reflexive imitation – constitutes a behavioral replication of models, the reproduction of which is considered desirable and can be acquired consciously or unconsciously. On the other hand, for the sake of comparison, it is worth bearing in mind that in the case of projections en masse, provoked simultaneously in a group of persons, where joint lucid projection is practiced in a technical manner – through heterohypnosis, for example – the participating intraphysical consciousnesses generally do not, on average, present high-quality experiences. This is due to the extremely individual aspect of the projective experience and the mutual interference or reflections of the individual extraphysical spheres of consensual energy between the participants.

Bibliography: Krishna (867, p. 131), Vieira (1762, p. 38).

469. LUCID PROJECTION AND HUMOR

Definition. Humor: the mood to perceive, appreciate and express the surroundings in a negative or positive manner.

Synonymy: disposition of temperament; state of consciousness.

Psychosoma. Common humor, including the black, anticosmoethical humor of the intraphysical consciousness that is projected in the extraphysical dimension, stems from the psychosoma or emotional body. This is why it exists, without parathological connotations, near the terrestrial crust, in paratropospheric conditions, or in less evolved extraphysical dimensions per se. Mentalsomatic humor achieves levels of fruition that we are not accustomed to in our ever problematic daily human life.

Scowling. On the one hand, extraphysical good humor definitively liquidates any desire for extreme austerity and negative scowling by the consciousness of the projector, which repressive human mysticism is sometimes able to implant in the conditioned behavior of the individuals of the unthinking human masses or those lacking scientific knowledge.

Serenity. On the other hand, extraphysical good humor, by itself, demonstrates the need for the intraphysical consciousness to assume, without radicalism, a position of natural balance and serenity – the attribute of great, luminary intelligences of evolved extraphysical communities – to decide with wisdom and correctness on all occasions, both inside and outside the human body.

Mentalsoma. In order to achieve the pure manifestations of the mentalsoma, the intraphysical consciousness needs to act without deep or irrational emotional interferences. Until arriving at that point, the good humor of fraternity is preferable in any suitable circumstance because this special condition of the consciousness keeps the person's mental health protected from extreme segregationist, inculcatory, repressive rigorism or brainwashing, which can lead the personality to intraconsensual imbalance.

Bibliography: Sculthorp (1531, p. 77), Vieira (1762, p. 183).

470. LUCID PROJECTION AND YOGA

Definition. Yoga: the integrated system of self-discipline and physical and mental control, the objective of which is illumination, liberation and self-realization, in order to transcend the entire manifested universe and return to the origins of one's own consciential life.

Synonymy: *hatha yoga; kundalini yoga; laya yoga; mantra yoga; raja yoga; samadhi yoga* (types). The noble lineage of yoga (elitism) recommends and stipulates the use of the term in the masculine, with y, and the pronunciation with the closed o: *o yôga* – in Portuguese (*academicism* appears everywhere).

Types. The practice of some of the more than 144 types, systems, modalities, lines and specialties of yoga that exist, results in countless phenomena, including altered states of consciousness, which allow the practitioner to reach the extraphysical dimensions in a self-aware manner.

Videha. The *videha*, the Sanskrit term which literally signifies “one which has no body”, corresponds to the spontaneous lucid projector, or the intraphysical consciousness who presents a natural ability for leaving the human body, according to yoga practitioners.

Pranayama. The control of energy, or prana, *pranayama*, or the science of respiration, a yoga technique, is 1 of the basic methods for predisposing the intraphysical consciousness to leave the human body.

Raja. Among the diverse types or aspects of the series of interconnected disciplines of yoga which are directly related to projectiology, the following should be singled out: *hatha yoga; mantra yoga; raja yoga* or mental discipline; and *samadhi yoga*, which allows the achievement of cosmic consciousness (cosmoconsciousness), namely the major projection in the mentalsoma.

Powers. Among the psychic abilities, powers, achievements or *siddhis* which are taught by the Hindu scriptures that address yoga, the following, being intimately related to projectiology, merit singling out: to remain unmoved in the face of the inevitable ills of the human body, in other words, to obtain the serenity that becomes indispensable to the projected consciousness desiring to evolve; to see and hear distant events, or traveling clairvoyance; to reach the speed of thought, or volitation; to introduce oneself into the human body of any intraphysical being, or the action of the communicant-projector; to make the body die at will, or intentional self-desoma; to acquire knowledge of the past, or self-retro-cognition; also to acquire knowledge of the present, or clairvoyance, and knowledge of the future, or precognition; and to read the thoughts of others, or telepathy.

Practice. The development of the practice of yoga allows the individual to: increase the temperature of a point in the human body; walk on hot coals; control the human metabolism; stop bleeding; control the soma and the consciousness; produce telekinetic effects; stop or reactivate the heart; remain buried alive for a period of time; overcome pain; perspire at will; use the fingers like scissors; and live standing up (erect) for a period of years.

Machines. Western citizens can currently, in a few hours, learn some of the mental and therapeutic techniques with which the yogis take years of exercises to master the functions of the human body through the mind. This is done using machines that supply information to the person about the changes in personal organic systems. In other words, biofeedback, through which the practitioner can learn to control the blood pressure, heart rate, pain thresholds, body temperature, brainwave activity and other biological functions.

Chakras. Another aspect of the close relationship between lucid projection and yoga is the study of the force centers or chakras, as well as *kundalini yoga*.

Projection. The careful study of projectiology and the consequent practicing of lucid consciential projection solely through the decided willpower of the individual, over time, finally dispenses with the systems and exercises of yoga, as well as with all imaginable psychophysical

crutches. It should, however, be recognized that the millenary practices of yoga systems has greatly aided and emancipated consciousnesses, from 30 centuries before Jesus Christ up until current times.

471. LUCID PROJECTION IN TOTAL INSTITUTIONS

Definition. Total institution: the place of residence and work where a large number of individuals in a similar condition and separated from the greater society, lead a formally administrated, closed life for a considerable period of time.

Synonymy. The restrictive total institution is sometimes called: collective establishment; greenhouse for changing persons; public institution; social institution; warehouse of interned persons.

Types. There are 5 categories of total institutions in modern, human society, with diverse purposes:

1. Persons who are thought to be incapable and inoffensive: homes for the blind, elderly, orphans and indigents.
2. Those who are considered to be incapable of caring for themselves and who also threaten intraphysical society, although unintentionally: hospitals for the mentally ill, sanitariums for tuberculars and those for individuals with other specific illnesses, and establishments for hansenotics.
3. The protection of the community against those who are intentionally dangerous: prisons, penitentiaries, prison camps and concentration camps.
4. The organization of specific tasks: headquarters, ships, boarding schools and work camps.
5. Refuge from human life and for the religious instruction of recluses: convents, abbeys, and monasteries of contemplative life.

Analyses. Certain psychological and sociological perspectives should not be disregarded in the careful analyses of projectiology. All traditional confinements of human activity can generate involuntary and even voluntary lucid projections. Cases of lucid projections with those confined in restrictive total institutions are well-known, these institutions always being detrimental to the individual's civil identity. This is particularly the case for those entering involuntarily, as occurs in prisons, POW camps and hospitals for the mentally ill.

Closed. The closed conditions of the total institution cause a restriction of information, an absence of leisure activities, a distancing from certain opportunities for behavior, the impossibility of accompanying recent social changes, a sense of lost time and a sharp restriction in individual freedom.

Prisons. Confinement in prisons, for example, operates through prohibitions and barriers to social interaction with the outside world – gratings, locked doors, thick and high walls, steel walls, barbed wire, towers, iron bars, moats, water, forests or swamps – and lead to the invalidation, degradation, humiliation, mortification, profanation and mutilation of the detainee or prisoner's ego.

Examples of this are found in the lives of Edward Morrell, much cited in projectiological literature, and Henri Charrière (1907-1973).

Dioxide. The prison confinement, the dust in the environment, and the polluted, somewhat deoxygenated air in the cell provoke a reduction in the percentage of oxygen inhaled by the prisoner, resulting in the spontaneous production of lucid projection through the technique of increasing the carbon dioxide in the human body, notably in the cerebral hemispheres.

Example. The following is an impressive example of what the author affirms in this description by Henri Charrière (1906-1973), in *Papillon*, pages 337 and 338 (Robert Laffont, 1982):

“Plus, lorsque littéralement rendu je m’etends sur mon bat-flanc, je pose la tête sur la moitié de ma couverture et, l’autre moitié, je la replie sur mon visage. Alors, l’air déjà raréfié de la cellule arrive à ma bouche et à mon nez avec difficulté, filtré qu’il est par la couverture. Cela doit provoquer dans mes poumons un genre d’asphyxie, ma tête commence à me brûler. J’étouffe de chaleur et de manque d’air et alors, d’un seul coup, je m’envole. Ah! ces chevauchées de l’âme, quelles sensations indescriptibles elles m’ont données.”

(“Afterward, completely annihilated, I lay down on the bed, placing my head on top of half of the cover and cover it with the other half. The air in the cell – as it is already thin – hardly gets to my mouth and nose, being filtered by the cover. This may provoke a type of asphyxia in my lungs and my head begins to burn. The heat suffocates me, I am without air and – suddenly – I take off. Ah! These cavalcades of the soul, what indescribable sensations they gave me.”)

Predisposing. These conditions of restriction in total institutions impel the confined individual, a true modern captive, to desperately seek resources for escaping this type of slavery or exile. In certain cases, this anxiety has an influence on the subconscious will, resulting in the unintentional, spontaneous production of the lucid projection experience.

Significance. Lucid projection in the total institution signifies a silent protest, an undetectable individual rebellion, an advantageous insubordination and a reasonable investment of time which is spent there involuntarily, making the interned-projector momentarily forget his/her real human situation. As the individual finds nothing to learn, he/she therefore turns to him/herself.

Evidence. We encounter clear evidence of this affirmation in the aforementioned work by Henri Charrière in another passage written in highly descriptive prose with cathartic effect, on pages 338 and 339:

“Ni toi, procureur inhumain, ni vous, policiers à l’honnêteté douteuse, ni Polein, misérable qui a marchandé sa liberté au prix d’un faux témoignage, ni les douze fromages assez crétins pour avoir suivi la thèse de l’accusation et sa façon d’interpréter les choses, ni les gaffes de la Réclusion, dignes associés de la “mangeuse d’hommes”, personne, absolument personne, pas même les murs épais ni la distance de cette île perdue sur l’Atlantique, rien, absolument rien de moral ou de matériel n’empêchera mes voyages délicieusement teintés du rose de la félicité quand je m’envole dans les étoiles.”

(“Neither you, inhumane prosecutor, nor you, police officer of doubtful honesty, nor Polein, that scoundrel who bought his freedom at the cost of a false testimony, nor the dozen fools on the jury, who were sufficiently stupid to accept the charges brought against me by the plaintiffs and their manner of interpreting things, nor the prison guards, worthy associates of the “devourer of men,” no one, absolutely no one, not even the thick walls, nor the distance where this island is located, lost in the Atlantic, nothing, absolutely nothing, no moral or material thing will prevent my deliciously rose-colored journeys of happiness, when I take off and fly to the stars.”)

Substitution. Sociologically speaking, lucid projection, in these cases, constitutes a true type of secondary adjustment, an act of evasion, an unprecedented liberation, a process of psychological, or more appropriately, projectiological or parapsychic substitution.

Escape. The projective phenomenon modifies the conditions of life that is planned for confined projectors and allows them to forget themselves, representing a defense mechanism for shielding them against moral and even physical pain, temporarily erasing all sense that they have of the environment in which and for which they must live.

Extraphysical. The extraphysical world, for those confined in a total institution, literally acts like a world of regular escape, a means of escape from the shackles of confinement.

Helpers. The assistance of the helpers provided to those confined in total institutions is a common type of *assistential* consciential projection, or *assisted* consciential projection, aiming to avoid the extreme despair of suicide and homicide.

Volitation. Unrestricted volitation is much more useful for the intraphysical consciousness who is in the maximally restrictive conditions of total institutions, than it is for the common person, accustomed to enjoying the full freedom of this external intraphysical dimension.

Visits. There is evidence, backed by the reports of prisoners, prison guards and family members of accused innocents who, while living as prisoners – including one case of a prisoner on *death row*, awaiting electrocution in the electric chair, or even on the gallows – received an extraphysical visit from their extraphysical family members who consciously projected from the human body, being moved by intense stress, sometimes even due to physical torture, which may be evident, disguised or covered up.

Incapacity. These affirmations of extraphysical assistance from the extraphysical helpers, which is frequently unexpected, are supported by the known fact that ex-convicts who consciously project while incarcerated, become unable to consciously leave their body as soon as they are freed, beginning a period of permanent projective recess. This also confirms the principle that no one leaves prison in a perfect state.

Myrmecologist. The condition of the evolved consciousness, endowed with a global vision and greater consciential acuity, upon extraphysically *gazing down* at this planet in order to analyze humankind (*Homo sapiens*) and the environment in which it lives (earth) in town and country, is analogous to the myrmecologist who researches and makes detailed observations on the environment, the habits and behavior of ants (*Phylum Arthropoda*; Class *Insecta*; Order *Hymenoptera*; Suborder *Clistogastra*; Family *Formicidae*; Genus *Atta*; Species *attasexdens*) in their miniworld (colony), in the primary and secondary tunnels. A similar analysis can be made by the intraphysical consciousness when lucidly projected in the mentalsoma.

Convent. Incidentally, the convent (of nuns) is the particular restrictive, total human institution (sociology) that is most similar to the ant hill where only female ants live as sisters (myrmecology). They are 2 types of social animals, although extremely diverse, according to the evolution of the consciential principle.

472. LUCID PROJECTION AND PERSONAL MOVEMENT

Definition. Personal movement: the act or process whereby a person moves him/herself or changes physical position with his/her human body.

Synonymy: individual dislocation; personal action.

Rapidity. Sometimes, a rapid, repeated, uncommon, lengthy movement can provoke dis coincidence between the psychosoma and the human body, triggering a lucid or even nonlucid projection. In other words: the person seated in a gyrating chair; the *cavalo* (“horse”) in the gyrations of *Umbanda*; the shaman in a frenetic dance; the *mambo*, or voodoo priest, in the whirling of his/her spasmodic pirouettes; the dervish in his/her gyratory dance movements; the athlete or an ordinary runner jogging; the parachutist at the precise moment at which he/she is waiting for the automatic parachute to open.

Direction. Consciousnesses sometimes have completely lucid experiences outside the human body – while their body continues with the coordinated, complex activity – whether driving a vehicle in movement, a normal car, a race car, a locomotive, a bus, plane, motorcycle or motorized bicycle; or even when the person is taking a driving test; someone is simply walking; the orator is speaking; the pastor is delivering a sermon; the author is writing a book; the marathoner is running; the sports enthusiast is playing; the singer is singing a song; the dentist is extracting a tooth from a patient.

Aid. Most projective experiences in which the person is at the wheel of a vehicle are of extremely short duration. In these circumstances, it seems that accidents do not occur due to a subprogram in the mental computer, or the aid of a helper attending to the spontaneous projectors in these momentary projections.

Stop. When someone applies the brakes in a vehicle, e.g.: a car, the human body suffers an abrupt stop. In this case, the psychosoma can continue in movement for a brief moment, so that the intraphysical being feels symptoms similar to those of an illness.

Causes. The main cause of these phenomena, it would seem, is in the absence of a certain amount of oxygen in the cerebral hemispheres – with a predominance of carbon dioxide – as occurs in other cases of a different nature, although from similar causes, triggered by a reduction in respiratory frequency, whether in critical situations of anesthesia, suffocation, drowning, landslides and cave-ins. It seems that these facts can also be related to the resonance frequency of the psychosoma when coincident with the human body, due to the state of external vibration of the vehicle’s engine; as well as an external predisposition provoked by sound, thought or vision.

Inertia. Nevertheless, it should not be forgotten that many cases of dis coincidence of the vehicles of manifestation of the consciousness are actually due to the mechanical inertia of the psychosoma and/or holochakra.

473. LUCID PROJECTION AND SPORTS

Definition. Sport: the set of physical exercises practiced using a method.

Synonymy: aerobics; athleticism; calisthenics; gymnastics; physical exercise; recreation.

Hygiene. Physical and mental hygiene are an essential precept for the normal human existence of any person, in the development of any activity. Based upon this premise, sports, or the regular practice of physical exercise, can only aid the projector’s development, as it maintains adequate conditions of health and suitable or healthy psychophysical predispositions.

Conditioning. In the physical conditioning of the athlete, as it applies to the practice of lucid projection, it is worth highlighting the value of swimming, long-distance running, *hatha yoga* and the important condition of organic detoxification, based on the premise, which is widely accepted today, that the concentrated performance of a sport is a powerful inducer of altered states of consciousness, without any pathological connotation, in this case. This is because physical exercises particularly stimulate and intensify the energies, the holochakra the chakras.

Swimming. There are indications made in other references in this book to certain positive prescriptions for the projector-swimmer, especially with reference to physical (*soma*) relaxation and the projective technique of an extraphysical back somersault of the *psychosoma*.

Running. There are records of runners who consciously saw themselves outside the human body during exhaustive, long-distance runs, which require maintaining a rhythm of harmonic movements and a constant velocity. Curiously enough, these sport enthusiasts are considered “consciential athletes” by the new sports elite.

Detoxification. Physical exercises, even those ordinary ones which are practiced on a regular basis, efficiently help to shape the human body and keep the organism detoxified, eliminating intestinal constipation, headaches, dizziness and other occurrences which hinder the smooth development of the human physiology, impair the mental world of the intraphysical consciousness and impede the production of the lucid consciential projection experience.

Principles. The following are 2 uncontested principles of *modern civilization*:

1. **Sedentariness.** An inactive or sedentary life (sedentariness) leads to premature desoma for those personalities who are careless regarding the survival *of* and *in* the soma.

2. **Bellicosity.** *Non-radical* sports are the healthy equivalent of the multimillenary or atavistic (group karmic) insane practices of war and armed conflict (bellicosity).

Bibliography: Andrews (37, p. 121), David-Neel (368, p. 191), Greenhouse (636, p. 339), Murphy (1113, p. 3).

474. LUCID PROJECTION AND WAR

Definition. War: armed conflict declared between sovereign states or belligerent powers, whether between nations or factions of the same people.

Synonymy: air warfare (type); armed battle; armed conflict; civil warfare (type); declared hostility; guerrilla warfare (type); military combat; total warfare (type).

Explosions. Battle fatigue, isolation and desperation, extreme physical and mental tension, the sudden, violent dislocation of masses of air in the environment, or the impacts caused by explosions and the shockwaves of blasts during war, provoke frequent cases of instantaneous, forced lucid projections in soldiers and civilians prior to their desoma or in those who do not reach the point of losing their lives (without deactivation of the soma).

Forced. The lucid projections that occur on battlefields are invariably forced by circumstances and the physical and psychic traumas which occur, or which assail the human body of the occasional projector. However, in many cases, the fear of death and the deliria generated by war itself also act as powerful projectiogenic factors, as well as being agents against material or biological life. Paradoxically, in these cases, the fear that generally blocks the experience of voluntary lucid projection predisposes forced phenomena.

Weapon. The extremely frightening mental power of the application of consciential energies is, sadly, beginning to be technically explored as an incredibly powerful, modern weapon of war and sabotage, stemming from the research of psychokinetic (PK) phenomena, which, sadly, are currently

undisputedly accepted as an instrument in combat operations, with the explosive purpose of increasing war between nations. In this tragic mental warfare – or psychic warfare, consciential warfare, telepathic warfare, telekinetic warfare – as it is called, which is currently being developed, research continues with the major powers engaged in multimillion dollar and multimillion ruble projects (which have already occurred) in the study of parapsychology, including projectiology, for exclusively bellicose purposes, as a dependable instrument for defeating the enemy, practicing acts or *effective interference*, in top secret projects.

Examples. The following are 8 significant examples of this research in which the major powers have been engaged since the 1980s: the possibility of discovering and locating military targets at a distance, through the production of remote viewing; the mental tracking of hiding places for missiles, through projective espionage; the technical theft of documents, through apport or extraphysical telekinesis; the mental command, at a distance, of the discharge of all types of combat equipment, through extraphysical telekinesis; the acquisition of secret mental material from other persons, through extraphysical telepathy; the changing of other persons' minds, including ideas, decisions, humor and emotions, also through extraphysical telepathy; the anticipation of plans that are as yet not conceived or fully materialized by the enemy, through extraphysical precognition; the act of inflicting illnesses upon persons through the malign use of consciential energies.

Savagery. Incidentally, the impressions which are made in the mentalsoma are more lasting than those made in the psychosoma. These impressions are constantly reproduced through memory and imagination. The mentalsoma stimulates the psychosoma, awakening desires within it which, in the subhuman animal, lie dormant until they are awakened by physical stimulus. Thus is born within the human consciousness the calculated cruelty that makes the human being, humankind on earth – the so-called *superior* animal – potentially more dangerous and brutally savage than any other subhuman animal considered *inferior*. All this due to the individual's ignorance of the existence and use of his/her own mentalsoma or, in other words, a lack of knowledge about his/her true essence.

Protest. For this reason, the author records here his vehement protest against the worrisome absurdity of war, irrespective of which war it might be, generated by the animal instincts and passions of modern humanity, *the civilized barbarian*, the greatest technical barbarian in human history. At the beginning of 1983 alone, according to the press (*Jornal do Brasil*; Rio de Janeiro; Brazil; daily; year XVII; N. 345; 23, March, 1983; p. 12), there were an estimated 40 major and minor bloody armed conflicts – “conventional wars” or “guerilla wars” – on the earth, involving 45 of the 164 nations existing on the planet at that time, with the involvement of more than 4 million soldiers engaged in full-time combat.

Impact therapy. According to *impact therapy*, or the experience of the clarification task, through leading-edge truths, among the greatest official intrusion-related tasks in human life, the following 4 can be singled out: war, espionage, sabotage and intentional disinformation.

Vaccine. These intraphysical consciousnesses involved in wars – the commanders and the troops – need to know, and the sooner the better for everyone, the individual and deeper realities of the experience of human lucid projection. This inoculates the intraphysical consciousness against all types of war, because it leads one to a better control of the psychosoma – the parable of desires and emotions – through a greater comprehension and better use of one's own mentalsoma, on the way to extraphysical maturity. It is for this reason that the author presents this technical work as his contribution against the savagery of war and all *warlords*.

475. LUCID PROJECTION, ESPIONAGE AND BUSINESS

Definition. Projective espionage: the act of spying, investigating and gathering information as a projected, intraphysical spy-projector.

Synonymy: extraphysical espionage; extraphysical spying; parapsychic spying technique; projectiological spying technique; projective spying; psychic espionage.

Spy-projector. In the field of consciousness technology, the secret agent who is dedicated to extraphysical espionage through lucid projection is called: psychotronic agent, extraphysical spy, parapsychic spy, para-spy or spy-projector.

Applications. Extraphysical espionage is classified within the public applications of lucid projection, given that some of these applications are exceptionally positive and the majority of the applications are negative, through the active participation of the projector in diverse practical operations.

Objectives. Such espionage aims to serve industrial, military, private, police, political, journalistic or any intelligence related secret service with bellicose objectives, which proposes to achieve the goal of observing and investigating the privacy of intraphysical consciousnesses, institutions and public areas, as well as the creation of efficient anti-telepathic barriers.

Unsafe. Extraphysical espionage, despite being an inadvisable practice in certain cases, is based on the well-known principle that no secret can really be secure on earth, in light of the universal possibilities of the interference of the perceptions of one consciousness upon other consciousnesses, through king-size lucid projection, extraphysical telepathy and extraphysical telekinesis.

Archives. The governments of the currently major powers are becoming increasingly interested in projectiology research. They aim to use lucid projection as a sophisticated espionage process through the invisible probing of the military, political and industrial archives of other countries, as well as the cunning entry of the projected consciousness into the minds, brains or human bodies of military leaders, political leaders and the members of the embassies of foreign powers.

Invisible. Some countries already take seriously and spend huge sums of money on the creation of their own team of *invisible men*.

Frequency. The observation and collection of information in vital, strategic areas – which is invisible to others and direct and first-hand to the projected projector – and their subsequent report, have actually been used with greater frequency than the public imagines. It is not complicated, because distances and physical barriers do not exist for the consciousness projected outside the human body.

Counterespionage. It becomes far more difficult, compared to routine extraphysical espionage, to detect extraphysical espionage executed by another or, in other words, efficiently perform *extraphysical counterespionage*.

Experiments. In 1973, the Central Intelligence Agency (CIA) of the United States of America performed fully conscious long-distance experiments with the well-known North American sensitives Ingo Swann and Patrick H. Price, conducted by parapsychologists Harold E. Puthoff and Russel Targ at the Stanford Research Institute (SRI) in the state of California, obtaining results which were auspicious and extremely positive for them.

Descriptions. In controlled tests of traveling clairvoyance, the spy-projectors precisely described top-secret military installations and even the contents of confidential archives at these bases. In one of the experiments with Pat Price, the detailed description of a hidden Soviet installation in the Ural Mountains was confirmed by CIA agents in the former Soviet Russia. Both of the abovementioned sensitives extended their projective espionage to China and CIA contacts in the People's Republic confirmed the precision and accuracy of the descriptions.

Scheme. Another scheme of bellicose extraphysical espionage, for example, is based on the undue, temporary and direct appropriation of top-secret maquettes or blueprints for strategic defense, recent inventions, new arms projects, equipment blueprints, vehicle designs and other studies of this nature.

Vestiges. This goal can be achieved by immediately copying the blueprints in the spy-country and later returning them, also extraphysically, to the place from which they were temporarily removed. This is the type of crime that is apparently perfect to human eyes, or the clean, concise infraction, leaving no trails, marks, signs, fingerprints, clues or traces of any type; and thus without creating “inopportune and undesirable” corpus delicti.

Biteleportation. The entire abovementioned scheme, although difficult, is totally feasible in ordinary life, as much in theory as in practice, as it occurs in the extraphysical tropospheric dimension, although demanding an enormous amount of work. In other words, it requires two successive projections by the acting intraphysical consciousness who goes and comes, twice, from the spying country to the country that is being spied upon; performing the transportation of objects or roundtrip biteleportation; and, what is more, the alternant dematerialization-transport-rematerialization, also twice, in each location.

Secrets. Nevertheless, the author does not advise any lucid consciencial projector to even try to extraphysically discover: the secret formulas of soft drinks; the nuclear codes of Washington and Moscow; bank account numbers in Switzerland and other countries; the secret of Fatima; and other secrets considered to be well-guarded by the world.

Police. Police investigations executed successfully by projected projectors, through the exteriorization of the consciousness induced by hetero-hypnosis are very well-known. They have the purpose of: tracking missing or kidnapped persons; locating airplanes that have crashed in unknown or inhospitable locations; examining crime scenes; correctly identifying delinquents. On this point, the tasks of projective espionage become positive beyond a doubt and are within the reach of any person willing to develop them.

Warning. Acts of extraphysical espionage, however, are problematic since they are based on malevolent objectives – or unethical, anticosmoethical reasons – which are directly contrary to the principles of cosmoethics, involving misuse of the powers of the human consciousness. They thereby cause negative, serious and unpredictable consequences, whether immediately or soon after their execution, for the entire team of participants of operations of these consciencial wars, beginning with, and mainly with, the spy-projector.

Universalism. It is incidentally worth clarifying that unethical reasons are extremely relative. The interrelationship between persons and the lack of understanding between them, although having a positive intention on the part of one of them, is unethical in accordance with the analysis and capacity for understanding on the part of the other. Thus, “unethical” is dependent upon the mental amplitude or degree of universalism of the persons affected. Therefore, what should prevail here, above all, is the capacity to receive the effect, through the actions performed and the subsequent dampening of the vibrations and actions emitted by neophobes. Human life is always thus, and this characterizes consciencial evolution. The real level of cosmoethics varies from person to person and is contingent upon lucid intraconsciencial self-evolution.

Backfire. The mechanisms of the ever-present law of karma (backfire, boomerang effect, cause and effect or action and reaction) exclude no one, not even the projected intraphysical consciousness or the extraphysical consciousnesses willing to cooperate in positive or negative acts of espionage.

Business. The companies or legal firms which have been created in order to commercially exploit extrasensory powers have been using spy-projectors successfully on their staffs in the United States of America.

Research. In the fulfillment of contracts signed with large corporations, these specialized firms address a diversified field of action by performing research in a parapsychic manner, or through animic (intraconsciencial) and parapsychic (with the intervention of another consciousness together with the intraphysical consciousness) processes, such as the following 7:

1. **Tracking.** The tracking of missing persons.
2. **Archeology.** Archeological investigation.

3. **Ships.** The location of sunken ships.
4. **Cities.** The location of underground cities.
5. **Reserves.** The location of subterranean reserves of minerals, natural gas and petroleum.
6. **Prospective.** Forecasts of the prices of precious metals – silver, gold – for private investors.
7. **Computer science.** The production of psychic videogames, like Psi Ball, in which the player, using only mental force, without pressing any buttons, tries to keep the ball in the center of the screen.

Intrusion. Soviet parapsychological research sought, for some decades, maintaining a rigorous ultra-materialist-dialectical posture, to achieve the main objective of influencing or controlling the emotions or behavior of persons at a distance, endeavoring to act upon the frequency and intensity of the brainwaves of others, through the energetic impulsion of the will, directing them toward their interests of political domination. In other words: they sought to intentionally create intraphysical intruders who are aware of the intrusion that they intentionally practiced. To this end, they applied the greatest diversity of drugs, hypnosis and instruments in order to intensify the parapsychism of the sensitives.

Confidential. In addition to everything that has been presented here, it is sad to affirm that there is a military use of projectiology for sabotage and espionage. Projectiological subjects, in certain – extremely interested – official government circles, are also considered to be and are classified as confidential, secret, marked by the indefectible seal of top secret, with dossiers prohibited to the public, still far from being open research.

Contributions. It is to be hoped, however, that the impressive multimillion dollar and multimillion ruble investments applied in these new research areas will bring relevant, albeit long-term, contributions in favor of basic, fraternal, therapeutic, universalistic, illuminating projectiological investigations of the human consciousness.

XIII), Vieira (1762, p. 97), Webb (1804, p. 77), Wilson (1856, p. 126), Yeterian (1893, p. 17).

476. LUCID PROJECTION AND ART IN GENERAL

Definition. Art: the activity involving the creation of sensations or states of consciousness that are generally of an esthetic nature, but that are charged with deep, inner experience capable of eliciting the desire for renovation in another.

Synonymy: artistic work.

Works. Ever since the nineteenth century, lucid projections have inspired the elaboration of countless literary works, poems, stories, soap operas and novels. Some of these works are only fiction, while others relate true cases, dramatic experiences, real extraphysical romances or, in other words, true stories that occurred with the actual authors depicted as characters. Many of these authors are famous writers, while others are sometimes well-known parapsychic intraphysical consciousnesses or simply students of projectiology, who gradually assume a place of significance in the general scheme of human culture.

Prose. In the area of prose, the following are 22 novels of note written on the theme of lucid projection: *Louis Lambert*, by Honoré de Balzac (1799-1850); *...Entonces Seremos Dioses, En la Noche de los Tiempos* and *Rumbos Humanos*, by Rodolfo Benavides (1907-); *Voyage en Astral*, by Mme. Ernest Bosc; *Entre Dois Mundos*, by Antoinette Bourdin; *Zanoni*, by Edward George Earle Bulwer-Lytton (1803-1873); *Papillon*, by Henri Charrière (1907-1973); *Estela*, by Nicolas Camille Flammarion (1842-1925); *Do Outro Lado*, by Wilson Frungilo Júnior (1949-); *Resurrection*, by William

Alexander Gerhardt (1895-1977); *A Farewell to Arms*, by Ernest Hemingway; *The Island*, by Aldous Leonard Huxley (1894-1963); *O Filho de Zanoni*, by Francisco Valdomiro Lorenz (1872-1957); *Peter Ibbetson*, by George Louis Palmella Busson Du Maurier (1834-1896); *Récits d'un Voyageur de l'Astral*, by Anne & Daniel Meurois-Givaudan; *The Octopus*, by Benjamin Franklin Norris (1870-1902); *Adonai*, by Jorge E. Adoum; *Nas Voragens do Pecado*, by Yvonne do Amaral Pereira; *Metrô para o Outro Mundo*, by José Herculano Pires; *Confidências de Um Inconfidente*, by Marilusa Moreira Vasconcellos; *Ave, Cristo*, by Francisco Cândido Xavier (1911-).

Poetry. Among the poetic compositions specifically conceived objectifying the departure of the consciousness from the human body, the following stand out: *The Prisoner*, by Emily Brontë; *La Nuit de Décembre*, by Alfred de Musset; *Album*, by Wilhelm Busch.

Opera. The novel *Peter Ibbetson* by George Du Maurier, was adapted for opera, with music written by Deems Taylor.

Fiction. In early science fiction stories, teleportation appeared in the form of lucid projection in the following period: *Urânia* (1899), by the French astronomer, sensitive and writer Camille Flammarion; *The Stolen Body* (1898), by the English writer Herbert George Wells (1866-1946); and *Star Rover*, by the North American author Jack London (1876-1916). Many other science fiction (sci-fi, SF) works were subsequently written, wherein lucid projection appears together with reports of phenomena such as levitation, telepathy, telekinesis and traveling clairvoyance.

Children. Authors of children's books sometimes enter the domain of lucid projection in order to compose stories for children. An example of this is Raphael Américo Ranieri, the author of *João Vermelho no Mundo dos Espíritos*, published by Livraria Allan Kardec Editora, of São Paulo, SP, Brazil. This is a story about 2 miniprojectors, João Vermelho and Glorinha, and their instructive excursions outside the human body.

Paintings. The projected consciousnesses of many painters have been acquiring inspiration in the extraphysical dimension through lucid projections to paint on their canvasses. Examples of this type are encountered in the pictographic works of William Blake (1757-1827), Peter Hurkos (pseudonym of Pieter Cornelis van der Hurk: 1911-1988), and Ingo Swann.

Comics. In the popular creations of comic book stories (comic strips) – the so-called eighth art – dozens of authors, scriptwriters and artists, over various decades, have built their stories based on lucid projections. Of all the comic strip heroes, however, the attributes of *The Phantom*, created by the American E. C. Stoner, should be singled out. It was introduced in Portuguese, in Brazil, with N. 25 of the biweekly color magazine *O Guri*, in June of 1941, p. 22-31.

Interiorization. With story line by Roy Thomas, drawings by John Buscema and production by George Klein, the superhero *Doctor Strange* has been shown leaving projected in the extraphysical body, including drawings of his consciencial interiorization, as can be seen in the monthly magazine *Heróis da TV*, by Rio Gráfica e Editora, N. 35, May, 1982, p. 81, 82, 97. The same thing happens in the American color magazine, *Doctor Strange Classics*, Vol. 1, N. 1, March of 1984, from the Marvel Comics Group, with story line by Stan Lee, illustration by Steve Ditko and words by Artie Simek, wherein the consciousness of Dr. Strange transfers itself from one place to another in his “extraphysical form”, “etheric form”, or “ectoplasmic form” as it is explained in the story itself.

Repercussion. With script by Chris Claremont and John Byrne, and art by Terry Austin, the story “Psychic War”. shows projections of the consciousness in the psychosoma, self-transfigurations and the phenomenon of physical repercussion in the monthly magazine *X-Men*, from Rio Gráfica e Editora, N. 8, July-August, 1982, p. 72-76.

Indigenous. With text by G. L. Bonelli, the hero Tex shows many scenes of lucid projections induced by indigenous persons, as seen in the story “Os Filhos da Noite,” in the monthly magazine *Tex*, published by Vecchi, Year VI, N. 89, August, 1982, p. 25, 26, as well as other stories in the same genre.

Holotheca. The holotheca of the Center for Higher Studies of the Consciousness (CHSC), in Iguassu Falls, Parana, Brazil, stores in its collection not only examples of the *O Guri* collection and other abovementioned publications, but also hundreds of other editions of comic book stories, complete collections, a vast library and a considerable amount of material from 22 countries, many of which are based on human lucid projections or the phenomena of projectiology of diverse authors and superheroes.

Bibliography: Ash (57, p. 208), Balzac (72, p. 71), Benavides (108, p. 46; 109, p. 178; 111, p. 10), Bosc (173, p. 25), Bourdin (178, p. 20; 179, p. 30), Browning (213, p. 219), Bucke (218, p. 109), Bulwer-Lytton (221, p. 150), Busch (226, p. 252), Charrière (274, p. 337), Crookall (320, p. 9), Dickens (398, p. 46), Digest (399, p. 274), Dostoyevsky (408, p. 62), Duchatel (430, p. 112), Ebon (453, p. 116), Farrère (497, p. 26), Flammario (523, p. 60; 525, p. 140), Frungilo Jr. (561, p. 84), Gerhardie (584, p. 11), Giovetti (593, p. 19), Greenhouse (636, p. 188), Hemingway (710, p. 53), Huxley (770, p. 45), King (847, p. 273), London (944, p. 3), Lorenz (949, p. 171), Meurois-Guivaudan (1039, p. 22), Mitchell (1058, p. 354), Norris (1134, p. 262), Pereira (1233, p. 9), Pires (1246, p. 44), Ranieri (1372, p. 14), Ring (1406, p. 37), Sabom (1486, p. 39), Steiger (1601, p. 22), Thiago (1676, p. 33), Vasconcellos (1730, p. 13; 1731, p. 154), Wang (1794, p. 460), Wolman (1863, p. 781), Xavier (1870, p. 90).

477. LUCID PROJECTION AND EXTRAPHYSICAL MUSIC

Definition. Extraphysical music: sonorous chords that the projected projector hears in the extraphysical dimension.

Synonymy: metachromatic music; music of the spheres; *nad*; *nada*; parapsychic music; transcendental music.

Types. The most diverse types of music can be heard by the projected intraphysical consciousness, with or without the identification of its origin; played with instruments, orchestrated or presented by refined multi-voices from invisible throats, in passages of conventional melody, choruses without words or in unknown patterns and arrangements beyond human musical staves; in brief passages or during the entire period of extraphysical exteriorization and even during the interiorization of the consciousness into the human body.

Effects. The effects of extraphysical music vary from gentle melodies to vibrant marches and vehement rhythms, eliciting compassion or enthusiasm, with or without the evident purpose of music therapy.

Immanence. The harmony often exists and immanently endures in the extraphysical environment, regardless of the existence of resident or autochthonous extraphysical consciousnesses and the projected consciousness that is foreign and alien to the environment.

Relaxation. Music in general is particularly used as a psychological support for psychic self-relaxation, or mental concentration, by novice projectors with some success, establishing one or more points of contact for leaving the human body. Normally, slow pieces such as adagios and andantes lead to tranquilization, greater clarity of thought and self-relaxation, as with: *Adagio* (Tomaso Albinoni: 1671-1750); *The Swan* (Charles Camille Saint-Saëns: 1835-1921); *Coppelia* – extracts (Léo Delibes: 1836-1891); *Swan Lake* (Pëtr Ilyich Tchaikowsky: 1840-1893); “Largo”, from the opera *Xerxes* (George Frideric Handel: 1685-1759); *Panis Angelicus* (César Auguste Jean Guillaume Hubert Franck: 1822-1890).

Bibliography: Brittain (206, p. 75), Crookall (338, p. 119), Fodor (528, p. 258), Freixedo (554, p. 42), Greenhouse (636, p. 218), Heindel (705, p. 113), Kardec (824, p. 158), Monroe (1065, p. 124), Muldoon (1102, p. 82), Rogo (1448, p. 18; 1455, p. 9), Shepard (1548, p. 626), Vieira (1762, p. 152), Wheeler (1826, p. 68).

478. LUCID PROJECTION AND THE THEATER

Definition. Theater: the art of representing *life*, costumes and humankind, per se.

Synonymy: dramatic art; dramatology; dramaturgy.

Stage. Appearing on a stage before an audience – whether speaking, acting, dancing, singing, playing a musical instrument or even representing a personality before the public, which is absorbed in the artistic performance – often triggers lucid projections.

Hypotheses. Hypotheses have been proposed that the sound and rhythmic pattern of the human voice, the intense desire to perfect the artistic work and the self-abstraction regarding one's own artistic performance, are the causes of the lucid projections of artists who are on stage.

Ambiguities. Probably the artistic condition of actors – which have to deal with the ambiguities of the attitudes of the various characters that they represent – lead them to altered states of consciousness, notably due to psychosomatics.

Impossibilities. The condition should logically be inserted here, among the greatest ambiguities of *human life*, of the individual living with optimism, inner satisfaction and constant motivation. This, despite recognizing in this current human life, and for an indefinite number of intraphysical lives and intermissive periods to come, the following impossibilities, among others: perfection; a perfect human society; absolute truth; certainty; precision; and besides this – as it is still infinitely improbable to join the two conquests at the same time and place – to know that it is politically more relevant to have *freedom without equality* rather than *equality without freedom*.

Spectators. On the other hand, there are cases of spectators who, motivated by inner exaltation of their involvement in the art of the actors on the stage, have lucidly projected to the ceiling of the theater house.

Bibliography: Crookall (343, p. 6), Digest (399, p. 273), Green (632, p. 48), Greenhouse (636, p. 178).

479. LUCID PROJECTION AND CINEMATOGRAPHIC ART

Definition. Cinematographic art: set of methods and processes used to photographically register and project animated or moving scenes used in movie houses, television stations, videocassette recorders and other types of equipment.

Synonymy: cinema; cinematography.

Television. Cinematographic art, in the cinema as well as on television, including commercials, have sometimes used projectiology themes. However, the exploration of this subject has still not been attributed with the importance it is due, nor has it received the high-quality technical treatment that it deserves, due to social, religious and scientific preconceptions.

Cinema. In cinema, perhaps the most sophisticated approach thus far presented has been *Beyond and Back*, a full-length movie in Technicolor by Sunn Classic Pictures, distributed by Columbia Pictures, produced in 1977, written by Stephen Lord, partly based on the book of the same name by Ralph Wilkerson, produced by Charles E. Sellier Jr., directed by James L. Conway, with music by Bob Summers.

Near-death. This acclaimed film, distributed with the restriction that only those 17 years or older may attend, is based on the fundamental analysis of the true experiences of individuals who were declared clinically dead and came back to human life or, in other words, the near-death experience phenomena.

Evidence. Within its context, however, the film clearly presents, through the narration provided by Brad Crandall: evidence in favor of human survival and lucid consensual projection; consensual blackout; the disturbed zones of the paratropospheric dimension; the phenomenon of consensual self-bilocation;

self-permeability of the psychosoma; surgery and human accidents in relation to lucid projection; the existence of extraphysical helpers; the theory of successive lives; and parapsychic communication between consciousnesses.

Personalities. The film shows dramatic depositions and studies of famous personalities, along with their relationships to parapsychic phenomena, including Louise May Alcott (1832-1888), Hippolyte Baraduc, Elizabeth Barrett Browning (1806-1861), Benjamin Franklin (1706-1790), Ernest Miller Hemingway, Harry Houdini (1874-1926) and Plato.

Critic. Unfortunately, a Brazilian film critic (*O Globo*; Rio de Janeiro, Brazil; newspaper; daily; year LVIII; September 2, 1982; p. 36), summarized a condemnation of *Beyond and Back* in the following sentence: “A fascinating theme brought to the screen with ingenuousness and incompetence.” This reference, however, did not discourage the public, which was seen to attend the film with reasonable enthusiasm and hold lively discussions on the themes and scenes at the door of the movie theaters soon after the sessions.

Parable. The 114-minute color film, *Jonathan Livingston Seagull*, released in 1973 by Paramount, directed by Hall Bartlett, is based on the extremely successful work of the same name, by Richard Bach. It is a fantasy or parable on the life of a seagull which intends to fly faster than others and which finally penetrates a perfect world. It tackles the following phenomena and occurrences in projectiology, among others: lucid projection; extraphysical helpers; successive lives; instantaneous extraphysical translocation; unimpeded volitation; extraphysical environments; sudden disappearances. The film was awarded 1 star, in a 4-star rating method that encompasses films besides routine production (Leslie Halliwell; *Film Guide*; 2nd ed.; Granada Publishing; London; 1982).

Others. Besides those already mentioned, the following films which address the phenomena of projectiology should be kept in mind: *Altered States*; *Somewhere in Time*; as well as the hundreds of other films which are more easily found in contemporary video stores.

Future. *More realistic* cinematographic productions and television mini-series are awaited, in the near future, that present less stereotyped portrayals of persons having parapsychic experiences and are artistically better on the theme of lucid projections, including electronically created images in the studio, so-called *scene simulations*. It will someday be possible to make films about lucid projection that do not look like low budget or “B” movies.

Bibliography: Targ (1651, p. 135), Wilkerson (1848, p. 39).

480. LUCID PROJECTION AND NAPHOLOGY

Definition. Naphology: the branch of science which studies, deals with and examines the phenomena and events which are said to exist or occur, but for which there is no scientific explanation, in other words, all types of natural sciences, including pseudosciences (*deviant sciences*) and diverse fields such as alchemy, astrology, cabalism, witchcraft, magic, numerology, possession, superstition and UFOlogy or *navexology*.

Synonymy: heterodox disciplines; anomalous phenomena; nebecism; parasciences.

Parasensitives. Over half a century ago, subjects that were considered by science not to be accessible to direct, common, sensory experience, such as the photon and life, were already labeled as parasensitive. Many phenomena characteristic of the parasciences are still genuinely parasensitive. This is why they require special research and scientific approaches that are different from conventional methods. It is clear that, for this reason alone, these parasciences cannot be classified as mere “occult sciences”. The phenomena that are called parapsychic exist. The processes for detecting and analyzing them, however, depend upon us and we have so far been insufficient or impotent to decipher, interpret and decode them.

Dimensions. These amorphous fields of interest and complex studies are still subject to a great deal of questioning, cover-ups and omissions of the truth, and any examination of them engenders heated controversies. Nevertheless, it is undeniable that the theory of parallel dimensions, for example, is of interest to all of them, including studies of lucid consciential projections, because of the extraphysical dimensions to which the intraphysical consciousness is projected.

UFology. Projectiological phenomena are directly or indirectly involved in many areas of life and human behavior. The nature and effects of the psychic phenomena and the psychokinetic energy investigated by parapsychology, in general, and projectiology, in particular, have a relationship mainly with UFology, or para-UFology, and the accumulation of data of one field can always be of interest to the other. This is why these subjects are addressed here.

Abductees. In the interest of speculation, the following 15 are observations and characteristics showing similarities between the experiences of projected projectors and the individuals who allege to have been kidnapped or abducted according to controverted *navexology* reports.

1. Amnesia of entire periods of extraphysical or extraterrestrial events.
2. Instantaneous translocation, including interplanetary translocation.
3. The paralysis of the kidnapping victim is reminiscent of projective catalepsy and the state of slow motion.
4. The appearance of a diversity of lights of various colors and manifestations.
5. The appearance of forms coming out from points of light.
6. The flotation of bodies or vehicles of manifestation of the consciousness.
7. Extraphysical, or non-terrestrial, locations without corners or straight lines and with curved surfaces.
8. Beings (*ufosapiens* or *ufonauts*) having appearances or forms (morphology) which are different from humans, in extraphysical contacts with helpers or extraterrestrials.
9. Beings with eyes that are larger than ordinary human eyes.
10. Telepathic dialogues with mental explanations.
11. Seeing the planet earth smaller, at a distance.
12. Loss of the exact sense of chronological time (a difference in the passage of time).
13. The time of translocation being different from the time that has passed *in the location* of the uncommon experience.
14. Expansion of the consciousness with the potentiation of elaboration of thought.
15. The intensification of parapsychic attributes or faculties.

Reports. The registering of the frequent descriptions and reports of contacts with UFOs through lucid projection should not be ignored. These are facts that speak in favor of the hypothesis that the UFOlogical phenomenon occurs in a dimension of the consciousness and does not come from other planets or the more distant confines of sidereal space. There may, nevertheless, be civilizations of intraphysical consciousnesses with technology that is capable of mastering space-time.

Questions. Among the many hypotheses or questions to be answered in the field of naphology, the following, which are of extreme interest to projectiology, should not be forgotten: What is the relationship between extraphysical helpers and the so-called *sedopianos*? Are ill extraphysical consciousnesses *manodins*? Is there a difference between the terrestrial and the extraterrestrial helper?

Progress. Despite the aforementioned hypothesis on the dimensions of the consciousness, it is worth observing that, according to more recent calculations in the area of astronomy, the physical universe is approximately 20 billion years old; our galaxy, the Milky Way, including our closest fulgurating star, the sun, is approximately 10 billion years old; and this planet, the earth, is about 5 billion years old. Our planet is, therefore, a newcomer in the universe. This leads us to suppose that many stars must exist that are billions of years older than our planet and billions of years older than our sun. Those who reflect upon the degree of progress of science on earth, in only the last century, will easily understand that the advances

which can occur in a civilization 1 billion years older than terrestrial civilization is far beyond the limits of our imagination, as 1 billion years is the same as 10 million centuries.

Projection. For evolved civilizations on older inhabited planets – the inhabitants of which have already gone through the stages which we are now beginning – the golden cord, the mentalsoma, the mentalsomatic dimension and other very enigmatic subjects of equal magnitude, which we are still unaware of in all branches of knowledge, have surely ceased to be obscure long ago. Until we achieve these extremely advanced evolutionary stages, the only thing that remains to be done is to produce projections of the consciousness from the human body in order to help scientific research and thereby endorse our theoretical suppositions and decipher our enigmas little by little.

481. LUCID PROJECTION AND THE *THETA* PHENOMENON

Definition. *Theta* phenomenon: that phenomenon which refers to survival of the personality or continuation of the consciousness after biological death or death of the human body.

Synonymy: evidence of survival of the consciousness; post-desomatic survival; *psi-theta* research; the question of immortality; the theory of continuation of the consciousness; ultralife research.

Evidence. Projection of the consciousness allows the veteran projector 4 indubitable pieces of evidence regarding the survival of his/her own *self* after the death of the human body:

1. **Vehicles.** Personal proof of the existence of the psychosoma and mentalsoma, which survive biological death or deactivation of the soma (desoma).

2. **Self-bilocation.** The phenomenon of consciential self-bilocation evidences, in a definitive, incontestable manner for the self-bilocator, the existence of his/her lucid consciousness acting without the human body, proving to him/herself, while still breathing among humans, the survival of the *self* (you) after biological death or desoma.

3. **Encounters.** Extraphysical encounters of the projector with familiar personalities that have passed through the transition of physical death of the soma prior to the projectionist.

4. **Desoma.** Observation and often direct, extraphysical, active participation of the projector in the phenomenon of the healthy desoma of another, as a desomatics assistant, through assistential consciential projections.

Motivation. In light of the facts of a personal nature, lucid projection eliminates the preoccupation with physical death and thanatophobia, the morbid fear of death or deactivation of the soma for all who are interested. This can be individually obtained by anyone, as long as that person is sufficiently motivated toward projective practices and experiences. Then, the individuals must prepare themselves (prospective, existential program, existential completism, intermissive period) to continue existing with lucidity and discernment. Suicide is the act that generates maximum frustration for any intraphysical consciousness.

Laboratory. On the other hand, lucid projection is an important area for laboratory experiments with the aim of detecting the continuation of the personality and the survival of the human consciousness after biological death or desoma.

Electroencephalogram. Brain death was previously defined in terms of the electroencephalogram, when indicating a straight line (flat or isoelectric electroencephalogram) or electrocerebral silence (ECS). Nevertheless, the EEG alone, even in ECS, is not always sufficient for defining brain death. If evidence of lucid projection were to be found, by as yet undeveloped methods, during the period in which the person has an isoelectric electroencephalogram, this will demonstrate that the consciousness is not a function of the central nervous system and continues to be active after the decomposition of the human body and, therefore, the physical brain.

Bibliography: Ashby (58, p. 5), Bayless (95, p. 148), Bord (170, p. 381), Crookall (339, p. 105), Currie (354, p. 71), Gauld (576, p. 219), Grattan-Guinness (626, p. 109), Meek (1030, p. 55), Morris (1090, p. 1), Osis (1159, p. 1), Reis (1384, p. 60), Rogo (1445, p. 50), Sherman (1551, p. 197), Thouless (1682, p. 155).

482. LUCID PROJECTION AND SUCCESSIVE INTRAPHYSICAL LIVES

Definition. Successive intraphysical lives: the form of survival in which the ego, or the consciousness, returns to human life using a body of flesh and blood, after having experienced the biological death or *desoma* of another physical body or *retrosoma*, and passing through a period of existence in the extraphysical dimension or *intermissive period*. Afterward, the extraphysical consciousness returns to human life through *resoma* and the entire *resoma-desoma-intermission cycle* recommences over centuries and millennia.

Synonymy: consciousness in series; cycle of opportunities; ECM (extracerebral memory); extracerebral memory; holoresomatics; life-death alternation; metensarcous; metensomatosis; palingenesis; plurality of corporeal lives; plurality of existences; rebirth of the personality; *resoma-desoma* alternation; seriated consciousness; space-time anchoring; successive lives; transmigration of the soul.

Revegetation. In their own way, plants, insects and subhuman animals also undergo *resoma*. In botany, *revegetation* occurs. Insects, without *flesh* as we understand it, also go through *reinsectization*. Successive intraphysical lives reach intelligent or consciential principles at all of their levels and evolutionary states.

Reasons. The knowledge or, better still, the acceptance of the theory of successive intraphysical lives, which currently reaches half of the terrestrial population, besides bringing profound implications for human beings, alters their general philosophy, eliminates all racial prejudice, nationalist passion and sexual chauvinism. The innermost knowledge of prior, personal intraphysical existences sometimes becomes of vital necessity, because in these lie the origins of egokarmic and groupkarmic problems and the root of many illnesses which currently afflict certain persons. This thereby gives rise to past life therapy, or reincarnationist therapy.

Research. Besides the spontaneous emergence of memories of previous lives which are intimately connected to the internal evolution of the social being, of recurring nightmares, hypnotic pre-natal regression, deep meditation, special massage techniques and other intraconsciential processes and postures, lucid projection is an efficient research method for individual access by the intraphysical consciousness to his/her past or previous existences through the holomemory and projective or extraphysical self-retrocognitions.

Survival. Existential seriation – or seriality of the lives of the consciousness – is proof of the survival of the ego after the deactivation of the human body, or *desoma*, the future of the being, through recollection of *past experiences*. Lucid projection is proof of the same survival, through the interdimensional recall of *current experiences*. The implication of the time factor and the action of the mechanisms of memory occur in both cases.

Phenomena. Among the 3 consciential states, the intraphysical state and the projected state are, strictly speaking, projections that stem from the extraphysical state of the extraphysical

consciousness, in our current evolutionary level of relative multidimensional self-awareness. Conclusion: existential seriation or seriality of consciencial lives are nothing more, in the final analysis, than a projectiological phenomenon or, in other words, a less fleeting projection of the consciousness that nowadays lasts 7 decades on average, according to human chronology.

Processes. Personal existential seriations can be researched by the projected intraphysical consciousness through extraphysical recall or retrocognition, sometimes induced by an extraphysical helper, or psychometrically executed in the paratropospheric dimension. There are, however, those intraphysical consciousnesses who are anxious to know about their previous intraphysical lives, when they were accomplished personalities, because they are currently not realizing what they should. This is a reaction of parapsychic compensation.

Laws. The facts indicate that, for any of the existing methods for recalling past lives, there is a sequence – which is non-random, but controlled by as yet unknown laws or agents – for any multi-secular recollection, whether just a single existence or a series of successive existences.

Key factors. Certain key factors always remain hidden until the consciousness learns the lessons of previous intraphysical lives which have already been recalled.

Conclusion. The memories which have occurred are like an elucidative conclusion and are advantageous for the evolution of the consciousness, intensifying the sense of responsibility for the individual regarding the personal multiexistential cycle.

Autobiography. On certain occasions, a consciousness (intraphysical or extraphysical) looks for a personality in the extraphysical dimension and never encounters it. It was that person itself. The authentic multiexistential identification of a figure which was well-known in the past is more difficult to admit publicly. It is sometimes better to keep the discovery a secret. Since the past cannot be changed, why then worry about the fact, creating problems for yourself? The best option is for someone to participate by providing answers in programs such as *O Céu é o Limite* (*The Sky is the Limit*, a Brazilian TV show), obviously using his/her pre-resomatic autobiography or personal holobiography.

Purpose. The main purpose of the lucid projection of the intraphysical being is the gradual elimination of the need for the consciousness to undergo resoma, thus freeing it from the cycles of successive intraphysical lives. The *anti-existential-seriation function* of lucid projection makes it the liberator from the cycle of rebirths and *redeaths* or resomas and desomas.

Senility. The process of aging, arteriosclerosis or human senility is a teleological part of the mechanisms of successive intraphysical lives. When the intraphysical consciousness, in the final part of intraphysical existence, has to prepare to return to his/her extraphysical origin (extraphysical hometown), he/she begins to insistently and fixedly recall – due to the biological alterations imposed by the passage of time and the use of the human body – his/her experiences from infancy and youth, those companions and beings who have preceded him/her to the grave or crematorium and who he/she will inevitably soon reencounter under the injunctions of the law and groupkarmic interprison. It is from this that pathological unconscious evocations are born.

Disappearance. Existential seriation, as an evolutionary process, gradually disappears on its own, on each planet, through lucid projection. The average inhabitants – beginning with the *irruption of the psychosoma* in human life – continue to make the surrounding extraphysical dimension more and more similar to, and intimately identify with, the physical dimension, and this, in turn, with the extraphysical dimension, such that one gradually absorbs the other. This makes successive intraphysical lives lose their *raison d'être*. At this point, the average of the inhabitants of the planet will have already reached the 7th stage in the scale of the state of continuous consciousness. This is the case from a collective point of view because, with regard to the individual consciousness, evolution can be performed through more advanced stages faster than the average of the planetary population through *petifreeness*, *evolutiology* and *serenology*.

Formula. The formula of the endless evolution of the perfectible consciousness, through the chain of existential seriation, is expressed by the individual, consciencial condition, in relation to the human body through time or, in other words, through the following 5 steps:

1. *Day before yesterday*: worse.
2. *Yesterday*: bad.
3. *Today*: good.
4. *Tomorrow*: better.
5. *Day after tomorrow*: very good.

Types. Strictly speaking, the existential seriations of consciousnesses on planet earth are not equal. In fact, there are 2 basic types of human existence here within the *democracy of consciential evolution*: fixed and alternant.

1. **Fixed.** The first type of intraphysical life – fixed or ordinary – is the singular, dense, immutable type, which is only interspersed with 8 hours of sleep and 16 hours of usable wakefulness, on average, every day.

2. **Alternant.** The second type of intraphysical life – alternant, diversified and enriched – is the union of two simultaneous, interwoven, alternating lives, which are consecutive, one in the ordinary, physical waking state and the other with the intraphysical consciousness projected with lucidity in the extraphysical dimensions.

Percentage. In the second type, the human lifetime is lived with one third more waking chronological time and evolutionary opportunities than the first type, and is currently still not achieved by even 1% of intraphysical humanity living on this planet.

Interest. However, it is noted in the extraphysical dimensions that the time has come to increase the percentage of the second type of existence among human beings on earth. This is the reason for the accentuated increase of interest in lucid consciential projections observed in the environments of intraphysical crustal life, as much as in the environments of extraphysical life (paratroposphere).

Groups. According to this hypothesis (without any concern regarding elitism) of successive, alternant intraphysical and extraphysical lives – which endeavors to support a convergence of evidence – it is considered that intraphysical consciousnesses can be classified into 5 groups:

Group 1. All of terrestrial humanity, or 100% of the population, for example, currently 6 billion persons throughout earth, in theory, have *nonlucid* consciential projections every night.

Group 2. Approximately 20% of this same humanity, or 1.2 billion persons, have *semilucid* consciential projections.

Group 3. Approximately 1%, or 60 million persons, have *conscious* or totally lucid consciential projections.

Group 4. A minimal percentage, perhaps one thousandth, it is supposed, or 60 thousand persons, spread throughout all continents and countries, may already be composed of *alternant* intraphysical beings.

Group 5. A high percentage, perhaps the majority of the 80% or the 4.8 billion persons who only conscientially project in an unconscious manner, seem to have undergone *resoma* without passing through a full second *desoma*, thereby living with the remains of the silver cord or the (denser) energetic parabody of the previous human life (last *retrosoma*), in a *condition of being more tightly locked* within the human body. This logically explains the high rate of nonlucid consciential projections and the condition of generalized somnambulism of current terrestrial humanity in regard to the extraphysical world or multidimensionality.

Organicism. In the research fields of biology and medicine, in general, and anatomy and physiology, in particular, nothing was found to evidence the existence of *anchored and alternant* persons, and *free and locked* persons, because the scope and capacity of the operation of these fields of science remain exclusively restricted to the organicist, human, cerebral, psychic or intracerebral scope of personalities. In order to detect these conditions, it is urged that the energetic parabody or holochakra, and the psychosoma be researched parapsychically, beyond the human body. It is therefore hoped that parabiology, paramedicine, para-anatomy and paraphysiology will consider these and many other advanced themes in a timely manner. The concept of the so-called *bioplasmic body*, presented as a *discovery* in the former Soviet Union, still does not transcend the limits of organic matter. We await the future, while continuing to research.

Chart. In a summary-chart of the percentages and classifications of individuals, their consciencial projections and lifetimes on this planet today (fig. 482), it can be seen that: in population group 5 – included within the percentage of group 4 – are those individuals who are definitely interested in projectiology; in population group 4 – within percentage group 3 – adolescents and youths are included who spontaneously left the human body with a degree of lucidity during a certain period and later forgot about the matter, being pressured by the demands of human life; in population group 3, persons are found who experienced lucid dreams; in population group 2 is the assembly of those intraphysical consciences in general who are completely indifferent or, more to the point, unaware of the themes of consciencial projection.

Consanguineous. *Consanguineous lifetimes* can predispose animic-parapsychic phenomena between individuals, including auric coupling, joint lucid projection and others. For example: one of two unmarried sisters, who are very close, undergo desoma while still young. The surviving sister, after marrying, receives the extraphysical consciousness of the extraphysical sister, which is going through resoma, as her daughter (consanguineous lifetime) and both of them, now mother and daughter, present a mutual disposition or greater capacity for producing the phenomenon of auric coupling and lucidly projecting together.

Career. With the passage of time, the animist-sensitive, the philosopher, the artist, the scientist, the businessperson and the politician create evolutionary experiences of egokarmic and groupkarmic multiexistential careers that are linked in succession by many existences and groups of consciences. In the recent and new soma, the intraphysical consciousness hides from the intruders of his/her past which, in turn, end up taking on other new bodies. In certain cases, however, the responsible knowledge of a previous intraphysical life helps to enhance the current human life. Hence the value of self-retrorecognitions, when they are healthy.

Herd. While the consciousness still finds itself stuck in the groove of consanguineous lifetimes, co-racial lifetimes and intergroupkarmic lifetimes (interprisons), its polykarmic account is found to be poor, tainted by narrow sectarianism, factiousness, nationalism or the egoism of the herd, lacking greater and open horizons of pure, universalistic or cosmic megafaternity for the development of its actions. This is the condition of the *lesser mega-ego* (infantile egocentrism) within the *greater mega-ego* (stratified adult egoism).

Glimpse. Depending upon the intraphysical consciousness, he/she can, while still in the final phase of this human existence, begin to glimpse the outlines of the next intraphysical life. This even includes the approximate length of his/her intermissive period, the environment in which he/she will live, the probable location of the future resoma and the basic conditions of the new terrestrial stage, including the directives and bases of the existential program.

Prospectives. This can be forecast by the intraphysical consciousness without resorting to precognitions or futurological calculations, but simply through deductions of logical perspectives, when consciously projected in the extraphysical dimension, or even in the ordinary, physical waking state.

Self-intrusions. We currently constantly and irresistibly follow in the same exact footsteps (self-thosenic signatures, self-relays) of other previous intraphysical lives. The most subtle self-intrusions are those which are composed of spontaneous retrorecognitions that surface in the memory precisely in the period of the epilogs of groupkarmic rescues, on the eve of final settlements in the closing of accounts.

Identities. The consciences of the karmic group are the same, presenting themselves in other somas, other clothing and other physical identities, having the same familiar tendencies, somewhat improved, faced with the consequences of the role they played in the dramas, which are about to be interred, thereby ascending each step within the multidimensional cycle in the scale of evolution. In 1 century, 5 centuries or 8 centuries, the actors are the same, the roles are similar, on average improving minimally, little by little.

Reencounters. Existential seriation promotes – everywhere, anytime, with all those who appear and cross our path – inter-secular, inter-racial, international, inter-social, inter-sexual, intertendentious reencounters.

PERSONS vs. CONSCIENTIAL PROJECTIONS vs. HUMAN RESOMAS

Population Groups	Percentages (%)	Terrestrial Humanity (1998)	Consciential Projections	Human Resomas
1 (Total)	100 %	6,000,000,000 Persons	All types	All types
2	80 %	4,800,000,000 Persons	Nonlucid	Anchored and Locked
3	20 %	1,200,000,000 Persons	Semilucid, Lucid and Continuous	Semi-anchored, Free and Alternant
4	1 %	60,000,000 Persons	Lucid and Continuous	Free and Alternant
5	0,001 %	60,000 Persons	Continuous	Alternant

Figure 482

Synchronicities. This is because the coincidences are simple multiexistential effects that, because of our ignorance, mask the compulsory, inevitable, omnipresent and uninterrupted synchronicities. That which we do not understand today, at the precise moment of the liquidation of the groupkarmic account, each one of us will know in detail through the reflexes of the integral memory.

Acts. The acts in which the ego shows itself to be good, comprehensive, forgiving, cooperative, attentive and cosmoethical signify the facilitation of *credit* in the liquidation of holokarmic debts, generating more prolonged *farewells* between the *interdebtors* (interprisoners). These epilogues of evolutionary stages involve extraphysical interplanetary transmigrations.

Earth. The sharp differences between the dimensions – the human and the extraphysical – for those consciousnesses on earth, clearly demonstrate the evolutionary delay in which we still live here, which is clamoring for understanding and the practical application of the principles and techniques of lucid consciencial projection. Real life, for all of us, is in the intermissive period.

Path. All indications are that if the intraphysical or extraphysical consciousness, on earth, wishes to definitively free him/herself from the cycle of intraphysical/intermissive lives, he/she should first of all concern him/herself with the understanding and intense practice of assistential service in favor of other consciousnesses through lucid projections. There does not seem to be another shorter evolutionary route or a more practical and immediate solution in sight.

Near-death. The near-death experience (NDE) – in which the intraphysical consciousness extraordinarily *revives* (never dies) in his/her own human body – should not be confused with the theory of successive intraphysical lives, in which the extraphysical consciousness revives and expresses itself on earth, in another *human body*, whether occurring through biological human conception and rebirth, or even, according to the controversial theory, definitively borrowing from another consciousness that is at an adult physical age, in the hypothesis of consciencial relay or walk-ins.

Capsule. The act of assembling a panorama of human lucid projection to date, with this large volume, implies the intention of the author to achieve continuity of this well-intentioned analysis in the next personal intraphysical life. This public confession registers, in a multiexistential, anticipated evocation, the desire to encounter this book – or what is left of it as a cohesive, coherent set of ideas with a philosophical, scientific and rational beginning, middle and end – operating like a *time capsule* for individual use somewhere on this earth in the near future. Codes of names and numbers inserted in the text – post-hypnotic autosuggestions – will predispose the recall, subsequent identification and avoidance of any attempt at usurpation of authorship, also post-desomatic, which would be discouraging, in this case.

Research. The author thus launches the human, intraphysical and holokarmic foundations of the relay of simultaneous, personal research of projectiology and successive lives, through more than 1 human body of the consciousness. In this way, the prospection and confirmation of the theory of successive lives is sought for that selfsame person, within that individual, always in the ordinary, physical waking state. Two different questions are posed here: Is this research mere inconsequential pretense on the part of the author? Is all this work compulsory, already coming from the past? We shall see.

Departure. On the ascensional itinerary (route) of departure and return of consciencial evolution, the rudimentary consciencial principle – initially (path of departure in the evolutionary spiral) impelled only by brute, unconscious, instinctive egoism – is removed from *polykarma*. For example: the unity in the ovary of fish. Next, the consciousness proceeds, stuck, up until *groupkarma*. For example: the subhuman *group-soul*. It next arrives, unconsciously, at *egokarma* (dependent individualization) with a sectarian egoistic mentality. For example: the guardian of dogmas, the ideological patroller of orthodoxy (ultra-orthodoxy, fundamentalism), the prisoner of personal belief systems (religious, philosophical, political), the executor of consolation (consolation task).

Return. From this, the consciencial principle travels back along the evolutionary spiral. Now moved by the conscious altruism of pure megafaternity, it leaves *egokarma* in a secondary position, detoxifying itself from egoism or from itself (*inflated ego, mega-ego*). It balances itself in a just

relationship with its *groupkarma*. For example: the evolutionary team (groupality). From here, it finally returns to its origins, *polykarma*. Then, entirely aware of the holokarmic process, it has the refined notion of interdependence or ample free will, with a mentality which is cleansed, completely altruistic (full independent individualization) or universalistic. For example: the individual who seeks consciential maturity, the person who follows personal altruistic principles and not doctrines (leashes of the ego), the executor of clarification (clarification task).

Fingerprints. It seems that the element which would best prove the theory of successive lives is the matching of the fingerprints of 2 beings who were reborn in different periods. There are difficulties in researching this hypothesis. It is first necessary to know if it is possible. If the fingerprints are the same in two intraphysical lives of the consciousness, this fact will prove that they come from the psychosoma. And the laws of genetics, in this case? Dactyloscopy, as a science, only really came into effect after 1890. Thus, this research must necessarily encompass only those human lives from that date until the present, a period in which it is presumed that dactyloscopic registers exist in the archives of some countries. Fingerprints can prove the phenomena of physical bilocation, but this is another matter.

Animals. According to that which can be deduced from the facts observed so far, rebirth or successive lives *seem to occur* exclusively within the same evolutionary species until the consciential principle evolutionarily surmounts it and moves on to another more evolved species, whether on this or another planet. This is why the veteran lucid projector encounters extraphysical animal consciousnesses in the extraphysical dimension – evolutionarily inferior to the level of the human consciousness – which have not been reborn on this planet. This promotes the supposition that many of the beings that represent species in extinction on earth – so strongly defended by ecologists today – may continue their multiexistential evolutionary cycles on other planets throughout the cosmos. There may be planets inhabited only by dinosaurs, for example, and others having animal populations with a much greater variety – intraconsciential forms and levels – than on earth.

Theory. Lucid projection experiments and the experience of extraphysical retrocognitions allow the lucid intraphysical being to research and apply the theory of multiexistential analysis in his/her own existence. In this way, his/her personal identity in this human life is characterized in comparison with him/herself in another, previous intraphysical life, whether it is the previous life, or one or more less recent lives (holomemory, retrosomas, paragenetics). In this way, the individual can enumerate, with extreme self-critique, his/her improvements and evolutionary progress, as well as his/her failures and apparent consciential regressions.

Facets. Through the theory of multiexistential analysis, the individual can endeavor to compare personalities, the similarities between their experiences, exact identifications, inner progress, evident egokarmic indemnification and real or apparent regressions. In this way, at least 10 personal facets of each human period are observed: physical constitution; temperament; human life; scholarship; personal style; religion and religiosity; parapsychism; science and occupation; personal interests and research; and activity in the holokarmic account.

Analyses. In light of the presented theory, after listing over one hundred aspects in the comparison of personalities, the researcher generally arrives at a minimum of 7 analytical observations:

1. **Surmounting.** At a certain point, the consciousness begins to concern itself with surmounting its pluri-secular insufficiencies, in existential seriation or interlinked intraphysical lives, consecutive tasks that continue from one human life to another (consciential self-relays).

2. **Indemnifications.** The appearance of “intraconsciential progress”, after the interference of “past causes”, characterizes the condition of “evident indemnifications”.

3. **Immunization.** The person is immune to public opinion, because he/she may constantly hear or read those who praise and those who criticize, with sensibleness or passion, about that which he/she did, neglected to do (deficit-producing omissions), or affirmed in another life, sometimes not in the last life, but the next to the last or the second to the last.

4. **Para-hypocrisy.** After the establishment of incontrovertible evidence, it becomes necessary to take care regarding acts of para-hypocrisy.

5. **Policy.** The consciousness which is awake to its evolutionary, consciential policy, in the current intraphysical life, not only needs to return to grow evolutionarily, but should ensure that this growth does not repeat distortions (dispensable self-mimicries) which occurred in the past. It will then incorporate the teachings and new conceptions that the previous experience bequeathed it. The consciousness should consider itself as being in frank development, in a singular situation of pluriexistential self-knowledge, enjoying a maximal degree of consciential autonomy – or self-aware free will – without limiting itself to stratifying doctrines, outdated formulas, sectarian principles, parties or factiousness and stagnating conventions, making better use of its intraconsciential paragenetic potential, without excessive dependence upon human or animal life.

6. **Incoherence.** A disparity of points of view, opinions, principles and types of approach can occur in relation to the current ideas or thoughts of the same personality in two human lives. If there is an improvement in this disparity, an apparent incoherence then occurs or, in other words, a positive change. In this case, the consciousness corrects its own mistakes, critiquing itself and combating its past in a critical intraphysical life. It often *unteaches that which it prescribed* to its evolutionary companions, among the millions of consciousnesses of its karmic group, shouldering all the frustrations that this causes, the more self-aware it is of past facts.

7. **Maturity.** The conquest of consciential maturity becomes extremely relevant in regard to the cycle of successive, individual, intraphysical and intermissive existences. For example: in theory, a consciousness can perform the same human clarification task, in 5 short human lives, each having a maximum of 35 years of human existence – because it will mature more quickly – with very short intermissive periods of 1 lustrum or 5 years at most, in 5 different existential periods, in 5 different countries, situated in 5 different continents, in a total period of only 2 centuries. In this case, the consciousness itself plays the role of “the yeast that leavens the bread” with its coherent ideas and edifications interconnected in diverse locations, periods, peoples, customs, languages and conditions. Is it possible that someone on this planet is already utilizing this scheme, which is so simple and yet so complex? This is another research hypothesis regarding successive intraphysical lives.

Cord. The following is a theory for analysis. There are still 2 types of successive lives, with regard to the action of the silver cord: more evolved and less evolved.

Second. The first type: the more evolved lifetime of a streamlined extraphysical consciousness that has passed through the second desoma or, in other words, that has already discarded the remainder of its silver cord from the previous human life, or the last, most recent life.

First. Second type: the less evolved lifetime, of an extraphysical consciousness that has only passed through the first desoma or, in other words, that has lost only the human body, but still has the *base* of the silver cord, or the remainder of the energetic connections that linked it to the previously developed human body (retrosoma), or even the fetal body, and which began to decay. Many *subintrans* human lives of the same consciousness or, in other words, those having very rapid or short intermissive periods, through abortions which may or may not be pathological but are successive, for example, are included in this second type.

Third. The consciousnesses that have passed through the third desoma, or that have already discarded the psychosoma, no longer undergo resoma and are free consciousnesses (FCs).

Root. It can thereby rationally be concluded that the root or the basic connection of the silver cord in the psychosoma can continue acting in more than 1 intraphysical period of the same consciousness. This signifies that the principles that operate in the creation, formation and development of the silver cord are not as rigid as they seem at first sight.

Locking. The theory of successive lives of the less evolved type, referred to here, rationally explains the occurrence of many cases of intraphysical consciousnesses who are excessively *locked* in their human bodies or, in other words, who live in a more rigorous state of coincidence of their consciential vehicles of manifestation. They are generally found to be more materialized – or *physicalized* – as they have an older silver cord that acts more strongly as a physical anchor or, in other words: because they have a laden psychosoma or one which is denser, even before they are reborn.

These intraphysical consciousnesses tend to have more semilucid projections because they project with the dense, laden psychosoma in paratropospheric environments.

Looseness. On the other hand, it can logically be deduced that the consciousness which went through the more evolved type of resoma is precisely the one that is predisposed to have a loose holochakra or, in other words, a *slippery* psychosoma, because it has a *recently acquired* silver cord. This is the intraphysical being who is more predisposed to lucid and impactful projections.

Excommunication. One of the high points of modern human life is the intensification, as never before in the past, of communication between individuals which can thereby *provide incessant inter-assistance*. For this reason, when the elements of contemporary intraphysical society prefer to close themselves up in a shell-like type of egoism, with little desire for communicating with others; occupying themselves only with themselves; maintaining isolation and a constant narcissistic image, wherein the ego is most relevant in first, second and third place; dialoging less and less with others; avoiding the personal bonds of friendship; living more and more as adepts of instruments (*electronic hermits*) or, in other words, computers, telex, telephone, fax, radio and television, which generates *excommunication*; intraphysical life, for them, substantially loses its use as an evolutionary resource. This is the condition of egolatry (the “me” cult) and of the human robotization in its worst states. The Internet is great, but the internaut (or *netizen*) should not forget the skin-to-skin, pore-to-pore and chakra-to-chakra condition of proxemics. Nowadays, so-called *netizen depression* is discussed and even treated.

Self-critiques. There are consciousnesses that undergo rebirth with the exclusive purpose of correcting their ideological or doctrinaire errors from a previous human life, combating their own past, which is sometimes recent. This signifies scrutinizing themselves (para-self-critique) or, in other words, proceeding with multiexistential, holomnemonic and holo-autobiographical self-critiques through human acts, correcting their own direction and the destiny of those consciousnesses which they helped to push onto ideological sidetracks and evolutionarily stagnating ways.

Improvvidence. There are intraphysical consciousnesses who waste their human life like an unconscious cultivator. Those who dedicate themselves to work, using only vulgar, popular knowledge, or common sense, which is transmitted from generation to generation, through informal education, without the application of a method or technique, base themselves only upon imitation and personal experience. Lacking scientific knowledge, the imprudent peasant does not improve the plantations or dynamize personal progress as a consciousness.

Popular. On the one hand, popular knowledge is *sensitive* or, in other words, refers to personal experiences, and is *subjective*, because the consciousness itself organizes its own experiences. On the other hand, it is predominantly *superficial*, or conforms to appearances; is *unsystematic*, not using a systematization of ideas; and is *noncritiquing*, not manifesting in a self-critiquing and heterocritiquing manner.

Repetitions. It is well-known, for example, that the repeated cultivation of the same type of plantation every year in the same location exhausts the soil. It likewise occurs with the consciousness in repetitive or self-mimetic existential seriations with undesirable, unnecessary and already dispensable self-relays.

Renovation. The use of projectiology techniques, through appropriate training, permits the simultaneous use of personal knowledge, paragenetics (innate ideas), in that which is worthwhile and efficient, as well as rational self-knowledge through scientific procedures. These have the purpose of explaining *why* and *how* the phenomena of existential seriation occur, in the attempt to evidence the correlated synchronous facts (holokarma), in a more global, multiexistential, personal, retrocognitive vision. This renovates and accelerates the evolutionary progress of the consciousness.

Desomatics. One of the more recent uses of resoma has been seen in the last few decades, namely avoidance of the premature desoma of an intraphysical consciousness. For example, that mother, together with her husband who gives birth to a younger child, who will be the only chance for the oldest daughter, suffering from leukemia, to continue to live intraphysically. The only hope for the 18-year-old leukemic youth is to be the recipient of a bone marrow transplant.

Bioethics. The donator-baby is conceived, in this case, with this primordial purpose: to be a donor. The total compatibility of the marrow, which is extremely rare between biologically unrelated individuals, is greater between siblings, but even so, the probability is one in four. The new child is an intentionally *fabricated* organ bank. Up to what point is this arrangement within the principles of bioethics or cosmoethics?

483. EXISTENTIAL SERIES

Definition. Existential series: the condition of continuous alternation of one period of life after desoma (extraphysiology) and one period of life after resoma (intrapysiology) comprising the incessant evolutionary itinerary of the consciousness until it frees itself from the compulsory cycle of intraphysical rebirths.

Synonymy: Abred circle (Druidism); human life-desoma alternation; intermission-resoma binomial; *multiexistential cycle*.

Intermission. There are 3 consciential states: the desoma state, the resoma state and the projected state. The desoma state *reterminates* with resoma and *recommences* with desoma. The interval existing between one human life and another constitutes the intermissive period or the intermission.

Holokarma. The karmic accounts, or the relationship of the consciousness with the law of cause and effect or action and reaction, can be classified into 3 basic types:

1. The account of the individual or egokarma (inner life).
2. The group account (resoma group) or groupkarma (private life).
3. The collective account or polykarma (public life).

Predominance. The predominance of 1 type of karmic account over the other 2 has a powerful influence in the category and compulsoriness of the existential series of the consciousness.

Criteria. The facts indicate that various criteria are used in the implantation of the seriality of intraphysical existences, according to the characteristics of the evolutionary level of each consciousness, which is in constant progress. Any generalization on this point will be erroneous. Each case needs to be analyzed in detail, separately. In theory, human calendars have little influence upon the criteria that regulate the multiexistential cycles.

Choices. The more evolved the consciousness, the greater its scope of free will and the broader its range of existential choices. Within the criteria that establish the existential series, the following 4 can be singled out as initial working hypotheses:

1. **Groupkarmality.** The criterion applied according to the expression of the group karmic account (groupkarma) of the consciousness, with its group karmic debt being greater than its personal karmic debt. In this case, the length of its human life and the length of its intermissive period depend, over a long evolutionary period, upon its karmic debts and the cycle of the components of its evolutionary group. A great number of consanguineous human lives are included in this criterion; the consciousnesses

possessing a level of individualization that is still very restricted; the participants of group suicides (more than one suicide).

Groupkarma. In the criterion of pure karmality (groupkarma), 2 groups of groupkarmic accounts are distinguished: firstly, the one related to the consciential principles (consciousnesses) that are of a similar or identical evolutionary level (legal consanguineous family); and secondly, the one related to evolutionarily inferior levels of consciential principles (beings of the reborn individual's para-ecosystem, including viruses, bacteria, germs, worms).

2. **Complementarity.** The criterion applied, for example, to the consciousness that either directly (conscious) or indirectly (unconscious), whether at once or slowly, committed individual suicide (egokarma), and went through resoma immediately, as soon as possible, in order to complement the final period it did not live out in intraphysical life. The consciousness of the suicide tends to reduce the experiences of its intermissive periods over an extended period along its evolutionary way. Suicide is one of the factors having the greatest influence upon direct changes of the criteria that operate in the existential series. Another case of complementarity is death provoked by dementia due to an impacted molar (wisdom tooth), for example.

3. **Activity.** The criterion is applied according to the demands of the pluriexistential activities of the extraphysical consciousness that is evolutionarily above average. The periods of human life vary as greatly as the intermissive periods, in this case, and are independent from each other. Nevertheless, in this case, the unwavering tendency arises for the intermissive periods to become increasingly dilated, which is understandable. The consciousness' life of human leadership sometimes requires direct extraphysical assistance or post-desomatic work in the intermissive period for an extended period (polykarmality).

4. **Equality.** The criterion applied to average consciousnesses that are still very tropospheric in their tendencies, having a personal karmic debt (egokarma) greater than their group karmic debt (groupkarma). It is based on the duration of human life, where the intraphysical life is equal to the intermission or, in other words: human life = intermission. If the consciousness, for example, lived on earth for 7 decades, it will have the equivalent of a 7-decade inter-resomatic period ahead. And so it goes.

Lucidity. Consciential lucidity or, in other words, the level of awareness of the ego in relation to the reality of its series of personal existences, can be composed of 3 conditions:

1. **Unconsciousness.** In the condition of unconsciousness regarding its own existential series, the criteria of karmality and complementarity are included.

2. **Self-awareness.** In the condition of self-awareness regarding its own existential series, the criterion of activity is inserted.

3. **Ambivalence.** In the condition of consciential ambivalence or, in other words, unawareness or self-awareness (cognition) regarding its own existential series, the criterion of equality is involved.

Application. One of the practical applications of knowledge of the existential series can already be identified here: if there are many consciousnesses on this earth (the overwhelming majority) which have still not liberated themselves from their existential series, there already exists a good number of these same consciousnesses which are able to change the criterion regarding the series of their existences through their current human life. From this arises the importance of the conscious life of the intraphysical consciousness currently in development on this planet. In summary: to be free of the cycle of resomas from one moment to the next is impracticable, but to alter the criterion of the multiexistential cycles of the upcoming intraphysical lives for the better is practicable for many resonant consciousnesses.

Models. Let us observe the logic, rationality and discernment of the framework shown here regarding the existential series. If you do not agree, find it very simplistic, or still very lacking regarding certain details of the structure of consciential evolution, endeavor to compile another model that better addresses the existential series. In this way you will actually be cooperating with the projectological and even philosophical research in progress, and its practical and even cosmoethical consequences.

484. PROJECTION WITH CONTINUOUS SELF-AWARENESS

Definition. Projection with continuous self-awareness: the experiment in which the intraphysical consciousness maintains uninterrupted lucidity at all times, with prolongation of the waking state through sleep, from takeoff until interiorization and return to the ordinary, physical waking state.

Synonymy: conscial projection without blackout; projection of continuous wakefulness; self-awareness in 2 worlds; waking conscial projection.

Rarity. Projection with continuous self-awareness from beginning to end of the experiment has, as its essential characteristic, an absence of any blackout or interruption in continuity of intact wakefulness, the projector maintaining self-awareness in two or more dimensions. This is a rare and extremely impactful experience for the intraphysical consciousness.

Conditions. The projection with continuous self-awareness generally occurs in psychophysical conditions which are ideal for the projector, after sleeping many hours, in the early morning, at a time when the environment is propitious for the experiment. It more commonly occurs spontaneously, in the bedroom where the human body is located. However, it can be provoked and becomes easier to repeat after a few experiences.

Takeoff. The high point of the projection with continuous self-awareness is in the entirely lucid takeoff, the most difficult stage for the projector to obtain, when the consciousness (you) perceive slowly, in detail, in an incontestable and definitive manner, the sensations of the dichotomy of the forces of the silver cord. The greater part of the cord retracts to the human body and the lesser part goes along with the projected intraphysical consciousness.

Sensations. Besides the dichotomy of the energies of the silver cord, the individual perceives intracranial sounds that are generally mild and provoked by the energies of exteriorization. This occurs in a joint action of the partially exteriorized silver cord and the extraphysical head of the psychosoma which exteriorizes itself, as well as the impressive condition of lightness acquired in a lightning-fast manner by the consciousness that escapes the perceptively heavy chains of the human body and the indescribable state, beyond weightlessness and immateriality. The projector has an inner, firsthand, absolute certainty of the unmistakable difference between one inferior condition and another evolved condition.

Step. The *projection* with continuous self-awareness is the first individual and inevitable step for the intraphysical consciousness toward achieving the *state* of continuous self-awareness.

Hypnagogy. In the major projection with continuous self-awareness, the natural conscial states of hypnagogy and hypnopompy cease to exist, without any negative consequence occurring for the intraphysical projector.

485. STATE OF CONTINUOUS SELF-AWARENESS

Definition. State of continuous self-awareness: the extremely rare condition of the intraphysical consciousness, or extraphysical consciousness, which has achieved continuity of absolute, lucid awareness during the entire period of biological as well as integral conscial life, in the passage of chronological time as we understand it, or in the state of “immortality” of self-discernment.

Synonymy: conscial *continuum*; continuity of awareness; continuous wakefulness; etheric bridge; mental *continuum*; projective *continuum*; psychophysiological ascesis; state of permanent alertness; unification of self-awareness; uninterrupted awareness; uninterrupted wakefulness.

Steps. The awareness and full application of the resources of lucid projection constitute an advanced conquest in the evolution of terrestrial humanity. The human being currently endeavors to overcome 10 distinct steps in his/her development, in random order:

1. *Homo sapiens*, a type of being endowed with reason and astuteness.
2. *Homo loquax*, the animal with a human body, which speaks, reads and writes.
3. *Homo habilis*, which invents manufactured products.
4. *Homo faber*, which makes and uses tools, developing the resources of technology.
5. *Homo economicus*, the proprietor or owner of assets and merchandise.
6. *Homo informaticus*, which recognizes the need to learn and the need to teach through interconsciential communication.
7. *Homo maniacus*, which is impassioned and becomes fanatic, when still dominated by the parable of desires and the emotions, or the psychosoma.
8. *Homo humanus*, which acquired the sentiments of compassion, a humanitarian sense, the idea of abnegation and justified cosmoethical self-renunciation.
9. *Homo psychicus*, which is anxious to amplify its own self-awareness.
10. *Homo sapiens cosmicus*, which begins to explore the physical universe through astronautics.

Projectius. The human being now achieves the status of *Homo projectius*, that in which he/she is able to be temporarily liberated from physical life, producing the projection of the lucid consciousness from the rustic body of blood, skin and bones in a voluntary manner, or merely through the exercise of his/her own will.

Percentage. Currently, on this planet, the majority of intraphysical beings – even those who produce consciential projections with lucidity – do not even recall an average of 20% of their extraphysical experiences. The ideas and events which are acquired and experienced in projections gradually blossom later in the ordinary, physical waking state through the channels of common intuition.

Panoramic. According to the theory offered here for research, the state of continuous self-awareness, at an advanced level, provides a simultaneous panoramic perception of all existential dimensions, regardless of where the consciousness may be temporarily headquartered.

Future. In the future, lucid projection, by virtue of its natural manifestations, will tend to substitute the human being's sleep state, until attaining the condition of continuous self-awareness, thereby discarding both day and night, in an existence with no break in continuity. This will bring a concomitant expansion of attributes of the mentalsoma, in a phase of evolution which humanity is destined to inevitably achieve, as a natural acquisition, over the millennia.

Characteristics. The initial high point of projection with continuous self-awareness is in the spontaneous elimination of recollection on the part of the lucid projector. This more advanced period of the consciousness has its beginning in the experience of ordinary lucid projection, subsequently passing through an ascending scale with various basic stages. The condition of continuous self-awareness allows the consciousness to participate in the team of awakened lucid projectors and represents the main superior activity, which is common to all intraphysical and extraphysical beings.

Examples. The following are historic examples of personalities who are presumed to have constructed the bridge between the physically awake consciousness and the sleeping consciousness or, in other words, sampling the condition of continuous self-awareness, in special, specific periods of their intraphysical existences: Gautama Buddha, Jesus of Nazareth, Emanuel Swedenborg, Mohandas Karamchand Gandhi (1869-1948), Ramana Maharshi (1879-1950).

Yoga. The state of continuous self-awareness – or the suppression of consciential discontinuity – is the highest goal of yoga, in all of its modalities, through the unification of 4 types of awareness:

1. Ordinary or diurnal waking awareness.
2. The state of sleep with dreams.
3. Sleep without dreams.
4. Cataleptic awareness.

Level. The state of continuous self-awareness is still at a very rudimentary level on earth. However, it is worth asking the following question: Have some of the so-called extraterrestrial beings, of as yet unconfirmed existence, already mastered the condition of continuous self-awareness?

Age. At what physical age can the consciousness already initiate its state or condition of continuous self-awareness in human life: from infancy, in youth or only in full biological maturity?

Asomnia. To what degree is asomnia, or the capacity of unknown etiology that allows the sensitive to control natural, physiological or delta sleep – to the point of annulling the need for this state over a prolonged period – related to the state of continuous self-awareness?

486. SCALE OF THE STATE OF CONTINUOUS SELF-AWARENESS

Definition. Conscientiogram: the system of evaluation of the evolutionary flow of the consciousness, or intelligent principle, established from the self-awareness of the lucidity of the ego itself (consciential holomaturity).

Synonymy: consciential scale; model of consciential evolution; projective consciential flowchart.

Validity. Following the orientation of an extraphysical helper, this evolutionary scale of the lucid consciential projector was elaborated. It is a practical process used as a pattern for measuring intraconsciential progress over time, a model of evolutionary attribution. The scale includes, delineates and measures a specific evolutionary period of the consciential principle (you) located somewhere between the hominal level – when leaving unconsciousness, indifference and improvisation behind in order to seek specialization, with spontaneous self-discernment – up to the deactivation of the psychosoma, upon reaching the condition of free consciousness or FC.

Factors. The characterization of these stages of the scale of continuous self-awareness are influenced by 3 basic factors:

1. **Human:** the improvement of the vehicle of manifestation and the utilization of chronological time.
2. **Extraphysical:** the relationship between evolutiologists and gradual multidimensional assistance.
3. **Consciential:** the evolution of memory (holomemory) and the application of cosmoethics.

Existential series. The stages were organized into only 7 steps, it being extremely difficult to exclude any of them; on the contrary, the scale can be amplified with small transitional stages. In the same way, it seems to be very problematic to achieve the advanced stages with very few sequential intraphysical lives, which are dedicated to the improvement of projective self-performance, in different human bodies or somas and energetic bodies or holochakras, besides the successive alterations of the personal psychosoma. There are other *specific* evolutionary scales of conscientiology.

Stages. In order to achieve the state of continuous self-awareness, the intraphysical consciousness projector and, likewise, the extraphysical consciousness projector – from pre-serenity to serenology – using the mentalsoma, experience these evolutionary advancements or ascendant stages beginning from the *pre-serenissimus*:

1. **Tests.** In this stage are included common intraphysical projectors of many categories, intrusion-victim-projectors, intruder-projectors, including those which have projections while the human body is in movement, whether walking, horse riding, dancing, singing, typing, playing piano, writing, speaking, in a train, driving a car, racecar, motorcycle, motorized bicycle and even piloting a hang glider, helicopter or airplane. The psychosoma and silver cord are discovered and the personality

learns to deal with these instruments of the consciousness. The uncertain searches come to an end and the first period of examinations, or psychophysical tests, begin for the apprentice of multidimensionality before his/her extraphysical helper. Impure, sporadic or accidental lucid projections occur; as well as pure lucid projections in the psychosoma of the adult, which are continuous from the beginning to the end of the episodes; and lucid self-projections.

2. **Impact.** This is the crossroads-stage for utilization of the current existence on earth regarding a transition in the performance of the lucidity of the consciousness. It includes the impure processes of consciential projections in the psychosoma produced by fakirs who have themselves temporarily buried alive, remain projected in the proximity of the human body during the period of intentional human hibernation and show faulty recall. They have pure lucid projection in the mentalsoma, superconsciousness (samadhi) or the experience of cosmoconsciousness and, under the impact of recalled cosmoconsciousness, the intraphysical projector defines his/her destiny in human life (penta, consciential epicenter, extraphysical clinic), either remaining in neutral or proceeding forward, mastering the physical body or soma.

3. **Admission.** Mixed consecutive consciential projections arise, alternating the vehicles – the psychosoma and the mentalsoma – with various experiences in a single night, including mild consciential projections and continuation-projections. The *flight range* of the projected intraphysical consciousness is already between one and two hours of absence from the human body. The projector begins to maintain greater emotional stability (serenity) and uniformity in his/her physical and extraphysical procedures, which allows superior intraconsciential efficiency. The integral, *en bloc*, recall of extraphysical experiences becomes habitual. The developed parapsychism shows itself to be of immense value. Deintrusive lucid projections become common and both nightmarish projections and spontaneous projections are extinguished. The second level, the period of admission or acceptance of the apprentice by the extraphysical helper occurs, in which the former can no longer expel the latter from the personal psychosphere. Psychophonic monologs appear in which the specialized, assistential extraphysical consciousness orients the tasks of the intraphysical lucid projector who perceives the positive interference in all aspects of existence, through unmistakable signals of parapsychism (signage), intuitions, suggestions, messages and, especially, the energetic shower that starts at the coronachakra. The individual now ceases to be merely a passive sensitive and is transformed into an active assistant (shoulder to shoulder, hand in hand) of extraphysicality, dispensing with formulas, rituals and crutches, as well as doctrines and sectarianism (factiousnesses).

4. **Ethics.** This is the period of consecutive lucid projections in the psychosoma lasting over an entire single night, or the phase of uninterrupted self-awareness for an entire day, eventually. From this ethical stage forward, moral intangibility, from a cosmic point of view, becomes indispensable. Ostensive assistential lucid projections occur and are incorporated into the projector's routine: the habitual viewing of the auras of beings and things in daily life; clairvoyance, clairaudience, telepathy, self-retrorecognition, precognition and other phenomena and perceptions, such as the grandiose expansion of the human aura. The existence of the lucid projector (petifree being) in matter without the experiences of lucid projections becomes practically impossible. They become an indispensable part of the projector's diuturnal life, constituting an act that is just as physiological as the actions of inhaling and exhaling in the ordinary, physical waking state.

5. **Affiliation.** The projector begins to have mixed consecutive projections frequently during an entire night, and eventually consecutive lucid projections in the mentalsoma over the whole night. From this point on, lucid projections permanently occupy a part of the existence of the intraphysical projector as well as the extraphysical projector. The *flight range* of the consciousness surpasses two hours of absence from the vehicle of manifestation. The extraphysical studies and the extraphysical intraconsciential assistance are increased and the consciousness dives more deeply into the archives of its past intraphysical existences and intermissive periods, through periodic self-retrorecognitions, taking the first steps toward *continuous memory* or holomemory. The emotionalism disappears from the consciousness' micro-universe to make way for constant serenity outside the human body, the consciousness mastering the psychosoma. There are lucid consciential projectors, in this phase, who

work efficiently while extraphysical consciousnesses, but fail dismally when they are reborn, demonstrating that projections of the mentalsoma are more difficult for the intraphysical consciousness than for the extraphysical consciousness. The majority of the projections of the intraphysical consciousness cannot be registered with clarity due to an insufficiency on the part of the neuropsychic memory circuits. The intraphysical projector first endeavors to discard the factor of natural sleep and, next, to eliminate dreams, both being extremely difficult intraconsciential feats. This stage corresponds to the third level of the apprentice, with a full matriculation or affiliation occurring with the extraphysical helper. The parapsychic manifestations become more refined and the intraphysical projector advances in the knowledge of upcoming facts regarding his/her way, through frequent self-precognitions. The evolutiologist gains an evolutionary boost in this stage.

6. Refinement. Consecutive projections in the mentalsoma of an entire night frequently begin to occur, as well as the eventual occurrence of mixed projections, until the consciousness attains a predominance of consecutive, prolonged, mentalsomatic projections lasting the entire night. From this stage forward, the intraphysical projector acts in the extraphysical dimensions leaving the dense body in the physical base, in the condition of *protected suspended animation*, which makes him/her immune to all negative or pathological influence, practically extinguishing the deintrusive projections. The intraphysical projector – who, up until this point, always returned to the human body in order to energize it – ceases to do this, using the full potential of the human brain. The interviews with genius extraphysical personalities, including positive historical personages, are intensified and there is little difference between the ordinary activities of the intraphysical projector and those of the active extraphysical projector, based on abnegation and lucid, discerning, self-conscientiality. The psychosoma, whether of the intraphysical consciousness or of the extraphysical consciousness, becomes more fluid, rarefied and subtle. The mentalsoma is amplified in a manner incomprehensible to the perceptions of our current understanding, and both categories of consciential self-projection become similar. The serenity of serenology predominates in this stage.

7. Purification. In this stage, consecutive lucid projections in the mentalsoma – or continuous self-awareness per se – are produced every night. This is possible for the intraphysical projector from infancy, which makes the human body seem to be an instrument at his/her service, or to disappear, at will, and execute final self-projection by him/herself, at the correct moment, through a cardiochakral or umbilicochakral self-desoma. At the last part of this stage, the free consciousness (FC) is born – the living-freed (*moksha*, freedom from the multiexistential cycle, the end of the errantry of the consciousness), which discards the now deactivated psychosoma, transcending all the bodies and parabodies of manifestation, limitations and conditions, besides all successive intraphysical and intermissive existences. Now free from the 2 vehicles – the rustic (human) and the subtle (psychosoma) – it is definitively removed from the gears of compulsory successive rebirths, in a form of conditioned existence. It continues to exist in the mentalsoma in the resplendent communities (mentalsomatic dimension), intensifying its relationship with cosmic extraphysical consciousnesses of high intraconsciential evolution, in cosmic extraphysical spaces, visitors from other planets, systems and galaxies, becoming occupied with intergalactic extraphysical processes, with the agents of karma, the builder consciousnesses and the architects of galaxies. At this point, this consciousness takes part in and orients the ample transformations, natural convulsions, catastrophes, cataclysms and destructive calamities that are generated by earthquakes, seaquakes, cyclones, hurricanes, volcanic eruptions, plagues, floods, rainstorms, hailstorms, snowstorms, windstorms, sandstorms; epidemics and the cycles of collective accidents; astronomical or cosmic catastrophes, such as the collision of heavenly bodies and even entire galaxies; and other great disasters and accidents which pummel planetary humanities.

Characteristics. The following are 17 other characteristics of stage 2, *impact*, gathered through suggestions at a public brainstorming session, with the participation of dozens of projectiology students and researchers, on October 27, 1990, at the International Institute of Projectiology, in Rio de Janeiro, RJ, Brazil:

1. **Alternance.** An understanding of the condition of the alternant intraphysical consciousness (intraphysical state/projected state).
2. **Self-discernment.** Repudiation of old idolatries or adorations (guru worship) with self-discernment and consciential maturity.
3. **Self-mimicries.** Self-awareness of necessary and dispensable repetitions in human life.
4. **Self-organization.** Awareness of the indispensable necessity of evolutionary self-organization.
5. **Self-projections.** Planned, lucid self-projections.
6. **Behavior.** Identification and the beginning of peaceful coexistence with inevitable ambiguities (pattern-behavior/exception-behavior).
7. **Cosmoethics.** Initial personal questioning regarding applied cosmoethics.
8. **Epicentrism.** The gaining of a greater awareness (consciential epicenter) of the individual's own lucid, evolutionary sufficiency.
9. **VS.** Practical mastery of the prophylactic vibrational state (VS).
10. **Karmic group.** Identification and location of oneself within the karmic group.
11. **Holokarma.** A primary understanding of personal holokarma.
12. **Intermission.** Self-persuasive recollections of the most recent personal intermissive period (personal intermissive course).
13. **Bait.** Acquisition of the condition of lucid multidimensional assistential bait.
14. **Goal.** Identification of one's own multi-existential goal (existential program and multi-existential cycle).
15. **Existential recycling.** Existential recycling or the constant renewal of one's existential perspective.
16. **Retrocognitions.** Personal experiences (mnemosomatics) of retrocognitions, even when intrusion-related.
17. **Strong-traitism.** Recognition of one's own mega-strong-traits and mini-strong-traits, mega-weak-traits and mini-weak-traits.

Projectability. This stage 2, *impact*, is extremely relevant in practical life because it specifies the level of lucid projectability of the majority of projectiology students and researchers, in order to achieve the *petifree condition* in this human life.

Potentiality. The extraphysical consciousnesses that permanently live in the mentalsoma find themselves potentially capable of maintaining awareness of the energetic auras of galaxies; make the consciousnesses located on evolved planets go into a vibrational state; promote the positive auric coupling of groups of stars; trigger transcendent orgasms or galactic holo-orgasms, and the state of joint, simultaneous, cosmic self-awareness (cosmoconsciousness) of entire physical and extraphysical populations, when necessary.

Considerations. In a single stage, the projector can come across small variables of transitional experiences that pertain to the prior stage or the subsequent one. The average projections of the projector define his/her level on the scale. The most difficult feat is to maintain uniformity in the series of self-aware, major and constant projections. In order to reach the fifth stage, for example, thousands of successive physical existences, similar to those on earth, or on a similar planet, must be necessary, dedicated to this goal, in multiple services of megafaternity. It can thus be seen that there must be people (consciousnesses) today that are endeavoring to move up one stage of one step of the scale, improving performance in lucid consciential projections since the age of the initiations of ancient Egypt, or even before this. What is most important is that the consciousness discovers and becomes aware of the manner in which the consciential evolutionary system (consciential flowchart or conscientiogram) functions.

Civilizations. Assuming that there are at least 3 types of intelligent civilizations, based upon their control of energy sources: Type 1 is that which is capable of exploiting and controlling a quantity of energy equal to the total energy sources of its planet; Type 2 is that which is capable of exploiting and controlling the energy equal to the total energy production of its native star (sun); Type 3 is that which is capable of exploiting and controlling the energy equal to the total energy production of its

galaxy; can we conclude that the universalistic components of the Type 3 civilization would all evolutionarily be at the 6th stage of the scale of the state of continuous self-awareness?

Mastery. When the consciousness fully masters the physical vehicle of manifestation, including its biological requirement for natural sleep, leaving this only for the human body, through lucid self-projection, it gradually acquires definitive continuous self-awareness without recesses. Upon achieving this level, the human body can offer nothing more to the consciousness as an element of evolutionary purification and it ceases to go through *resoma*, as we understand it. At this point, the lucid projection achieves its anti-existential-series purpose, eliminating the cycles of the intraphysical and intermissive lives of the consciousness' realities or experiences.

Discretion. What is most impressive in certain consciousnesses of above-average evolution (*serenissimus*) is the phenomenon of absolute discretion or the condition of complete anonymity that is purposely self-imposed, in a sacrificial manner, and in which they remain while they are intraphysical. These intraphysical human consciousnesses, *serenissimus* – situated above and beyond encyclopedias – can be encountered while lucidly projected in extraphysical dimensions. However, it becomes impracticable, at least according to the experiences of the author, to identify them and encounter them in the ordinary, physical waking state. Why? How are they able to be simultaneously participative without showing themselves?

Questions. The following are some working hypotheses: Can one imperious suggestion, while in a deep hypnotic state, help the individual achieve the first steps toward the state of continuous self-awareness? Would someone be able to provide information regarding how many anonymous practitioners on this planet are currently in the sixth stage? Better still, do you know some of these practitioners? Which stage of continuous self-awareness have the so-called masters of the Himalayas achieved? If we consider, in infinite consciential evolution, animal life as the *first course*, and continuous self-awareness as the *second course*, what would the *third course* be? And what is the *fourth evolutionary course*?

Bibliography: Bentov (119, p. 132), Kardec (824, p. 91), Michaël (1041, p. 105), Powell (1279, p. 224), Vieira (1762, p. 214).

487. FREE CONSCIOUSNESS

Definition. Free consciousness: the mature consciential center of energetic irradiation that is free from matter, form and space, and from the cycle of lifetimes in perishable bodies, divested of the psychosoma, living only in the isolated mentalsoma.

Synonymy: agent of karma; archangel; architect of galaxies; evolutionary catalyst; FC; living-liberated; pure consciousness; quasi-perfect being.

Characteristics. The following are characteristics of the free consciousness: the condition of no longer suffering the influence of matter, of its tests and expiations; the enjoyment of an inner state of unalterable well-being and harmony; the performance of the transcendent function of an interplanetary or intergalactic transient, without living in errantry (mentalsomatic dimension); the sublime, lucid and incessant action of the consciousness in the quality of the evolutionary catalyst of other consciousnesses. It can thus be seen that the free consciousness is the same God of ancient peoples, the image and likeness of which humankind was considered to be.

Attributes. It naturally becomes difficult for us to understand the nature of the free consciousness. It is presumed, however, that it has an imperturbable serenity; masters immanent energy in a manner that is direct and still not understood within our current resources of understanding and self-maturity; whether it is a permanent flow of sentiment or of rationalized emotion; feels pure tranquil love; understands dense matter and the extraphysical constructions as being substances that are derived from the same source; achieves a level of supreme genius; has powers that can be characterized in our *current* evolutionary condition as being similar to the notion we ascribe to omniscience, omnipotence and omnipresence.

Manifestation. It is presumed that the free consciousness – although it has deactivated its own human body, holochakra and psychosoma – simultaneously perceives all consciential dimensions where it manifests in only a wholesale, intrinsic, consciential manner or, in other words, in a universalistic manner and within megafaternity.

Notion. The following are 8 subjects that can lead the interested individual to a better understanding of the notion of the reality of free consciousness:

1. **Cosmoconsciousness.** The condition of cosmic self-awareness or the experience of cosmoconsciousness.
2. **Mentalsomatic.** The existence of the mentalsomatic dimension.
3. **Mentalsoma.** The subtle manifestation of the mentalsoma.
4. **Projectability.** Lucid consciential projections in the mentalsoma.
5. **Self-awareness.** Projections with continuous self-awareness.
6. **State.** The state of continuous self-awareness.
7. **Scale.** The scale of the state of continuous self-awareness.
8. **Serenology.** The ideas and principles of serenology.

Earth. Due to its young age and its low level on the evolutionary scale or, in other words, its planetary consciential immaturity, planet earth still does not have native free consciousnesses – consciousnesses in the state of *moksha* or liberated from the series of intraphysical existences – residing here or which have been purified on this globe, achieving, directly from here, the seventh stage of the scale of continuous consciousness.

Universalism. It is important, above all, to emphasize that free consciousnesses present an evident universalistic nature and, therefore, do not feel themselves to be in a *planetary*, telluric, geocentric, sectarian or factionalist condition.

Extraterrestrials. The free consciousnesses that control the collective evolution of the earth, extraphysically manifesting on or for this planet, are therefore extraterrestrial beings. They are the most evolved extraphysical consciousnesses among all of those that are directly and *tangibly* related to intraterrestrial beings in general.

Cosmic. Through the notions of the free consciousness, it can be observed that there are 2 characteristic types of condition of cosmic self-awareness or the major projection through the mentalsoma: the solitary consciousness (*samadhi*, *satori*) and the accompanied consciousness, or that having encounters in the mentalsomatic dimension, where advanced interconsciential communications occur.

Contactees. In this sense, it is worthwhile mentioning that not all contactees (abductees) encountered by UFOlogy can be categorized as kidnap victims. The human contactees, investigated by UFOlogists, as extraterrestrial beings, can be systematically classified into 3 types, based on their consciential vehicles:

1. **Soma.** The physical contactee, when in the human body in the ordinary waking state (fourth degree or EC-IV), while the consciential vehicles are in the state of integral coincidence (unified body).
2. **Psychosoma.** The extraphysical contactee when the consciousness is projected outside the human body in the psychosoma, obviously with the mentalsoma.
3. **Cephalosoma.** The extraphysical contactee when the consciousness is projected outside the human body and psychosoma, in the isolated mentalsoma (cephalosoma).

Fluency. These last 2 contact processes enable more fluent, positive interconsciential communication through parapsychic means, with the full extraphysical self-awareness of all personalities involved in the encounter process.

Desoma. Consciousnesses, on the earth, which have gone through desoma and are lucid, establish their contacts with the last 2 types of benign extraterrestrial beings. This more easily eliminates the *conditions of interplanetary intrusion* (traumatic victimizer-victim(s) encounters).

Choice. On the other hand, the extraterrestrials, even in their physical contacts, purposely choose their terrestrial contacts (UFOlogical witnesses) according to their physical, psychic and parapsychic (parapsychophysical dynamic) characteristics or pre-conditions. These contacts (fourth degree) almost always inevitably inflict profound intrapsychic and behavioral changes and, sometimes, the condition of positive existential recycling.

Occupation. Among its activities in the field of astronomy, for example, the free consciousness maintains self-awareness regarding the energetic auras of galaxies; amplifies the state of consciousness of entire planetary populations; supervises the physical and consciencial evolution of stars and constellations. It can thus be concluded that the consciousness does not cease to be busy even when purified, according to the evolutionary criteria that we are able to discern. This shows that idleness is intrinsically contrary to evolutionary patterns or, in other words, carries a pathological connotation.

Future. The more we understand the reality of the free consciousness, the greater will be the excellence of the quality of our projects and proposals, in view of our immediate future. The condition of the free consciousness is an inevitable goal – although still remote – and is an unwavering model for you, for me, and for all intraphysical consciousnesses.

488. SELF-DESOMA

Definition. Self-desoma: the technical, methodical, painless and conscious act of provoking the deactivation of the soma or human body.

Synonymy: chakral desoma; death by mental induction; discarding of the human body; energetic immolation; final self-projection; *mahasamadhi*; parapsychic death; parapsychic desoma technique; parathanatosis; psychogenic death; psychogenic self-desoma; second level of Kriya Yoga; self-euthanasia; self-metathanasia; voluntary abandoning of the human body.

Types. There are two basic, parabiological types of self-desoma: cardiochakral and umbilicochakral, or voluntary self-combustion. Besides these, negative methods are employed, *mahasamadhi*, for the conscious, definitive abandonment of the physical body by yogis, especially in the Himalayas, such as self-freezing (*him samadhi*), self-suffocation (*jal samadhi*), and the deliberate opening of the head (*sthal samadhi*) with the rupturing of the silver cord at the top of the sinciput, similar to natural death. According to affirmations, all of these processes are painless and rapid, although no one knows for sure whether or not any of them represent an act that is correct or condemnable, cosmoethical or uncosmoethical or, in other words, if it was performed at precisely the correct moment of the biological death of the soma for the intraphysical consciousness.

Fine. The line between an act of accelerating or slowing the moment of a desoma or, in this case, between correct self-desoma and veiled suicide (self-destruction), or self-euthanasia, is a very fine one and is complex to interpret. For those who enjoy good health, biological death is not an easy procedure, but for those who know that their life is hanging by a thread, balancing on the edge, feeling the coldness at the edge of the abyss, or in the final phase of the lucid projector, things become less difficult.

Reason. The greatest pretext for provoking self-desoma has been the intention of avoiding the negative effects of advanced senility or, in other words, the frank caducity of certain individuals, which in many cases can merely be the pressure of pride and vanity. Modern preventive and therapeutic resources for defending the intraphysical consciousness against senile disturbances or those derived from arteriosclerosis (Alzheimer's disease), when used in time, have significantly reduced the negative consequences of caducity and senile psychoses.

Moral. The moral question, which is extremely serious in this case, merely refers to the individual's own cosmoethics, the self-discernment and hyperacuity of the intraphysical consciousness

who, if he/she wishes, can end his/her physical life rapidly, without any other human being becoming aware of his/her real intentions.

Key. Those who perceive and mobilize elevated consciential energies have easy access to the key to voluntary final projection through the definitive disconnection of the vehicles of manifestation, the human body and psychosoma. This provokes the irreversible rupture of the silver cord, the real and final *causa mortis*, common to all human beings.

Suicide. Self-desoma is only understood to be a positive or healthy process when it occurs, according to cosmoethics, with projectors who are at the seventh stage of the scale of continuous self-awareness and know when the human body ceases to be a useful vehicle for manifestation of the consciousness. Prior to this period, any similar act is reprehensible, negative and anticosmoethical. This is because it is equivalent to a suicide or self-murder, without evidential proof or *corpus delicti* or, in other words, self-euthanasia, as it is provoked prematurely, or before the correct, appropriate time, in many cases perhaps as an escape from senility which began to appear and be self-perceived or detected by the person through the sensations or by observing personal biological or hereditary lineage according to the individual's elderly close relatives.

Period. The period of appropriate desoma of the intraphysical consciousness does not always correspond to his/her possibilities of self-desomatic performance. Many intraphysical beings can even have resources and techniques for self-desoma when they still find themselves healthy and feeling well, *prior to* the desoma period. However, the appropriate period, due to deficiencies of consciential energies (holochakrology), mental concentration and sufficient will for the attempt, end up being unable to realize their self-desomatic experience. This fact may have led an intraphysical consciousness to induce premature desoma for this very reason, which, nevertheless, is still an error, escape, pathothosene and egokarmic debt.

Incorruptibility. It is common knowledge that, in mortuary records, cases are registered of unaltered cadavers, devoid of any visible sign of physical decomposition, such as desiccation, mold and the characteristic odor. They also remain immutable and untouched for a period of days, months or even years, facts frequently attributed to a special purpose and the "sanctity" of the deceased.

Coma. Somnambulism outside the human body and the natural trances of first desoma, or deactivation of the cellular body, are proof of one or another case of post-desomatic physical incorruptibility – which under the circumstances represents a great irony – signifies nothing more than conservation of the connections of the vehicles of manifestation of the consciousness in the state of coincidence and that one did not *paraphysiologically* pass through the entire process of the first desoma. It thus remains in the proximity of the inactive dense body, while it is still unaltered, in a state of *extraphysical coma*. How many cases of self-desoma can be included in this type of occurrence?

Analogy. The condition of the veteran projector who is aware of self-desomatic techniques is very similar to a patient who has received a permanent artificial heart – made of metal and polyurethane, created by specialists in mechanical medicine, activated by external equipment, a miniaturized air compressor, a generator and tubes – which has full access to the switch that can turn off this heart-apparatus that keeps the individual alive among humans. Both are equipped with the frank option for suicide. There is generally no risk of the projector suiciding, because the projections themselves keep the person in excellent intraconsciential condition. This makes the individual consider the great importance of human life, maintain a permanent interest in living intraphysically and concluding that it is worthwhile to take advantage of the evolutionary possibilities that the intraphysical terrestrial stage still offers.

489. VOLUNTARY CARDIAC ARREST

Definition. Voluntary cardiac arrest: the act of the intraphysical consciousness intentionally provoking a cardiac arrest within him/herself, with the objective of producing the deactivation of the human body, or final projection.

Synonymy: cardiochakral desoma; cardiochakral self-desoma; cardiochakral self-euthanasia; provoked mental cardiac self-collapse.

Cause. The fundamental cause of voluntary cardiac arrest is mental concentration, through deep reflection upon the cardiochakra or, more specifically, upon the heart, a vital organ of the human body, making it definitively cease to function, similar to the discharge of a ray which instantly kills the soma, provoking cardiac arrest.

Effects. Evidently, the immediate effect of cardiac arrest is the death of the human body due to the definitive stopping of the heart's functioning, when specialized resources are not used, such as thoracic massages, adrenaline and defibrillators.

Types. There are 2 basic types of the phenomenon of cardiac arrest, from a cosmoethical perspective, which is very important in this case: when provoked by a projector who is already in the seventh stage of the scale of continuous self-awareness, not constituting suicide as we understand it; and when definitively triggered by a projector who is in any of the other previous stages of this same scale, thereby representing calculated suicide, self-murder or self-euthanasia, with the obvious profoundly negative egokarmic consequences, which are easily understood by those who are accustomed to extraphysical realities.

Warning. Voluntary cardiac arrest is the reason why the author has never recommended any psychophysical practices that involve the direct control of the heart with the will, as certain gentle practices recommend direct control of respiration. Thought is a living force and we do not always know, nor are we always predisposed to dose it out within the correct physiological, cosmoethical and productive parameters, as seen, besides this occurrence, in voluntary self-combustion. Both of these phenomena can also be provoked unintentionally and even without the self-awareness of the person responsible for their existence (uncalculated self-euthanasia).

Impact. In order to reflect upon the relevance of the thoracic or cardiac area in research performed by self-aware individuals, it is sufficient to emphasize that conventional science currently admits that a small impact to the heart can kill (desoma). Studies prove that a quick blow at just the right moment makes the heart stop. This is why athletes and children faint suddenly (*Jornal do Brasil*; daily; year CVIII; N. 71; section: *Ciência*; Rio de Janeiro, RJ, Brazil; June 18, 1998; p. 14).

Medicine. For those who have difficulty in assimilating the reality of these facts, it is worth remembering that cardiology currently considers orgasm, euphoria, a setback, a mere agreeable surprise, or a simple shock to be causes of fatal cardiac arrest, under certain conditions.

Bibliography: Muldoon (1105, p. 212).

490. VOLUNTARY SELF-COMBUSTION

Definition. Voluntary self-combustion: the act of the intraphysical consciousness making the real *inner flame* of fire, or psychophysical energy, operate, thereby burning the human body and reducing it to ashes.

Synonymy: consensual self-implosion; provoked mental self-burning; provoked self-oxidation; pyrogenic self-euthanasia; umbilicochakral desoma; umbilicochakral self-desoma; voluntary self-cremation.

Survivors. Spontaneous human combustion, or spontaneous fire – a phenomenon referred to in ancient oriental texts, of which there are currently hundreds of registered cases – is one of the mysteries of the universe of parapsychic phenomenology. It has even been addressed in popular

television programs on scientific dissemination and the survivors of this combustion – victims of the occurrence who did not die – have already been studied. There are still no definitive explanations for the occurrences of spontaneous human combustion, only hypotheses, such as a *mechanical failure* in the human organism's temperature control system.

Description. Extranormal combustion is described as a small, but intense, flat, bluish flame that very quickly spreads to all parts of the human body which is affected. This persists until the parts are blackened and, as a rule, are reduced to ashes and oily stains, leaving an unexplainable sweet smell and a grayish smoke. On many occasions, attempts were made to extinguish the flame with water, without success.

Causes. Spontaneous human combustion is caused by the occasional concentration of the internal energies of the organism, the sexochakral energies (*kundalini*), at one or many organic points or areas. Voluntary self-combustion, on the other hand, is provoked by the intention of setting oneself on fire, through a deep mental concentration upon the solar plexus, umbilicochakra or abdominal brain.

Predisposing. The following are 7 physical and physiological conditions that can generally predispose the phenomena of spontaneous human combustion:

1. **Biochemical.** Some chemical components, which are inert when isolated, form explosive compounds when combined.
2. **Bioluminescence.** The bioluminescence emitted by certain insects and fish demonstrates the possibility of *internal fire* of some type.
3. **Fats.** The fats and oils, which the human body contains in quantity, are excellent combustibles.
4. **Phosphorous.** Phosphorous, a chemical constituent of the human body, catches fire spontaneously when exposed to atmospheric air.
5. **Electricity.** Static electricity produces sparks that can, under certain conditions, set the human body on fire.
6. **Intestines.** Human intestinal gases are flammable.
7. **Cadavers.** The gases produced by human cadavers are flammable.

Effects. Among the effects of spontaneous human combustion, the most frequent is sudden desoma, with a small amount of gray residue and a thick layer of greasy soot. More rarely, only multiple burns on various areas of the organism occur, which are not seen or felt during the event and have no apparent cause.

Selective. Among the effects of spontaneous human combustion, as well as that which is voluntarily provoked, is the transformation of the human body into a pile of ashes, which strangely occurs in a selective manner, without provoking a local fire and without burning – and almost always without even singeing – the surrounding flammable substances with which the organism was in direct contact during the occurrence.

Temperature. Incidentally, in order to reduce the human body to ashes – which occurs in official crematoriums – a temperature of over 3,000 degrees Fahrenheit, or more than 1,650 degrees Celsius, is needed for at least 8 hours, in order for the bones to turn to dust. As can be seen, this is a difficult temperature to produce without the aid of flammables.

Somas. Men (androsomas) only burn at more elevated temperatures than women (gynosomas). Does this suggest that consciousnesses are physically more *reborn* when in androsomas or masculine bodies?

Types. According to the preceding reference regarding voluntary cardiac arrest, there are 2 basic types of occurrence in relation to the phenomenon of voluntary self-combustion, from a cosmoethical perspective, which is very important in this case: when provoked by a projector who is already in the seventh stage of the scale of continuous self-awareness, which must be extremely rare and does not constitute suicide as we understand it; and when triggered by a projector who is in any of the other prior stages of the referred-to scale, thus representing suicide, self-murder or calculated self-euthanasia, with obvious, profoundly negative egokarmic consequences that are easily understood by those who are accustomed to extraphysical or multidimensional realities of evolution of the consciousness.

Warning. The phenomenon of human self-combustion, as much as voluntary cardiac arrest, warn of the extremely powerful force of thought, of which we are still not fully aware and do not dose out in a correct, physiological and productive manner. This is why care should be taken when putting the psychophysical energies of the organism and its chakras into motion, because both of the referred-to phenomena can also be provoked unintentionally and even without the responsible party being self-aware and perceiving their existence.

Jesus. At this stage of the analysis of the facts, the following hypothesis is worth examining: Could it be that the disappearance of the human body of Jesus of Nazareth, evolutionarily already living in the seventh stage of the scale of continuous self-awareness, was deliberately and consciously performed by himself, or was it achieved through voluntary self-combustion, leaving no human residue or physical traces? Who knows how many disappearances of persons have not already occurred, and occur nowadays, through this process? Who knows how many disappearances of persons have not already occurred, and occur nowadays, through this process?

Hypotheses. The following are two more pertinent work hypotheses: What is the relationship between bioluminescence (uncontrolled light or energy) and spontaneous self-combustion (wasted heat or energy), 2 of the most uncommon and obscure biological phenomena that challenge human intelligence? Will humankind someday be able to voluntarily produce bioluminescence, when it is able to control light as a form of energy through the phenomenon of irruption of the psychosoma?

Bibliography: Ajaya (08, p. 401), Castaneda (256, p. 13), Digest (400, p. 91), Freixedo (554, p. 53), Vieira (1762, p. 202).

491. PSYCHOPHYSIOLOGICAL ANCHOR

Definition. Psychophysiological anchor: the psychological and/or physical element that maintains the consciousness of the advanced projector connected to or interested in human life, performing a consciential prophylaxis against his/her alienation regarding the necessary physical experience on earth.

Synonymy: human anchor; psychophysiological anchoring crutch; the intraphysical consciousness' true friend.

Psychosoma. Generally speaking, psychophysical anchoring is the implantation of the substantial connection of the intraphysical consciousness more strongly to human or terrestrial life. This connection is more frequently executed through exacerbation of the functions of the psychosoma – the partbody of emotions or desires – which activates the emotionalism and passions that bind the intraphysical consciousness to the earth through the illusions of the tropospheric senses. It can thus be concluded that great lucid self-projections in the mentalsoma will forever free the intraphysical projector from the use of psychophysical anchors.

Types. The psychophysical anchor may not only be the dignified thought on the foundations of life, pure affection for someone or an object of noble work, but may also be religious or mystical affective sublimation, interest in a human activity, or an inoffensive but productive hobby.

Factors. The following are 10 extremely positive, motivating, psychophysical anchoring factors, listed in more or less decreasing order of importance, value and constructive repercussion for the intraphysical consciousness: human family ties, professional work, services of social assistance, studies of lucid projection, scientific research, elevated art, athletic performance, instructive travel, adoption of a domestic animal, educational collections.

Drugs. The medications prescribed for the prevention of arteriosclerosis or senility, although used for this purpose, act as powerful psychophysiological anchors for the intraphysical consciousness on earth, without the individual perceiving it. These drugs, generally when used continuously, improve cerebral vascularization, increase the degree of the patient's awareness, reduce the number of hours of sleep, unblock the flow of thoughts, strengthen the memory and, for some time, seriously impede the

production of the self-projection of the consciousness, actually anchoring the interests of the intraphysical being in the physical, daily involvements and attractions or in the diuturnal problems of human life.

Effects. The psychophysiological anchor neutralizes euphoria regarding the extraphysical dimensions; sustains, without vacillations and without sidetracks, the fundamental direction of human existence; favors a coherence in attitudes; constantly indicates the essential goal of individual destiny or the healthy execution of the existential program; allows the intraphysical consciousness to achieve a new stage in the scale of the state of continuous self-awareness; and presents a close relationship with the recess of sequential or seriated lucid projections.

Crutch. In its initial structure, the psychophysiological anchor of the consciousness in human existence still constitutes the ultimate crutch, or psychological support, which the intraphysical being needs in order to conclude the terrestrial stage with cosmoethical dignity.

Self-desoma. In an extreme extraphysical liberation, or prodigality, if the yogis and fakirs do not have a balanced psychophysiological anchor, they are susceptible to produce a premature self-desoma or, in other words, one which is completely negative or anticcosmoethical.

Excess. In a condition of extreme physical restriction, or attachment, when the human anchor acts excessively upon the intraphysical consciousness, this resource ends up sidetracking the individual from extraphysical reality, reducing parapsychic sensitivity, or *materializing him/her*. Certain existential impacts, such as illnesses, medications, an elevated sum of money appearing unexpectedly and others, can intoxicate the human intraphysical consciousness, emotionally involving the individual in a mummifying crust or, in other words, fossilizing the still living person.

Helpers. Paradoxically, the extraphysical helpers are simultaneously *desoma facilitators* and *resoma facilitators*. This is because they not only aid in the exteriorization of the consciousness from the human body, but also, in certain cases, impede it from leaving this selfsame organism in an excessive, frequent or intense manner. In other words, they free it, on the one hand, and anchor it, on the other hand, within the appropriate and necessary balance required for the individual's terrestrial experiences and personal evolutionary necessities.

Middle ground. Thus it is perceived, far beyond religious, mystical or fanatical postulates, but evidenced and endorsed by the individual's own physical-extraphysical everyday life, that the ideal human conduct, and the necessary abovementioned balance required by terrestrial experiences and the individual evolutionary necessities of the intraphysical consciousness, are not at one extreme of attachment (egoistic and avaricious), much less at another extreme of detachment (prodigal and alienating). It is, instead, at a middle ground, which is appropriate, correct, cosmoethical, and lacks radicalisms, between attachment and detachment to material things on the face of the earth or within the world of intraphysical life.

Cord. The greatest existing physical anchor of intraphysical consciousnesses is the *old silver cord*, the remainder of which accompanies the psychosoma of the extraphysical consciousness even prior to its current resoma.

Bibliography: Vieira (1762, p. 173).

492. CONSCIENTIAL LOCATIONS

Definition. Consciential location: the state or condition wherein the consciousness *temporarily* anchors, concentrates or centralizes its focus, fulcrum, seat of action or the *locus* of its perceptive faculties in a certain evolutionary opportunity or moment.

Synonymy: condition of the consciousness; seat of the consciousness; state of the consciousness.

Point. Whereas the 2 cerebral hemispheres merely represent the visible point of the immense iceberg that constitutes the real consciousness, which is silently submersed in other existential dimensions, it also always has a seat or fulcrum of manifestation on any given occasion. The more evolved a consciousness is, the more frequent and more intense will be its changes of location.

Comprehension. In order to understand the theory of the locations of the seat of the consciousness, which vary according to existential levels, the intraphysical consciousness can use the following example: place 1 index finger in front of you pointing upward, look at it and consider that, in the same place where your dense, visible finger is, there can be 1 billion other similar coexisting fingers, which are invisible to the perception of your eyes, vibrating at different frequencies, with 1 not interfering with the existence of the others and many of these fingers can be mere creations of your consciousness or, in other words, simulations of the human finger.

Projection. In the example provided, your consciousness would be observing or distinguishing only 1 finger, the densest one, that which remains in the condition of physical coincidence. Suppose, however, that your consciousness wishes to project to another level or dimension. It would then use, as a temporary seat, for example, the frequency of the psychosoma, which corresponds to your similar, extraphysical finger, N. 87,587,587, a number chosen at random, being a component of the billion referred to.

Only. Instead of 1 billion fingers there can be “n” fingers, or an infinity of fingers for the psychosoma alone or the extraphysical dimension per se. For the mentalsoma, in the mentalsomatic dimension, the consciousness will not even need duplicates of fingers or the organic vehicle any longer in order to manifest itself.

Causes. According to the synthesis of the studies of locations of the consciousness, it is verified that they occur due to 6 distinct determining factors that comprise a model and can be used as a pattern-measurement to assess all the phenomenology of the consciousness in the following order: lucidity, will, energy, frequency, passivity and change.

1. **Lucidity.** The lucidity of the consciousness depends upon its evolution and can be classified as unconscious, semiconscious and conscious. The facts speak in favor of a constant instability of the consciousness, until such time as it achieves its maximum peak of balance, or relative stability, at the highest level of extraphysical serenity, as if this instability were a component that is indispensable to its life conditions, the demands of evolution and the nature of its perpetuity or eternity.

2. **Will.** The intensity of the will, or conscial activity, depends greatly upon the emotional motivation (emotionalism, psychosomatics) or the rational motivation (sentiment, mentalsomatics) of the consciousness. The will that acts motivated by emotivity demonstrates that the consciousness is still restricted to the manifestations of the psychosoma, the emotional body, or its animal, subhuman side. The will that acts motivated by positive sentiment, or by rationality, shows that it is already headed toward the predominance of conscial manifestations in the mentalsoma or the parabody of self-discernment.

3. **Energies.** The utilization of conscial energies depends upon the efficacy of the consciousness' performance. The performance of the consciousness in the use of conscial energies comes from the degree of awareness regarding the existence of these same conscial energies which, when manipulated unknowingly, or unconsciously, remains within the domain of the instincts of subhuman animals (reptilian brain, atavism) and does not show the same efficiency.

4. **Frequency.** Alteration in the vibratory frequency or density of the vehicle of conscial manifestation depends upon the flow of conscial energies employed by the intraphysical consciousness. There is no rigidly established conscial level for a determinate dimension of life where the consciousness is temporarily headquartered. Each dimension presents immense gradation, ranging from one extreme to the other, from a greater density to a lesser density, or from the condition of discontinuous conscial clarity to the condition of complete conscial clarity in that dimension. Not even the ordinary, physical waking state escapes this principle: no one has the same conscial acuity all the time he/she is physically awake. The same occurs in the paratropospheric dimension and even in the mentalsomatic dimension.

5. **Passivity.** The degree of sensitivity of a consciousness to the influences of others can be normal or pathological. Due to passivity alone, which suffocates the will, diverse distinct phenomena

occur: parapsychism, interconsciential intrusion, intuition, hypnosis, wherein the consciousness is *lived* or teleguided, instead of living or deciding for itself. Self-passivity, when excessive, alters the *groupkarmic account* of the intraphysical consciousness.

6. **Change.** The change from one dimension or level of manifestation of the consciousness can occur instantaneously, either with or without traumatizing it. Time becomes relative with regard to the influence that it exercises over the changes of the consciential locations, because these can occur as lightning-fast as the speed of thought.

Types. Dozens of phenomena stem from changes in consciential location, notably the following 15: self-bilocation of the projected projector; physical bilocation; physical-extraphysical trilocation or double projection; physical multilocation or the multiplicity of identical created forms; extraphysical translocation of the consciousness in the same dimension; pathological self-transfiguration of the consciousness when manifesting in the psychosoma, which is characteristic of extraphysical consciousnesses that are not able to maintain their own form; sudden extraphysical consciential disappearances; traveling clairvoyance; teletransportation; exteriorization of motricity; exteriorization of sensitivity; physical and extraphysical psychometry; physical and extraphysical retrocognition; physical and extraphysical telekinesis; psychophysical anchor.

Uses. Analysis of the factors that determine consciential locations indicates various uses that greatly help the lucid projector understand and obtain an improvement in his/her performance: the necessity of extraphysical serenity; the phenomenon of cosmoconsciousness; projection with continuous self-awareness; the state of continuous self-awareness; and a long list of other phenomena and situations of lesser significance.

Cosmoconsciousness. Consciential location in the condition of cosmoconsciousness becomes comprehensive in a wholesale manner, overall, thereby bringing about the absolute liberation of the consciential seat, which expands itself free from spaces, forms, weights, time, vibratory frequencies and all limitations. The state of cosmoconsciousness facilitates projections of continuous self-awareness which, in turn, push the consciousness to a better level on the scale of the state of continuous self-awareness.

Continuum. Rational conclusions come to the fore after comparing all the evidence: it becomes extremely difficult to predetermine an exact type of self-induced lucid projection. Lucid projection constitutes a consciential *continuum* or a constant succession of altered consciential states uninterruptedly amalgamating, interpenetrating or alternating themselves.

Phenomenology. All classifications of projectiology phenomena serve only to establish didactic theory for the rational and pedagogic analysis of the subject. This is because, in practice, the consciousness spontaneously surpasses classificatory parameters, no matter how rigid they are. In the analysis of the phenomena of lucid projection it will inevitably be accepted that the consciousness cannot be compartmentalized, insofar as it does not divide itself.

Brain. Another aspect that is important in order to understand projectiological phenomena more accurately is that many sensations or consciential states can occur without the departure of the intraphysical consciousness from its physical seat or, in other words, from the dense brain in the head of the human body. The projective consciential phenomenon only occurs when the consciousness dislocates itself, or projects from its physical seat outward, in this case to the extraphysical dimension, either in the isolated mentalsoma or *inside* the parabrains of the psychosoma.

Phenomena. The following are some consciential phenomena that can occur without the departure of the consciousness from its physical seat: daydream; sleep; dream; color lucid dream; nightmare; hypnagogic state; hypnopompic state; intuition; telepathic mental emission; parapsychic and hypnotic telepathic mental reception; mnemonic occurrences; and hallucinations. However, all these phenomena can also occur when the consciousness is located outside the dense, physical brain.

Bibliography: Delanne (382, p. 175), Vieira (1762, p. 73).

493. CONSCIENTIAL DISLOCATIONS

Definition. Consciential dislocation: the act or effect of the consciousness moving from one location to another.

Synonymy: consciential move.

Types. Consciential dislocations can occur according to the vehicles of manifestation of the consciousness, the environments and the dimensions of life, thereby being: holosomatic, environmental or interdimensional (fig. 493). They can also occur according to the direction or dislocation of the consciousness: centrifugal or centripetal.

Law. It is a basic law of projectiology in relation to the consciousness and its vehicles of manifestation that: the consciousness, regardless of its evolutionary level, always ordinarily manifests through its less evolved consciential vehicle. Every time the consciousness manifests itself through a consciential vehicle other than this less evolved one, it is projecting itself.

Evolution. *Lucid* projection tends to be a more evolved state than the physical, waking state of human or terrestrial life due to this fact. Desomas are the discarding of the less evolved vehicles. Therefore, in theory, they constitute evolutionary advancements by the consciousness.

Action. The consciousness, whether intraphysical or extraphysical, employing the vehicles of manifestation in its dislocation, can act as a projector, communicant consciousness or sensitive consciousness.

Series. The following is a list of 35 possible concepts and generalizations related to consciential dislocations and their consequences. The expression in italics identifies the central aspect of the topic, the core of the issue in the sequence of the development under analysis.

Redundancies. With a view toward enhancing the scope of the study, which is at once broad and didactic, subtle or obvious redundancies were maintained, as they are inevitable in the reiterations of the analyses. Before analyzing the following topics, the reader should arm him/herself with patience and remain in a tranquil environment or holothosene in order not to confuse his/her own thosenes.

1. Not every consciential dislocation is *holosomatic*. It can also be environmental.
2. Not every holosomatic consciential dislocation is *interdimensional*. It can also occur only in a single dimension.
3. Not every consciential dislocation is *environmental*. It can also be holosomatic.
4. Not every consciential dislocation is *interdimensional*. It might only be environmental.
5. Not every environmental consciential dislocation is *interdimensional*. It may be merely environmental change in the same dimension.
6. Not every consciential projection is dimensional change. It may be merely *environmental* (geographic or parageographic) change in the same dimension.
7. Every discoincidence of the vehicles of manifestation of the consciousness is a consciential *projection*.
8. Every discoincidence of the vehicles of manifestation of the intraphysical consciousness is *centrifugal*, in regard to the holosoma (the set of 4 vehicles of consciential manifestation).
9. Every coincidence of the vehicles of manifestation of the intraphysical consciousness is *centripetal*, in regard to the holosoma.
10. Not every discoincidence of the vehicles of manifestation of the consciousness is a consciential projection of the consciousness per se. It may merely be of the *holochakra*, a vehicle that does not transport the consciousness.
11. Every *intraphysical* (human) consciousness projects him/herself in the psychosoma. Nevertheless, the degree of extraphysical lucidity with which he/she is able to manifest him/herself varies.
12. Not every *intraphysical* (human) consciousness projects him/herself in the (isolated) mentalsoma. This occurrence depends upon the level of personal performance.
13. Not every *extraphysical* (human) consciousness projects itself in the (isolated) mentalsoma. This occurrence depends upon the level of personal performance.

CONSCIENTIAL DISLOCATIONS

CONSCIOUSNESSES	HOLOSOMATIC DISCOINCIDENCES	ENVIRONMENTAL DISLOCATIONS
INTRAPHYSICAL:		
1. Projector 2. Communicant 3. Medium	Takeoff: centrifugal Interiorization: centripetal Dislocation: centripetal Beginning: centrifugal End: centripetal	Centrifugal interdimensional departure Centripetal interdimensional return Centrifugal dislocation Remaining in the base-dimension
EXTRAPHYSICAL:		
4. Projector 5. Communicant 6. Medium	Takeoff: centrifugal Interiorization: centripetal Intrusion: centripetal Beginning: centrifugal End: centripetal	Departure: centrifugal Return: centripetal Errantry Remaining in the base-dimension

Figure 493

14. Every *takeoff* of the consciousness, whether intraphysical or extraphysical, that projects itself is centrifugal in relation to the holosoma, whether it is composed of 4, 3 or 2 consciential vehicles.

15. Every departure from the physical base is centrifugal for the projected *intraphysical* consciousness, in relation to the human body.

16. Every departure from the extraphysical base is centrifugal for the projected *extraphysical* consciousness, in relation to the psychosoma.

17. Every interdimensional departure of the projected *intraphysical* consciousness is centrifugal, in relation to the holosoma.

18. Not every interdimensional departure of the projected *extraphysical* consciousness is centrifugal or centripetal. The extraphysical consciousness lives in the condition of errantry within its community.

19. Every interdimensional dislocation of the communicant *intraphysical* consciousness is centrifugal in regard to his/her own holosoma or, in other words, specifically in regard to the *soma*.

20. Not every interdimensional dislocation of the communicant *extraphysical* consciousness is centrifugal or centripetal. The extraphysical consciousness lives in a state of errantry.

21. Every parapsychic *communication* is holosomatic intrusion generated by the communicant consciousness upon the sensitive (consciousness) and its holosoma.

22. Not every intrusion of the communicant *extraphysical* consciousness causes dis coincidence (holosoma) of the sensitive's consciousness, whether an intraphysical or extraphysical consciousness. This fact depends upon the intensity of the intrusion. There is even a process of possession that is specifically mentalsomatic.

23. Not every intrusion of the communicant *intraphysical* consciousness causes the dis coincidence (holosoma) of the sensitive's consciousness, whether an intraphysical or extraphysical consciousness. This fact depends upon the intensity of the intrusion. This is why direct interconsciential exchange is not always trustworthy.

24. Every sensitive, whether an intraphysical or extraphysical being, when executing its function, keeps part of its holosoma in the *base-dimension*, even when the consciousness leaves the state of coincidence of the vehicles of manifestation.

25. Not every *intraphysical* consciousness is able to communicate through a sensitive, whether intraphysical or extraphysical (*extraphysical* parapsychism exists). This occurrence depends upon the level of personal performance. There is even interconsciential intrusion of an intraphysical consciousness upon an extraphysical consciousness.

26. Not every *extraphysical* consciousness is able to communicate through a sensitive, whether an intraphysical or extraphysical being. This occurrence depends upon the level of personal performance.

27. Every parapsychic *communication* is an intrusive process for the sensitive's consciousness, whether an intraphysical or extraphysical being, in regard to the holosoma and, generally, in regard to the intraconsciential micro-universe.

28. Not every parapsychic communication is centripetal for the *extraphysical* communicant consciousness. It can remain in an unalterable condition in regard to this aspect. Even post-desomatic parapsychotics exist.

29. Every parapsychic communication is centrifugal for the *intraphysical* communicant consciousness.

30. Every return to the *physical* base is centripetal for the projected consciousness in regard to the holosoma or, in other words, specifically with regard to the *soma*.

31. Every return to the *extraphysical* base is centripetal for the projected extraphysical consciousness.

32. Not every interdimensional return of the projected *extraphysical* consciousness is centrifugal or centripetal. It can remain in unalterable conditions.

33. Every *interiorization* of the projected consciousness, whether intraphysical or extraphysical, is centripetal in relation to the holosoma or, in other words, in relation to the vehicle in which it is interiorizing itself.

34. Every reoccurrence of the vehicles of manifestation of the consciousness, whether intraphysical or extraphysical, is a consciential interiorization.

35. Every reoccurrence of the vehicles of manifestation of the consciousness is centripetal in relation to the holosoma.

Information. These 35 concepts are not simple word games, but a set of functional information regarding the specific and detailed characterization of personal parapsychic phenomena and those of others.

Occurrences. The analysis of the list allows the lucid projector to more intimately grasp the ideas and better understand the phenomena and consequences of his/her extraphysical experiences during consciential projections, notably regarding the following occurrences and realities: physical base; coincidence; *inter vivos* communications; takeoff; extraphysical disappearances; disincidence; base-dimension; consciential dimensions; errantry; holochakra; holosoma; incorporation; interiorization; extraphysical lucidity; parapsychism; mentalsoma; interconsciential intrusion; extraphysical dimensions; lucid consciential projections; psychosoma; extraphysical beings; volitation; and others.

Exercise. A good intellectual exercise, with the purpose of predisposing the interested individual to produce lucid projection in the isolated mentalsoma, is to look for some omission, illogicality or mistake in this complex list, which can actually be increased.

494. CONSCIENTIAL NOMADISM

Definition. Consciential nomadism: the healthy condition of the consciousness, when lucid and errant, which constantly moves itself from one *locus* to another, in search of experiences that are enriching for its evolution.

Synonymy: condition of the wandering consciousness; consciential errantry; state of the errant consciousness.

Erraticism. Consciential nomadism, within the context of projectiology, is a more evolved condition than projective erraticism or, in other words, the situation of disorientation of the consciousness when projected.

Holomaturity. The abovementioned consciential nomadism does not constitute any pathological disturbance, deviation, straying, disorientation, oversight or aimlessness of the projected consciousness lacking a mental target. On the contrary, it is the result of the holomaturity of the consciousness, which intentionally becomes nomadic, with lucidity, through the powerful impulsion of its own will.

Dimension. The consciousness, per se, does not sleep. The human aura or the person's energetic psychosphere is always in movement and never stops. The extraphysical consciential dimension (energetic dimension) that is immediately adjacent to the human dimension or that of the soma, corresponds to the direct, specific manifestations of the holochakra, in which the human aura is included. This dimension, which is energetic, comprising unstable creations, is suitable for stimulating the movement of the consciousness, its lucid projections and, finally, consciential nomadism.

Evolution. The more evolved the consciousness is, the more errant it becomes, in regard to its lucid, consciential location. The consciousness progresses or educates itself by voluntarily dislocating itself from a situation or type of manifestation in a gradually more intense, uninterrupted, active and productive manner.

Omnipresence. Consciential nomadism suggests that the consciousness does not have – and was essentially not constituted to have – a fixed seat where it would manifest forever. This is the first evidence that the consciousness evolves to a condition of omnipresence that is *less and less relative*, or active and applied. In this case, it is a sectorial, localized, still partial omnipresence in the universe or a semi-omnipresence, always maintaining its individualization intact.

Paramesology. Therefore, the more centered the consciousness is in its *inner* micro-universe, the more decentralized it becomes regarding the *exterior* multidimensional macro-universe where it lives. Its paramesology is amplified in a manner that is still incomprehensible to us.

Instantaneity. The dislocation of the consciousness from one consciential location to another becomes, in a crescendo, increasingly instantaneous or lightning-fast.

Paradox. The condition of serenism of the *serenissimus* (*Homo sapiens serenissimus*), through its characteristic of interdimensionality or multidimensionality, is paradoxical. This is because, according to these evolutionary conjectures, the more evolved the consciousness is, the more nomadic and, at the same time, the more serene it becomes. Imperturbable consciential dislocations occur. Its serenity does not signify inertia, indifference or disinterest, but consciential energetic activity, growth and realization. This makes it so that its address book becomes a large library and its degree of communicability reaches conscientese.

Continuity. The condition of advanced consciential nomadism only occurs after the consciousness reaches a better stage of continuous self-awareness, or continuity of its lucidity in the 3 basic consciential states: extraphysical (intermission), intraphysical (human life) and projected (projections of intraphysical and extraphysical consciousnesses).

Pyramid. Using a metaphor: the consciousness leaves the apex of its *evolutionary pyramid* in order to influence all the angles and sides of the bases of its rearguard. The more evolved it is, the greater the volume of its pyramid and the better the scope (extension and qualification) of the bases of its influence.

Projections. The more infrequent and nonlucid its projections of the consciousness are, the more distant the consciousness will be from the condition of consciential nomadism. The more frequent and lucid its projections of the consciousness are, the closer it will be to the condition of consciential nomadism.

Moksha. The condition of consciential nomadism gradually eliminates the effect of the cycle of successive resomas and desomas, allowing the consciousness to achieve the state of liberation of the multi-existential cycle, the third desoma or *moksha*, the main goal of the objective application of lucid consciential projections. In other words: consciential nomadism is a more practical and efficient instrument by way of which lucid projections annul the necessity of the consciousness to go through resoma.

Productivity. Upon becoming continually lucid and active, the consciousness singularly sophisticates or increases the degree of its productivity, which is far removed from the condition of the bedridden patient (entropies), of the human cadaver (fossilizations) or the *brainwashed* human-robot (repressions).

Condition. It can thus be understood, with reasonable clarity, that all effort tending toward the funneling of the ego, egokarma and groupkarma (egocentrism); submission; shyness; a monastic vocation; a parochial mentality; provincial or backwoods complacency; introversion; monoglotism with low communicability; and superspecialization which tends toward elitism is, basically and strictly speaking, a still very *anti-evolutionary* condition in relation to the real progress of the consciousness.

Avoidances. In light of the above, it is worth making the effort to remain forever alert, avoiding or combating: sectarianism; stagnant traditionalism; the obstinate judgment of corporatism; *nationalistic idolatry*; courtliness (castes); *group narcissism*; *leashes of the ego*, such as class, the orthodox church, race, the strict school, the radical faction and the impassioned club; canine, xenophobic territorial self-defense; religious, political, technical, athletic and sexual intolerance.

Domestication. Consciential nomadism exalts the continuous self-evolution of the person, opening up to fellow beings through mega-universality, impelling the intraphysical consciousness to make political unification of the globe a reality; the defense of ecology and the *omnilateral mind*. For this, it proposes that the person assume the *triangular interaction* of human-animal-plant and, as a social being, propose a *mutual domestication* of human and subhuman intelligence.

Character. Above all, consciential nomadism reaffirms, in a theoretical and definitive manner for the interested individual, the *stateless character of the consciousness* or the compulsory and inevitable inseparability that exists between all beings within evolutive.

XVI – Scientific Perspectives

495. LABORATORY EXPERIMENTS WITH LUCID PROJECTION

Mind. Conventional science abandoned the study of the mind or, more precisely, the consciousness, in the sixteenth century, when the scientific revolution began. There is still strong resistance from the scientific community, and even from human governments, toward acceptance of parapsychic phenomena in general as legitimate objects of research.

Paramind. Psychology, for instance, avoids even using the term *mind*, both *scientifically and euphemistically* (or with a *politically and scientifically correct posture*). When we refer to *mind*, it is only a primary perspective, or that indicative of a *kindergarten level of consciencial evolution*, characteristic of the intraconscial world of the *intrapysical consciousness*. It is not the far more complex perspective of the *extraphysical consciousness*, when free and healthy, and in possession of what can be called the *paramind* or the consciencial micro-universe, which employs the holomemory, paragenetics and the reclaiming of holomaturity without the restrictive influences of the *resomatic funnel* of the holochakra and soma, with which we coexist, in a constrained manner, in human life.

Scientists. All scientists who resist the possibility of researching *mind-matter* (brain-consciousness) *interaction*, find it difficult to confront the facts of projectiology because of an alleged inability to comprehend its mechanism. Scientists are generally busy and do not like to change the way they think.

Case study. However, these same scientists accept the idea of the *gravitational field*, without really understanding how this field works, which even further complicates the interaction of 3 or more bodies; they accept the space-time curvature caused by a physical body, without, in fact, knowing how this occurs.

Methods. According to Charles Fiore, scientific method requires rigorous proof for any new phenomenon. The less common and less orthodox the phenomenon is, the more rigorous the proof should be. This generally means developing a laboratory experiment which, when repeated, regardless of how many times – by any competent researcher, in any laboratory, in any part of the world – produces identical results.

Ease. Standard scientific method is relatively easy to apply in the areas of thermodynamics, atomic physics, organic chemistry and the physical sciences in general. In the cases listed above, the elements under investigation do not have a will of their own, since the relevant external variables, such as temperature, pressure, humidity, composition and other similar variables that are easily identified, measured and controlled, are kept constant and the phenomenon manifests on its own, in the same way, as many times as is necessary to be measured and quantified.

Prospective. The aspects of the reality detected can then be articulated into broad mathematical theories with great powers of prediction (prospective).

Psychology. Of all the sciences, psychology, sociology and economics present the most vague, uncertain and controversial information. The psychological and behavioral sciences present a context which is totally different from the physical sciences.

Control. The control of a certain number of variables becomes extremely problematic. Monkeys, rabbits and rats can be temperamental. The best experimental project can fail because on a certain day a pigeon is not sufficiently hungry to want to get its tasty reward, or a nasal infection makes the hamster incapable of smelling its way through a labyrinth.

Problems. The ability to repeat the experiment indefinitely and the use of statistical techniques is therefore essential in order to satisfy the requirements of scientific method. Nevertheless, psychological phenomena are, in fact, extremely capricious. Furthermore, a plethora of apparently spontaneous,

repetitive, automatic, undirected parapsychic events occur. *Parapsi* phenomena are anomalies in the greatest philosophical sense.

Variables. The thoughts, reactions and general behavior of human beings are made up of a great number of variables – a far greater amount than in subhuman animals – such that it becomes a great deal more difficult to fit them into patterns, identify, control and predict them.

Will. Our will is sometimes recalcitrant, often due to causes that are unknown to ourselves and many others. This represents a problem in all psychological sciences, where the facts under investigation are, in and of themselves, subtle, quick, unconsciously provoked and little understood as much by the human-guinea pig as by the researcher.

Ignorance. Even the greatest amount of patience and the best experimental project cannot always obtain parapsychic results, nor can forecasts of results be made. We know very little about the effective control and precise measurement of the phenomena associated with the consciousness, including indispensable variables such as emotional states and processes of the will, but much can be understood through experiments, cataloging, annotation of commonalities, hypotheses, tests, and the construction of models, theories, theoricity and its evolution.

Impartiality. The scientist must be impartial and therefore does not have the right, without consideration, to refuse to fulfill the obligation of examining any alternative hypothesis that might be able to explain a phenomenon, regardless of its source.

Projection. The most difficult area for humankind to study is the consciousness' survival of biological death, deactivation of the soma or the *theta* phenomenon. Death of the human body constitutes a subject that is difficult to discuss even in an abstract manner. How can we introduce this complex study to the rigidly controlled conditions of the laboratory? Some researchers, nonetheless, now think that there is a process whereby they can do this through projection of the consciousness, or laboratorial minideaths.

Data. In the areas of parapsychology, in general, and those of projectiology, in particular, researchers should not expect to encounter research data in the manner in which they are accustomed, namely instrumental readings, photographs, maps, graphs and charts, together with the greatest possible quantity of statistical support, because we are coming face-to-face with the psyche and the mental world that lies outside the better known parameters and physical laws.

Instruments. Nevertheless, new instruments for detection and analytical study should begin to be built, at least for a part of this research, in the same way that these studies should begin to be compared with existing, known science in general.

Methodology. In order for projective phenomena to be studied, it is necessary to develop adequate research methodology in order for scientists to avoid making the common mistake of believing that the entire range of reality can be studied with the methodology of some of the natural sciences.

Studies. The body of evidential and circumstantial data on lucid projection – which should fit together like pieces of a puzzle – constitutes a fascinating and provoking field of study, for those whose temperament is not offended by the extremely individual nature of the information and who know how to coexist with the ambiguities of the problems, circumstances and occurrences that arise.

Science. In projectiology, one must endeavor to behave in accordance with the elevated ideals of science or, in other words, remain curious about everything that happens in the human consciousness' environment (holothosene), investigating and weighing things, and then calmly, fairly and impartially considering the evidence.

Cosmoethics. On the other hand, science is progressive, does not submit to preconceptions, does not become enslaved to convention, nor does it build walls that impede its investigations, although it must always respect ethics or cosmoethics.

Elimination. In projectiology, it is still necessary to eliminate the 4 most pernicious elements of the *gray area* of human knowledge:

1. **Doubts.** Depressive doubts or those which generate anxiety and insecurity, subsequently provoking compulsion.
2. **Mistakes.** Mistakes, generally of personal and paragenetic origin.
3. **Factiousness.** Sectarian opinions or those characteristic of the *human animal*.
4. **Preconceptions.** Preconceptions (or a priori generalizations) generated by social repressions and *leashes of the ego*.

Specialization. There is a need for specialization in the studies of projectiology that provides ample space for specialized studious individuals, because any research team should be multidisciplinary, as it requires the participation of parapsychologists, sensitives, psychologists, physicists, physicians, illusionists (prestidigitators), librarians, computer operators, technicians, and others.

Discovery. It is necessary to beware of overzealous individuals and those who are easily satisfied, valuing the competent students who have a considerable scientific, technical and professional training, who need to be curious, admiring and eager regarding discovery.

Difficulties. It is clear that countless unknown extraphysical occurrences exist, as well as those which are difficult to interpret and understand. The scarcity of explanations in the reports of lucid projections should be accepted as a fact of the current situation of projectiology in the same way that scientists relate to obscure phenomena, such as the experiences of Albert Abraham Michelson (1852-1931) and Edward Williams Morley (1838-1923); the fact of the energy quantum; and many others. The phenomenon itself requires an explanation and, for this reason alone, it is not possible to affirm its non-existence.

Processes. There are 2 general experimental processes regarding lucid projections:

1. **External.** The external method or that of objective, laboratorial and heteropsychic verification.
2. **Internal.** The internal method or that of subjective, individual and self-psychic experimentation.

Training. After dedicating him/herself to arduous training, the researcher becomes his/her own disciple, acquiring firsthand experience (projectiologist-projectionist). Lucid projections have been scientifically demonstrated in the laboratory.

Personalities. There are 4 types of distinct personalities involved in projectiology experiments:

1. **General.** The experimenters in general.
2. **Laboratorial.** The laboratorial projectors.
3. **Participative.** The participative researcher-projectors.
4. **Independent.** The independent projectors with individual experiences.

Motivation. One of the most powerful and convenient motivating factors encountered among those who dedicate themselves to laboratorial self-research with the lucid projection experience is precisely the laboratorial, prior, personal, participatory and nontransferable self-experience of a reasonably lucid, spontaneous consensual projection provoked by psychedelic drugs or a personal method. It may have been a single projection or one in a series, but is an incontestable fact for the individual. This will have indelibly been impressed upon the individual's rationality, self-discernment and memory, upon becoming a lucid consensual projector, or self-aware sensitive by him/herself.

Examples. Among the experimenters who have personally executed participatory research – the evidencing of facts through some type of lucid projection self-experience – the following 9 persons can be given as examples: Raymond Bayless (95, p. 153); Susan (“Sue”) J. Blackmore (139, p. 1); Barbara B. Brown (211, p. 213); Hereward Hubert Lavington Carrington: 1880-1958 (249, p. 22); Michael Grosso (650, p. 188); Stuart Keith (“Blue”) Harary (Rogo, 1446, p. 170); Andrija Karl Puharich (Black, 137, p. 159); D. Scott Rogo (1446, p. 170); William (“Bill”) George Roll Jr. (Ashby, 58, p. 5). Apart from these, there are dozens of other researchers who have directed experimental parapsychic sessions, or even those of a philosophical and/or religious nature.

Understanding. If other researchers were able to learn to induce lucid consciential projections by themselves, in self-experiences – thereby avoiding the use of drugs, which distort both physical and extraphysical perceptions – they would be able to obtain better conditions for understanding the projectiological phenomenon for themselves.

Demand. Some of the above-named scientists, as well as many others, have been convinced of the reality of the experience of the consciousness outside the human body. Their dilemma continues to be extremely real and perturbing, as it is almost impracticable to satisfy the demands of their colleagues, in terms of the controlled laboratorial proof of projectiological experimentation, due to its parapsychic or multidimensional nature.

Drugs. Some experimenters have been solely inducing forced consciential experiences using light or heavy, legal or illegal drugs. This masks or jeopardizes their capacity to judge the projective phenomena critically. This posture generates false or erroneous conclusions regarding the phenomena that are restricted to the consciential area of classic, human or common psychology. Any type of drug – or consciential experiences forced in an extreme manner by pharmacological agents – does not always favor the development of projectiological research, due to the natural confusion that is established in the mind of those who experience these lucid projections and later analyze them.

Permanence. Laboratorial research, coupled with the psychophysiological experiences of the consciousness outside the body, within the constellation of projectiology phenomena, will now gain a permanent status. This will be structured in accordance with an obligation to the truth – in the judicious adoption of a position that is devoid of radicalism, with an emphasis upon a convergence of proofs, and in laborious investigation resulting from team effort – as will be seen in the next chapters, in which laboratory experiments are related.

Summaries. In each of the 6 chapters presented further ahead, which bring together the main laboratory experiments thus far performed with lucid projection, the following basic data have been emphasized: research object; researcher; location; institution; date; sensitive; personal data; experimental conditions; auxiliary equipment; time; duration; number of attempts; targets; findings; comparative percentages; conclusions; working hypotheses; and specialized bibliography.

496. SEVEN MINUTES IN ETERNITY

Period. William (“Bill”) Dudley Pelley, a North American writer and journalist, had been secluded with a large stock of provisions for several days in early May, 1928 in the tranquility of a cottage on his property in Altadena, California, for the exclusive purpose of writing a book.

Scenario. The property was located close to Pasadena, tucked away at the base of the Sierra Madre Mountains. The bedroom, situated at the back of the house, was quite well ventilated with two immense windows facing the mountains.

Occupation. The intellectual work proceeded normally and he was about to complete it. He felt himself to be both mentally and physically in good shape, writing 6 to 8 hours a day and enjoying outdoor recreation. He was alone, except for his dog Laska. One night, like any other, he went to bed

at about 10 o'clock and began to read an interesting study on ethnology, a typical type of leisure reading for him.

Moment. At about midnight, Pelley felt sleepy. He put the book down, took off his glasses and turned off the bedside lamp, following a routine identical to that of hundreds of other nights spent in the tranquility of that isolated place. Laska slept curled up on the floor at the foot of the bed, its favorite spot.

Habits. Pelley did not recall having any specific dream, physical disturbance or insomnia during the first half of that night. He was not in the habit of drinking alcohol, but had been a moderate pipe smoker for the previous two decades, the pipe being an item that was always with him at the typewriter.

Scream. However, between 3 and 4 o'clock in the morning – a time that was later verified – a sharp, internal and frightful scream, commanded by his sleepy consciousness, abruptly came from his throat. Horrified, and in desperation, he moaned to himself, "I am dying! I am dying!"

Sensation. What actually happened to him at that moment he never knew. Some mysterious instinct had mercilessly interrupted his sleep, awakening him with that desperate admonition. Certainly something very serious had happened to him – something that had never occurred to him in his entire life – a physical sensation that he, as a professional writer, was able to describe, in every detail, as being a combination of a heart attack and apoplexy.

Beginning. It was a physical sensation. It was not a dream. He felt entirely awake and lucid. He knew that something had occurred with either his heart or his head – or maybe both – during sleep. His conscious personality was battling forces over which he had no control.

Recollections. He recalled that the phenomenon had begun when he lay down on the bed in the dark bedroom in that cottage in California, whereupon he was dragged to the depths of a cold, blue space with a sensation of endless descent, as though he was succumbing to the effects of anesthetic ether. Strange sounds rang out in his ears. Suddenly, a single thought curiously predominated as he continued to fall, "So, is this death?"

Laska. In the interval between the sharp attack and the end of his descent, he was in sufficient control of his physical senses to think, "My dead body will remain in this isolated house for many days before someone discovers it, unless Laska wakes up and looks for help."

Voice. At one point, a calm, clear, friendly voice whispered into his ear, "Calm down, my friend. Don't worry. You're all right. We're here to help you."

Extraphysical consciousnesses. Someone was helping him – actually two extraphysical consciousnesses – one with its right extraphysical hand at the nape of his neck, and another with its arm under his knees. He remained physically weak, unable to even open his eyes, because a sparkling opaque light was diffused throughout the place where they had taken him.

Dialogue. When Pelley finally regained control of himself, he discovered that he had been *reborn* over a beautiful marble slab, and had come to rest, nude, in front of 2 physically vigorous, apparently friendly youths in white linen uniforms. Both were discreetly amused by his confusion and obvious vexation. The taller one asked, "So, are you feeling better?" He answered, "Yes. Where am I?"

Question. They exchanged glances and merely responded that he should not try to perceive anything in the next 7 minutes. Pelley felt that his question could not be more ridiculous. He knew what had happened. He had gone through all the sensations of death and had appeared in a fascinating place where he had never been before.

Ecstasy. In his new state, he felt an indescribable mental and physical ecstasy. He knew that he was not dreaming. He felt he was alive and among many other intensely alive personalities. He had come with a type of personal body suitable for the new environment, through which he was aware of the beauty and enchantment of the surroundings, that surpassed any descriptions written

by humankind. He perceived that he knew those two creatures intimately. His extraphysical experience continued to progress.

Experiences. There was a pool off to one side in which they recommended that he enjoy himself. Upon swimming in the apparently clean water, it seemed that the water itself clothed the nude body. Other extraphysical consciousnesses now appeared. He had the feeling that he had personally and intimately known each one of these enchanting beings at some time in the past. All prior feelings of terror and unfamiliarity had now disappeared completely.

Return. The conclusion of his experience was as unique as its beginning. He felt overcome by a sudden whirlpool of bluish vapor, arising from an unknown source, and something cracked inside his body. He instantly felt himself to be back in his human body, seated on the bed and completely awake. He noted only a certain physical exhaustion throughout the thorax and abdomen that lasted for some minutes. He then shouted, “That was not a dream!”

Dog. His voice awakened the sleeping dog.

Article. At first, this journalistic writer was very reluctant to write and publish his profound personal experience, for which he could be taken to be an eccentric or a lunatic. He had never performed any parapsychic research. Reporting the event could even affect his solid literary reputation. Nevertheless, the editors of *The American Magazine*, in New York, overcame his resistance and the work was written, still under protest, and went public as the first article in the magazine in March, 1929.

Reaction. At that time, the magazine’s circulation was approximately 2,225,000. The magazine’s advertisers calculated that, each issue being read by at least 4 people, a total of approximately 10,000,000 readers had had access to the report, if the majority of those people had actually read it. This fact was later confirmed due to the overwhelming number of letters received in response. Thousands upon thousands of individuals requested further clarification on his extraordinary experience.

Letters. Over a 6-month period, the writer qualified, analyzed, classified and answered the plethora of letters. Impressively, only 24 respondents did not believe that Pelley was healthy or normal. Many hundreds of readers affirmed that they had had similar experiences with the consciousness outside the human body. The majority, however, did not have the courage to relate the occurrences even to their close relatives, as they were fearful of being considered insane.

Verification. Pelley verified that the majority of the respondents had had experiences that were substantially identical to his in their basic elements. The magazine received the texts of 144 sermons that had been given by religious leaders to the public on the experience in question. The article was published in countless religious and theological periodicals. Of all the pastors, only one accused him of “having sold his soul to the devil,” because his article did not mention Jesus Christ.

Pioneer. Suddenly becoming a celebrity with the article, Pelley was aware of having, in a certain strange manner, acquired new senses or prodigious perceptive faculties. This man who was a declared materialist, now felt like a pioneer of human consciousness research. During the same year of 1929, he wrote the small volume: *Seven Minutes in Eternity with their Aftermath*.

Bozzano. Professor Ernesto Bozzano – the indefatigable Italian researcher of animic and parapsychic phenomena, to which he dedicated himself for approximately 50 years – presented Pelley’s account as Case N. 4 in one of his dozens of monographs: *Xenoglossy – Polyglot Mediumship*. The publishing house of the Brazilian Spiritist Federation released his book in Rio de Janeiro, faithfully translated to Portuguese by Guillon Ribeiro, in 1933, some time after the occurrence.

Crookall. The prolific English scientist, paleobotanist and author Dr. Robert Crookall, presented Pelley’s account as Case N. 92 in his highly significant work, *The Study and Practice of Astral Projection*, published in London in 1960 and in New York in 1966. The case is included in the section of the book dedicated to the analysis of natural, or non-forced, out-of-body experiences.

Today. The facts under analysis here span 7 decades. Now, as the twentieth century draws to a close, in many countries and through a substantial amount of research, the phenomena of projectiology – especially impelled by near-death experiences, thanatology or desomatics, transpersonal psychology and lucid dream research – receive profound interest from eminent scientists in diverse areas, even in interdisciplinary fields.

Arguments. Research pertaining to experiences of the consciousness outside the human body is currently among the main arguments that most contribute toward scientifically and irrefutably evidencing the multiple dimensions of life and the multiple vehicles of the consciousness.

Freedom. Above all, one thing is currently incontestable: one can openly speak about human consciential projection, even by way of the greatest vehicles of mass communication, without worrying about being insane or considered ridiculous by various types of public.

Facts. The facts continue to speak for themselves. The 254 bibliographic sources on lucid projection cataloged by Professor Ernesto Bozzano over the course of 5 decades, grew to 838 cases meticulously analyzed by Dr. Robert Crookall over 3 decades. According to the archives of the author this has currently reached 5,116 diverse bibliographical sources, from 37 countries, in 20 different languages, as listed in the book, *700 Conscientiology Experiments*. It can be seen that projectiology and desomatics are now being developed on a firm footing. The only people who have not yet noted this fact are those who are out of touch with or uninformed regarding international scientific research.

3. **PELLEY, William Dudley;** *Seven Minutes in Eternity with their Aftermath*; Autobiography; 58 pp.; illus.; 17 X 12 cm; hb.; New York; Robert Collier; 1929; pp. 1-58.

497. BRAIN WAVE PATTERNS

Projector. One of the classic experiments with lucid projection was performed by Charles Theodore Tart (1661, p. 3) in 1966 with a young projector, a young single woman, little more than 20 years of age, identified only by the pseudonym of “Miss Z.” This experiment was conducted with the objective of demonstrating whether consciential projection could be produced in a laboratory, in this case at the University of California at Davis, USA.

Conditions. On 4 non-consecutive nights, Miss Z reclined on a comfortable bed in the sleep laboratory, making herself available for rigorous experimentation. In order to obtain the profile of all of her physiological changes, she was confined during the experiments – not being able to move from the dorsal position – with electrodes on different points of the head, hands and face, connected by cables to a battery of registering and measuring instruments that monitored: her brain wave patterns (EEG), involuntary synchronous rapid eye movements (REM), her basal skin resistance (BSR), galvanic skin resistance (GSR), heart rate and blood pressure (digital photoplethysmograph).

Room. Two types of multi-channel polygraph machines – Grass and Sanborn – were installed and were completely isolated in the next room, like mechanical sleep monitors, along with an intercom, which allowed the operator to communicate with the projector.

Target. The experimenter chose one 5-digit number at random (a different one each night) from a mathematical table of random numbers. He wrote the number, 2” (5 cm) high, on a small piece

of paper. He then hid this on a shelf that was almost 5' (1.5 m) above the young woman's head, thus not allowing her to see the card with the number. She was instructed to sleep well and attempt to read the 5-digit number – her mental target – during a projection of her consciousness or, in other words, a projection of her self or the seat of her lucidity and elaboration of thought.

Findings. From the second to the fourth night, Miss Z reported having seen the wall clock over the shelf while floating outside the human body, which could not have been consulted from where she was, on the bed. She indicated the time shown by the hands of the clock to be precisely the time at which the equipment and polygraphs incontestably demonstrated unique, strange brainwave patterns obtained through the 2 frontal-to-vertex and vertex-to-occipital circuits, and the absence of involuntary rapid synchronous bi-ocular movements that accompany dreams.

Identification. On the fourth and last night, the projector accurately reported the hidden target-number: 25132.

Details. The researcher paid such attention to detail that, in anticipation of refutation by skeptics, he posed the hypothesis, which could not be discarded, that the sensitive could have seen the number reflected in the wall clock's black plastic casing, but he did not believe that this had occurred.

Results. The positive results of the experiment highlighted the brainwave patterns that had appeared with diverse flat, plane or straight-lined characteristics on the electroencephalogram and with accentuated alpha activity, when Miss Z reported that she had been outside her human body. The lack of eye movements shows that the lucid consciencial projection is not merely an impression, or a simple autosuggestion or dream, but is a specific state of consciousness, different from the familiar stages of sleep, dream, somnolence and other altered states of consciousness, even the ordinary, physical waking state.

498. EXTRAPHYSICAL IDENTIFICATION OF AWAKE PERSONS

Projector. Between September, 1965 and August, 1966, a researcher, Charles Theodore Tart (1662, p. 251), requested on 8 occasions that author, inventor, businessman and projector Robert A. Monroe, produce lucid projections while connected to various types of equipment for measuring physiological functions in the Electroencephalograph Laboratory in the School of Medicine at the University of Virginia, USA.

Conditions. The conditions in the laboratory were not comfortable. A wooden cot – upon which he was to lie, remaining shirtless, dressed only in pants – with a sheet and a pillow, were set up in the semi-dark recording room. He was restricted by connections to the electroencephalograph (EEG) to measure his brainwaves, to an electrocardiogram (EKG) to monitor his heart rate and an electrooculograph (EOG) to measure his involuntary eye movements. The electrodes clipped to his ears caused discomfort and pulsation in the ears, making physical and mental relaxation difficult.

Target. The projector was requested to endeavor to direct his movements during exteriorization to the next room, not only in order to observe the activities of the technician who was monitoring the equipment, but also in order to attempt to read a 5-digit target-number that had been placed on a shelf 6'6" (2 m) above the floor.

Results. On the first 7 nights that he attempted to produce a lucid projection, Monroe did not meet with much success. On the eighth night he was able to produce two brief lateral departures of the consciousness. In the first brief projection, he witnessed some unknown persons talking to each other in an unknown location and was not able to verify whether or not this had been a real perception of occurrences at a distance. In the second brief projection, Monroe did not see the target-number in the next room because he was not able to control his movements. He did, however, correctly describe the female laboratory technician, who was outside the room in the corridor with a man who was later identified as her husband.

Findings. The two brief lucid projections occurred together with what are classified as Stage 1 brainwaves – the brainwave pattern that usually occurs in natural sleep with dreams – and some involuntary rapid bi-ocular movements. His heart rate remained between 65 and 75 beats per minute. The bi-ocular movements were not as rapid as is generally the case during normal sleep. The consciencial projections occurred almost immediately after the consciencial projector had gone to lie on his bunk, which is extremely rare, because Stage 1 natural sleep occurs after the sleeper has already had 80 to 90 minutes of dreamless sleep.

Conclusions. The experimental result was considered to be quite encouraging, given that it was one of the first attempts to scientifically produce and analyze the complex lucid consciencial projection phenomenon in the laboratory.

499. VISION OUTSIDE THE HUMAN BODY

Projector. The out-of-body vision phenomenon was studied 2 to 3 days a week over many months in 1972 in research conducted by Janet Lee Mitchell, a researcher at the American Society for Psychical Research (ASPR) in New York, NY, USA, and Karlis Osis (1917-). The research subject in these experiments was Ingo Swann, a surrealist painter and writer in his forties, and a clairvoyant with an outgoing personality. Remote viewing or traveling clairvoyance was also studied in these experiments. This is a phenomenon in which the brain of the sensitive is not totally emptied of the consciousness, as occurs during a classic projection in the psychosoma wherein the projector's consciousness is separated to a great degree and has no direct contact with the human body, except for the vital connection of the silver cord (holochakrology).

Conditions. The experiments were conducted during the day, with the clairvoyant seated, completely awake and aware. Electrodes were attached to his scalp, on his left and right occipital lobes, where vision is structured. There was a modern polygraph machine in the next room, thus controlling his movements during the entire period he was in the room.

Target. The immediate target area that the sensitive was to describe was located about 11'6" (3.5 m) above the floor in the room where he would sit. It was placed on a suspended platform that could only be seen when very close to the ceiling. The door was locked. The sensitive, who would enter the room precisely when the experiment began, was to see the target-objects, verbally describe them and subsequently draw them.

Results. The results of the experiments were entirely satisfactory. Swann's exterior vision seemed capable of perceiving more than his normal vision, such as seeing the forms of certain

rays of light, ionization of the air with changes in luminous sources and reflections off shiny surfaces.

Details. The repeated experiments demonstrated that the clairvoyant generally seems to perceive the primary colors of paintings or drawings more clearly. Familiar forms seem to be identified with greater ease than unfamiliar forms and objects. Materials such as leather, fabric and ceramic seem to be more perceptible to clairvoyance than plastic, shiny paper or glass.

Judgment. A series of 8 different targets was used to evaluate the projectability of Swann's conscious vision by his describing the objects hidden in the suspended box. His drawings and transcribed verbal descriptions were all mixed together with the real target-objects, and a psychologist, who served as an independent judge, was asked to match the drawings to the target-objects. The judge correctly matched all 8 drawings with their respective target-objects. This result is so highly improbable that it could only happen, at random, in less than 1 in 40,000 attempts, which readily attests to the projective component of Swann's viewing.

Brain. The electroencephalograph readings of both of Swann's cerebral hemispheres were studied. During the periods in which the clairvoyant affirmed that his vision was outside the human body, there was a drop in electrical activity and some more rapid brain wave impulses appeared in the visual areas of his brain's occipital region. The drop in alpha activity during the state outside of the human body was more evident in the right cerebral hemisphere than in the left. All other organic functions remained normal.

500. WILLFUL FLIGHT EXPERIMENT

Flight. In January, 1973, Karlis Osis, a parapsychologist, executed the experimental fly-in project, or the out-of-body experiment wherein volunteer projectors would *fly* into the building of the American Society for Psychical Research (ASPR), in New York. The project began with a general summons, throughout the entire United States, to those individuals who felt they could project, at will, from where they were to that Manhattan address.

Target. A small office on the fourth floor of the building of the institution was adapted in order to serve as the target-area for about 100 projectors, selected from a large number of volunteers who came forward. These people were informed where to project and, upon arriving, that they were to view 4 unrevealed target-objects which were later displayed in front of a fireplace. These objects were to be viewed at a predetermined time and in a specific position and angle of observation.

Devices. Considering that the direction of vision would be a key problem in the research, 2 optical instruments were used in the experiment: the Optical Image Device and the Color Wheel. Each of them had a small viewing window, the only opening through which the entire target could be seen. In the Optical Image Device, for example, which exhibited different images plus the different colors of the 4 quadrants, the final image was formed using black and white shapes, a color wheel and a series of mirrors. These optical instruments were created in order to eliminate the use of clairvoyance and telepathy. The projected consciousness that claimed to have perceived from a certain point in space should be able to see the target as it appeared through the viewing window, with the *stimulus figure* distorted by optical illusions.

Reports. After the experience, the projector was asked to report what had been observed in detail, according to a preestablished questionnaire, also producing, when possible, drawings and layouts of the location and the objects, either by mail or over the phone.

Percentage. After examining all the reports, it was clear that the experiment had not achieved total success. Only 15% of the *flying* participants were able to give convincing evidence that their consciousnesses (or rather: they themselves) had actually visited the ASPR office through some extraphysical process or vehicle.

Detours. Among the errors noted, certain detours made by lost projected projectors not able to reach the target-area deserve attention. A projector from Toronto, Canada reported interrupting the excursion in order to watch a fire on a nearby block. An extraphysical visitor described commonplace activities that had been occurring on the first floor of the ASPR building, as well as the time that had been wasted by watching many people preparing an art exhibit. Another projectionist affirmed having entered an apartment in a building across the street and having enjoyed silently observing its occupants.

Details. Some projectors had a distorted perception of the size of the target-objects. Others experienced a circular or global vision of things, seeing in all directions at the same time. The barrier placed on the table to divide and block the target-objects was perceived as being transparent by the consciousness of many narrators.

Cup. Among the volunteers who had showed that they had actually been in the target-place, one sensitive, Alexander Tanous, reported that his consciousness had left Portland, Maine many times during the experiment. He not only correctly identified the collection of objects on the round coffee table, the main programmed task, but also indicated the presence of an out-of-place cup of tea, left there due to the oversight of another researcher.

Plant. Another sensitive, Elwood Babbitt, reported that he had *flown* from his house in Wendell, Massachusetts and had reached the target-place on the third attempt, correctly describing it. This projector later drew a wide floor plan of the right side of the back of the office. It included a picture hanging on a wall and a certain plastic figure of a smiling little girl placed at the right side of the target-table.

Statuette. The figure of the smiling girl added a special dimension to the experiment. The researcher, Karlis Osis, had secretly contracted an artist to sculpt a double figure. The statuette appeared to be one thing, when seen from the front, the face of the smiling Venus, and something completely different, when seen from behind or, in other words, a *reclining chair*; in the place of the hair on the head and nape of the Venus. Babbitt saw the face of the statuette and did not see the recliner. This actually could not have been seen from the door from where he affirmed that he had been looking.

Discovery. Teddy Marmoreo, the projector from Toronto, was projected on a certain night, making a *extraphysical advance visit* (anticipatory excursion), investigating the environment ahead of schedule in order to familiarize himself with the target-area. On this occasion he saw Karlis Osis sleeping in the empty ASPR building, which was confirmed by the researcher.

Observations. The experiments showed the same results whether the physical body (soma) of the projector remained seated or lying down; or when the consciousness manifested in an extraphysical body or when it did not sense having any body at all, the condition of a projection in the mentalsoma, the parabody of self-discernment.

Successes. Most good experiments, when the observations were more obvious and conclusive, presented these characteristics: the consciousness did not remain lucid during the entire period of extraphysical exteriorization; the consciousness of the reporter arrived at the destination suddenly, landed right in the office and described the vision as clearly as if the person was, in fact, producing a trip outside the human body.

Failures. The experiment always failed in the following cases: when the sensitive reported having left the physical body slowly and with difficulty; when the consciousness remained lucid during the entire takeoff while leaving the physical body; when one experienced a long flight through space or seemed to be using a vehicle; and when one did not land in the chosen location or did not even find it.

Clairvoyance. The experiences showed that certain sensitives simultaneously felt aware in their physical bases and the ASPR office, which indicated the occurrence of the phenomenon of simple traveling clairvoyance and not an integral lucid consciential projection.

Instruments. Incidentally, researchers now have precise equipment that allows them to perfectly distinguish remote clairvoyance and the phenomenon of telepathy from genuine lucid projection of the consciousness from the human body. For this purpose, targets are placed inside a special box constructed such that they will become visible only when seen through a small viewing window set into one of the sides of the box.

Information. However, according to the same researcher, the results were generally not significant because even the best consciential projectors often saw or described objects in terms of their shapes and colors, and not specific material things with their precise names. Nevertheless, the experiment served to demonstrate the experimenter's hypothesis that the process of acquiring information during the state of lucid projection differs from that of ordinary extrasensory perception.

Brazilians. The Center for Continuous Consciousness, in Rio de Janeiro, Brazil, an institution of parapsychic research that existed prior to the International Institute of Projectology and Conscientiology, applied the fly-in process over a period of months in the 1980's. Only 3 Brazilian consciential projectors were able to incontestably identify the objects, which were always maintained secret and were changed periodically. During this period, they were located in a room, in a building on Visconde de Pirajá Street, Ipanema district, at the consistently established time of one o'clock in the morning.

501. ANIMAL-DETECTORS OF THE PROJECTED CONSCIOUSNESS

Spirit. Among the laboratory experiments performed on lucid projection, it is worth singling out the projects performed in 1977 by the American researcher Robert ("Bob") Lyle Morris. On that occasion, Morris used Stuart Keith ("Blue") Harary, then a psychology student at Duke University, in the United States, as a research subject. The team, hypothesizing the psychic sensitivity of subhuman animals, tested Harary's 2-month-old kitten, named Spirit.

Cage. The kitten was placed in a cage, the floor of which measured 30" x 80" (76 cm x 203 cm). It was divided into 24 numbered 10-inch (25 cm) squares, over which the animal was obliged to circulate.

Observations. All of the activities of the animal were observed during 2 preliminary periods, followed by 2 experimental periods of 2 minutes each, 1 during a lucid projection and the other during an occasion in which the projector was awake and speaking with the researchers.

Squares. The kitten was monitored using a synchronized clock. Its activity was determined by counting the number of squares over which it moved, thus determining whether or not it could detect the physical-extraphysical presence of the visiting projected projector's consciousness.

Equipment. The sensitive-projector, Stuart Harary, remained in a laboratory of the University of California at Santa Barbara, surrounded by equipment for monitoring his psychophysiological changes, including: an EEG (brain), an EOG (eyes), and an EMG (chin), his respiration, a digital plethysmograph and measurement of the electrical resistance of his skin.

Detection. In order to detect the presence of the projected projector, many other instruments were also used to measure the intensity of the electromagnetic field, the magnetic permeability of the

circulating air. Oscilloscopes, thermometers, photomultiplier tubes and a spectrometer were used, in order to measure changes in the energy patterns of the target-area visited by the projector's consciousness or "incorporeal self" (ego).

Indications. The experiments worked splendidly, in regard to the use of all the instrumentation, intended to allow external incontrovertible indications that could fully demonstrate the occurrences.

Behavior. During the experimental period of the projection, the kitten behaved in a passive manner, remaining calm, without meowing, as though it were seeing or perceiving Harary's physical presence. When Harary was not projected, Spirit was constantly trying to get out of the animal activity board and mewed 37 times, but during the lucid projection period, the kitten became calm and did not mew even once.

Results. It was concluded that there was less than a 100:1 possibility of these results occurring by chance. In other words, the results suggested a *parapsi interaction* between the animal and the projected consciousness of the student.

Imagination. At another point, Harary was asked to perform a *false projection*, in which he would endeavor to create the mental images he usually associated with the *real projection* of visiting the kitten, including images of playing with the animal, petting it and getting its attention.

Effects. This other experience demonstrated that merely thinking about and imagining scenarios with the animal did not provoke any of the effects that had occurred during the lucid projection.

Telepathy. The imaginary experience excluded the possibility of simple telepathy having occurred, or another essential parapsychic phenomenon or concomitant phenomenon having taken place between the projector and the subhuman animal. It did, however, indicate something more substantial, namely the production of a projection of the lucid consciousness from the human body in another consensual dimension.

Affinity. Later tests with a hamster (cricetid, gerbil) and a snake did not present the same positive results as those which had occurred with the clairvoyant kitten. According to Morris, the affinity between Harary and his kitten Spirit, actually a pioneer animal-sensitive, a true hero of experimental science, helped the laboratorial proof, which did not occur with the other animals, with which the student had no affinity.

Communication. This experience was very important based on the fact that, for the first time on the entire planet, psychic communication between a human being and an animal had been consistently demonstrated in a strictly controlled laboratory experiment.

Bibliography: Baumann (93, p. 110), Black (137, p. 74), Blackmore (139, p. 220; 146, p. 5), Bowles (182, p. 48), Currie (354, p. 88), Digest (399, p. 278), Douglas (409, p. 332), Ebon (453, p. 86), Eysenck (493, p. 158), Fiore (517, p. 165), Giovetti (593, p. 25), Globo (602, p. 17), Grattan-Guinness (626, p. 83), Greenhouse (636, p. 295), Hintze (726, p. 96), Holroyd (737, p. 101), Krippner (861, p. 150), Mishlove (1055, p. 135), Morris (1089, p. 2; 1090, p. 8; 1092, p. 55), Pisani (1248, p. 128), Rogo (1439, p. 57), Salley (1496, p. 162), Stokes (1625, p. 23), Targ (1651, p. 154), Vieira (1762, p. 20).

502. KINETIC EFFECTS OF THE PROJECTED CONSCIOUSNESS

Tests. In 1979, Karlis Osis and Donna L. McCormick, at the American Society for Psychical Research in New York, researched the kinetic effects of the ostensive position of the consciousness in projections from the human body by using perception tests.

Conditions. The team used a system of control and automatic register, containing sensors placed inside a sealed chamber that were capable of detecting the physical presence of the projector-observer's psychosoma projected from the human body. Alexander Tanous was the projector in this experiment.

Target. During this projection, the projector was to provide extrasensorially perceived information about a figure that was produced at random by a special optical system inside the shielded chamber.

Results. The experiment consisted of 197 attempts, resulting in 114 hits and 83 misses, during 20 sessions. This indicated the presence of *something*, in this case, the kinetic effects of the psychosoma's presence between the sensors in the shielded chamber every time the projected projector was able to correctly describe the figure selected by the *optical image device*.

Conclusions. Lucid projection experiments are the same as some research performed on personality theory: they neither conclusively prove nor invalidate the basic concepts of the theory, but can reinforce or weaken them. The results of this experiment decisively reaffirmed the validity of the working hypothesis of the location of the consciousness outside the human body (extrasomatic) during lucid projections.

Photography. It is to be hoped that, in the future, the psychosoma of the projector, while projected from the human body, will be photographed by an ultra-sensitive camera at the precise moment that its presence is perceived by the activation of sensors in the sealed chamber.

503. PHYSIOLOGY OF THE PROJECTIVE STATE

Definition. Projective state: the set of conditions in which the human organism remains during the entire period of the lucid projection of the intraphysical consciousness from the physical body or soma.

Synonymy: extracorporeal state; mescalinic destiny; OBE state; OOB state (out-of-body state); projective condition; psychedelic condition; state of unfolding.

Physiology. The initial observations with respect to the physiological performance of the human organism during the lucid projection of the consciousness – an activity of the individual that is also physiological or non-pathological – are beginning to emerge subsequent to pioneering experiments with self-induced projections in laboratories.

Brain. Electroencephalograph recordings have shown that a decrease in the electrical activity of the brain occurs during lucid projection.

Hemisphere. The aforementioned decrease in cerebral electrical activity is most pronounced in the right cerebral hemisphere, together with acceleration of the brainwave patterns in the visual areas of the occipital lobe of the lucid projector's physical brain.

Information. The processes of the right cerebral hemisphere suggest that these same processes are involved in the mechanism of acquisition of extraphysical information by the projected intraphysical consciousness.

Sleep. The projective state differs from that of natural or delta sleep, according to the various measurements taken with laboratory equipment.

REM. Electrooculogram recordings have verified that involuntary, synchronous, rapid, bi-ocular movements (REMs) greatly diminish or even cease during lucid projection.

Myology. According to various physiological verifications, including basal skin response (BSR) and galvanic skin response (GSR) readings, a reduction in *muscle tonus* occurs in the human body of the projector during lucid projection.

Frequency. The supposition that a lowering of cardiac frequency is a predisposing factor toward lucid consciential projections, as affirmed by diverse projectors, has still to be confirmed by

electrocardiograph and blood volume (digital photoplethysmograph) measurements of the physical body of the projected projector.

Discoincidence. Ganzfeld stimulation (“entire field”), a state of profound progressive muscular self-relaxation, mental concentration, physical stress and psychophysical shock can trigger or precipitate the lucid consciential projection process. This induction is apparently caused by a lack of proprioceptive feedback from the muscles and motor system of the human organism, as well as a general paralysis of the motor system and a decrease in respiratory frequency, which results in discoincidence of the vehicles of manifestation of the intraphysical consciousness.

Conquest. The consciential condition of lucid projection, or the projective condition, is common to both the intraphysical consciousness and the extraphysical consciousness. After their productive, voluntary provocation, lucid projections will always continue as a personal, inalienable conquest of the aware consciousness.

Desomatics. According to extraphysical observations, the intraphysical consciousness accustomed to having lucid projections – even if they are only in the psychosoma – will, after the biological shock of desoma (final projection), be predisposed and apt to produce lucid paraprojections in the mentalsoma. Conclusion: the individual who begins to produce fully lucid consciential projections will not stop having these experiences, either as an intraphysical consciousness or as an extraphysical consciousness.

Psychosoma. From the foregoing we may infer that there is also a *parapsychophysiology* of the extraphysical consciousness’ paraprojective state. In this case, parapsychophysiology refers to the psychosoma of the extraphysical consciousness, when it finds itself in the paraprojective state.

Seats. Strictly speaking, the projective state refers to two separate parts, or consciential seats, of the set of vehicles of manifestation of the consciousness:

1. **Full.** The *full* (inhabited) seat where the consciousness is located at any given moment or, in other words, the parabrains of the psychosoma (extraphysical dimension), or the mentalsoma (mentalsomatic dimension), relative to the paraprojective state.

2. **Empty.** The *empty* (vacant) seat left behind, in this physical dimension, by the intraphysical consciousness in the act of projecting or, in other words, the condition of the brain of the human body emptied of the consciousness, which finds itself projected; or even, the empty brain also accompanied by the *empty parabrains* (of the psychosoma), relative to the projective state.

Projected. The projective state relative to the full seat of the consciousness constitutes 1 of 3 basic states of the consciousness (conscientiology): the desomatic state, the resomatic state and the projected state. The *projected state* can be divided into the intraphysical consciousness’ projected state and the extraphysical consciousness’ projected state.

Methods. In addition to the laboratorial experimental procedures relative to human consciential projections that have been analyzed in this section up to this point, and better than all the projectiological research processes, 3 other methods are commonly employed in the accurate study of these phenomena. They will be addressed in the following chapters and are: self-observations, public research and the collection of cases on projective occurrences. The detailed research of public opinion can prove to be qualitatively superior to collections of individual projective cases because they are more systematized and demand greater technical sophistication in their development. The research performed with self-observation and collection of projective cases are generally overly influenced by the intrusion of preconceptions, conditioning and the theoretical tendencies of the researcher.

Bibliography: Blackmore (139, p. 121), Grattan-Guinness (626, p. 85), Huson (768, p. 115), Mitchell (1060, p. 44), Morris (1092, p. 127), Osis (1168, p. 319), Salley (1496, p. 162), Schutel (1525, p. 22), Stokes (1625, p. 22), Tart (1661, p. 3), Vieira (1762, p. 177).

504. INDIVIDUAL EXPERIMENTS WITH LUCID PROJECTION

Definition. Provoked lucid projection: the individual, physiological experiment, produced by the will under more natural conditions, wherein the consciousness exits the human body in an intentional, deliberate and repeated manner.

Synonymy: deliberate projection; intentional projection; physiological projection; willful projection.

Specification. The provoked lucid projection, referred to here, in addition to not being an exteriorization that is excessively forced by artificial means, is also not spontaneous, much less occurring in a gratuitous manner, without effort.

Introspection. In the nineteenth century, the basis of psychological investigation was the method of introspection, through which the individual, who was also usually the investigator, tried to observe and classify his/her thoughts and experiences while solving problems, learning, recalling or executing any other cognitive activity, exploring the nature and functions of mental or psychic processes.

Contestation. The traditional procedures of introspection began to be contested in the twentieth century because the investigations in which only one person can make observations are generally not considered to be scientifically rigorous. The observer's statements, in this case, cannot be verified and are therefore open to criticism, especially if the individual is simultaneously the researcher and the research subject, and if it is known that the person has interests (a priori judgments, preconceptions) in regard to establishing a specific theory, to the detriment of another.

Registers. According to the material presented, techniques and instrumentation for measuring rapid, synchronous, involuntary eye movement, electrical brain activity and other physiological processes are extremely important for the study of lucid projection in the laboratory because this apparatus makes it possible to observe some aspects that occur when the subject describes mental (imagetic) images.

Comparison. Nevertheless, the basic problem of the personal nature of these images still requires a solution, which is why, in the research of phenomena as subjective as lucid projection, individual experiences cannot be definitively discarded, as they will always have documentary value, especially with regard to the comparison of reports.

Subjectivity. If we ponder the subject with maximum rationality, conventional scientific methods – to the degree that, due to their methodology, they do not lend themselves to the possibility of understanding that which is specifically subjective – cannot discard individual reports.

Paratroposphere. Experiences of the consciousness outside the human body provide certain images that are directly observable only by the researcher-subject-self-observed-projector. In many cases this excludes other people, as with experiences of the consciousness in paratropospheric districts of the extraphysical dimension (those beyond the terrestrial crust), as well as expansions of the consciousness in the mentalsomatic dimension.

Prospective. So far, no one has been able to conceive any reliable and executable experimental project using human instrumentation, except for the consciousness itself, in order to detect these transcendent experiences. Only the future will tell regarding this matter.

Amateur. Based on the facts, we can conclude that parapsychic research is, without a doubt, currently one of the only fields of human investigation in which the amateur still has a chance to compete with the professional.

Projectiology. Those who decide to investigate self-psychically – within and by themselves – the fields of parapsychic phenomena, especially within projectiology, can still discover one or two things ahead of the scientists. This offers a great incentive for candidates to lucid projection self-research, whether youths or adults.

Conflicts. Given that each person's judgment is very individual, we can understand why there are sometimes apparent conflicts between the observations of events that engage the projected intraphysical consciousness while in another dimension. This is due to the diversity of cultural backgrounds, degrees of extraphysical perception and different capacities for translating extraphysical sensations, as well as intraconsciential conditioning, social influences, abdominal brainwashing and various types of repression.

Conditioning. The intraphysical consciousness' intraconsciential conditioning of an educational, religious, philosophical, scientific, or professional nature, among others (leashes of the ego), represents those factors that most negatively influence the precise evaluation of the intraphysical consciousness' personal experiments when projected outside the human body – whether *distorting* with *parti pris* or fanaticism, consciously or unconsciously *masking* and subverting facts with spurious and undesirable fantasies, exaggerations and superfluity, which suffocate even the best self-critique.

Agreements. In spite of the effects of the complexity of human personalities, the convergences of opinion, mutual agreements or interactive and common denominators that are encountered greatly serve to overcome the divergences in observations made regarding sensations in and reports on the periods before, during and after lucid projection. These convergences of opinion or universality of reports are what can confidently lead researchers to a consensus on definitive evidence, which is accepted *urbi et orbi*, and which permits the establishment of solid foundations in this and other books, theses and specialized papers on the subject.

Objective. Unquestionably, the main objective of all lucid self-projectors regarding the problems of projectiology has been to find a practical, safe, universal projective method that works for all persons, regardless of gender, age, health, culture, domicile and background, as well as psychological or intraconsciential conditioning of any kind.

Fantasy. This method has still not been found and it may simply be a fantasy, in view of the profound diversity of human personalities.

Directives. Nevertheless, it will always be useful to establish the greatest possible number of technical directives that serve to help novice lucid projectors. This is one of the objectives of the author, this book, the IIPC, CHSC and the IAC.

Practice. The authors of the works in the general bibliography at the end of this book have, almost in their entirety, not had any personal experience with lucid projection. This fact is totally comprehensible to any lucid projector.

Writers. The majority of writers are simply writers. They write things to sell (instant books) and do not really have personal experience; they have not actually *gone through* everything that they write. They can even be theoretically very honest when writing, sharing their knowledge, but they are merely repeating what they have read from other authors who, in turn, copied from someone else before them. That is why individual experiences with lucid projection are so very valuable.

Theoricity. Before employing the bibliography of other authors, the author, to maintain honesty, needs to have personal, nontransferable experiences, *sweating blood*, in order to affirm any principle in a manner that is cosmoethical, within the world of projectiology and conscientiology research.

Conscientiologist. It is always a minor accomplishment (existential miniprogram) to be a mere bibliographical or *self-mimetic* researcher who does not propose challenging theories as a multidimensional, holosomatic conscientiologist (scientist who studies the consciousness, consciential researcher), endeavoring to act beyond the scope of conventional science, beyond the complacent, gratifying aspects of the consolation task.

Irrefutable. It is necessary to go far beyond the status quo, in the manner of those works that already exist and have withstood refutation for several decades, along with their consequent practices (theories), techniques, tests and therapies. The following are 5 examples from among more than 200 that have been published and tested by thousands of intraphysical consciousnesses, within the world

of projectiology and conscientiology: *Homo sapiens serenissimus* (serenology), penta (assistentiology), existential inversion (invertology), VS (holochakrology) and thosene (thosenology).

Self-projections. Finally, it becomes clear why individual projective experiments have been maximally stimulated everywhere, obtaining, when possible, the collection of opinions and personal reports that either corroborate or contradict the established data and previously tabulated figures. All this has the purpose of establishing the technical directives for behavior, work hypotheses, paradigms for the phenomena, and the formation of a valid consensus regarding the true nature of the human lucid projection experience. The non-experimental methods likewise demonstrate the undeniable usefulness in generating hypotheses that can be experimentally tested in the future.

Projector-authors. The following is a list of 30 projector-authors – among many others – who have written analytical, descriptive communications or autobiographical works on the phenomena of human lucid projection. They are grouped here according to their 9 countries of origin:

West Germany: Herbert H. G. Engel; Reinhard Fischer; Alfred Lischka.

Brazil: Yvonne do Amaral Pereira; Hamilton Prado.

Denmark: Johannes E. Hohlenberg.

Spain: Vicente Beltrán Anglada.

United States of America: Patricia Garfield; Richard A. Greene; Stuart Keith Harary; John Mittl; Robert Allan Monroe; Sylvan Joseph Muldoon; Henry Steel Olcott (1832-1907); Ingo Swann; Alexander Tanous.

France: Francis Lefebure; Marcel Louis Fohan (“Yram”); Anne Osmont (1872-1953).

England: J. H. Brennan; Annie Brittain; Hugh G. Callaway (“Oliver Fox”); William Alexander Gerhardt; Frank Hives; John Oxenham; Frederick C. Sculthorp; Vincent Newton Turvey; Joseph Hilary Michael Whiteman.

Ireland: Eileen Jeanette Vancho Lyttle Garrett.

Sweden: Emanuel Swedenborg.

Projectiological Bibliography: Ald (10, p. 21), Anglada (39, p. 25), Brennan (200, p. 71), Brittain (206, p. 45), Engel (480, p. 1), Fischer (519, p. 19), Fox (544, p. 32), Garfield (569, p. 72), Garrett (574, p. 69), Gerhardt (584, p. 21), Grattan-Guinness (626, p. 86), Greene (635, p. 47), Harary (679, p. 21), Hives (728, p. 69), Lefebure (909, p. 65), Lischka (937, p. 91), Mittl (1061, p. 4), Monroe (1065, p. 63), Muldoon (1105, p. 45), Olcott (1147, p. 357), Oxenham (1179, p. 1), Pereira (1230, p. 16), Prado (1284, p. 14), Rosin (1475, p. 30), Sculthorp (1531, p. 17), Swann (1632, p. 65), Swedenborg (1639, p. 1), Tanous (1647, p. 113), Turvey (1707, p. 111), Vett (1738, p. 379), Vieira (1762, p. 17), Whiteman (1840, p. 1), Yram (1897, p. 55).

Specific Bibliography: The most recent work of the author on the subject: *200 Teáticas da Conscienciologia: Especialidades e Subcampos (200 Conscientiology Theories: Subdisciplines)*.

505. PROJECTIVE PUBLIC OPINION RESEARCH

Definition. Opinion research: surveys conducted in order to discern public opinion, arising from the personal experience of a given population through random sampling, based on the principle that every sample represents the entire population, in miniature.

Synonymy: analysis of reports from a sampling; public opinion poll; regional inquiry; statistical public survey.

Profile. The data collection method (survey, poll) is especially valuable for obtaining a cross section of the population, with comparative objectives.

Universality. The following are 26 statistical research projects, among dozens of others. They include those involving surveys (samplings and analyses of public opinion) that have been conducted since the last century, and more intensely in recent decades. They aim to characterize precisely aspects

of projection of the consciousness outside the human body, such as the frequency of the phenomenon and its characteristics and uses, in a search for a convergence of evidence through a universality of reports.

1. **Double.** In 1890, the British Society for Psychical Research, of London, asked thousands of persons this question: “Have you ever, when believing yourself to be completely awake, had a vivid impression of seeing or being touched by a living or inanimate object, or of hearing a voice; which impression, so far as you can discover, was not due to any external physical cause?” Of 17,000 answers, 10% were affirmative. One third of this group said that they had seen the doubles of living persons.

2. **Cases.** In the 1950s, Hornell Norris Hart (1888-1967), then an assistant to Joseph Banks Rhine, examined 288 cases of lucid projection cited in specialized literature. In 99 of these cases he received satisfactory affirmations from the witnesses. In 20 of these 99 cases, the projection was provoked by hypnosis. The majority of the other cases occurred spontaneously, often at the very instant that the projector thought intensely about the other person that the individual would later visit.

3. **Positivity.** In 1952, the same Hornell Hart asked the following question to 155 sociology students at Duke University, in North Carolina, USA: “Have you ever actually seen your physical body from a viewpoint completely outside that body, like standing *beside* the bed and looking at yourself lying *in* the bed, or like floating in the air near your body?” The researcher received 27% affirmative responses.

4. **Critical.** In 1956, Joseph Hilary Michael Whiteman published examples that were chosen from 550 cases of lucid projection, some of which he himself experienced, in which he, in principle, excluded those of a mystical nature. According to this researcher, the projectors’ faculties of critical reflection were not only maintained, but also amplified and intensified by an apparently higher level of awareness. The sense of this would be retained after the interiorization of the projected intraphysical consciousness.

5. **Questionnaires.** In 1966, the psychical researcher Celia Elizabeth Green (1935-) made requests in the press and over London radio stations that the reading and listening audience respond to questionnaires regarding experiences in which they had observed things from a point outside their human body. Two questionnaires were sent out in order to be returned; 326 responses to the first questionnaire were received and 251 responses to the second, with written narratives that were typical of projections of the consciousness. These were detailedly and systematically tabulated and statistically analyzed.

6. **Oxford.** In 1967, Celia Elizabeth Green asked 380 students at Oxford University, in Great Britain, if they had had any experience in which they felt they were outside the human body. The researcher received 34% affirmative responses.

7. **Southampton.** In 1967, the same researcher and author, Celia Green, repeated the previous survey, but now asked 115 students at Southampton University, in Great Britain. She received 19% affirmative responses.

8. **Press.** In 1967, John Poynton, a biologist at the University of Natal, South Africa, published a questionnaire in the local press requesting written reports on lucid projection. He received 122 analyzable positive responses.

9. **Psychedelics.** In 1971, Charles Theodore Tart, the well-known American researcher and author, received 44% affirmative responses about lucid projection in a research project including 150 people who had had psychedelic experiences with marijuana.

10. **Religious.** Frances Mary Banks verified that 45% of a group of 800 English, religious, churchgoing individuals affirmed, when asked, that they had already experienced the consciousness being outside the human body.

11. **Audience.** In the 1980s, well-known projector and author, Robert Allan Monroe, asked, in a public lecture on the subject in New York, how many in the audience had had experiences outside the human body. About 1/3 of those present raised their hands.

12. **Postal.** In 1974, John Palmer conducted a research project on lucid projection using questionnaires that were mailed to 700 adult residents of Charlottesville, Virginia, USA. Of the 341 residents who returned a completed questionnaire, 48 (or 14%) responded in the affirmative. Of the students who participated, 266 (or 89%) answered the item about lucid projection, and 66 (25%) of them responded that they had experienced a lucid projection. In the combined samples, 83% of those who reported having had a projection had experienced it only once and 34% had had 8 or more projections. The findings showed that lucid projection is an experience that is common to humanity.

13. **Paranormality.** In 1975, Richard L. Kohr conducted a survey of parapsychic experiences among Americans who were living in cities and were members of the Association for Research and Enlightenment (ARE), headquartered in Virginia Beach, Virginia, with the aim of evaluating the degree of relationship between *parapsi experiences* and other correlated factors, such as habits, attitudes and demographic characteristics. More than 400 people responded, and their responses on lucid projection figured significantly in all the tabulations that were statistically analyzed.

14. **Iceland.** In 1977, a research project was performed in Iceland, wherein 8% of the 902 individuals interviewed affirmed already having experienced at least one lucid projection.

15. **Surrey.** In 1978, another research project was performed with students of Surrey University, Great Britain. Of the 132 interviewees, 11% affirmed having already had an experience outside the human body.

16. **Virginia.** In 1979, another research survey among students at the University of Virginia, USA, revealed that, of the 268 interviewees, 25% had already experienced at least one lucid projection.

17. **Residents.** In 1979, another research project conducted with Virginia state residents showed that 14% of the 354 participants had already had one lucid projection.

18. **Australia.** In 1980, another research program involving students at the University of New England, Australia, verified that 16% of 177 interviewees had already experienced lucid projection.

19. **Psychiatrists.** In 1980, psychiatrists Glen O. Gabbard, Fowler C. Jones and Stuart W. Twemlow, all professors at the University of Topeka, Kansas, USA, sent questionnaires on experiences outside the human body to 420 randomly selected people who were in good physical and mental health, had a college education and were not addicted to drugs. Of those, 339 responded to the questionnaire, allowing the researchers to establish some of the main characteristics of the phenomenon: 85% considered the experience to be very agreeable; 43% considered lucid projection to be the most important factor in their life; 94% affirmed lucid projection to be more real than a dream; 66% thought that their life had changed after the occurrence. These researchers made a marked distinction between lucid projection and the pathological states of depersonalization, morbid autoscopy and schizophrenic syndromes.

20. **Lucid.** In 1981, in England, Susan J. Blackmore verified the existence of a 13% and 14% occurrence rate of lucid projection among groups of 217 students and 155 students respectively. They were simultaneously questioned about lucid projection and lucid dreams, or semilucid projections.

21. **Electors.** Susan J. Blackmore, in 1981, also developed a research project on the lucid projection experience that was mailed to a total of 593 participants selected at random from the registered voters in Bristol, England. The questionnaire asked about dreams, hallucinations, distortions in the corporal image, psychic experiences and beliefs, mystical experiences, imaginal creations and lucid projections. She received 321 (55%) completed questionnaires. Of these, 12% of the respondents reported having had lucid projections. The most important finding was the pronounced association between many of the experiences.

22. **Psychotronics.** On July 28, 1982, on the final night of the III National Congress on Parapsychology and Psychotronics, at the Rio Sheraton Hotel, in Rio de Janeiro, Brazil, during

a presentation on the subject, the author queried the auditorium, filled with 350 participants, and received the immediate response that 25 of those present, namely 7.14% of the audience, had experienced a lucid projection.

23. **Location.** Relative to statistics on written personal experiences, Robert Crookall, a celebrated London researcher, revealed that, in 85% of 838 cases of lucid projection, analyzed in detail, the consciousness of the projected projector remained right here, in the physical or human world (intrapysiology); in the remaining 15%, the projector entered the extraphysical world *per se* or, in other words, *the world of extraphysical consciousnesses* (extraphysiology).

24. **Italy.** The Italian researcher Paola Giovetti developed a public opinion poll on projection of the consciousness, distributing 300 questionnaires in Italy with dozens of questions, from which 110 were selected and diverse aspects of the phenomenon were analyzed in detail.

25. **Frequency.** Research has also been performed with projectors regarding the frequency of their experiences outside the human body or, in other words, projections in series.

26. **Congresses.** During a presentation made by the author on lucid projection, in room “A” at Rio-Centro, Rio de Janeiro, RJ, Brazil, at 4:00 PM, Sunday, October 27, 1985, on the final day of the extremely popular I Esoteric Fair, it was publicly verified that, of the 450 people present, 30 affirmed having already had at least one lucid consciential projection during their life. The same occurred at the Recife International Club, in Pernambuco, Brazil during the V Brazilian Congress on Parapsychology, at 7:00 PM on Saturday, October, 1986, when it was publicly verified that, of the 572 persons present, 81 affirmed having had at least one lucid consciential projection in their life. In the same manner, in room “A” at the Brazilian College of Surgeons, in Rio de Janeiro, during the I Congress on Alternative Therapies, at 7:00 PM, on Saturday, October, 1986, of the 174 persons present in the audience, 73 declared having had at least one lucid consciential projection in their existence.

Differences. The differences in the percentages of the public opinion surveys conducted on lucid projection over time are attributed to 4 basic causes:

1. **Samplings.** The striking differences between the population samples polled.
2. **Questions.** The variation and nonuniformity of the questions posed to the interviewees.
3. **Context.** The specific context within which the questions were formulated.
4. **Understanding.** That which was actually understood by those interviewed with regard to the questions asked.

Incentive. The expressive, convergent results of these public opinion polls, the collection of similar experiences and the rich source of material for projectiological study – with immense potential for statistical analysis – were obtained over a period of almost 1 century and collected in 7 countries (United States of America, England, South Africa, Iceland, Italy, Australia and Brazil) situated on 4 continents. They have provided an even greater incentive toward the scientific research of projections of the consciousness in other consciential research centers.

Percentage. Based on all existing coordinated, compared statistical tabulations, it is currently estimated, with complete confidence, that approximately *1 out of every 100 persons* or, in other words, 1% of existing humanity (approximately 6 billion persons in 1998), or precisely 60 million individuals, have had some form of *lucid consciential* projection experience, at least *once* during their intraphysical existence.

(690, p. 153), Holzer (751, p. 107), Irwin (792, p. 3), Kohr (857, p. 395), Kovach (860, p. 94), Martin (1002, p. 37), Morris (1093, p. 102), Noyes Jr. (1141, p. 19), Palmer (1184, p. 221), Poynton (1282, p. 20), Ring (1406, p. 45), Rogo (1446, p. 36), Roriz (1471, p. 20), Salley (1496, p. 157), Smith (1572, p. 14), Steiger (1601, p. 5), Twemlow (1710, p. 450), Vieira (1755, p. 5), Walker (1781, p. 63), Watson (1800, p. 135), Wolman (1863, p. 772).

506. CASES OF LUCID PROJECTION

Definition. Case of lucid projection: example of a projectiological case study including a report of an experience of the consciousness outside the human body, whether spontaneous or induced.

Synonymy: projectiological case study; report of lucid projection.

Case study. It is indisputable that the phenomena of lucid projection, whether voluntary or involuntary, cannot be rejected due to the large number of reports in case studies, or the collection of synopses of individual cases compiled by diligent investigators. A vast general bibliography already exists that is surprisingly and profoundly provoking for science, irrespective of the fact that everyone realizes that this voluminous accumulation of evidence merely constitutes valuable indications and not definitive proof.

Facts. A single isolated fact does not constitute proof. The mass of facts can provide indications of verisimilitude.

Acceptance. Incidentally, it is worth bearing in mind that scientists nowadays readily believe in things they have never seen or measured, because others have made certain claims and fit them within the context of conventional science. However, upon presenting them with something that is outside this framework, they want to see comprehensive proof and experiments, otherwise they ridicule the new perspective. The *quark* has not been satisfactorily detected in the laboratory, but all physicists accept its existence and have awarded the Nobel Prize for its discovery.

Reporters. Those people who report projective experiences – which first undergo a selection process in order to determine their reliability – come from the most diverse social levels, locations, situations and human periods. They are not questionable, psychotic, unstable or illiterate individuals, but are competent, psychologically normal and sane, many of them being researchers, experimenters and practitioners who are particularly responsible and sensible.

Upright. Upright individuals, in this case, are those of solid reputation, who are accustomed to responsibility, holding down a good job, are family men and well-employed women, and are known for their honesty in dealing with others. These people are not seeking publicity (unlike self-promoters), nor do they make the slightest attempt to capitalize on their projective experience or obtain immediate or long-term financial gain (unlike merchants), thereby placing themselves within the patterns of the greatest scientific respectability. They are commonly accepted by the witnesses or participants of unusual and exceptional occurrences.

Experiences. Those who report spontaneous experiences are almost always reluctant to speak about them, at least until they are certain of the sincerity and seriousness of the interlocutor. These people describe real occurrences that they recognize as such. They are experiences out of the ordinary that have no similarity to a dream, and for which they are generally not prepared. They are recognized as being beyond comprehension or outside the patterns of daily life.

Dependability. The more sophisticated and cultured the lucid projector is, the less likely that individual is to make a written report of his/her experience, unless it is possible to remain anonymous, as well as enjoying due respect for the deposition, in order to not be exposed to public ridicule. This is because no one can in all honesty find a single reason to not accept the

coherent reports of lucid projectors, especially when they match up with the reports of other individuals, who also have an acceptable level of dependability, thus making the material worthy of consideration.

Rigor. It should be noted that the selected reports are unaltered, nothing having been omitted or added to achieve a possible agreement with other previously published cases. Even after making allowances for exaggeration, errors in judgment and insufficient data, the narratives survived a rigorous selection process and were admitted into the arena of truly intriguing and instigating cases.

Universality. Nevertheless, the narratives match the description of other similar experiences, verified by other people, who have lived in other times, places and circumstances. These facts reaffirm the universality and convergence of the reports.

Prototype. In other words, the cases used in these works are representative of many thousands of others which, although not being absolutely identical in detail, generally fit within the prototype outlined by many existing cases. The uniformity of the testimonies indicates that the occurrences were generally neither exaggerated nor invented.

Translation. The ordinary person's vocabulary is inadequate regarding the situations created by lucid projection. More intelligent projectors sometimes find themselves incapable of putting the elements of their experiences into descriptive and practical words. It is surprising to note how highly educated projectors encounter difficulty in translating the sensations and perceptions that they experience into words.

Descriptions. If we have difficulty – even with regard to accessible subjects on day to day topics – in understanding strange ethnic groups with cultural patterns that are different from ours and geographical conditions that we are not accustomed to, it must be much more difficult, if not impossible, to describe any other dimension of life beyond our daily experience in the ordinary, physical waking state.

Analogies. Lucid projectors often resort to analogies or metaphorical and symbolic language in order to describe something that, for them, is totally indescribable in common terms, mainly when referring to the mentalsoma and the mentalsomatic dimension. Hence the necessity for creating scientific terminology or *technical nomenclature* for all sciences, including projectiology and conscientiology.

Comparisons. The comparison of reports from different individuals helps to shape a perfectly clear picture of lucid projections. This allows the complete or partial examples, which are useful for statistical studies, to indicate and illustrate the prototypes of the most common categories of projections, leading to the construction of basic paradigms for the general analysis of the experiences. This fact affirms the need for the *consciential paradigm*.

Paradigms. The study of the reports of individual – and quite representative – cases of lucid projection, the set of which produces a network of indications, or an interconnected whole, constitutes in its totality, in and of itself, an unquestionable demonstration of the realities of projectiological phenomena. In these reports we can single out innumerable additional details for the research, comparative analysis and establishment of paradigms for these same phenomena.

Elements. When a report of lucid projection demonstrates the existence of extraphysical elements, including extraphysical consciousnesses or extra-human intelligences, it would be completely unscientific not to take them into consideration. The information that each case represents should not be concealed. It should also not be forcibly explained in another manner. Only in this way will we be acting within the canons of authentic scientific research, which require an open mind and an impartial temperament.

Consultation. The cases cumulatively acquire a suggestive force and irresistible supporting evidence. The cumulative reports of these numerous cases, descriptions and admissions, already studied

exhaustively, form an immense barrier against the skepticism of those who have not yet experienced lucid projection for themselves. These reports allow the establishment of the fundamental bases that characterize the phenomena of projectiology, which are listed and analyzed in this book and can be consulted in the recommended specific bibliography further ahead. Were it not for the frequent registration of cases of spontaneous lucid projection, other types of research in the projectiological area would probably never have begun.

Computer. The case study of lucid projection is substantially consistent in terms of data. It is still awaiting standardization in a manner that can be correctly read and processed by machines. The computer, upon the implementation of an efficient system or specific program, will allow accurate evaluation of the reports with the comparison of elements, and the statistical analysis of type and content according to the pattern of the narratives in order to determine, from among innumerable aspects, the basic categories of the phenomena through meticulous surveys. A cybernetic investigation of projectiology will thus be performed.

Types. The works from which cases of lucid projection were compiled, indicated in the bibliography of this chapter, can be classified into 2 types:

1. Autobiographies that present detailed individual experiences: Fox, Greene, Monroe, Muldoon, Prado, Sculthorp, Turvey and Yram.
2. Books with reports of various projectors: Ebon, Green, Greenhouse, Kardec, Martin, Muldoon, Myers, Shirley, Eleanor Mildred Balfour Sidgwick (1845-1936), Tyrrell (1879-1952) and Walker.

Crookall. It is worth pointing out that a single author, Robert Crookall (1890-1981), analyzed a most diverse selection of 838 cases of lucid projection in detail, in 5 volumes of his personal bibliography (see the bibliography of this chapter), composed of 21 volumes.

Treatises. Three treatises deserve special mention as they present collections of hundreds of cases of *inter vivos* apparition and other phenomena of projectiology:

1. *Phantasms of the Living*, by Edmund Gurney (1847-1888), Frederic William Henry Myers (1843-1901), and August Frank Podmore (1856-1910), published in London in 1886, 2 volumes and 1,420 pages, presents 701 (702 minus number 209, which was omitted: see Vol. II, page 11) numbered cases of parapsychic phenomena, analyzed in detail.
2. *Human Personality and its Survival of Bodily Death*, by Frederic William Henry Myers, published in London in 1920, 2 volumes and 1,426 pages.
3. *Les Apparitions Materialisées des Vivants & des Morts (The Materialized Apparitions of the Living & the Dead)*, by Gabriel François Marie Delanne (1857-1926), published in Paris in 1909, 2 volumes and 1,370 pages.

Citations. From among the cases in the field of projectiology research that are most often cited throughout parapsychical literature, each one providing records, reports and detailed analysis, we can single out 3 classic examples of projectiological phenomena regarding which it is important to consider the dozens of bibliographic references of each one:

1. Lucid projection or traveling clairvoyance: the case of the clairvoyant Emanuel Swedenborg, 1759: Balzac (72, p. 144), Barboka (78, p. 213), Bonin (168, p. 475), Bret (203, p. 136), Browning (213, p. 54), Byse (230, p. 116), Carrington (248, p. 32), Chiesa (279, p. 46), Cohen (290, p. 39), Coste (309, p. 8), Digest (400, p. 20), Doyle (411, p. 36), Dusen (443, p. 217), Ebon (453, p. 23), Fodor (528, p. 373), Freedland (550, p. 63), Frost (560, p. 27), Goes (605, p. 408), Gooch (617, p. 23), Greenhouse (636, p. 58), Grimard (644, p. 286), Heaps (700, p. 115), Inardi (786, p. 149), Jung (813, p. 481), Knight (851, p. 89), Krippner (861, p. 286), Larcher (887, p. 115), Matter (1014, p. 145), Miguel (1045, p. 70), Mishlove (1055, p. 56), Mitchell (1058, p. 56), Myers (1114, p. 659), Rhine

(1389, p. 27), Richards (1394, p. 31), Seabra (1535, p. 133), Silva (1559, p. 112), Steinour (1612, p. 203), Stevens (1615, p. 81), Still (1622, p. 222), Tuttle (1708, p. 15), Twitchell (1712, p. 147), Wang (1794, p. 24), Wilson (1853, p. 312; 1854, p. 279; 1856, p. 58).

2. External autoscopy and physical bilocation: the case of professor Emília *Sagée*, 1845: Aksakof (09, p. 543), Andrade (27, p. 150), Bertrand (127, p. 57), Blackmore (139, p. 12), Bret (202, p. 69), Chevreuil (278, p. 206), Delanne (382, p. 175), Denis (389, p. 155), Dubor (421, p. 303), Duchatel (430, p. 117), Dumas (432, p. 214), Ebeid (452, p. 138), Flammarion (524, p. 45), Fugairon (562, p. 114), Giovetti (593, p. 12), Goes (605, p. 409), Gomes (612, p. 117), Green (634, p. 106), Hart (690, p. 180), Hemmert (712, p. 28; 713, p. 39), Heydecker (716, p. 49), Imbassahy (780, p. 83), Kardec (827, p. 72), Keller (835, p. 345), Lancelin (876, p. 115), Lawrence (893, p. 378), Lombroso (943, p. 252), Marin (996, p. 122), Meck (1027, p. 127), Metzger (1038, p. 130), Miguel (1045, p. 45), Montandon (1070, p. 228), Moutin (1100, p. 393), Pearce-Higgins (1214, p. 67), Poodt (1272, p. 265), Richet (1398, p. 702), Senillosa (1540, p. 177), Wauthy (1803, p. 171), Wilson (1853, p. 380; 1858, p. 52).

3. Joint projection and physical bilocation: the case of the industrialist S. R. *Wilmot*, 1862: Bardens (79, p. 142), Baumann (93, p. 30), Blackmore (139, p. 200; 147, p. 2), Bret (203, p. 173), Crookall (338, p. 48), Cummins (350, p. 88), Dingwall (404, p. 9), Dumas (432, p. 221), Ebeid (452, p. 108), Flammarion (524, p. 63), Hart (687, p. 183; 690, p. 162), Hemmert (712, p. 22; 713, p. 39), Hill (723, p. 14), Holms (735, p. 456), Hunt (767, p. 53), Knight (851, p. 104), Miranda (1052, p. 72), Mitchell (1058, p. 377), Montandon (1070, p. 232), Myers (114, p. 682), Pearce-Higgins (1214, p. 71), Pisani (1248, p. 127), Rogo (1442, p. 83; 1447, p. 94), Rýzl (1485, p. 126), Smith (1572, p. 87), Steinour (1612, p. 107), Targ (1652, p. 191).

Contact files. The Center for Continuous Consciousness, in Rio de Janeiro, Brazil – the first Institute of Projectiology, founded in 1981 – served as a central receptor of consciencial projection experiences and compiled 5 categories of records in the archives of its documentation department, or its databank of projectiological data:

1. Contact files on lucid consciencial projectors.
2. Mailing list of active lucid consciencial projectors.
3. Collection of confidential reports of unique lucid consciencial projections.
4. Responses to detailed questionnaires distributed on the fundamental themes of projectiology.
5. Collection of questions formulated by participants during debates on projectiological themes in diverse cities.

Intention. The intention, in cases such as these, is to publish this data at the appropriate time, after having tabulated the occurrences, in order to separate new patterns of phenomena and subsequently establish paradigms.

Bibliography: Alvarado (16, p. 11), Andreas (36, p. 51), Baumann (93, p. 15), Bayless (95, p. 162), Black (137, p. 3), Blackmore (142, p. 45; 145, p. 302), Bord (170, p. 26), Bozzano (188, p. 12; 193, p. 105), Bret (202, p. 66), Carrington (250, p. 190), Christian (281, p. 4), Cooke (300, p. 29), Crookall (320, p. 3; 330, p. 1; 331, p. 5; 333, p. 11; 338, p. 17), Delanne (382, p. 154), Dingwall (403, p. 93), Ebon (453, p. 115), Edwards (463, p. 165), Fardwell (494, p. 15), Flammarion (522, p. 206), Fox (544, p. 32), Geddes (578, p. 373), Gibier (587, p. 123), Giovetti (592, p. 46), Green (632, p. 19), Greenhouse (636, p. 185), Guieu (660, p. 83), Guimaraes (662, p. 25), Gurney (666, p. 707), Hart (687, p. 153), Hemmert (713, p. 64), Holms (735, p. 451), Holroyd (736, p. 97), Kardec (816, p. 11), Knight (851, p. 274), Lippman (934, p. 346), Martin (1002, p. 70), Mitchell (1058, p. 354), Monroe (1065, p. 63), Montandon (1070, p. 227), Muldoon (1102, p. 47; 1103, p. 55; 1105, p. 49), Myers (1114, p. 369), Pearce-Higgins (1214, p. 66), Prado (1284, p. 14), Rogo (1438, p. 5), Sabom (1486, p. 31), Schmeidler (1517, p. 102), Sculthorp (1531, p. 17), Seabra (1534, p. 85), Shirley (1553, p. 71), Sidgwick (1556, p. 217), Stead (1598, p. 24), Steiger (1601, p. 15), Turvey (1707, p. 111), Tyrrell (1717, p. 165), Vieira (1762, p. 17), Walker (1781, p. 63), Wang (1794, p. 157), Wauthy (1803, p. 162), Yram (1897, p. 55).

507. LABORATORY EQUIPMENT IN PROJECTIOLOGY

Definition. Projective equipment: mechanical, electric or electronic agents, any and all other organs, implements, tools or apparatuses that serve to produce a certain work destined to detect specific aspects of the lucid projection phenomenon.

Synonymy: projective apparatus; projective artifact; projective device; projective machine.

Types. Among the objects, machines, ordinary instruments (created for multiple purposes) and equipment created specifically for experimentation with the projected consciousness in the laboratory, the following can currently be singled out: basal skin resistance (BSR) machine; the galvanic skin response (GSR) machine; digital photoplethysmograph for registering cardiac frequency and blood volume; electroencephalograph (EEG); electrocardiograph (ECG, EKG); electromyograph (EMG); electrooculogram; oximeter; equipment for indicating REM or involuntary rapid synchronous eye movements; special equipment for the detection of optical images, optical image device, or optical illusion box; 16-inch (40 cm) spiral florescent colored disc, or color wheel, that spins at approximately 1,200 rpm, designed for tests; Grass 12-channel polygraph; “gyrating chair”; closed-circuit television; multiple recorders; synchronized electronic chronometers; thermometers; barometers; magnetometers; various sensors; oscilloscopes; photomultiplier tubes; ultraviolet and infrared detectors; spectrometers; electromagnetic effect detectors; and soundproof room.

Sensitive. These laboratory instruments allow for the detailed physiological measurement and efficient monitoring of the sensitive and that individual’s specific and general reactions during the entire experiment. Nevertheless, they produce a great deal of discomfort because the subject needs to relax while remaining restricted by bipolar electrodes on the chin, plates, conductive wires, the right index finger immobilized and the human body almost always in a fixed position, like a robot that is preprogrammed and teleguided from another room or nearby building.

Detectors. As well as human and animal detectors, diverse types of laboratory equipment have been employed as mechanical detectors in order to evidence the presence of the consciousness in a given place, at a specific moment, in the course of lucid projection.

Medicine. The modern instrumentation currently used in medical technology can also serve to detect many physiological variables, including anatomic and neurological ones, which will facilitate experiments of the intraphysical consciousness.

Ideas. Many other ideas have been put into practice regarding the utilization of instruments in the field of projectiological research, such as: television, for dissemination, as well as hetero-hypnotic induction, of lucid projection; the computer, as an advanced piece of research equipment in the evaluation, codification and analysis of data collected in investigations for the development of projectiology; use of camcorders and VCRs as auxiliary equipment for the researching and registering of projectiology phenomena, as well as the teaching of projectiology classes; the *projectarium*.

Prospective. The future holds many surprises in this field of investigation, because a reliable system for the physical detection of the human consciousness projected from the human body has yet to be discovered, a fact that will inevitably occur in the natural order of things.

Bibliography: Andrade (29, p. 107), Baraduc (76, p. 117), Black (137, p. 52), Ebon (453, p. 73), Grattan-Guinness (626, p. 83), Morris (1092, p. 127), Pratt (1285, p. 43), Rogo (1446, p. 12), Steiger (1601, p. 226).

508. EXPERIMENTAL PROJECTS

Tests. The following are 6 experimental parapsychic projects, among many others that exist, which were created in order to test projections of the consciousness and are apparently still unprecedented:

1. **Animal.** Demonstration of an animal-witness (detector) inclined to move in the direction of 1 point in space where the projected projector is located (Robert Lyle Morris).
2. **Joint.** Production of two lucid projections together in which the 2 projectors will try to visit the same target-area together, detecting what was specially placed there (Robert Lyle Morris).
3. **Sensitive.** The projector, surrounded by monitors, projects his/her consciousness to 1 unknown psychophonic sensitive, who is also surrounded by physiological detection equipment. Once in the projection location, the projector's consciousness controls the sensitive's human body, in the same way as in the phenomenon of psychophony, giving information about him/herself which is unknown to the sensitive. If the projector manifests personal traits that definitively identify him/her as being the projector, the phenomena of lucid projection and *inter vivos* parapsychic communication will be evidenced (John Palmer).
4. **Change.** A complex variant of the previous projective experiment wherein the consciousness of the sensitive (during the trance, on that occasion) additionally extraphysically projects to the inactive human body of the projected projector, proceeding to manifest through that projector's body (Herbert B. Greenhouse).
5. **Blind.** The projector will read the title of a book that has been placed on the highest and most inaccessible shelf of the library, with the cover facing up. The book will have been placed there in the projector's absence by an unknown person who selected the book at random from many other works, without knowing which book was chosen. This will make the project a "double-blind" test, thus removing possible interference from the telepathic phenomenon. The assistants in this project should be skeptical in regard to lucid projection (Carl Sagan).
6. **Television.** Create a television system based on a type of information other than light, such as a magnetic field, electrical field, density, electrical conductivity, magnetic permeability and ionization that will allow one to see, study and film the projected projector. In order to accomplish this, it is first necessary to invent a new camera.

Bibliography: Greenhouse (636, p. 299), Sagan (1492, p. 61).

509. GENERAL HYPOTHESES IN PROJECTIOLOGY

Definition. Hypothesis (Greek: *hypo*, under; *thésis*, placement, proposition): doubtful, however not improbable, supposition regarding natural or parapsychical phenomena, through which an understanding is anticipated, and that will later be directly or indirectly confirmed.

Synonymy: elaborated supposition; hypothetical reasoning; provisional proposition.

Method. In scientific studies, the method followed, upon addressing a subject such as experiences of the consciousness, is to first collect the facts, then classify them and, in the final step, suggest the best method for explaining them. The hypotheses developed in this manner indicate new lines of research and experimentation.

Uses. Hypotheses, constituting unproven ideas, present evident uses, notably to explain the diversity of facts under analysis and prepare the set of established observations for greater acceptance by researchers.

Categories. The 41 general hypothesis that are explanatory of projectiological phenomena can be classified into 4 categories according to the nature of their origin: pharmacological hypotheses, neurophysiological hypotheses, psychological hypotheses and parapsychic hypotheses.

Pharmacological hypotheses:

1. Lack of oxygen or reduction of glucose in the circulatory system (also a physiological explanation).
2. Sensations produced due to the consumption of drugs (pharmacology).
3. Effects of chemical substances produced in the brain (e.g.: endorphins).

Neurophysiological hypotheses:

4. Neurotic aberrations.
5. Effects of chemical substances of the brain itself (e.g.: endorphins). In essence, it is the same as item 3, above.
6. Epilepsy.
7. Cerebral hypoxia.
8. Ineffective functioning of the brain.

Psychological hypotheses:

9. Ordinary, spontaneous hallucination.
10. Autosopic hallucination.
11. Induced hallucination.
12. Congenital psychic anomaly.
13. Imperceptible autosuggestion.
14. Mental creations (e.g.: the psychosoma).
15. Depersonalization (defense of the ego).
16. Convincing daydream.
17. Morbid state.
18. Fabulations.
19. Self-hypnotic fantasies.
20. Fecundity of the unconscious.
21. Illusion.
22. The early stages of schizophrenia.
23. Projection of the omnipotent and omniscient unconscious.
24. Pseudoprojection.
25. Psychosis or eccentric psychopathology.
26. Resurgence of a forgotten idea.
27. A merely interesting dream.
28. Psychological theory.
29. Mythical visions.
30. Desire or wish to believe.

Parapsychic hypotheses:

31. Imaginary body.
32. Objective body.
33. Rehearsal of biological death (desomatics).
34. Altered state of consciousness.
35. Self-hypnotic state.
36. Fantasies generated due to the increase of *parapsi energy*.
37. Phenomenon of telepathy plus clairvoyance.
38. Parapsychoanalysis or tautological theory.
39. Extrasensory perception without the separation of the consciousness from the human body.
40. Information theory.
41. Theory of the vehicles of the consciousness (holosomatics).

Important. It can be seen that the majority of the proposed hypotheses have a psychological origin, some apparently being redundant, while others are derived from psychiatry or psychopathology. The more important hypotheses deserve a succinct study in separate chapters. The others were defined through different approaches in the various sections of this book. The bibliography specific to this chapter is extremely relevant for the individual who is interested in gaining a deeper understanding of the subject of general hypotheses in projectiology.

Audition. One hypothesis that is still indicated for the explanation of conscial projection concerns auditory pathology. According to this thesis, the occurrences would be produced due to the semicircular canals of the ears being out of adjustment, where the sense of spatiality and orientation in space are located. The world of projectiological occurrences, however, present manifestations (e.g.: physical bilocation, *inter vivos* apparition) quite beyond the restricted sphere of influence of the auditory mechanisms of the human person, a fact that weakens and greatly reduces the possibility of the explanation of the hypothesis.

Production. The majority of the hypotheses and alternative explanations listed here were put forward by people who have not produced conscial projection with unquestionable lucidity. The individual who has experienced extraphysical lucidity – the ideal person for judging the facts, in this case – tranquilly and definitively accepts the exteriorization of the consciousness from the human body without confusing the phenomenon with any other altered state of consciousness. Some of these hypotheses can explain isolated cases, although they do not clarify the entire enormous body of projectiological occurrences, not even when they are added to other hypotheses.

Analyses. All hypotheses (to be verified) should nevertheless be judiciously analyzed by someone who is still reluctant to accept the literal interpretation of lucid conscial projection as being the exteriorization or projection of a semiphysical element or vehicle of extraphysical manifestation leading the consciousness out from the cerebral hemispheres.

Self-hypnotic. The hypothesis of the self-hypnotic state deserves to be mentioned here, based on the studies of hypnotized subjects who show a reduction in the amplitude of their brainwaves on the electroencephalogram. Self-hypnosis can certainly generate lucid conscial projection. Nevertheless, the consciousness projected deliberately, by oneself through the impulsion of one's own will, demonstrates conduct that is quite different from that of the person's consciousness when hypnotized.

Paraphysiology. The occurrences of projectiology allow the creation of a theory of the natural or physiological operation of the vehicles of manifestation of the consciousness, which the author defends as being the only theory that seems to cover all the material regarding lucid, semilucid and nonlucid conscial projections, and their more complex implications.

Experimentation. No projectiological theory should have theological passion, as frequently occurs in the areas of science. The theory of the vehicles of the consciousness will either be confirmed or invalidated by other individual experiences, new and different laboratorial experiments. If the theory is correct, ways will be found to verify its validity. Let us wait for things to transpire and the final verdict of the research to be delivered, without any of us neglecting to perform our own research.

Bibliography: Bayless (95, p. 195), Black (137, p. 129), Blackmore (138, p. 230; 142, p. 225), Champlin (272, p. 208), Crookall (333, p. 22), El-Aowar (474, p. 6), Grattan-Guinness (626, p. 86), Greenhouse (636, p. 271), Hart (690, p. 153), Honegger (753, p. 230), Ingber (788, p. 20), Irwin (791, p. 247), Larcher (887, p. 191), Mitchell (1058, p. 367), Morris (1092, p. 53), Palmer (1187, p. 19), Pearce-Higgins (1214, p. 76), Rogo (1446, p. 338), Sculthorp (1531, p. 156), Shirley (1553, p. 17), Smith (1577, p. 149), Steiger (1601, p. 74), Stokes (1625, p. 22), Taylor (1666, p. 154), Vieira (1762, p. 73).

510. HYPOTHESIS OF THE IMAGINARY BODY

Definition. Hypothesis of the imaginary body: the recent parapsychical hypothesis for explaining lucid projections of the consciousness based on the premise that the second body of the consciousness is not real, but is a simple figment of the imagination.

Synonymy: hallucination hypothesis; recent hypothesis; theory of morphothosenes (thought-forms).

Inadequacies. The hypothesis of the imaginary body can explain a small number of cases registered within the scope of psychiatry or general psychopathology, but it cannot adequately clarify the following 3 categories of phenomena:

1. **Third party.** The simultaneous witnessing of the indisputable apparition of the projection by third parties, or various unfamiliar individuals and subhuman animals, in cases of physical bilocation.

2. **Subhumans.** The phenomena in which persons see the freed double of dogs, cats, horses and other subhuman animals, in which circumstances they could not rationally have only noticed the presence of the mental image created merely by the mentality of these animals.

3. **Extraphysical consciousnesses.** The numerous well-authenticated instances of persons who saw the double of individuals who had already passed through desoma, whom they had not known or had not thought about on those occasions, and for which, in these circumstances, it would be difficult to find a motive for the imagined mental images.

Bibliography: Champlin (272, p. 208), Crookall (333, p. 22), Grattan-Guinness (626, p. 86), Mitchell (1058, p. 368), Pearce-Higgins (1214, p. 77), Rogo (1446, p. 339).

511. HYPOTHESIS OF THE OBJECTIVE BODY

Definition. Hypothesis of the objective body: the old and natural parapsychic hypothesis for explaining lucid projections of the consciousness based on the premise that the second body of the consciousness is real, although non-physical.

Synonymy: doctrine of lucid projection; hypothesis of the double; hypothesis of the extraphysical body; natural hypothesis; old hypothesis; theory of pneumatology (Jung-Stilling); theory of the second body.

Masks. Theories are indispensable in science. Nevertheless, we cannot mask the *facts* with sophisms, opinions, false information, disinformation, tautologies, unscientific attitudes, conjectures, hypotheses or even “theories.”

Adequations. The hypothesis of the objective body presents an *adequate explanation for the world of the occurrences of projections of the consciousness* and extends even beyond them, including phenomena such as the near-death experience (NDE), clairvoyance in general, materializations, psychometry, apparitions and some cases of poltergeist, which demonstrates that these occurrences are not simple fantasies or imaginative creations. This more plausible hypothesis, accepted as valid in this book of wide-ranging research, clarifies the following 8 basic phenomena, among many others:

1. **Psychosoma.** The fact that people categorically affirm having already seen and felt their own double or psychosoma (psychosomatics) freed from the human body, or lucid projection per se, as well as the existence of the chakras (holochakrology).

2. **Self-bilocation.** The allegation by individuals that they are certain of having seen and felt their double in the horizontal position, 3' (1 m) above their own human body, stretched out over the bed, or consensual self-bilocation (projectiology).

3. **Helpers.** The multiple cases in which projectors observe that they are assisted in exiting the human body by many extraphysical associates, namely helpers. The assistance of such helpers would be unnecessary if the experience were merely imagined.

4. **Cord.** The various matching reports of individual and unquestioned verification of the existence of an intercorporeal energetic connection, the silver cord, between the human body and the psychosoma, a characteristic which the human body does not possess (nor does it ostensibly present) subsequent to the severing of the umbilical cord, soon after biological rebirth (resomatics).

5. **Telekinesis.** The numerous cases of the movement of physical objects, or extraphysical telekinesis, executed by the intraphysical consciousness while manifesting directly through the psychosoma.

6. **VS.** The occurrence of an intense vibrational state (VS), felt with complete lucidity, and the sensations that go beyond the anatomical limits and physiological manifestations of the human body.

7. **Sounds.** The incidence of *sui generis* intracranial sounds during the temporary exit and reentry of the consciousness from and into the human body.

8. **Sensations.** Generalized occurrences of an absence of fear or pain, of an expansion of the consciousness and its reluctance to return to the human body. This happens because the sensations *outside the body* (out-of-body sensation: OBS) experienced through the isolated psychosoma are very agreeable and gratifying to the ego or self.

Against. It is worth noting that no theory will ever be in complete agreement with all known facts in its area. That is why, nowadays, the following facts still speak against acceptance of the hypothesis of the objective body: the natural mixture of correct and incorrect information from lucid consciential projectors, due to imagetic influence and the technical insufficiency of those consciousnesses; and the fact that no one knows how the psychosoma is produced, a challenge that remains for consciential projectors of every evolutionary category and origin. This is therefore the justification and vital importance of projectiological research, in order to transform this idealistic theory into a realistic theory, or one that is verifiable in a conventional manner.

Theory. Nevertheless, the formal proposition of the *objective body* – upon which the context of this book (beginning from the Introduction), or projectiology, is founded – can undoubtedly be considered, at this point, to be an expressive scientific theory which is difficult to discard, because it fulfills the 7 basic prerequisites demanded by scientific rigor as being the foundations for a theory, which are listed below:

1. **Methodology.** The theory of the objective body systematizes human knowledge by supplying an appropriate projectiological methodology: Sections I, II, III and others.

2. **Concepts.** The theory of the objective body serves as a source for an analytical structuring of concepts and conceptual classification (system of reference): dozens of chapters.

3. **Facts.** It explains, generalizes and synthesizes the knowledge of projectiological problems or phenomena (facts): Sections III, IV, V, XIV and others.

4. **Knowledge.** It increases humankind's knowledge (Section II) and discovers gaps indicating areas that have still not been explored in this same field of humankind's knowledge: dozens of chapters.

5. **Comparability.** It reinforces comparability or, in other words, contributes toward the verification of factual, underlying values: Sections X, XI and others.

6. **Research.** It orients projectiological research: Sections VIII, XVI and others.

7. **Guideline.** Lastly, the theory of the objective body offers a guideline for a sector of consciential reality and becomes a means for forecasting facts: Sections I to XVIII, the entire panorama.

Proof. This entire book, with its extensive specialized bibliography, even when meticulously analyzed as a whole, does not offer something that can be taken as being a general, public and definitive proof regarding the existence of the objective body. Nevertheless, with the amount of evidence

accumulating on a daily basis, more and more interested persons are discovering the importance and significance of performing continued research based on this hypothesis. With the accumulation of evidence, projection of the consciousness, in the objective body, can progressively make the other hypotheses related to extracorporeal experiences that are currently not well received gain greater acceptance.

Bibliography: Crookall (325, p. 3), Dumas (432, p. 227), Gauld (576, p. 219), Grattan-Guinness (626, p. 86), Pearce-Higgins (1214, p. 83), Rogo (1446, p. 338).

512. LUCID PROJECTION AND THE UNCONSCIOUS

Definition. Unconscious: the set of contents not present in the current field of consciousness, processes and psychic facts that act upon the conduct of the individual, but are outside the scope of awareness and cannot be brought to the fore by any effort of the will or memory, emerging, however, in dreams, Freudian slips, and neurotic or psychotic states.

Synonymy: attic of the mind.; basements of the memory; dead file of the personality; non-conscious; non-critical memory bank; second memory; storehouse of the consciousness.

Hemisphere. The usual psychoanalytical model is composed of the mental strata (psychic apparatus), the unconscious, preconscious and conscious. Psychology and neurology researchers defend the hypothesis that the unconscious is located in the right cerebral hemisphere, the area of the pre-verbal ego, emotivity and, preponderantly, of parapsychic manifestations.

Fecundity. Psychoanalysts who have not experienced lucid projection for themselves might propose the hypothesis of fecundity of the unconscious as the cause of projections. According to the concept of the unconscious – or second memory, in psychoanalysis – it would be part of the mental activity that contains primitive or repressed desires, of which the individual is not aware.

Sleep. By way of the unconscious, the psychic facts that act upon the individual's consciousness, and remain outside the scope of this same consciousness, would emerge during the period of natural sleep, when the consciousness is not alert.

Catharsis. The referred to concept constitutes the same psychological catharsis or liberation of tension in which the personality frees its own repressed desires in a realization of the unconscious, as if the person were living another life. This is purgation or the act of extricating oneself from a disturbing (mental clyster; consciencial enema) sentiment (emotion). According to this simplistic hypothesis, all lucid projectors would be ordinary patients of psychoanalysis.

Queries. The controversial unconscious still requires many explanations, it not being unreasonable to ask: How is the unconscious formed? What function does the unconscious serve in the human being? Is the unconscious an exclusively mental process? Is the unconscious a product of a mechanism identical to that of the central nervous system and its physiochemical reactions? Or could the unconscious be the result of both these functions?

Similarities. It can therefore be observed that the situation of the unconscious is very similar to that of the lucid projection: it is a psychic or consciencial process, the existence of which the projector is obliged to accept unquestioningly, deducing it from its respective effects, but about which he/she knows little, and regarding which the individual who has not experienced lucid projection possesses absolutely no technical and experiential authority with which to formulate an opinion.

Characterization. In fact, there seem to be at least 4 characteristic types of unconscious: the human personal, the human collective, the animal collective and the cosmic. The human personal unconscious seems to be merely another name arranged to characterize the psychosoma or the integral memory minus the current recallable memory or, in other words, the mentalsoma.

Mentalsomatics. *The human collective unconscious would thus be none other than the mentalsomatic dimension of consciousnesses.*

Inexplicable. The following are some occurrences of the phenomenological complex of lucid projection that the unconscious cannot explain: the phenomenon of the physical bilocation of the personality, evidenced by another; joint projections, or those wherein many intraphysical consciousnesses are projected at the same time; lucid projections detected by laboratory equipment; precognitive projections; the contemplation of one's own human body while the consciousness is temporarily outside it during a lucid projection; the convincing examination of one's own silver cord, or the semimaterial connection between the human body and the psychosoma, by the projector; the physical or telekinetic actions produced by the projected intraphysical consciousness; besides other occurrences.

Time. When the lucid projector extraphysically encounters the personality of a deceased individual who the projector had known when that extraphysical consciousness was seventy years of physical age, and who now looks young – with the para-appearance of the thirtieth year of human life, for example – it clearly counters the hypothesis of the unconscious for explaining the phenomenon of lucid consensual projection. This is evidence related to time or chronology.

Retrocognitive. All things aside, it is worth noting that certain projections of the intraphysical consciousness seem more like direct exteriorizations of the individual's unconscious, briefly suffocating the lucidity of one's ordinary, physical waking state, with no transition phase between one state and another. This may explain many retrocognitive consensual projections (retroprojections) or those related to the recollection of the intraphysical consciousness' previous life.

Unverifiable. In light of the above, we may draw the following conclusion regarding the unverifiable thesis of the unconscious: given that it is still incredibly obscure, the unconscious itself first needs to be explained in order that it may someday be able to satisfactorily explain some occurrence within the sector of projectiology. How can we affirm that $A = B$ without understanding A, B, or both terms or facts?

513. PSYCHOLOGICAL THEORY

Hypnagogic. In 1978, John Palmer presented a psychological theory in order to explain experiences of the consciousness outside the human body, based on the assertion that consensual projection is not a parapsychic phenomenon, but an experience or mental state, like dreams or other altered states of consciousness, deriving from the hypnagogic state, or a psychological process similar to memory and imagination.

Association. Consensual projection, for this researcher, might be associated with the parapsi factor but is nevertheless not inherently a psychic phenomenon, thus seeking to explain it without the support of suppositions involving mind-body separation.

Evidence. This theory, however, does not clarify the evidence of apparitions of the projected intraphysical consciousness, the phenomenon of physical bilocation witnessed by third parties and projection with continuous self-awareness, which does not present the hypnagogic state or, more to the point, completely excludes hypnagogic and hypnopompy.

Bibliography: Blackmore (139, p. 242; 148, p. 21), Grattan-Guinness (626, p. 87), Palmer (1187, p. 21).

514. INFORMATION THEORY

Mechanism. Some theorists and parapsychologists, including Joseph Banks Rhine, suggested that the mechanism of extrasensory perception, even when not directly associated with a lucid consensual projection, is related to the act of the mind projecting itself outside the human body and obtaining information in this manner.

Cogitation. The lucid projection experience actually constitutes an exceptional resource for obtaining transcendent information, but the consciousness, upon projecting itself from the human body, is not always looking for information, or even unconsciously or subtly cogitating on it. Evidences of this are the instances of unexpected, spontaneous, abrupt consensual projections that are not sought by the consciousness.

Unconcern. It is worth remembering that the less concerned a person is regarding personal and existential problems or the more unconcerned one is regarding anything that tomorrow may bring, the more predisposed the individual's consciousness becomes to producing lucid consensual projections.

Fundamental. On the other hand, according to modern information theory, many researchers readily admit that information constitutes an element that should be considered as another fundamental variable of nature. In other words, not only does *transport of a quantity of movement* occur, but also the transport of information, a factor that will be important in the appreciation of natural phenomena or even paraphysiological phenomena, including here human lucid consensual projections.

515. THEORY OF REHEARSAL OF BIOLOGICAL DEATH

Trailer. The explanation of lucid consensual projection being a rehearsal for biological death, or deactivation of the soma, has already been put forward by parapsychologists.

Final. Without a doubt, the lucid projection experience can, in most cases, be rationally characterized as a rehearsal of first desoma, or final projection, but this supposition does not explain the occurrences.

Examples. The hypothesis of the rehearsal of biological death is not sufficient to clarify the following facts: the unrecalled apparition of the projected human projector; lucid consensual projection motivated by some emotional cause capable of promoting an encounter with another intraphysical or extraphysical being; the complete absence of worry regarding physical or biological death on the part of certain veteran lucid projectors or even inexperienced lucid projectors. It can be seen that an inauthentic scientific theory can lead us to a great number of true conclusions and show itself to be of great value and usefulness.

516. WORKING HYPOTHESES

Research. Projectiology is a source of research problems. The following is a list of studies that remain to be performed *ab ovo* in the areas of projectiology: codification of precise rules for the development of gifted parapsychic projectors and a reduction of the empiricism that has existed up until now; rationalization of projectors' techniques and basic manifestations, thereby standardizing the variants in use; creation of bases that allow projectors to receive a basic technical education and maintain an informational exchange between themselves (Invisible College of Lucid Projectors); classification of projectiological phenomenology with adequate terminology that is accepted in all areas of human knowledge; presentation of new hypotheses for a rational explanation of the phenomena involving parapsychology, psychology, medicine, physics and other subjects.

Problems. To projectors, parapsychologists, psychologists, biologists, physicians, researchers in general and those persons interested in projection, the author presents some relevant research problems, in addition to the abovementioned experimental projects, which are listed here, according to 12 sectors of experimental assumptions. These constitute viable hypotheses for future generations of researchers.

1. **Projectiological:** the social elements involved in the development of projective capacity; the extent of the possibilities of projectiology as a field of education; how to turn the productive exceptions in the manifestations of projectiology into rules; an easy method for maintaining continuous self-awareness; an easy method for prolonging the duration of lucid projection; the maximum distance between the human body and the psychosoma for projection in the mentalsoma; agents for projecting in the psychosoma and in the mentalsoma; exteriorization of the mentalsoma from the freed psychosoma; currents of negative forces in paratropospheric extraphysical districts; the human aura and holochakra (holochakrology); an easy method for distinguishing between the mentalsoma and a partial configuration of the extraphysical head of the less dense psychosoma; an easy method for interrupting a period of recess in self-lucid projections; reliable projective aids; an easy method allowing anyone to project in the psychosoma; an easy method for producing joint lucid projections; an easy method allowing anyone to project in the mentalsoma; the differences between morphothosenes and authentic extraphysical images; an easy method for improving recall of the extraphysical stages of conscial projection; the use of hypnosis as a reasonable (without abdominal brainwashing) projective technique; an easy method for penetrating evolved extraphysical communities and environments.

2. **Parapsychological:** the relationship between morphothosenes and hallucinations in the ordinary, physical waking state; the dynamics of the projector's parapsychism; induction of healthy mutual possession; controlled emotions in the psychosoma; holomemory in the mentalsoma.

3. **Psychological:** an easy method for the concentration of thought; an easy method for maintaining permanent mental hygiene.

4. **Biological:** heredity as an active factor in lucid projection; the constitution of the human body in lucid projection; complications during childbirth and projective predisposition.

5. **Para-anatomical:** understanding of the nature of the psychosoma; the nature of the silver cord; chakras; organs of the psychosoma; addressing the nature of the mentalsoma and the golden cord.

6. **Physiological:** excessive physical weight in relation to lucid projection; the maximum physiological possibility of the human body when emptied of the consciousness, which is projected in the psychosoma along with a greater amount of the holochakra; systematization of the projector's animism; stimulation of acupuncture points in the deltoid region and projective capacity.

7. **Paraphysiological:** basic reasons for the variability of projectors' aptitudes; the pregnant woman, the fetus, lucid projections and the probable idiosyncrasies of lucid projection processes; discoincidence in the initial stages of human gestation; differences between extraphysical energy and individual conscial energies; extraphysical malleability and agility of the psychosoma; differences between the energies of intraphysical consciousnesses and extraphysical consciousnesses; criterion for the application of energies obtained by extraphysical technicians (helpers, evolutiologists); the organic cause of intracranial sounds; differences between the energies transmitted by the consciousness when in the human body, the psychosoma and the mentalsoma; an easy method for stimulating projective capacity or lucid projectability.

8. **Pharmacological:** the action of chloroform and other more modern anesthetics in the production of lucid projection; the action of psychedelic drugs in the production of lucid projection.

9. **Therapeutic:** lucid projection as an advanced therapeutic resource; an easy method for the conscial application of energies by the projected intraphysical consciousness.

10. **Parapathological:** the frequent prolonged separation of the consciousness and the *empty brain syndrome*; the parapathology of the silver cord and the holochakra.

11. **Physical:** photograph, with an ultra-sensitive camera, the projector projected in between the sensors of a shielded camera; the relationship of the Faraday cage and the projected consciousness; ionization of the physical base and the lucid projectability of the intraphysical consciousness; human and extraphysical equipment (paratechnology) in projectiology; researching of the microcosm, macrocosm and extraphysical matter, through various types of lucid projection experiences.

12. **Artistic:** lucid projections in literature (poetry and prose); lucid projections and other artistic areas.

Resources. Resources exist – working hypotheses that are still fairly unclear – which can be transformed into psychophysiological crutches for the intraphysical consciousness in order to project, such as certain allopathic or homeopathic medications. The original ideas listed in this volume can also inspire working hypotheses.

Expanders. The mechanism of lucid projection, within the individual or psyche, triggers the *psychopetal movement* of the consciousness, first through relaxation, centralizing the consciousness in the brain, especially in the mnemonic center, and the loss of motor manifestations, with the subsequent torpidity of the entire human body. Secondly, *psychofugal movement* occurs, wherein the consciousness leaves the restriction of the physical brain and expands beyond the force field of the human body, or exteriorizes, overflowing to the extraphysical dimension. In other words, there is first an implosion, followed by an explosion. From a human *animal* point of view, there is first a retreat into concentration, wherein the consciousness prepares itself to kickoff. It then advances and expands, kicking off, per se or, in other words, leaping toward the unknown extraphysical world. To what extent do mind-expanding drugs predispose these movements of the consciousness?

517. HARMONIC SERIES MODEL

Definition. Harmonic series: an infinite sequence of tones that arises from a fundamental, stationary oscillation, originating from electric oscillations, sounds or other sources.

Synonymy: harmonic scale; harmonic order; harmonic sequence; Fourier series; harmonic succession.

Difference. Without looking at the 2 musical instruments – a flute and a violin, for example – which alternately play the same note of the same pitch and intensity, any person can tell the sound of the flute from the violin. Even though one has never heard either of the 2 instruments, it is clearly possible to distinguish the difference between the 2 sounds. This gives rise to the following question: If the note of the same pitch and intensity has the same fundamental frequency, and the vibrating air carries this same oscillation to our ears (tympana), how is one able to distinguish the difference between the sound of the 2 instruments? Expressing it another way: How does the oscillation of the air allow differentiation between the sounds, if the oscillation occurs at the same frequency? The answer lies in a greater understanding of the harmonic series.

Base note. Supposing that “do” is the base note, or fundamental frequency, the harmonic series, resonant from this base note, simultaneously with it, that is emitted from each instrument is:

Infinite. This series is theoretically infinite, despite the fact that the harmonic sounds very distant from the fundamental are, in fact, not detected, due to their low intensity. The intervals of frequency between the harmonics can be observed: perfect eighth, perfect fifth, perfect fourth, major third, minor third. Much of what is currently known about the main intervals of musical harmony arose intuitively from this series.

Theorice. In electricity, harmonics play important roles. When a great number of these curves – each one representing 1 harmonic – are superimposed, the resulting curve can have a highly

complicated form. The richness and quality of a fundamental frequency depends solely upon the proportions in which the different harmonics are added.

Harmonics. The answer to the previously asked question was shown in the nineteenth century through the investigations of Hermann von Helmholtz (1821-1894), who stated that the different sound characteristic, or the so-called *timbre of a sound*, is determined by the proportion in which the different harmonics are heard or, in other words, it depends upon the energy of the various harmonics, which varies for each instrument, or even according to the way in which the sound is produced.

Figures. Figure 517.2 shows the relationships between the wavelengths of the first 6 harmonics, or the various ways in which one string of 1 musical instrument vibrates for just one note and its first harmonics. Figures 517.3 (b) and (c) show the waveform of a piano and a clarinet, playing one note of the same frequency, but differing in their forms, which characterize the timbre, represented by the sum of its more intense harmonics. A spectrum of frequencies showing the amplitude of each harmonic is shown in figure 517, on page 1,152.

Series. The amplitudes of the harmonics are mathematically represented through the coefficients of a Fourier series (Joseph Fourier 1768-1830).

Perception. There are human ears that can perceive and distinguish up to the seventh harmonic, while others barely perceive or differentiate the fundamental sound. In the same way, a medium and a sensitive are able to perceive visually, or through other consciencial senses, various vibrations of matter to different degrees.

Term. It is worth clarifying that the term *sensitive*, in this case, is more ample than the term *medium*, as it includes animic perceptions, while the *medium* plays only the passive role of an intermediary between two consciencial dimensions.

Model. This is the proposition of an initial and simple, factual theoretical model, based on well-known analogies of waves with consciencial states, amplifying the wave concept through an expansion of the harmonic series with its infinite spectrum of harmonics for each fundamental stationary frequency, as the first step toward future, more sophisticated, models of the states of the various vehicles of consciencial manifestation, their parts, their interactions with the various states of “matter” or condensed fields, interactions with other consciencial states and intra-actions with the consciencial itself (intraconscienciality).

Empiricism. The analogies that are established here, in an initial model, are exclusively empirical – or are based on physical-extraphysical observation – and are associative. They should be tested in order for the model to evolve.

Suppositions. Along the lines of, and by analogy with, the infinite and quantic (noncontinuous) harmonic series – arising naturally from a fundamental vibration of any 1 body, in stationary oscillations progressing to higher frequencies – 7 initial or basic suppositions can be made:

1. **Chakras.** By way of simple association, and based on the monochrome condition that some chakras present – each of them being of a fundamental frequency and accompanied by their various harmonics – various states are established in which each of the chakras can be encountered, depending on the spectrum or intensity of the harmonics, or its respective timbre, thereby configuring the various tints of each one. The state of condensation of the fields associated with each chakra determines its higher or lower frequency, as well as determining the stage of interaction with condensed physical matter.

2. **Idea.** A fundamental frequency can be associated with each idea, which propagates itself through resonance, starting with its outflow from the mental computer in the mentalsoma, through the psychosoma, the holochakra, and finally arriving at the more condensed plasmas of the human body in the brain. It is not known what it is that enters into vibration in these various bodies or vehicles of consciencial manifestation. Nevertheless, the transmission picks up interference from each one of them. It can be richer or poorer, according to the state of the various bodies; richer or poorer in harmonics, according to how much that idea has been learned; richer or poorer in other packets of lateral disciplinary ideas, which will either help or hinder conclusive reasoning. Many ideas or thoughts trigger other ideas or thoughts through the phenomena of resonance, where one of

the harmonics of the original idea excites other fundamentals. This gives us an idea of the complexity of this oscillatory system.

3. **States.** These states of vibration might be associated with the complex stages of the vibration of fields, and here the field concept becomes obsolete, and the mechanical and electrical vibrations initially given as an example would be the last stages of vibration of as yet unknown types of fields, but would probably turn out to be fields that are not limited by known space-time dimensions, oscillating in unknown dimensions, arriving at the human brain through simple resonance and the increase of lateral packets of experiences of the various consciential bodies or meta-organisms. Understanding the nature of these vibrations is one of the relevant points that should be an integral part of the interests in future research.

4. **Packets.** The blocks or packets of disciplinary, associative and lateral ideas gradually become refined by taking advantage of the experiences of successive lives (existential seriation), gradually becoming disciplined, purified and controlled through the equilibrium of the infinite harmonics of its wave packets which, acting jointly with the central idea will equilibrate or disequilibrate the response emitted from the complex mental computer. For illustrative purposes, we can cite the paralogy of emotions (psychosoma), uncontrolled due to the fear factor, which arrives as 1 emotional and lateral packet pertaining to a specific central situation. When faced with this situation, the paralogy of emotions spills out its fear factor, with the full intensity of its charge, vibrating at the fundamental or primary harmonic which, when added to any subsequent rational idea, will remain dominant, being introduced as a negative and prejudicial factor. The individual, with the aid of rationality, good intentions, self-discernment, greater knowledge and a good utilization of personal experiences, can gradually transfer the intense energy of the first harmonic to the others, thus stabilizing the emotions and allowing reason or intuition of the higher paralogies to become purer. In the same manner, and in the opposite direction, if one works toward improving oneself in the denser bodies, one will automatically be improving, in detail, the less dense bodies through other reverberations of the harmonics which are imperceptible to us.

5. **Timbre.** The timbre or “color” of the fundamental vibration is the main point of this model. The consciousness, through a strong will, can interfere in the timbre, or the spectrum of the energies of a fundamental frequency, thus modifying the relative intensity of the various harmonics; can transfer energy from certain harmonics to others, thereby reinforcing the main points of a central idea; or one can modify the fundamental and the spectrum of the harmonics into a specific curative (therapy) energetic transmission or into a physical effects energetic transmission, or in order to provoke a lucid projection. As an illustration of a similar application, we can cite the projective circumstance wherein the projector – wishing to leave the human body (soma) with continuous self-awareness – mobilizes the energies of the chakras using a strong will and reinforces, with a greater intensity, the fundamental frequency of the psychosoma, which is interiorized within the human body along with the holochakra, thus provoking a projection of the consciousness in the psychosoma through the vibrational state. If, on the contrary, the projector reinforces not the fundamental harmonic, but another harmonic with a frequency superior to that of the interiorized psychosoma, a projection will occur without entering into a vibrational state; but directly, with the consciousness *inside* the psychosoma vibrating at a higher frequency.

6. **Ambiguities.** The strong, *ironclad*, projective and dominating mental control of morphogenesis is associated with the mastery of the frequencies of one’s own consciential vehicles of manifestation, which are rich in harmonics and controlled by the mind. It is truly the “know thyself” principle of personal conduct recommended by Socrates (470-399 B.C.), dominating and controlling all the bodies (or the soma and the paralogies) of the intraphysical consciousness, making them vibrate together, due to a common goal, which will afford it the greatest possible strength. The more frequencies that vibrate in order to achieve a specific goal, the more solid they will become. The more harmonics that accompany them, the more balanced and perfect it will be. The balance of the intraphysical consciousness’ coexistence with ambiguities and his/her deep understanding come into play here.

7. Projection. The main, complementary and sole route to the cleansing of each of the bodies – in regard to negative ideas, those ideas of the basement of the mind (consciential basement), the residue of the ferocious animal, regressive or infantile egoistic vanities – lies in lucid projection. It represents the act of knowing yourself fully, confronting and modifying your own self deeply in all the bodies, without mysticism, hypocrisy and egoism, toward the efficient use of the mentalsoma and the experience of the most ample universality that is possible. Through projections of the consciousness, the true sense of the equilibrium of the frequencies of their harmonics in a profound and universal manner is established.

Synthesizers. In a manner analogous to the operation of sound synthesizers – with which one can electronically regulate the duration, intensity, fundamental frequency and timbre of sound at will – mediums, sensitives, animists, parapsychics and lucid projectors can also learn to control these variables through their studies (theories) and training (practice), or theorices, since they possess more acute perceptions and have sufficient consciential energy for this purpose. This will allow them to achieve better experiences that will go to the limit of the individual's control and imagination – while harboring good intentions and self-discernment, and remaining as scientific and universal as possible. We can see that it is necessary to influence the oscillatory system in this case.

Universalism. The expressions “scientific” and “universal” are complementary here. Science occupies itself with the search for truth. This search must have a so-called *scientific* control, in order to avoid jumping to conclusions when faced with phenomena that are masked by many hidden variables. Also, this should be accompanied by a sufficient degree of universalism in order to eliminate fanaticisms (sectarianisms, factionalisms) of any nature, temporary preconceptions, idolatry of any kind and general neophobia. The intraphysical consciousness should, as far as possible, maintain a posture of open-mindedness (intraconsciential openness, neophilia) for the acquisition of new knowledge (or the creation of neosynapses), although never overlooking the indispensable self-discernment of scientific control. These two attributes may appear antagonistic to those who seek leading-edge relative truths – and the traps are set at all times – until the floating balance of both are adjusted, which enables a more rapid ascension.

Acquisitions. These are acquisitions resulting from constant and personal work, improving the manner in which one sees things and relates to problems, always supposing here the preexistence of good intention (self-discernment and cosmoethics, in this case). The control and the universalism of the sensitivity of the extrasensory perception of the upcoming consciential stages is often independent. This is due to the non-linear nature of knowledge acquisition. These perceptions, then, serve to call attention to this type of openness-control.

Altered. Altered states of consciousness – such as oneiric images, the hypnagogic state, the hypnopompic state, daydream, mental concentration, exaltation and dream – would probably be connected with the assimilation of events that one has experienced, or the *digestion* of one's more internal experiences and impressions of the waves that exist in the ocean of one's memory (holomemory) in the various vehicles of manifestation of the intraphysical consciousness. These states gradually disappear in proportion with humankind's evolution, becoming more profound and complementary, until they disappear, leaving the state of completely continuous self-awareness.

Sensitive. The refined sensitive is able to bring the impressions of his/her deeper, more remote frequencies and harmonics to the sphere of the human brain with clarity, as a result of already having controlled and perceived these frequencies in a balanced manner and knowing how to amplify them without interfering with them, positioning the (always preferably *self-aware*) pointer of the consciousness there. These subtle frequencies – upon resonating with the external harmonics of extraphysical objects, persons, or extraphysical agents – may or may not be perceived by the sensitive, depending upon his/her predisposition, motivation, interest, positive curiosity and ability to penetrate the frequencies in question.

Holomemories. Penetration into the mental archives of other consciousnesses (holomemories of consciential micro-universes) can occur up to the level of internal archives, to which not even the assaulted consciousness (violated victim) has access. The depth of penetration is a function of the sensitive's

control of consciential frequencies, upon acquiring, by way of resonance, the consciential energies, certain packets of which are located in the space-time of the assaulted consciousness.

Stages. The base-bodies – due to their diverse natures and functions – evidence the necessity of levels of stability in each process, passing from body to body, in order for the evolution of these stages to be processed – just as there are laws for all phenomena, outlining their validity – to our current mental state of the moment or the currently sufficient model. This causes our mental organization to be oriented within these limits, in order to subsequently move forward.

Inspiration. It is common that persons, upon finding themselves absorbing diverse energies (holothosenes), such as under the spray of a shower, or others already cited, perceive changes in the energies of the various harmonics of their vehicles of manifestation, or the timbre of the various bodies and parts, according to the direction of their thosenes (*tho*) toward questions or problems that they wish to solve, in such a manner that they are able to amplify the harmonics up to those of the mentalsoma (parabody of self-discernment). At this point, the consciousness – in a process analogous to that of clairvoyance – brings to the brain or, in other words, transfers itself to the more intense harmonics, causing interesting ideas and achieving the highest states of inspiration.

Precognition. These states of amplification of the waves of the mentalsoma can also occur in the sense of waves traveling through time, explaining the phenomena known as presentiments (self-precognitions). These waves, which are probably multidimensional and have multiple traveling frequencies, even in space-time, address these variables in a relativistic and unconventional manner. A logical, conventional, classic, initial and immediately understandable explanation can be established whereby the pure mentalsoma with its intensive analysis of causes, performs a search for all the possible ways. We can make a pale analogy by comparing this to an immense computer that forecasts the upcoming moves in a chess game after considering all existing pieces and a profound knowledge of its adversary, not overlooking a single variable. This irresistible analysis vibrates in time with the greatest intensity toward the most probable route and with a lesser intensity toward others. The sensitive is sometimes able to single out this wave from the ocean of ideas, locating it while in the waking state, in the manner of a presentiment that comes to the fore, thereby characterizing precognition. Nevertheless, the phenomenon of self-precognition must undoubtedly be influenced by a combination of various phenomena: relativistics, harmonic series, changes of systems, mentalsoma, environment and others as yet to be studied.

Will. It is not necessary, nor is it appropriate or possible for the memory and the organismic consciousness, or the current human body, to be aware of all causes and processes that occur in order to arrive at a similar presentiment, or another type of processing, in the same way that it is not necessary to be aware of the mechanism of all cerebral, nerve, muscular and chemical reactions in order to move a leg to walk. The harmonies of these internal processes are sufficient only with the action of the will – the externalizing pointer of the memory banks and processes of the mental computer – the intensity of which is dependent upon the vibrational harmony of all bodies of the human being, who evolves while learning how to control them, understand them, operate them and finally harmonize them in a single way, or that of balanced, correct and cosmoethical will.

Processes. For mechanisms such as ordinary movements, simpler processes – which have been assimilated and connected to the animal body for a long time – are sufficient. Nevertheless, with the advent of imbalances, blockages can occur during these processes. On the other hand, for more subtle processes, a lot of cultivation and a long period of balance are necessary, removing the priorities of the primary processes (genetics, somatics) during the waking state and substituting them with processes of the mentalsoma (paragenetics, mentalsomatics).

Learning. We should not fail to seek out and understand the mechanisms and causes of the production of effects simply because it is not necessary to be self-aware of them. On the contrary, it is necessary to bring these learnings to the ordinary waking state through the improvement of theories and a great deal of study, in the same manner that a great portion of the nervous, muscular and chemical reactions needed to produce the movement of a leg are known.

Apparatuses. One of the points in favor of this model is the interference produced by certain individuals and sensitives in electronic apparatuses, the operation of which is dependent upon harmonic frequencies, e.g.: telephone switchboards. These individuals are therefore not able to work in such places. In this case, it is probably the harmonics of their consciencial energies intersecting, resonating, colliding and interfering with the harmonics of the electronic apparatuses. It is probably the denser, unchanging energies of the chakras (holochakrology) that produce the interference. Other similar cases are probably certain instances of poltergeist and telekinesis.

Impregnation. During intraphysical life, an individual can perform mental impregnations upon the assembly of positive, negative or neutral waves or, in other words, in favor of, against or indifferent toward others, such that this waveform always returns in different intensities to his/her various bodies, when faced with analogous situations. These situations can be sponsored by the individual or others, so that facts such as these – also positive, negative or indifferent – befall him/her when they become present within the process of free will in human life, whether it be situations, environments, objects or beings that induce this return.

Human diapason. The standard musical pitch (diapason) from a tuning fork is considered, in fact, to be a pure tone or, in other words, is devoid of harmonics superior to the fundamental, as these harmonics are of very low intensity – the pure fundamental thus essentially predominating. The “human diapason” would vibrate with greater intensity in the fundamental, or would somehow directly block the superior harmonics from his/her own senses, and is, for this reason, in lack of sensitive capacities, due to the fact of not being able to significantly modify his/her own timbre, or unblock it to the point of obtaining clear perceptions in order to change or highlight the energies of the harmonics, as occurs with the sensitive who sometimes controls or receives these highlights spontaneously. At any rate, the “human diapason” does not cease to be a potential sensitive to the degree that he/she comes to develop the energetic control of the superior harmonics of his/her consciousness, or extract it from the blockages. This is why it can be affirmed that every human personality (intraphysical consciousness) is, potentially, a medium or sensitive, or even an animist.

Vital. The presence of the vital body, or holochakra, in the psychosoma of the projected intraphysical consciousness, brings with it the harmonic frequencies that are characteristic of the parts of these bodies, especially the centers of consciencial energies or chakras. This makes it difficult for the intraphysical consciousness to remain within the frequencies of the psychosoma, with lucidity, when faced with such a great variety of frequencies produced by the energies of the more important chakras, and which the projector is not able to organize and balance. All this must produce dissonances in one’s lucidity, which subsequently reduces. This may explain the necessity for the existence of the brain in the human body, which serves as a bastion for the maintenance of awareness, when faced with the condensed flows of the energies of our atomic-molecular-organic matter.

Predisposition. An individual’s so-called predisposition – including one’s own projectability – would then be directly related to the momentary spectrum of energies of the respective harmonics of his/her bodies. If the superior harmonics are high (up), that is to say unblocked, the individual’s extraphysical sensitivity or intuitions will be amplified. On the other hand, and to the contrary, one will not discern much (down) and will mostly think using the fundamental frequencies, if one is in a very terrestrial, tropospheric condition.

Nullification. Based on this control of harmonics, sensitives are able to modify the frequencies of their own harmonics, according to their greater or lesser energetic capacity or will power. The sensitive can also send energies to someone in order to diminish the other’s extraphysical sensitivity, through the decrease or nullification of the intensity of the superior harmonics of that being. If the sensitive is sufficiently balanced in regard to his/her consciencial energies, he/she will maintain his/her spectrum in a state of constant energetic compensation (holochakral homeostasis). Otherwise, his/her sensitivity will decrease and he/she will enter into energetic imbalance, which is sometimes called illness, disturbance, interconsciencial intrusion or stress fatigue (languidness, mental laziness, intraconsciencial vacuum).

Holochakrology. Through transmissions of consciencial energies (magnetic passes, laying on of hands, blessings), the extraphysical helpers can reinforce: the deadened harmonics of an individual, such that his/her consciousness does not remain in the fundamentals, thus turning him/her into a sensitive; the harmonics of the natural frequency of the psychosoma of the intraphysical consciousness, helping him/her produce a lucid projection; the superior harmonics of the psychosoma of the projected consciousness, amplifying his/her extraphysical vision; or the amplification of the frequencies of the mentalsoma, thereby provoking the projection of the consciousness of the individual toward one of these frequencies, thus occurring projection in the isolated mentalsoma. The intention behind the transmissions (liberations, exteriorizations) of energies to intraphysical ill beings (intraphysical consciousnesses and extraphysical consciousnesses) is perhaps the modification of the timbre or the spectrum of the harmonics, or the elimination of the ill, mental, thosenic waveform that the person, or even the extraphysical consciousness, is unable to discard alone and in whom it becomes strongly impregnated.

Coupling. In the consciencial conditions of auric coupling, a type of common resonant junction might occur between the frequencies of the attitudes and thoughts that are cultivated (within the integral holomemory of any time) and the frequencies that are common to other objects or consciousnesses, with or without the perception of the wakeful consciousness of the individual, depending upon his/her capacity for parapsychic perception or energetic sensitivity. This junction can promote subsequent occurrences which are positive-healthy or negative-pathological for consciousnesses, depending upon the intensity of the coupling and whether or not the *internal* consciousness is able to send the perception or intuition of the quality of the coupling to the *external* (wakeful) consciousness.

Intensity. If the quality of the coupling is negative or pathological, the consciousness tries to inhibit its intensity, regardless of whether or not the wakeful consciousness is aware of the posture that has been assumed. In this way, one may or may not change the intensity of the coupling, depending upon the profile of the frequencies that prevail at that moment.

Accidents. If the cultivation (self-thosenity) that prevails over a person is, on average, of analogous (negative) thosenes, that person will reinforce the coupling, principally if there is a predisposition; otherwise the coupling will be undone. We can cite the following example: the imminence of a ceiling (object) falling on a person (consciousness). If that person cultivates analogous negative thosenes (personal holothosene) against others, the individual will be negatively predisposed (accident proneness) and will strengthen that coupling, thereby getting drawn into the reaffirmation of those very frequencies, thereby suffering the accident. In a contrary condition, some excuse or a call will predispose that consciousness to leave that location.

Objects. Objects that are impregnated with certain attitudes and sentiments, whether positive or negative, by their owner, can affect persons who subsequently come to own them. This is because they resonate (empathy, affinity) with the waves of sentiments that emanate from them (psychometry).

Interprisons. At this point, it is also important to recall the mechanism whereby the processes that generate *groupkarmic interprisons* are formed, within consciencial micro-universes. These maintain the groupthosenes, group holothosenes, and an anticosmoethical and common materthosene.

Transit. A person who is driving irresponsibly can become connected, through auric coupling, to other drivers or vehicles of analogous mental emissions or those who do not maintain an adequate mental posture. The coupling flow is therefore almost instantaneous, due to analogous resonant frequencies that are cultivated and united to a greater predisposition, which is further connected both to that moment in time, as well as to the individual's consciencial evolutionary imperfection. This is why both individual and group commuter neuroses exist. This also explains the importance of cultivating good thoughts (orthothosenity) at any time or place, thereby elevating the positives and inhibiting the negatives. These occurrences are customarily given various names, such as: "current condition of consciencial evolution"; "will of God"; "activity in one's egokarmic or individual account"; "activity in one's groupkarmic or group account".

Synchronicity. As can be seen with these facts, the condition of cosmic synchronicity, which involves us all, can also become somewhat more explicit through this harmonic series model.

Energies. The process of the exchange of consciencial energies is probably intimately connected with the phenomenon of resonance. A person, upon sending his/her energies to another is, through simple resonance, amplifying certain fundamentals and harmonics of the other's consciousness with a greater or lesser intensity, which will be determined by the duration of the transmission and the intraconsciencial action of the receiving system. This transmitted psychic energy can be of a positive-cosmoethical or negative-anticosmoethical nature. The person whose energies are amplified by another can, for this reason, assume attitudes, postures, or have ideas that are likewise positive-healthy or negative-ill, and which that person would not have taken or had if he/she had been isolated from the energetic field (personal holothosene) of the other, or if he/she knew how to receive these amplifications with indifference, rationality, self-discernment, analysis and coherence in his/her own attitudes.

Ramifications. Auric couplings can have many ramifications, depending upon their energetic concentration and their objective (quality of intentionality). There are auric couplings which range from the collective transport of psychosomas, to resonant amplifications in other consciousnesses of any order; from psychic warfare in unprepared minds, to consciencial elevation on the way of cosmoethics; from the preparation of mechanical and electronic apparatuses, to their proper use and operation, through the organization of consciencial energies; from the organized preparation of the vehicles of manifestation of the consciousness to self-control in any place, time and situation, culminating in projection with continuous self-awareness.

Channels. Probably, due to holokarmic problems or attitudes adopted by the consciousness in the past, there may be an amplification of certain energetic channels and a dampening of the amplitude of others. The amplification of the dampened channels is incumbent upon one's own thosenes, a cultivation of attitudes and the extent of one's own imagination. This will depend upon the creation of a suitable method for those amplifications. It is important that these methods be registered – if indeed they are conscious – in order that other consciousnesses may also utilize them so that they can come out from the darkness of their own senses. These intensities of amplification of sensitivities, according to prior attitudes and without perceiving the entire picture, can be compared to a fine thread, a thicker rope or an iron chain.

Trauma. There are persons who have an “intrinsic energetic imbalance”, or bioenergetic imbalance, for whom everything goes wrong in life and who, when submitted to parapsychic testing, present results below a random probability. The complete impairment of a sense can create a condition in which the person does not even consider that sense. Nevertheless, the random probability remains. However, to have a sense (a sensory capacity) totally impaired and to choose neither correct nor random options, but only incorrect ones, is unusual. It is an indication that the person is perceiving (with that sense), but insists on looking for the option that is contrary to that which is correct (pathothosene). This reveals a type of subtle consciencial trauma, the energetic opening or amplification of which is like a fine thread.

Imbalance. It is very common to encounter a child who is energetically imbalanced. His/her chakras do not have balanced energies, some operating excessively and others deficiently. This often occurs as a result of playing, excessive laughing and nervousness, which is characteristic of those who rob consciencial energies (energivore, vampire or human drainer), or others who transmit negative energies. The same occurs with subhuman animals (zoology) and plants (botany). So-called *blessings* or so-called *energetic passes* can stabilize the chakras, thereby temporarily eliminating the problem.

Adults. Nevertheless, there are also legions of adults who often have the same problem – uncontrolled energetic balance (self-cure or self-remission) – frequently leading to chronic syndromes or illnesses which, over time, affect nearby physical organs, thereby causing concrete problems of an organic or somatic nature. When these energetic imbalances occur, many surrounding persons try to stabilize the other, in a conscious or unconscious manner. However, the person lacking control cannot spend his/her entire life depending on others and feeling sick. He/she should seek the self-control of organization, the balance of self-thosenes and attitudes, rationality and applied self-discernment, emerging from emotional infancy and moving from the condition of being helped (consolation task) to the condition of helping (clarification task) with maturity and self-control, in line with his/her own consciencial evolution and the evolution of his/her karmic group.

Analogies. Analogies can be extrapolated in order to construct theories in this field, one example being the uncertainty principle or the phenomenon of changes in quantic states. The greatest probability for encountering the human being’s consciousness is in the present and within the sphere of energies of his/her human body. Nevertheless, there also exists the probability of encountering someone’s consciousness projected in the past or the future, or encountering it outside the human body in the extraphysical sphere of energies, or projected outside the sphere of energies, and almost free, in any other location. Regardless of which of these states one is encountered in, upon emitting a “photon” of energy, either through the silver cord (holochakrology) or in the direction of another body, in a direction outward from the body where one is located, a change will occur in this quantic state toward another quantic state or energy-frequency-dimension plane that is freer from heavy impositions upon the system, vibrating at more subtle frequencies, and wherein the dense body would be the nucleus of the complete consciential atom. It is common knowledge that analogies act as seeds for the future creation of initial models, improvements, subsequent theories and, finally, a comprehensive vision of reality.

518. TO THE READER

Warning. A warning is appropriate at this point: if you feel comfortable and complacent with your repressions, conditionings, sacralizations, castrations, taboos, myths, subjugations, leashes of the ego and interconscial dependencies of human existence, the following 3 things should be avoided as much as possible:

1. **Projectiology.** Projectiology.
2. **Phenomenology.** The phenomenon of lucid projection and you.
3. **Projectability.** All veteran lucid projectors.

Dangers. The 3 items above are real dangers for you. If you begin to reflect upon the reality that they will provide, you will never be the same. Your *good life* will end. You will become aware of greater responsibilities as a result of leading-edge relative truths. You will know more. You will have more power. You will want to work more. You will live with a more lucid consciousness. All of this will inevitably bring you enormous problems, conscial growing crises and constant self-recycling from that point on. Run away from these dangers that are real for you. Continue to calmly repeat yet another self-mimetic human life. After all, the consciousness is imperishable. Evolution is infinite. Why be in such a hurry? You have a long life ahead of you and an abundance of time. Another thing: forget this book. *This is the classic message of the brainwashers* or the human robotizers in this still pathological, superconsumeristic, anti-ecological intraphysical society in which we participate to some degree.

Revolution. The practice of lucid projection gradually makes the lucid projector become quite a revolutionary within *materialist* intraphysical society, as well as in *mystical* human intraphysical society. It is sufficient to consider only 10 personal conditions that the lucid projector achieves:

1. One's personal possibilities maximally deconditioned.
2. Unrepressed to the greatest degree possible (freed).
3. Desacralized regarding everything and everybody, without exception (anti-demagogue).
4. *Untabooed* regarding any subject (self-sufficient).
5. Definitively debrainwashed regarding the intraphysical society in which we live.
6. Unimplicated to a greater degree regarding the immaturities and errors of others (cosmoethics).
7. One who questions everything that exists in a positive continuous and omnipresent manner (self-discerner).
8. Sincere in the extreme regarding frank relative truths (conscial maturity achieved through impact therapy).
9. Free, truly entirely free, in all senses.
10. Universalistic to the point of living with multidimensional self-awareness (self-lucid conscial epicenter).

Presentation. This book can merely serve as a reference work or it can be read from beginning to end. The individual who has reached this point in the book will observe that this methodical work has sought to present the bases of projectiology as a scientific discipline through investigation or construction of a special and systematic science, demonstrating its relevance in the area of knowledge and its revolutionary consequences in many sectors of human activity. Projectiology deserves to be studied in depth because it represents a step forward, a new and unexpected area of unforeseeable positive achievement that promises to amplify the terrestrial consciousness' sphere of activity. However, new knowledge is not merely added to existing knowledge: it has to integrate with this knowledge.

Classification. The characteristic occurrences that are most frequently experienced by the majority of consciential projectors have been listed and studied. Certain observers may, at first sight, judge the comparisons presented here to be inadequate, precipitated or exaggerated, revealing unprecedented, but valid, aspects and giving the new discipline a scientific codification or classification with an analysis and naming of the occurrences. This may be due to an overestimation by uninformed individuals.

Reality. Nevertheless, if you ask your relatives, friends, co-workers, acquaintances and neighbors, and probe your social relationships, you will always find some well-informed person who has already experienced or studied lucid consciential projections. The obvious evidence of consciential, paraphysiological occurrences leaves everyone no alternative other than to accept extraphysical reality. There are countless witnesses who have placed the subject of lucid consciential projection as a top priority among their interests and inquiries, considering this phenomenon to be the most relevant mental and consciential experience that can be naturally achieved during a person's human lifetime.

Stance. The stance of the author regarding projectiology was not reached without a great deal of reflection. If, on the one hand, we maintain that this position is probably the most defensible in an imperfect world (deficiencyland), we do not, on the other hand, propose it as an absolute certainty, nor do we disrespect those who disagree, in light of the diversity of human experiences.

Rejections. Innumerable libertarian ideas of the human consciousness, including many having a strictly scientific origin, were not well-received or were frankly rejected and attacked by scientists, studious individuals and sometimes even by the people of the time. The following 24 discoveries, among many others, encountered adverse conditions of extreme rejection by the human consciousness:

1. Anesthesia.
2. Blood circulation.
3. Daguerreotype (photography).
4. Electric current.
5. Galvanism.
6. Gas illumination.
7. Homeopathy.
8. Hygiene during childbirth.
9. Intercontinental underwater cables.
10. Magnetism.
11. Railways (trains).
12. Sunspots.
13. The composition of air.
14. The earth's rotation.
15. The falling of meteorites.
16. The gramophone (phonograph).
17. The lightning rod.
18. The propeller.
19. The size of the stars.
20. The steamboat (navigation).
21. The undulation of light (wave theory).
22. The vaccine.
23. Thermodynamics.
24. Wireless telegraphy.

Evolution. It must be hoped that this era of crass obscurantism has already been surpassed, in spite of the religious, sociological, political and even scientific inquisitions that still occur here and there.

Approach. We intend to reach all types of young readers whose imagination and creativity have not been totally repressed by the current standardized educational process (*abdominal brainwashing*). We send our message to those who can cope with states of temporary ambiguity (pattern-behavior vs. exception-behavior) and are not afraid of confronting changes imposed by new ideas. What is presented here is a point of departure, a sketch of the basic idea, an instructive comparison, an invitation to your opinion and critique. What better approach is there for the analysis and research of these essential, high priority problems for people? Humankind transforms itself into the living dead when it abandons interrogation.

Critique. Finally, a reminder to all readers: the activity of reading does not end with the effort made to understand what a book has to say. It must be completed by critiquing or, in other words: with the work of judging everything you read.

519. TO SKEPTICS OF PROJECTIONS OF THE CONSCIOUSNESS

Restraint. We are all aware that everything which is official, academic, orthodox or fundamentalist constitutes a powerful restraint toward any and all intention for renewal. The human mind is primarily traditional and neophobic. There are individuals with a certain mental rigidity that makes their lucid entrance into extraphysical dimensions impracticable. In general, scientists enclose themselves in their own system and create their own world. They routinely negate everything they do not see or become used to not seeing.

Taboos. There are still areas which are protected against scientific investigation by taboos because the dogmatic scientist – cloistered in orthodoxy, defender of his/her social or intraphysical autobiography – lives enslaved by his/her reputation within the current extremely closed and corporative cultural world that does not allow divergences.

Orthodoxy. Etymologically speaking, “orthodoxy” signifies correct opinion or, implicitly, that all opinions which do not coincide with it are not correct. It is logical that professionals see themselves compelled to perseveringly defend their ideas as being the only valid and authorized ones, excluding that which requires revision or innovation. Everything that demands change, even for the better, is thus naturally converted into heterodoxy or deviation.

Discovery. It is generally accepted that no discovery can be enthusiastically received if it conflicts with some existing interest, when it contradicts the points of view of a scientific hierarchy or when it collides head-on with scientific dogmas.

Inhibitions. Logically, no object can, a priori, be excluded from the investigation of science, which should have no inhibitions or impossibilities, which does not admit taboos and which does not have permanently inaccessible areas. Even science is implicitly universalistic.

Gratuitousness. It will always be easy for the self-proclaimed rationalists, sophists of all types and persons with preformed opinions, to make gratuitous affirmations, discard the subject of lucid projection as being unworthy of serious discussion, or contradict, without any proof – for the mere sake of mental contortionism – the supposedly misinterpreted occurrences. In the same manner, a hostile approach of the “I know that this does not work” sort does not lead to any constructive result.

Scientist. It is common knowledge that the perfect human being does not exist. Not even a diploma, obtained through the education industry, confers omniscience. Even renowned scientists can show themselves to be and behave as irrationally as any other person, and perhaps even more so because, being only human, they do not always admit their mistakes and omissions, even when confronted with rigorous and irrefutable evidence, finding it necessary to be on the defensive against any anticipated contradiction or negation, as well as always maintaining awareness and a constant sense of critical judgment. That which is not sufficiently proven, to those who are not experienced, in this case, cannot be negated because, at the same time, they do not know how it is produced or, in other words, it does not fit within the framework of prevailing science.

Infallibility. There are always those who think that their statements should be accepted and believed, yet they will never accept the statements of others. These more stubborn and obstinate negators, compulsive skeptics and incredulous, unsubmitive individuals who always make anticipated judgments, are so convinced of their infallibility that they even doubt their own senses. One generally wastes time, logic and the effort expended with experimentation on these persons of retrograde mentality and narrow views, because they do not want to be convinced, not even by the facts of their own experiences.

Knowledge. The majority of authors of articles for technical magazines, unfortunately, do not have a more ample, multidisciplinary or universalistic knowledge of other scientific fields, not even in regard to international parapsychic research through the ages, as they are often monoglots. They are therefore sometimes not able to realize the full significance of their own discoveries in terms of interdimensional exchange between consciousnesses.

Uncommon. With projectiology, everyone is faced with a new situation that requires similarly new explanations. It is understood that ordinary intelligence rejects the uncommon nature of projectiology, the facts of which should be experienced directly by the individual in order to allow him/her to admit them.

Questions. On general ignorance regarding certain subjects in projectiology, such as the golden cord, or even the mental soma, the following 5 common, still obscure, questions regarding matter should also not be overlooked – proving that, within the world of science, not only certainties exist – such as:

1. What are electrons made of?
2. What is the nature of time?
3. How does the nerve fiber impulse occur?
4. How is awareness produced?
5. What type of phenomenon is thought?

Exit. This book aims to expand the limitations of the thoughts of those readers of goodwill and discernment, helping some people find an egress from the limited circle of their generally highly-regarded concepts – in the sense that the restricted consciousness can be replaced by an open mind – as well as advising them regarding the use of difficult words, such as *impossible*, *never* or *never again*.

Individualism. In light of the aspects presented, and taking into account the very individual nature of lucid conscial projections, it is worth posing two questions to all types of habitual skeptics or those who have never had personal experiences regarding the subject: Is the pure and simple abstention from the theme of conscial projection a just, truly valid or correct attitude? Is it worthwhile trying to understand that conscial projections exist and accept this reality as being an impulsion for the well-being of all? Methodical skepticism, a component of the scientific perspective, merely constitutes the permanent adoption of a critical attitude. Radical or systematic skepticism blocks the possibility of any knowledge.

Alternatives. When faced with a report of a lucid conscial projection experience, the inexperienced listener is left with 3 alternatives regarding the subject: take the narrator's description or tale at face value; question the narrator's mental balance; endeavor to have that same experience in order to evaluate the occurrence sensibly. We invariably recommend the third option to everyone.

520. TO APRIORISTS

Apriorism. No one has the right to judge and much less to condemn that which one does not know because, with the method of preconception or ready and pre-fabricated rejection, any fact can be considered to be almost anything, or judged in the manner that one wishes.

Negation. The following are 5 absurd attitudes that cannot be taken seriously in the analysis of the projectiology phenomena studied here:

1. The apriorists' systematic, unfounded negation of the occurrences without having experienced them.
2. The act of negation due to sheer intellectual cowardice, stemming from a subconscious complex or subconscious censure.
3. Negation because it would be too much trouble to accept the fact that the occurrences are veridical, and remain in an ultra-orthodox complacency that is impermeable to experimental evidence or any rational argument.
4. Negation of facts that are persistent, albeit contrary to prior knowledge, considered unpleasant and harmful to one's well-being because they affect other interests, striking at the survival instinct.
5. Negation in order to feed an *allergy to the future*, evidencing retrograde tendencies, neurophobia, misoneism, opposing everything that is new.

Impediments. All of these impede the development of the research that is destined to open new horizons to humankind.

Facts. The facts make one think and demand interpretation. These same facts do not need our agreement or acceptance in order to exist. We have never seen a fact cease to exist in order to assuage its negators. In theory, a fact is no one's exclusive privilege. It can neither be owned, nor does it enter into anyone's custody. It would be useless to submit it to interests, adapt it to contingencies, forge it or hide it. It is a truth and, as a truth, it imposes itself as such.

Attitude. No irrational attitude is capable of impeding new instances of lucid consciencial projection, which cannot be reproduced through mere hallucinations, but are repeated by human lucid projectors that are obviously not able to deny the testimony of their own senses or perceptions. The facts exist, with replicable and irrefutable objective and subjective proof, it being impossible to stifle them: people cannot be prevented from sleeping. Natural sleep frequently constitutes the basis for the launching of the xenophrenic state of lucid consciencial projection.

Beliefs. All people remain limited and bound to their personal belief system or preconceptions. If the intraphysical being believes that he/she is not able to lucidly project the consciousness from the human body, he/she is not really capable of projecting and will be unlikely to succeed as long as he/she continues to block his/her own manifestations through natural autosuggestion.

Case study. The following are 3 examples of limiting beliefs, detected by conscienciology, that impede the production of lucid consciencial projection:

1. **Scientists.** Innumerable elderly scientists have already reached an advanced mental (human) age and no longer have the will, motivation or capacity to accept the loss of their life's philosophy (conditionings or repressions).
2. **Psychologists.** Certain psychologists still do not value, and even come to fear, the revolutionary implications of parapsychology, in regard to the solid future of their own profession (professional competition).
3. **Magicians.** There are professional magicians, illusionists and conjurors who fear the real magic of parapsychology which, in some ways, turns all of them into real charlatans (professional competition).

Cause. The responsibility for a person not lucidly projecting lies with the individual. The reason or cause is in one's own consciousness which – as is the case with all others, prior to living in the open and universal world of one and all – lives in one's own private, closed and individual world, the *inflated ego* or *mega-ego*, with one's own ideas and morphothosenes. These persons must be left to the superintendence of evolutionary time, the greatest renovator of personal and group experiences.

Proof. Lucid projections provide crucial proof and irrefutable self-confirmation with relative ease. For public proof, the facts of lucid projection require dispassionate researchers who do not have strong preconceptions in regard to animism and parapsychism, either for or against, or whose emotional

levels are not heavily marked by belief or disbelief of any type, but who accept the evidence with balance and discernment, *without arguing against the facts*.

Progress. The way of science is evolution. Therefore, modify existing codes, reinterpret experimental results, alter university curriculums, rewrite manuals and redefine postulates, but do not interrupt scientific progress.

521. TO PARAPSYCHOLOGISTS

Problems. In the area of projectiology there is still much to be done, with as yet unresolved problems requiring the work of researchers who are willing to tackle this extremely vital subject with the necessary courage to risk traveling down unconventional paths using the transdisciplinary methods and approaches of scientific fact.

Principles. The 4 *principles of parapsychism*, namely transtemporal, transpatial, transphysical and transpersonal principles, constitute the characteristics that define the procedures of projectiology.

Conflicts. Its phenomena lie beyond known physical laws and conflict with 1 or more of 4 other *delimiting principles* that distinguish normal facts from so-called *paranormal facts*:

1. Principles of causation.
2. Limitations of the action of mind upon matter.
3. Dependence of mind upon the brain.
4. Limitations in the means of acquiring information.

Studies. The facts of projectiology are not prodigious: they all occur according to as yet unknown natural mechanisms and laws. Projectiology is, therefore, neither a subject of credulity nor skepticism, to be placed at the service of mystical tendencies, or to be directed by preconceptions of any kind. It does, however, constitute a theme of study devoid of ideological-religious connotations that is to be performed with rigorous submission to the universal laws of scientific observation, experimentation and explanation.

Perspectives. The researcher – parapsychologist, parapsychobiophysicist or psychotronicist – who is a puzzle solver, must consider the field of projectiology to be an experimental science and its phenomena as still undergoing inquiry. It is necessary to avail oneself of a good number of perspectives for planning projects that open new lines of investigation in the slow progress toward the general acceptance and scientific recognition of the current situation – *an abundance of questions and a lack of explanations* – that is part and parcel of a science in its infancy, albeit one which will be improved.

Objectivity. The reality and authenticity of the facts cannot be dealt with by using platitudes, obsessions or passionism, but rather with dignity, correctness, willingness to achieve the goal, objectivity and realistic vision, in order to separate projectiology from empiricism, improvisation and the mystical context with which it was arbitrarily connected, so that it evolves on positive foundations under the guidance of people who are capable in all senses and who observe the phenomena without *parti pris*, thus establishing fundamental norms.

Answers. We hope that, over the next few lustrums, many of the answers that are currently beginning to be sought and stressed in this book will be found. This will enable a reduction in the number of necessary steps and the elimination of a few of the many required generations of work, so that, in the future, the phenomena of projectiology can be added to the body of standard scientific knowledge in a practical manner.

Control. Based on the supposition that all aptitude present in certain members of the human race is unlikely to be found lacking in the rest, that if one person is able to do something, then others can also do it, and that everyone is potentially disposed toward parapsychism, it is then necessary that scientific research find a way to transform this aptitude into something more controllable, systematized

and accessible to everyone in order to utilize it at will. This will result in incalculable practical benefits in the field of projectiology.

Information. We can classify information according to the intensity of its transmission. The surface of an object is generally more visible than its interior. In the same way, each phenomenon manifests in a manner different from its diverse parts. Regarding written or oral information coming from a given person, it represents the smallest proportion of what is real. It is rare to gather complete documentation on a subject. When that documentation exists it is even rarer that it is consulted by everyone. The greatest goodwill in the world meets with a lack of time and means.

Hypotheses. As working hypotheses, we suggest that parapsychologists, who are specialists in specific subdisciplines of research, conduct a long-term, panoramic, multidisciplinary, exhaustive survey, without fearing the immense volume of data that will be achieved – even better than what we have endeavored to accomplish in this book with projectiology – regarding the essential aspects and phenomena of parapsychology, including the specialized international bibliography, without monoglotism, such as: telepathy; precognition; poltergeist; parapsychic therapies; ectoplasmy; and existential seriation.

Computer. This investigation and general analysis will intensify the confluence of findings and amplify the scope of international research, making possible the creation of a computer megaprogram (as we are currently endeavoring to do) exclusively dedicated to each one of these themes, which will be an invaluable reference resource for all researchers. Whether individually or in teams, with or without official financial support, today or tomorrow, in this or another country, we can foresee that these surveys will be inevitable, even disseminated over the internet or other still more developed processes, in view of the development of the natural order of things and the role of parapsychological research in the general evolution of the human being.

Modesty. The researcher, in general, and notably in projectiology, has to question everything and everyone. Humility – an unresolved illness – is the brother of passivity and both these predispositions of the intraphysical consciousness are contrary to an inquisitive disposition that is indispensable to the researcher in any scientific field. Modesty – a derivation of wisdom – or self-awareness regarding the limitations of human intelligence (self-awareness of one's evolutionary status), is another quite different predisposition of the personality. Creative, exploratory and efficient researchers can and should be modest, but should never be nor need be humble or, in other words, live with shyness, pusillanimity, or blind submission, as can be seen by the thousands everywhere.

522. TO PROJECTORS

Observations. The confirmations that have been established suggest some observations to the lucid projection candidate and the active lucid projector – without inconsequential paternalism – that is in their favor: the most intelligent approach is not to fear the cooperation of qualified persons in their experiments; the ideal is to allow their projective capacities to be tested; allow erudite researchers to document the activities with scientific research, in support of themselves, thus standardizing techniques and dispensing with useless procedures; do not content themselves with societal praise, allowing themselves to be monopolized by some cult or *leash of the ego*; take advantage of those valuable periods of more intense lucid projections in series, producing the experiments in a rational manner, before the period of projective recess sets in.

Experiences. It is important to remind novice projectors not to expect to exclusively produce fully lucid projections in the mentalsoma, because they will inevitably also experience interspersed projections in the psychosoma; not only to expect to explore resplendent, evolved extraphysical communities and environments, because they will also visit disagreeable and insalubrious paratropospheric environments; not to expect to satisfy only their personal wishes in the extraphysical

dimensions, as they will have to assist others if they wish to progress extraphysically; not to expect to continuously experience only projections in series, as the bases of the development of lucid projection presents periods of recess or inactivity; not to expect to sleep and always project with full lucidity, as novice projectors are not able to eliminate sleep, dreams and nightmares that physiologically coexist with consciential projections; not to expect to attain automatic consciential evolution, because it does not exist. All conquests of the consciousness depend upon gradual, persevering effort, as well, above all, upon ironclad will.

Selection. Many animal evolutionary advances that have been made over the millennia occurred more or less in the following manner: an excess of curiosity impels a small number of beings to a new area of the environment. In the beginning, only one or some of them, at most, ventures into this relatively unfamiliar territory. These constitute the vanguard. When the strange new environment offers advantages, others follow. Thus, natural selection begins to act upon the small group of adventurous individuals and adapts their organisms to the demands of life in the new habitat. After many generations, a new line of adapted animals arises. Intrapysical consciousnesses are currently doing the same, on earth, in regard to the extraphysical dimensions, the human brain and their vehicles of manifestation.

Objective. Let us not try to force the honing of our projective capacity exclusively toward a singular objective, whether trying to project only in the psychosoma in the paratropospheric dimension, or only in the mentalsoma, or wishing to solely achieve the goal of the supreme and immediate expansion of the consciousness through cosmoconsciousness.

Conditions. The efforts of the intrapysical projector should be simultaneously directed toward these 3 battlefronts or toward these 3 conditions of the projected consciousness, maintaining an open mind regarding all positive suggestions of intrapysical and extraphysical origin that can somehow cooperate with harmonious and conjoined self-improvement within the scale of continuous self-awareness.

Existential seriation. On the other hand, we cannot hope to *achieve everything* in this current intrapysical life or existential program. The series of lifetimes in the current evolutionary stage on earth is a long one. No one evolves in only 1 step, nor does anyone abruptly receive intraconsciential illumination in a wholesale manner, at once, as if one had won an invisible lottery. The impact of the prominent fascination in regard to the leading-edge relative truths of conscientiology has had its detonation prepared over successive centuries, millennia, resomas, desomas and intermissive periods.

Interest. In view of existential programology and cosmoethics, the more lucid intrapysical consciousness needs to seek out his/her own interest and overcome the stage of egoism, avidity and astuteness in order to achieve megafaternity and rationally justified abnegation.

Evolution. The lucid projection practitioner needs to conform and learn to play according to the rules of the evolutionary game, remaining alert to the fact that all consciential evolution derives from individual effort, in the improvement of self-performance. This is achieved gradually, step-by-step, projection by projection, strong trait by strong trait, interweaving this intrapysical existence with the next through consciential self-relays. In this manner, the individual advances in his/her stages and engages them in the same objectives of illumination within the positions of evolutionary teams and the network of personal, group and collective holokarmic tolls.

Approach. The manner in which one approaches projectiology will always be more constructive for the projector and for everyone involved when it is universalistic, from a philosophical point of view, and impartial, from a scientific point of view.

Precautions. Mainly the adult projector, especially the one whose first consciential projections resulted from personal animic effort, needs to prevent, as a self-prophylaxis, against 3 manifestations: the powerful and involving enchantment of self-mimetic mysticism; any incipient tendency toward sectarianism in his/her convictions and attitudes; and the temptation – much more common than one might think – of founding a new sect or religion.

Attitudes. The projectiology teacher, or projectiologist, needs to always publicly acknowledge 4 frank attitudes to those who come to study with that person:

1. “I know very little and am always a merchant of my own literate ignorance.”
2. “Even if I place my hands, together with the 40 hands of 20 of the volunteers from my team, on your head, I can still not cure a single sick idea of repression, conditioning or sacralization that you might maintain in your intraconscientuality.”
3. “I can explain all of projectiology to you, but I cannot understand it for you.”
4. “I can provide you with all the projective techniques, but I cannot perform the experiments for you, in your stead.”

Evidence. This is the evidence that we have encountered in the physical and extraphysical dimensions. Other lucubrations result from mystical fantasies that lack rational foundations.

XVIII – *International Bibliography of Projectiology*

523. CLARIFICATIONS

Definition. Bibliography: bibliographical, archival and procedural process of the evaluation and study of printed (or cybernetic) texts, in view of the elaboration of general or specialized repertoires, which include the phases of research, transcription, description and classification.

Synonymy: bibliographic references; specialized repertory.

Panorama. For the benefit of those bibliophiles, omnivorous readers or voracious reading athletes who wish to metabolize a copious amount of works that refer to lucid projection, only those books, newspapers, magazines, reprints, encyclopedias, dictionaries, anthologies, treatises, manuals, essays, university theses, autobiographies, biographies, novels, monographs, critical analyses, communications, reports, academic works, research results, technical articles from periodicals and other types of publications which address the subject of experiences of the consciousness outside the human body, in whole or in part, have been comprehensively inventoried in this general and systematic, retrospective and current, exhaustive and descriptive international bibliography.

Consult. Any type of research in any scientific area assumes and demands prior bibliographic research or, in other words: all technical research has its beginning and end in the library or holotheca. Over a period of time, approximately 46,000 works – in different languages, addressing the greatest diversity of basic subjects – were consulted and examined in detail, in order to select the publications listed in this bibliography. The abovementioned works were encountered in the private collection (holotheca) of the author, in public and private libraries, and in bookstores (selling new and used books) dealing with all areas of human knowledge.

Level. The essential intention of this book was to compose something unprecedented: the first *International Abstracts of Projectiology*. According to the principles of *confor*, the encountered works obviously vary in quality of content and are unequal in form. They range from those more serious, erudite and profound works, with all catalogic elements dictated by the most advanced library science, elaborated by highly trustworthy, competent contemporary authorities, scientists and researchers; to the writings of eminent pioneers who, although out of print and unlikely to be reprinted, will at least promote interest in current studious individuals for the eventual investigation of some lesser known authors, or a detailed analysis of the themes they address; to the arguably popular and commercial books that achieve the most fantastic lucubrations, created in order to satisfy needy readers and rejected seekers. Many of these works disseminate a particular doctrine, some defending evident human passions or undisguised irrationalities.

Languages. Most of the 1,907 works (plus an additional 20, upon updating) included in this bibliography, without barriers of country or language – thus evidencing the universality of the testimonies on the phenomenon experienced and the convergence of evidence – were originally retyped and later printed, the majority of them originally in 18 different languages. Some have 2, 4, 6, 12 or more volumes. A work is shown in parentheses, such as:

1. Arabic (Ebeid, 452).
2. Chinese (Wang, 1794).
3. Danish (Nielsson, 1127).
4. Dutch (Poortman, 1273).
5. English (Brennan, 199).
6. Esperanto (Kardec, 825).
7. French (Bret, 203).
8. German (Allgeier, 14).
9. Greek (Plutarch, 1264).

10. Hebrew (Almeida, 15).
11. Italian (Bozzano, 193).
12. Japanese (Meishu-Sama, 1031).
13. Latin (Swedenborg, 1639).
14. Portuguese (Antunes, 47).
15. Russian (Pushkin, 1342).
16. Sanskrit (Woods, 1864).
17. Spanish (Anglada, 39).
18. Swedish (Jacobson, 796).

English. Anywhere from 30 to 50 languages are used in scientific literature. English predominates in the works included in this bibliography – currently the language with the highest international penetration in the West – with 910 references, or 47.71% of the total. The Portuguese language is in second place with 589 references, or 30.88%.

Portuguese. It is worth mentioning that the lexicon of the Portuguese language contains 450,000 words. There are currently about 10,000 languages on earth, of which slightly over 100 are written languages. The others are unwritten languages. Of these 100 (written), only about 10 are used by over 100,000,000 people. Among these 10, the Portuguese language is in sixth place (*VEJA*; magazine; weekly; São Paulo, SP; Brazil; edition 1,547; year 31; N. 20; illus.; 20, May, 1998; p. 63), affecting about 180,000,000 people in 7 countries where Portuguese is the official language.

Countries. The works included in this bibliography were originally printed, distributed or edited in 28 countries. Sample works are shown in parentheses: Argentina (Calle, 232); Australia (Glaskin, 596); Austria (Rýzl, 1484); Belgium (Lefebure, 909); Brazil (Andrade, 27); Canada (Grof, 646); China – Taiwan (Wang, 1794); Denmark (Vett, 1738); Egypt (Ebeid, 452); England (Baker, 69); France (Dumas, 432); Greece (Plato, 1261); Holland (Poortman, 1273); Hong Kong (Badham, 67); Iceland (Gudjonsson, 657); India (Saher, 1493); Italy (Giovetti, 592); Japan (Meishu-Sama, 1031); Mexico (Benavides, 109); Portugal (Velho, 1734); South Africa (Laubscher, 889); former Soviet Russia (Vasiliev, 1732); Spain (Muntañola, 1108); Sweden (Jacobson, 796); Switzerland (Engel, 480); United States of America (Muldoon, 1102); Venezuela (Imbassahy, 782); West Germany (Dethlefsen, 396).

Scope. Chronologically speaking, the bibliography starts from the Bible, the writings of Plato and the work of Plutarch of Chaeronea. It circumstantially covers the last 22 decades of the lucid extracorporeal activities of the human race, from the publication of the theological books of Emanuel Swedenborg, including 117 reference works – encyclopedias, dictionaries, anthologies, treatises, catalogues and manuals – or 6.13% of the bibliography. On *January 11, 1985*, the author ended this bibliographic research, thus not including references to works published after this date, except for the 20 works included in the update. Exactly 349 listed works are indicated to have an alphabetic index by subject (alph.), which greatly facilitates the creation of a computerized database. Incidentally: the books containing an alphabetic index by subject are generally serious, more carefully produced, technically clearer and are prepared by authors who are assiduous and who make an effort to aid the reader.

Impartiality. This systematic list was compiled, with total impartiality, without preconceptions, in an ample and unrestricted manner – through exploratory, selective, reflective and interpretive confirmatory readings. This occurred more intensively over a 19-year period (1966 to 1985). It even lists individuals who presented positive and negative heterocritiques, and even controversial works. On the other hand, no work was included gratuitously, only to “pad out” the bibliography, according to the current academic system. All works, without exception, address the subject of lucid projection, even if *only on one page* of their text.

Exclusions. Dozens of diverse irrelevant works were excluded from this international bibliography in light of the this book’s objective or, in other words, those works that directly or indirectly merely touch upon the subject, in one or some lines of their texts, with very brief references and with

no significance to the themes of projectiology. These works would only increase the amount of books listed without introducing any quality to the list, bringing no effective contribution or real value to projectiological research.

Lies. On the other hand, the following should be kept in mind: there are leaders in the publishing community who openly declare that, nowadays, in intraphysical society, to sell art in general – theater, music, films, books – is to sell lies about lies, recognizing that, in this specific arena, *everyone lies to everyone*. The sociological process of consciential immaturity – extremely professional and professionalizing – is completed in 5 interconnected steps:

1. **Writer.** The circle of ridiculous falsehoods begins with the writer writing lies (palatable literature) for superficial readers.
2. **Agent.** Then, a literary agent reads two pages and affirms that the book is sensational.
3. **Publisher.** The publisher receives the work, reads 1 paragraph and lies to the bookseller, saying that this exceptional book will be a bestseller.
4. **Bookseller.** The bookseller, who reads nothing, repeats this heap of lies to the consumer, the reader of trendy, easily digested books.
5. **Industry.** The book industry continues to prosper, based upon the lucrative exploitation of the emotionalism of human animals, who are always too lazy to think for themselves.

Articles. The bibliography presents articles which are included in exactly 80 different periodicals (magazines, newspapers, bulletins and others) published in various countries, ranging from *gynecological* or *gynosomatic* magazines to essentially technical ones. There are isolated articles that were not listed here, whereas the most important ones are found to be analyzed, transcribed or cited in dozens of the books that are listed.

Collections. The following 9 are relevant, older periodicals, some of them out of circulation, in the collections of which can be found dozens of short and isolated works on projective studies or reports of interesting projectiological occurrences:

1. *Annales des Sciences Psychiques* (Paris).
2. *The Journal of the American Society for Psychical Research* (New York, NY).
3. *Journal of the Society for Psychical Research* (London).
4. *Light* (London).
5. *Proceedings of the Society for Psychical Research* (London).
6. *Revue de Etudes Psychiques* (Paris).
7. *Revue Métapsychique* (Paris).
8. *Revue Scientifique et Morale du Spiritisme* (Paris).
9. *Tidschrift voor Parapsychologie* (Amsterdam).

Database. In the holotheca of the Center for Higher Studies of the Consciousness (CHSC), in Iguassu Falls, Parana, Brazil, we have more than 90% of this international bibliography available for study and research, namely more than 1,700 works, aside from their various editions, totaling 1,907 works, which comprise the current database on projectiology. All works in the collection, some multi-volume, others with various editions, in different locations and languages, are read and reread. Their pages are underlined, with handwritten, detailed annotations, and are signed by the author on the title page. In the first page of each volume there is an exhaustive handwritten reproduction of the work's catalogic record, many of them with annotations or pertinent heterocritiques.

Private. If the reader wishes to study consciential projection phenomena using the works in his/her private library, simply verify if the author's name and the title of the work are listed in this international bibliography. If it is included in the list, the reference indicates the exact pages where the author addresses the subject of consciential projections or correlated phenomena.

Interest. The expressive quantity of opinion, data, and information gathered here cannot be flippantly disregarded. The accumulation of convergent indications on lucid projection is too large

not to be taken seriously, much less ignored. The extensive nature of this bibliography constitutes an irrevocable set of documents that, as well as solidly establishing the existence of the human lucid projection phenomenon, attests to the public interest in this consciencial occurrence that is growing faster than ever before and has been gaining increased publicity and a greater presence everywhere as never before in human history. This fact has provoked the creation of sections with their own titles, such as “Projection of the Consciousness”, on the bookshelves in bookstores specializing in parapsychology, psychology and metaphysics in New York City, the largest publishing and bookselling market that currently exists.

Collection. The current bibliography aims to contribute – within the geographic, chronological, economic and personal limitations of its compiler – with the evident objective of presenting, as closely as possible, the integral collection of literature that exists on this subject up to the present. Unfortunately, this work is still somewhat incomplete, owing to 3 distinct principles: first, the complete bibliography does not exist; second, no author is capable of exhausting a subject; third, the most interesting research in progress, in any specific field of human knowledge, has generally not been printed. One thought-provoking fact: according to the calculations of the author, an average of one new book a day (365 books a year) is currently published – in the English language alone – in the general area of parapsychology. This has been happening for the last two decades.

Unknown. Between the years of 1900 and 1966, 59,404 technical-scientific magazines were published. It is therefore accepted that half of the scientific bibliography generated was not indexed and remains unknown.

Objective. The essential intention of this list within this volume – which is an overall approach – was to constitute as homogeneous as possible a set of precise and detailed indications with elements of references even beyond the usual patterns of more accepted technical norms, when demanded by the work, in light of the possible different cultural backgrounds of the likely readers of this book.

Sources. In order to have greater assurance regarding the information, the use of primary or original sources was emphasized. The truth is that secondary and tertiary sources are always suspect and often biased, carelessly produced or simply erroneous. Secondhand references or indirect quotations, which tend to reduce the documented value, were used only as a last resort, after all means had been exhausted for obtaining the work in its original language and conveniently anatomizing it.

Translations. Whenever possible, preference was given to the revised edition of a publication in its original language, thus avoiding translations, even to the Portuguese language. In order to minimize the negative consequences of this orientation, in all cases where verification was possible, the languages to which the work had already been translated were indicated, as long as the work had not suffered an excessive number of commercial, mutilating cuts. Thus, the Bible was obviously excluded, for example, already (in 1985) having been translated into 1,685 languages and dialects.

Originals. It is always worth emphasizing that the discerning readers who wish to form their own opinions, will have to direct themselves to the original research work, seeking out original publications and sources.

Repetitions. It is understandable that, in a bibliography of this size, there is a repetition of themes, approaches and analyses, as seen with the references to cases of projectiological phenomena. Therefore, if an article was published in a periodical and later inserted in a book – such as an anthology – preference was given to the anthology, whenever possible. In these anthologies on different themes, priority was generally given to the citation of the editor or editors of the work, avoiding naming the author of every article included in the volume.

Projectionalia. As this bibliography is general and universalistic, it is natural that it would represent a true, currently unparalleled, *projectionalia*, being the *intellectual equipment* that is available on the subjects of projectiology, ranging from highly recommended works – according to the evaluation of their level of information – that confer a degree of precision and certainty, to those that are satisfactory and recommendable, and finally to those constituting simplistic literature. These last works are frankly

not recommended to many readers, due to their structural fragility, and they do not even deserve mention or further comment. Nevertheless, they are listed – with a maximum of impartiality – waiting for the heterocritiquing, discerning, analytical sense of that reader who is interested in deep intellectual prospects, capable of expunging basic errors, misleading premises, erroneous statistics, invalid arguments and simple falsehoods or fallacious logic (sophisms and philosophisms).

Ordering. In the bibliographic orientation, the works were listed in a uniform manner, using a specific record including that which was possible of the following 21 technical variables:

1. Alphabetical order of the authors, their pseudonyms (pseud), and indications regarding their real names, when known. The name of the author of multiple works was repeated in succession, in order to facilitate consultation by the reader.

2. Co-authors and other specifications were always included after the title, such as subtitle, author of the preface (pref.), translator (trans.), publisher, commentator or reviser.

3. Introduction (intro.).

4. Appendix (append.) or appendices.

5. Reference to illustrations (illus.) or figures (fig.).

6. Number of component volumes (vol.).

7. Number of the periodical publication.

8. Total number of pages (p.).

9. Number of pages or chapters (chaps.) that directly address the subjects of projectiology.

10. Original title of the work, in the translations in which this is listed.

11. Number of pages in the bibliography (bibl.) and the glossary (glos.), if they exist.

12. Alphabetical index of the subjects addressed (alph.) or bibliographic references.

13. Onomastic index (ono.).

14. Vertical dimension of the publication in centimeters (cm).

15. Type of volume, if it is hardback (hb.) or paperback (pb.).

16. Dust jacket (dj.).

17. Publishing house (pub.).

18. Number of edition (ed.) or printing (print.).

19. Location (city, state, province, country, if necessary).

20. Month and year of the edition in focus, when given by the publication.

21. Editions in other languages.

Pages. The total number of pages of each work is always indicated by an even number, rounding up, although in many cases, the last page has no text, and is, therefore, blank. This is because, strictly speaking, an odd-numbered last page cannot exist in the body of a book – except for the cover. The traditional argument of the odd number corresponding to the written pages is not accurate, because pages 2, 4 and others at the ends of chapters or sections, remain blank in the majority of books. In the vertical dimension of the pages of each work, only centimeters and half-centimeters were considered, thus eliminating annotations of intermediary millimeters in order to facilitate and standardize the library registers, where possible.

Reference. When reference is made to one, two or a few pages of a work, it is because some theme specific to projectiology is being addressed only on those pages of that work, whether it be lucid projection, apparition of human beings, physical bilocation, doubles, experience of the consciousness outside the human body, near-death experience that involves lucid projection, classification of this phenomenology, reports of occurrences, citations, annotations and pertinent definitions. The concerned individual can thus evaluate with greater precision the exact scope of the specialized information in the work in focus, before spending time or going to the trouble of looking for it and reading it. The illustrations (illus.) were indicated, although minimal, even when *only one* appears in the work.

Minilibrary. It is extremely difficult to select a few works from the entire international bibliography that are more relevant for the individual study of lucid projection. Nevertheless, particularly in order to help those who are *novices* regarding these selfsame lucid projections, and even running the risk of committing glaring and practically inevitable injustices, 50 books, and not single works, were indicated – the majority of which are relatively easy to locate. They include many classics on the subject that address the themes related to lucid projection in almost all of their pages. They are technically favorable for the development of the lucid projector and can serve to comprise a respectable international minilibrary on projectiology.

List. This list – as is the case with any other list of books – does not contain irreprehensible works. However, these 50 titles, from 8 countries, most of them published in the 1970s, representing only 2.62% of the bibliography, have received fewer negative criticisms from more demanding readers, as they are considered to be more technical, more complete, and particularly useful. The following list includes the name of the author and the country where each work originated (the number in brackets indicates the title of the work in the bibliography): Aksakof: Russia (09); Baker: England (69); Battersby: England (92); Baumann: U.S.A. (93); Black: U.S.A. (137); Blackmore: England (139); Bord: England (170); Bosc: France (173); Bozzano: Italy (188); Brennan: England (199); Crookall: England (338); Crouzet: France (344); Delanne: France (382); Denning: U.S.A. (391); Durville: France (436); Engel: (former) West Germany (480); Fischer: West Germany (519); Fox: England (544); Frost: England (560); Giovetti: Italy (593); Green: England (632); Greene: U.S.A. (635); Greenhouse: U.S.A. (636); Gurney: England (666); Hart: U.S.A. (687); Lancelin: France (879); Lefebure: France (909); Lischka: West Germany (937); Martin: England (1002); Mitchell: U.S.A. (1059); Monroe: U.S.A. (1065); Muldoon: U.S.A. (1105); Muntañola: Spain (1108); Myers: England (1114); Prado: Brazil (1284); Prieur: France (1289); Ritchie: U.S.A. (1407); Rogo: U.S.A. (1444); Sabom: U.S.A. (1486); Sculthorp: England (1531); Shay: U.S.A. (1546); Smith: U.S.A. (1572); Steiger: U.S.A. (1601); Swann: U.S.A. (1632); Tanous: U.S.A. (1647); Turvey: England (1707); Twitchell: U.S.A. (1712); Walker: England (1781); Wheeler: England (1826); Yram: France (1897). Four of these authors, Bozzano, Crookall, Muldoon and Rogo, produced other works on lucid projection, aside from those cited here, that deserve to be consulted by the diligent researcher. Robert Crookall and Scott Rogo are included among the most prolific authors in regard to the works that address the study and technical analysis of lucid projection. It is evident that most of these 50 works are among those which are most referred to in the specific bibliographies.

Specialized. Some of the topics addressed in 17 of the chapters in this book (see Table of Contents) have already been proficiently analyzed using many angles of approach by known authors in an entire book dedicated to the subject: “internal autoscopia and external autoscopia,” Sollier (1581); “cosmoconsciousness or cosmic consciousness,” Bucke (218); “near-death experience” (NDE), Sabom (1486); “panoramic vision,” Bozzano (186); “exteriorization of motricity,” Rochas (1428); “exteriorization of sensitivity,” Rochas (1429); “human parateleportation,” Fodor (530); “xenophobia,” Tart (1653); “human aura,” Kilner (843); “massage, musical and projective visualization techniques,” Glaskin (598; 599); “extraphysical invisibility,” Richards (1392); “extraphysical clothing,” Crookall (332); “helpers,” Crookall (323); “animism or mediumship,” Bozzano (184).

Youths. We recommend the following children’s book to those youths interested in the phenomenon of lucid projection, *They Travel Outside Their Bodies*, by Elwood D. Baumann. Unfortunately, this work has not been translated into other languages beyond the original English which, however, does occur with the absolute majority of good projectiological works.

Update. The following 20 extra works on lucid projections, selected from among those published between 1986 and 1998, in Brazil and abroad, are provided in order to update this International Bibliography:

1. **ARAÚJO, Luiz;** *Ensaio Extracorpóreo*; pref. Clóvis Ferreira & Werner Sheinpflug; 126 pp.; 20 chaps.; 20 illus.; glos. 26 terms; add.; alph.; 21.5 x 15 cm; pb.; 2nd ed.; Rio de Janeiro, RJ, Brazil; Instituto Internacional de Projeciologia e Conscienciologia (IIPC); 1998.

2. **ATWATER, P. M. H.**; *Beyond the Light – What Isn't Being Said About Near-death Experience*; introd. Melvin Morse; XX + 296 pp.; 14 chaps.; 16 illus.; 2 tabs.; 3 apps.; 23.5 x 15.5 x 3 cm; hb.; dj.; New York; U.S.A.; Birch Lane Press; 1994.
3. **BASCOM, Lionel C.**; & **LOECHER, Barbara**; *By the Light*; X + 212 pp.; 20 chaps.; 17.5 x 10.5 cm; pb.; New York; NY; U.S.A.; Avon Books; September, 1995.
4. **BORGES, Wagner D.**; *Viagem Espiritual II (A Projeção da Consciência)*; illustrations by Glória C. Costa; pref. Dráuzio Milagres; 238 pp.; 5 chaps.; Vol. II; 58 illus.; glos. 33 terms; 45 refs.; 19 x 27.5 cm; hb.; 1st ed.; Londrina; Paraná; Brazil; Editora Universalista; 1995.
5. **BRINKLEY, Dannon**; with **PERRY, Paul**; *Saved by the Light*; introd. Raymond Moody; XII + 162 pp.; 15 chaps.; 21.5 x 14.5 cm; hb.; dj.; New York; U.S.A.; Villard Books; 1994.
6. **BRUNEL, Pierre (org.)**; *Dictionary of Literary Myths (“Dictionnaire des Mythes Littéraires”)*; transl. Carlos Sussekind (et al.); pref. Braz. ed. Nicolau Sevcenko; XXVI + 940 pp.; dictionary: 124 terms; 2180 refs.; 4 diag.; 1 tab.; 24 x 16.5 x 5.5 cm; hb.; Rio de Janeiro, RJ; Brazil; José Olympio; 1997.
7. **BUHLMAN, William**; *Adventures Beyond the Body – How to Experience Out-of-Body Travel*; XII + 292 pp.; 8 chaps.; 13 illus.; glos. 33 terms; app.; alph.; 22 x 14 cm; hb.; dj.; London; Great Britain; Robert Hale; 1997.
8. **COUTINHO, Marco Antonio**; *Além do Corpo – A Arte Tradicional das Experiências Extracorpóreas*; pref. Pedro Camargo; 152 pp.; 11 illus.; 27 refs.; 21 x 14 cm; pb.; Rio de Janeiro; Brazil; Mauad; 1996; pp. 1-152.
9. **CRAZE, Richard**; *Astral Projection, a Beginner's Guide*; 92 pp.; 4 chaps.; 20 x 13 cm; pb.; London; England; Headway – Hodder&Stoughton; 1996.
10. **EBY, Carol**; *Astral Odyssey – Exploring Out-of-Body Experiences*; XVI + 256 pp.; 10 chaps.; 96 refs.; alph.; 21 x 13.5 cm; pb.; York Beach; Maine; U.S.A.; Samuel Weiser; 1996.
11. **EQUIPO DE EXPERTOS OSIRIS**; *La Proyección Astral*; Colección Ciencias Ocultas y Misterios; 110 pp.; 20.5 x 14 cm; pb.; Barcelona; Spain; Editorial De Vecchi; 1992.
12. **FIGUEIRÓ, Luely**; *Viagem Astral: Projecionismo: Passado-presente-futuro*; 110 pp.; 5 illus.; 21 x 14 cm; pb.; São Paulo; Brazil; Ícone; 1993.
13. **GODWIN, Malcolm**; *The Lucid Dreamer – A Waking Guide for the Traveler Between Worlds*; 256 pp.; 13 chaps.; 201 illus.; 46 refs.; alph.; 24 x 19.5 cm; hb.; dj.; Great Britain; Element Books; 1994.
14. **HARRIS, Barbara**; & **BASCOM, Lionel C.**; *Full Circle – The Near-Death Experience and Beyond*; introd. Bruce Greyson; XVI + 286 pp.; 22 chaps.; app.; 17 x 10.5 cm; pb.; New York; NY; U.S.A.; Pocket Books; April, 1990.
15. **HOWELL, Will**; *The Way to Why*; 192 pp.; 29 chaps.; 7 refs.; 21 x 14 cm; hb.; dj.; Birmingham; Great Britain; The Bean Press; 1988; pp. 1-192.
16. **HUGHES, Marilyn**; *Odysseys of Light – Adventures in Out-of-Body Travel*; XII + 142 pp.; 14 chaps.; 21.5 x 13.5 cm; pb.; Norfolk, VA; U.S.A.; Hampton Roads; 1991.
17. **LATZANG, Dharma**; *Como Fazer Viagens Astrais*; 88 pp.; 10 chaps.; 21 x 14 cm; pb.; Liberdade, São Paulo; Brazil; Traco Editora; 1993.

524. COMPLEMENTARY SUBJECTS

Marginal. The works that are capable of furnishing greater clarification regarding the 43 complementary technical subjects related to the phenomenological complex of projectiology, and whose marginal or specialized aspects in certain lines of thought were not referred to together within the context of this book, are listed below in order to facilitate the practical consultation of researchers and lucid projectors.

Anthologies: Angoff (40), Armstrong (56), Belline (105; 106), Bourguignon (181), De la Mare (378), De Mille (386), Favre (500), Grattan-Guinness (626), Huxley (771), Jorge (811), Knight (851), Krippner (861), Marx (1010), Meek (1028), Mitchell (1058), Morris (1092; 1093; 1094), Pearce-Higgins (1214), Prince (1290), Rogo (1446), Roll (1462; 1463; 1464; 1465; 1466; 1467; 1468; 1469), Schatz (1514), Tart (1663; 1664; 1665), Tchou (1668), White (1827; 1829; 1830; 1831), Wilson (1851), World (1865).

Anthroposophy: Easton (451), Shepherd (1549), Steiner (1610; 1611).

Autobiographies: Alverga (18), Anglada (39), Balzac (71), Bennett (118), Brittain (206), Castaneda (255), Charrière (274), Crowley (347), Espérance (485), Ford (536), Fox (544), Garfield (569), Garrett (572), Graham (619), Heywood (718), Hives (728), Home (752), Jung (812), Leaf (904), Lilly (927), Lima (928), MacLaine (980), Martins (1009), Monroe (1065), Muldoon (1105), Nielsson (1127), Osmont (1170), Pereira (1230), Prado (1284), Rampa (1360), Richmond (1400), Roberts (1416), Sculthorp (1531), Shell (1579), Swann (1632), Swedenborg (1639), Tanous (1647), Turvey (1707), Twigg (1711), Vieira (1762), Weil (1809), Yogananda (1894), Yram (1897).

Bibliographies: Clarie (286), Drury (418), Goes (605), Tubby (1701), Vieira (1753), Zorab (1904).

Biographies: Ajaya (08), Araujo (49), Barboka (78), Berthe (126), Browning (213), Bouisson (176), Byse (230), Calle (232), Castro (263), Conant (295), Cuno (353), Dillon (402), Edmonds (460), Freitas (552), Gauld (575), Hankey (677), Harrison (685), Holzer (748), Kardec (826), Kerner (840), Linedecker (932), Lutyens (960), Matter (1014), Mead (1024), Morato (1084), Murphet (1109), Neff (1120), Novelino (1140), Paschoal (1204), Rizzini (1411), Roy (1480), Sekanek (1538), Shepherd (1549), Shirley (1554), Silva (1559), Stanké (1595), Stead (1597), Steiger (1606), Thiago (1676), Thomas (1681), Wachtmeister (1780), Wilson (1852).

Book reviews: Adams (02), Amadou (22), Andrade (30), Blackmore (142; 144), Christie-Murray (282), Cook (299), Crookall (319), East (448), Eastman (449), Grosso (650; 652), Lucas (954), Maddeley (981), McHarg (1021), Osis (1162), Parrott (1203), Pearce-Higgins (1213), Rogo (1443), Schwartz (1526), Staff (1594), Stokes (1625), Tart (1655; 1656; 1657; 1659), Thouless (1683), Valle (1726), Whiteman (1837; 1838), Willmann (1850), Zorab (1905; 1906).

Cabalism: Berg (121), Ophiel (1151).

Castanedism: Atlan (62), Bancroft (73), Castaneda (255; 256; 257; 258; 259; 260; 261), Corvalán (306), De Mille (386), Dubant (419; 420), Drury (414), Noël (1132).

Catalogs: Ashby (59), Holzer (743), Popenoe (1274), Wilson (1858), Zorab (1904).

Catholicism: Ancilli (24), Poodt (1272), Thurston (1700).

Christianity: Almeida (15), Cayce (268), Crookall (326), Currie (354), Johnson (807), Pearce-Higgins (1214), Perry (1238), Ritchie (1407), Thomas (1681), Xavier (1870).

Controversies: (See “Critiques”).

Critiques: Anievas (41, p. 20), Balanovski (70, p. 194), Bleibtreu (156, p. 81), Bozzano (193, p. 5), Calle (233, p. 10), Cardillo (241, p. 99), Christie-Murray (282, p. 620), Christopher (283, p. 213), Crookall (334, p. 358), De Mille (386, p. 220), Dragaud (412, p. 53), El-Aowar (474, p. 6), Ernest (482, p. 3), Gardner (567, p. 3), Gooch (617, p. 45), Gynska (667, p. 13), Holzer (748, p. 156), Imbassahy (779, p. 29), Lorenzatto (952, p. 142), Machado (967, p. 83), Maddeley (981, p. 259),

Mendes (1034, p. 25), Miranda (1052, p. 39), Mirclair (1054, p. 87), Monroe (1065, p. 86), Paim (1182, p. 227), Paixão (1183, p. 76), Pisani (1248, p. 177), Poodt (1272, p. 268), Puharich (1337, p. 60), Pushkin (1342, p. 300), Rampa (1364, p. 7), Randi (1370, p. 145), Ring (1404, p. 273), Rogo (1446, p. 254), Rolim (1461, p. 450), Russell (1482, p. 17), Sagan (1492, p. 61), Sangirardi Jr. (1503, p. 15), Sargant (1508, p. 199), Schnaper (1519, p. 268), Segura (1537, p. 177), Sudre (1630, p. 396), Taylor (1667, p. 66), Tourinho (1692, p. 24), Valle (1726, p. 346), Vasiliev (1732, p. 144), Vieira (1744, p. 6), Walker (1786, p. 95), White (1831, p. 132), Whiteman (1837, p. 21).

Dictionaries: ADGMT (03), Ancilli (24), Bacheman (66), Blavatsky (153), Blunsdon (157), Bonin (168), Chaplin (273), Dalmor (361), D'arbó (365), Day (376), Depascale (392), Digest (401), Drury (418), Gaynor (577), Gómez (613), Heindel (705), Lee (908), Martin (1003), Mesquita (1037), M. F. R. C. (1224), Pike (1242), Planeta (1249; 1250; 1251), Rampa (1361), Riland (1403), Stebbing (1600), Tondriau (1690), Underwood (1721), Wedeck (1807), Zaniah (1899).

Ecstasy: Black (137, p. 1), Crookall (324, p. 1), Eliade (475, p. 117), Garfield (569, p. 72), Lewis (923, p. 199).

Encyclopedias: Abbot (01), Ash (57), Bowyer (183), Britannica (205), Cavendish (266), Devore (397), Digest (400), Espasa-Calpe (484), Ferguson (507), Fodor (528), Foin (532), Matson (1013), Poinot (1270), RPA (1481), Sachs (1489), Shepard (1548), Spence (1588), Walker (1783; 1784; 1785), Zolar (1902).

Esoterism: Fortune (541), Lorenz (951), Mead (1025), Meck (1026).

ESP: Agee (07), Alvarado (16), Braud (197), Burt (224), Christopher (283), Cohen (290), Colton (294), Cooke (300), Dale (357), Easlic (446), Ehrenwald (471), Faria (495), Hart (688), Herlin (714), Heywood (718), Holloway (734), Holroyd (739), Holzer (751), Huson (768), Knight (851), Ostrander (1172), Palmer (1189; 1190; 1191), Pratt (1285), Randi (1370), Rhine (1390), Rogo (1446), Sara (1506), Sherman (1551), Smith (1573; 1575), St. Clair (1593), Stratton (1627), Tchou (1669), Thouless (1682), White (1833).

Ghosts: Bayless (94), Cardillo (241), Carrington (247), Collison-Morley (293), Emmons (479), Fodor (529), Greenhouse (638), Gurney (666), Hemmert (712), Hill (724), Imbassahy (781), Imbassahy (783), Jaffé (798), Lang (885), Lethbridge (920), Mackenzie (970), O'Donnell (1144), Padilha (1180), Rogo (1436), Sidgwick (1556), Thiselton-Dyer (1678), Tyrrell (1717).

Glossaries: Blavatsky (153), Gómez (613), Mesquita (1037), Purucker (1340), Thalbourne (1675), White (1835).

Hagiography: Ancilli (24), Berthe (126), Ebon (455), Fielding-Ould (513), Lewis (923), Poodt (1272), Rogo (1447), Thurston (1700), Wallace (1788), White (1833).

History: Alexandrian (11), Blavatsky (155), Doyle (411), Durville (441), Gauld (575), Inardi (786), Inglis (789), King (845), Knight (852).

Huna: Crookall (343), Hoffman (733), Long (945; 946; 947), Steiger (1603), Straith-Miller (1626).

Initiations: Fortune (541), Guilmot (661), Lefebure (909).

Interviews: Ashby (58), Bleibtreu (153), Bolen (166), Hooper (755), Nietzsche (1128), Pose (1277), Psychic (1291), Régis (1380), Rodrigues (1434), Watkins (1799).

Jungism: Burt (225, p. 163), Crookall (329, p. 1), Jaffé (798, p. 143), Jung (812, p. 320; 813, p. 481), Serrano (1542, p. 147), Wilson (1852, p. 7).

Law: Barreto (83), Rodrigues (1433).

Levitation: Richards (1393), Turi (1705).

Magic: Christopher (283), Gardner (567), Randi (1370).

Magic practices: Bardon (80), Bourgeat (180), Butler (227; 228), Camaysar (236), Conway (297), Crowley (348; 349), David-Neel (368), Drury (414; 415; 417), Farrar (496), Fontaine (533), Fortune (540), Hartmann (693), Howard (761), King (844; 845; 846), Knight (852), Mauss (1016), Mousseaux (1099), Ophiel (1151), Papus (1198), Plytoff (1265), Poinot (1271), Prel (1286), Richards (1392), Sandwith (1502), Steiger (1603), Weor (1821).

Manuals: Bret (203), Carrington (251), Ebon (457), Greene (635), King (846), Leary (907), Mickaharic (1044), Mitchell (1059), Parrish-Harra (1202), Planeta (1257), Schatz (1514), Sefharial (1541), Stokes (1625), Tubby (1701), Verneuil (1735), Wolman (1863).

Polemics: (see “Critiques”).

Prophecies: Cheetham (176, p. 149), Cornillier (304, p. 85), Greenhouse (639, p. 58), Lessa (918, p. 337), Marin (996, p. 118), Vivante (1777, p. 122).

Pseudonyms: Ajaya (08), Babajiananda (65), Blacksmith (149), Christian (281), Crowley (347), Espérance (485), Fortune (540), Fox (543), Goldstein (607), Heindel (703), Hillel (1226), Imperator (784), Jefa (05), Kardec (815), Loester (942), Marrick (1000), Michaelus (1042), Moebius (1497), Ophiel (1150), Papus (1197), Ramacháraca (1347), Rampa (1349), Rocha (1425), Rohmer (1460), Satpren (1509), Sefharial (1541), Smith (1567), Steiger (1601), Valério (1725), Weor (1813), Yogananda (1894), Yram (1897), Zain (1898), Zaniah (1899), Zolar (1902).

Psychoanalysis: Ehrenwald (471), Eisenbud (473), El-Aowar (474), Fodor (531), Imbassahy (777), Marin (996), Wolman (1863).

Rosicrucianism: Bernard (124), E. P. (481), Heindel (705), Imperator (784), Loester (942), M. F. R. C. (1040), Rosacruz (1472).

Shamanism: Andreas (36), Drury (417), Eliade (475), Lewis (923), Mercier (1036), Planeta (1253), Wilson (1851).

Spiritism: Aksakof (09), Aliança (13), Barbanell (77), Barkas (82), Bozzano (184), Chevreuil (278), Chiesa (279), Cirne (285), Crouzet (344), Dassier (367), Delanne (383), Denis (387), Doyle (411), Ferreira (509), Green (634), Harnold (683), Imbassahy (775; 779), Kardec (818; 824), Karl (834), Lantier (886), Lombroso (943), Machado (967), Machado (969), Mackintosh (972), Marco (995), Mello (1032), Metzger (1038), Miguel (1045), Miranda (1052), Moutin (1101), Netto (1126), Owen (1177), Papallardo (1196), Paula (1208), Pereira (1230), Rigonatti (1401), Rizzini (1409), Roure (1479), Schofield (1520), Sech (1536), Silva (1561), Starke (1596), Stobart (1623), Thomas (1680), Torteroli (1691), Trespioli (1696; 1697), Tummolo (1704), Uchôa (1719), Velho (1734), Vesme (1736), Wallace (1788), Wauthy (1803), Xavier (1875).

Sports: Andrews (37, p. 6), Murphy (1113, p. 1).

Swedenborgism: Alexandrian (11), Balzac (72), Bellini (106), Boddington (162), Britannica (205), Byse (230), Cuno (353), Davis (371), Doyle (411), Dusen (443), Ebon (458), Fodor (528), Geymuller (586), Matter (1014), Miranda (1053), Pike (1242), Rizzo (1413), Swedenborg (1633; 1634; 1635; 1636; 1637; 1638; 1639; 1640), Thomas (1681), Tuttle (1708), Wilson (1851).

Theosophy: Anglada (38), Ashish (60), Besant (130), Blavatsky (155), Collins (292), Hodson (729), Leadbeater (899), Lyra (961), Neff (1120), Olcott (1147), Pavri (1210), Powell (1278), Richelieu (1397).

Theses: Lessa (18), Machado (967), Scott (1530), Silva (1561).

Treatises: Blavatsky (155), Cirne (285), Crowley (348), Delanne (382), Flammarion (524), Gurney (666), Myers (1114), Papus (1198), Richet (1398), Stevenson (1618), Swedenborg (1634), Wang (1794), Wilson (606).

Umbandism: Alverga (18), Babajiananda (65), Gomes (612), Silva (1562).

Zen Buddhism: Anderson (26), David-Nell (368), Humphres (766), Rogo (1441), Saher (1493), Suzuki (1631).

GLOSSARY OF PROJECTIOLOGY

Observation. The following is a listing of 303 projectiological terms, compound words, expressions and their technical equivalents.

Abdominal brain – The umbilicochakra (center of consciential energy located above the navel), when unconsciously selected by the intraphysical consciousness, who is still fairly unevolved, as the basis of his/her manifestations. The belly-brain, gut brain, abdominal brain, abdominal *pseudo*-brain, or abdominal sub-brain, is the *gray eminence* of the natural, encephalic brain (coronochakra and frontochakra); an indefensible obstacle to conscious self-evolution.

Admiration-disagreement binomial – The posture of an intraphysical consciousness who is mature in regard to consciential evolution, knows how to live in peaceful coexistence with another intraphysical consciousness who he/she loves and admires, but with whose points of view, opinions and positions he/she is not always in 100% agreement.

Advanced existential program – The existential program of the intraphysical consciousness who is an evolutionary leader, within a specific libertarian groupkarmic task that is more universalistic and polykarmic in nature. This individual acts as a lucid, *minicog* within a *maximechanism* of the multidimensional team.

Altered state of consciousness – See xenophrenia.

Alternant intraphysical preserenissimus – The intraphysical consciousness who is capable, from time to time, of simultaneously living consciously in the ordinary, physical waking state, as well as projected in extraphysical dimensions.

Androchakra (*andro + chakra*) – A man's sexochakra.

Androsoma (*andro + soma*) – The masculine human body, or the soma specific to a man.

Androthosene (compound word: *andro + tho + sen + e*) – The thosene specific to the primitive male intraphysical consciousness or the *macho man*.

Animism (Latin: *animus*, soul) – The set of intracorporeal and extracorporeal phenomena produced by the intraphysical consciousness without external interference. For example, the phenomenon of lucid projection induced by one's own will.

Antithosene (*anti + tho + sen + e*) – The antagonistic thosene, common in refutations, omniquestioning and productive debates.

Aphrodisiac female sexosoma – A woman's soma, considered specifically in regard to sex, when its form is capable of acting as an aphrodisiac. See *gynosoma*.

Artifacts of knowledge – Intellectual tools; resources used by the consciousness to store, retrieve or process information, such as books, computers and the internet.

Assisted lucid projection – The projection wherein the intraphysical consciousness finds him/herself to be directly assisted, during the experiment, by a helper which is almost always an expert in lucid projectability (LPB).

Assistential - Related to or denoting assistance. An assistential task is universalistic, cosmoethical, fraternal and should ideally be clarifying (clarification task) instead of consoling (consolation task).

Auric coupling – Interfusion of the holochakral energies between 2 or more consciousnesses.

Belly-brain – See abdominal brain.

Biothosene (*bio + tho + sen + e*) – The thosene specific to the human or intraphysical consciousness.

Bithanatosis – The deactivation and discarding of the holochakra after the first desoma, including removal of the remaining energetic connections of the holochakra in the psychosoma; *second death*; second desoma.

Blind guide – The amoral or inexperienced consciousness which helps another consciousness – in an anticosmoethical manner, according to its momentary egotistic interests – to the detriment of others.

Bradythosene (*brady + tho + sen + e*) – The thosene having a sluggish flow, pertaining to the bradypsychic human consciousness.

Cardiochakra (*cardio + chakra*) – The fourth basic chakra, the influential agent in the emotionality of the intraphysical consciousness which vitalizes the heart and lungs. Also known as the heart chakra.

Chakra – A nucleus or defined field of consciential energy, the totality of which basically constitutes the *holochakra* or energetic parabody inside the body. The holochakra forms a junction between the soma and the psychosoma, acting as a point of connection through which consciential energy (CE) flows from one consciential vehicle to the other. The word *chakra* is one of our *critical neologistic limits*. The author has not encountered another single international word that is more adequate, or apt, to put in its place and eliminate the *philosophical preconception* that exists with respect to this term (as well as its derivations and cognates). What is above all important, in this context, is *conceptual content* and not *linguistic form*. We live in *deficiencyland*, but consciential evolution proceeds with *holochakrology*.

Chirosoma (*chiro + soma*) – The soma considered specifically in terms of the use of the hands or manual labor.

Clarification task – The advanced assistential task of elucidation or clarification which can be performed individually or in group. Plural: clarification tasks.

Coincidence – The state of alignment of the vehicles (holosoma) of manifestation of the consciousness.

Communicology. The area or subdiscipline of conscientiology that studies all natures and forms of communicability of the consciousness, including interconsciential communication between consciential dimensions, considering lucid consciential projectability and the “entire” consciousness (holosoma, holobiography, holomemory).

Con – The hypothetical unit of measurement of the level of lucidity of the intraphysical or extraphysical consciousness.

Confor (*con + for*) – The interaction of content (idea, essence) with form (presentation, language) in the processes of interconsciential communication (communicology).

Conscientese – The telepathic, non-symbolic idiom that is the native language in the consciential dimensions of very evolved extraphysical societies.

Consciential amentia – The condition of the consciousness which is incapable of thinking with reasonable mental balance.

Consciential basement – The phase of infantile and adolescent manifestation of the intraphysical consciousness up to adulthood, characterized by a predominance of more primitive strong traits of the multivehicular, multiexistential and multimillenary consciousness.

Consciential bond – The cosmoethical, self-lucid, voluntary and polykarmic link between a volunteer and an institution. The consciential bond goes beyond the employment bond.

Consciential co-epicenter – The helper that works with an intraphysical consciousness who is a veteran consciential epicenter in his/her personal energetic task (penta). This helper can work as a colleague in the daily practices of penta as well as in the assistance continuously provided to extraphysical consciousnesses which are brought to the epicenter’s extraphysical clinic.

Consciential concentration – The direct, unwavering, focusing of the consciousness’ senses, consciential attributes, will and intention upon a singular object.

Consciential continuism – The condition of wholeness – without gaps – in the continuity of consciential life, through opportune foresight and evolutionary self-relay. In other words, the incessant linking of the experience of the present moment to immediately prior and subsequent experiences, in a cohesive and unified whole, with neither interruption in continuity nor stanching consciential experiences.

Consciential ectopia – Unsatisfactory execution of one’s existential program in an eccentric, dislocated manner, outside the programming chosen for one’s own intraphysical life.

Consciential energy (CE) – The immanent energy that the consciousness employs in its general manifestations; the *ene* of thosene.

Consciential epicenter – The key intraphysical consciousness of operational epicentrism who becomes a fulcrum of interdimensional lucidity, assistentiality and constructiveness through the extraphysical clinic. Directly related to *penta* or the personal energetic task.

Consciential era – That era in which average intraphysical consciousnesses find themselves sufficiently evolved, through the impacts, redefinitions and revolutions created through their experiences of lucid projectability (LPB), implanting *self-conscientiality first and foremost*.

Consciential eunuch – The intraphysical consciousness who is conscientially castrated and manipulated by sectarians, domesticators of *satisfied robots*, the modern slaves pertaining to the unthinking masses.

Consciential gestation – Useful evolutionary productivity, on the part of the human consciousness, within the framework of the personal works of his/her existential program.

Consciential hyperspaces – Extraphysical consciential dimensions.

Consciential micro-universe – The consciousness when considered as a whole, including all of its attributes, thosenes and manifestations during its evolution. The microcosm of the consciousness in relation to the macrocosm of the universe.

Consciential monoendowment – Intraphysical life under the pressure of constant intrusion by ill beings. This is experienced by mediocre intraphysical consciousnesses having few talents and no versatility.

Consciential paracoma – The state of extraphysical coma of a projected intraphysical consciousness who invariably remains unconscious, therefore having no recall of extraphysical events.

Consciential paradigm – Leading-theory of conscientiology, based upon the consciousness itself.

Consciential restriction – Restriction of the consciousness due to the process of manifestation in the physical state, in which one's natural level of awareness is reduced.

Consciential retailing – The rudimentary system of individual behavior characterized by lesser, isolated consciential actions having a minimum of productive results or great evolutionary effects.

Consciential scaffolding – Dispensable psychological or physiological *crutches* used by the consciousness.

Consciential self-bilocation (Latin: *bis*, two; and *locus*, place) – The act whereby an intraphysical projector encounters and contemplates his/her own human body (soma) face-to-face, when the consciousness is outside the soma, headquartered in another vehicle of consciential manifestation.

Consciential self-relay – The advanced condition in which the consciousness evolves by consecutively interweaving one intraphysical existence with another (*connected existential programs*), in the manner of the links of a chain (existential seriation), within one's multiexistential cycle (*holobiography*).

Consciential tri-endowment – Quality of the 3 conjugated talents most useful to a conscientiologist: intellectuality, parapsychism and communicability.

Consciential wholesaling – The behavior of an individual characterized by a tendency to approach consciential acts in a comprehensive or wholesale manner, not leaving negative evolutionary loose ends or gaps behind.

Conscientiocentric institution – The institution that centralizes its objectives on the consciousness and its evolution, as is the case with the International Institute of Projectiology and Conscientiology (IIPC); a consciential cooperative within conscientiological intraphysical society, based on employment and consciential bonds.

Conscientiocentrism – The social philosophy that concentrates its objectives on the consciousness itself and its evolution. Conscientiocentrism is a subject covered by *conscientiocentrolgy*, the subdiscipline of conscientiology that studies the creation and maintenance of the conscientiocentric institution based on consciential and employment bonds – like a consciential cooperative – in conscientiological intraphysical society.

Conscientiogram – The technical plan for measuring the evolutionary level of the consciousness; the consciential megatest having *Homo sapiens serenissimus* as a model – *serenissimus* being responsible for a positive egokarmic account. The conscientiogram is the basic instrument employed in conscientiometric tests.

Conscientiologist – The intraphysical consciousness who is engaged in the continued study and objective experimentation in the field of conscientiological research. The conscientiologist operates as an agent of evolutionary renovation (*retrocognitive agent*), in the libertarian work of consciousnesses in general.

Conscientiology – The science that studies the consciousness in an integral, holosomatic, multidimensional, multimillenary, multiexistential manner and, above all, according to its reactions in regard to immanent energy (IE), consciential energy (CE) and its multiple states.

Conscientiometry – The discipline or area that studies conscientiological (of the consciousness) measurements, using the resources and methods offered by conscientiology, that are capable of establishing the possible bases for the *mathematicization of the consciousness*. Main instrument: the conscientiogram.

Conscientiotherapy – The subdiscipline that studies the treatment, relief or remission of disturbances of the consciousness, executed through the resources and techniques derived from conscientiology.

Consciousness, the – The individual essence or intelligent principle in constant evolution. In conscientiology the word consciousness (as in “the consciousness”) is considered to be synonymous with mind, ego, intelligent principle, and others, and is not being used to refer to a state of consciousness. Outworn synonyms: soul, spirit.

Consolation task – Elementary, personal or group, assistential task of consolation.

Contrathosene (*contra + tho + sen + e*) – *The intraconsciential thosene of the intraphysical consciousness; mute mental refutation; mental word; mute thosene; a type of intrathosene.*

Co-projector – The helper who works with the intraphysical consciousness in the development of his/her lucid, assisted consciential projections.

Coronochakra (*corono + chakra*) – The chakra in the area of the sinciput, *crowning* the holochakra; crown chakra.

Cosmoconsciousness – The consciousness’ inner perception of the cosmos, of life and the order of the universe, in an indescribable intellectual and cosmoethical exaltation. In this condition, the consciousness senses the living presence of the universe and becomes one with it, in an indivisible unit. Interconsciential communication occurs in this singular condition.

Cosmoethical mimicry – The productive social impulse of imitating the evolved forebears of the intraphysical consciousness.

Cosmoethicality – The cosmoethical quality of the consciousness.

Cosmoethics (*cosmo + ethics*) – The ethics or reflection upon cosmic, multidimensional morality, or the cosmic moral code, which defines holomaturity. Cosmoethics surpasses social, intraphysical morals or those morals presented within any human classification. It is a subdiscipline of conscientiology.

Cosmothosene (*cosmo + tho + sen + e*) – The thosene specific to conscientese or the state of cosmoconsciousness; the form of communication of conscientese.

Co-therapist – The helper that works together with the intraphysical consciousness conscientiotherapist during the assistential technical procedures of conscientiotherapy that are applied to his/her patients.

Co-thosene (*co + tho + sen + e*) – The specific thosene of co-option of the collective actions of a chorus, of those praying in a group and of crowds.

Counterbody – The same as the holochakra, the specific vehicle of the intraphysical consciousness’ consciential energy (CE).

Daydream – The fanciful story created by the imagination during the ordinary, physical waking state of the human consciousness.

Dermatologies of the consciousness – The compound expression attributed to the conventional, physicalist sciences that are subordinated to the Newtonian-Cartesian, mechanistic paradigm and focus their research only upon the soma, because they do not avail themselves of the instrumentation necessary for direct, technical investigation of the consciousness itself; dermatologies of the intraphysical consciousness; periconsciential sciences.

Desoma (*de + soma*) – Somatic deactivation, impending and inevitable for all intraphysical consciousnesses; final projection; *first death*; biological death; monothanatos. *First* desoma, or simply desoma, is the deactivation of the human body or soma. *Second* desoma is the deactivation of the holochakra. *Third* desoma is the deactivation of the psychosoma.

Desomatics – The study of the physical context of desoma and of the psychological, social and medicolegal contexts related to deactivation of the soma. It is a subdiscipline of conscientiology.

Destructive macro-PK – Harmful PK (psychokinesis) capable of causing injuries to the intraphysical consciousness. Destructive macro-PK can even prove fatal to the soma.

Discoincidence – The state of non-alignment of the vehicles (holosoma) of manifestation of the consciousness.

Domiciliary holothosene – The holothosene specific to the intraphysical consciousness' physical base, energetically shielded bedroom and extraphysical clinic.

Dream – The natural consciential state which is intermediary between the ordinary, physical waking state and natural sleep. Dreams are characterized by a set of ideas and images that present themselves to the consciousness. The afflictive dream that has the effect of agitation, anguish and oppression is termed: *nightmare*; *night terror*; *nightmarish hallucination*.

Egokarma (*ego + karma*) – The principle of cause and effect active in the evolution of the consciousness, when centered exclusively on the ego itself. The state wherein free will is restricted by infantile egocentrism. The word *karma* is another of our *critical neologistic limits*. The author has not encountered another single, international, word that is more adequate, or appropriate, to put in its place and combat the *philosophical preconception* that exists with respect to this term (as well as its derivations and cognates). What is above all important, in this context, is *conceptual content* and not *linguistic form*. We live in *deficiencyland*, but consciential evolution proceeds with holokarmology.

Egothosene (*ego + tho + sen + e*) – The same as self-thosene; the *unit of measurement* of consciential egotism according to conscientiology or, more precisely, according to conscientimetry.

Energetic dimension – The energetic dimension of consciousnesses; the holochakral dimension; the *three-and-a-half* dimension. The natural dimension of the holochakra.

Energetic maxispringtime – The condition of a maximized or prolonged energetic springtime.

Energetic minispringtime – The condition of a minimal or ephemeral energetic springtime.

Energetic springtime – The more-or-less long-lasting personal condition wherein one's consciential energies (CEs) exhibit an optimal, healthy, constructive profile.

Energetic springtime by two – The energetic springtime of the evolutionary duo, the partners of which truly love each other and control the application of healthy consciential energy with complete lucidity, building their existential programs through consciential gestations.

Energivorous – Energy consuming, energy draining; in reference to intruder(s).

Enumerology – The didactic technique of processing texts based on informative self-critiquing.

Evoluent – The consciousness that is in the process of evolution and utilizing the services of a conscientiotherapist to further this process; outworn synonym: patient.

Evolutiologist – The consciousness which assists in the intelligent coordination of the existential program, or the consciential evolution of one or more consciousnesses of the same karmic group. The evolutionary condition between the petifree consciousness and *serenissimus*. A more adequate expression than *evolutionary orienter*.

Evolutiology – The subdiscipline of conscientiology that studies the evolution of the consciousness, which is addressed in a high-quality, integral manner. This subject is specifically related to the evolutiologist or evolutionary orienter.

Evolutionary duo – Two consciousnesses that interact positively in joint evolution; the existential condition of *cooperative evolutivity* by two.

Evolutionary orienter – See *evolutiologist*.

Existential completism – The condition wherein the existential program of the human consciousness is complete.

Existential incompletism – The condition wherein the existential program of the human consciousness is incomplete.

Existential inversion – An advanced evolutionary technique consisting of inverting sociocultural values and projects in human life, according to the principles of projectiology and conscientiology. It is based upon the prioritization of and the full-time dedication to the execution of the existential program, beginning at a young age.

Existential inverter – The intraphysical consciousness who is inclined to execute existential inversion in intraphysical life.

Existential invertibility – The quality of the intraphysical execution of existential inversion.

Existential maximoratorium – The condition of the greater existential moratorium which is given to an existential *completist*. It is an addition to his/her completed existential program. It is therefore the execution of a *healthy extension* to an existential mandate that has been concluded.

Existential maxiprogram – The maximal existential program having a *wholesale approach*, or targeting the execution of tasks of applied universalism and maxifraternity with polykarmic bases.

Existential minimoratorium – The condition of the lesser existential moratorium or one which happens to the *incompletist* intraphysical consciousness in order for him/her to compensate for a *holokarmic deficit* (deficit-based) or to achieve the condition of existential completism regarding his/her existential program. It is therefore the finishing of a still incomplete existential mandate.

Existential miniprogram – The minimum, *retail-oriented*, existential program targeting the execution of a minimal, groupkarmic task.

Existential moratorium – An extension of (a complement to) intraphysical life which is provided to select intraphysical consciousnesses according to their holokarmic merit. The existential moratorium can be either deficit-based (lesser), an existential minimoratorium; or can be profit-based (greater), an existential maximoratorium, with regard to the results of the individual's existential program.

Existential moratoriumist – One who receives an existential moratorium; moratoriumist.

Existential multicompletism – Existential completism obtained through the execution of various existential programs in diverse consecutive intraphysical lives (existential seriation).

Existential program – The specific program of each intraphysical consciousness, in his/her intraphysical existence.

Existential recyclability – The quality of the intraphysical execution of existential recycling.

Existential recycler – The intraphysical consciousness who is inclined to execute existential recycling.

Existential recycling – The evolutionary technique in which the intraphysical consciousness adopts a new set of values and priorities in his/her life, enabling the execution of the existential program.

Existential robotization – The condition of a tropospheric intraphysical consciousness who is excessively enslaved by intraphysicality or four-dimensionality.

Existential self-mimicry – Imitation on the part of the intraphysical consciousness of his/her own experiences or past experiences, whether they pertain to his/her current intraphysical life or previous intraphysical lives.

Existential seriation – 1. Evolutionary existential sequencing of the consciousness; successive existences; intraphysical rebirths in series. 2. Human or intraphysical life. Synonym outworn and exhausted by excessive use: *reincarnation*; this archaic word no longer serves those more serious individuals dedicated to leading-edge consciousness research.

Extraphysical – Relative to that which is outside, or beyond, the *intraphysical* or human state; the consciential state which is *less* physical than the soma.

Extraphysical agenda – A written list of high-priority extraphysical, consciential targets – beings, places or ideas – that the projected projector seeks to gradually reach, in a chronological manner, establishing intelligent plans for its own development.

Extraphysical approach – The contacting of one consciousness by another consciousness in the extraphysical dimensions.

Extraphysical catatonia – The fixed condition wherein a projected intraphysical consciousness performs repeated stereotypical acts that are generally useless or dispensable in terms of its evolution.

Extraphysical clinic – The extraphysical treatment center of the intraphysical epicenter (penta practitioner). The resources and extraphysical *installations* of the extraphysical clinic are numerous and remarkable. The extraphysical clinic is a domiciliary holothosene.

Extraphysical community – A group of extraphysical consciousnesses living together in an extraphysical dimension.

Extraphysical consciousness – The paracitizen of an extraphysical society; a consciousness which no longer has a soma. Outworn synonym: *discarnate*.

Extraphysical euphoria – The condition of euphoria experienced after somatic deactivation, generated due to the reasonably satisfactory completion of the existential program; *post-mortem* euphoria; para-euphoria; postsomatic euphoria.

Extraphysical gang raid – The action of a group of energivorous extraphysical consciousnesses, including extraphysical blind-guides, in the paratropospheric dimensions, with the objective of vampirizing the intraphysical consciousnesses in the environments of intraphysical celebrations or events which gather persons who are predisposed to the condition of collective victimization through consciential energies.

Extraphysical melancholy – The condition of extraphysical, postsomatic or *post-mortem* melancholy due to the unsatisfactory execution of the existential program; paramelancholy.

Extraphysical monitoring – The condition wherein assistance is provided by healthy extraphysical consciousnesses to a balanced intraphysical consciousness, while that intraphysical consciousness is performing balanced tasks of consolation or clarification.

Extraphysical precognition (Latin: *pre*, before; *cognoscere*, to know) – The perceptive faculty through which the consciousness, while fully projected outside the human body, becomes aware of unknown upcoming facts, as well as objects, scenes and distant forms in the future.

Extraphysical romance – The set of acts whereby an intraphysical consciousness dates or maintains a healthy or positive romantic relationship while projected outside the body.

Extraphysical society – Society of extraphysical consciousnesses.

Free consciousness (Latin: *con* + *scientia*, with *knowledge*) (**FC**) – The consciousness – or, more precisely: the extraphysical consciousness – which has definitively freed itself (deactivation) from the psychosoma or emotional parabody and the series of lifetimes. The free consciousness is situated in the *evolutionary hierarchy* above *Homo sapiens serenissimus*.

Geoenergy (*geo* + *energy*) – Immanent energy (IE) deriving from the soil or earth and absorbed by the intraphysical consciousness through the *pre-kundalini*. Archaic expression: *telluric energy*.

Golden cord – The alleged energetic element – similar to a remote control – that maintains the mentalsoma connected to the parabrains of the psychosoma.

Graphothosene (*grapho* + *tho* + *sen* + *e*) – The *thosenic signature* of the human or intraphysical consciousness.

Group of existential inverters – The intraphysical meeting and personal experience of existential inverters with the aim of attaining the experience of planned existential inversions.

Group of existential recyclers – The intraphysical meeting and personal experience of existential recyclers with the aim of attaining the experience of planned existential recyclings.

Groupality – The quality of the evolutionary group of the consciousness; the condition of evolutivity in group.

Groupkarma (*group* + *karma*) – The principle of cause and effect active in the evolution of the consciousness, when centered in the evolutionary group. The state of individual free will, when connected to the evolutionary group.

Groupkarmic course – The set of the consciousness' levels within the evolutionary consciential group.

Groupkarmic interprison – The condition of groupkarmic inseparability of the evolutionary consciential principle or the consciousness.

Groupthosene (*group + tho + sen + e*) – The sectarian, corporatist and antipolykarmic thosene; however, the groupthosene can also be constructive.

Gynochakra (*gyno + chakra*) – A woman's sexochakra.

Gynosoma (*gyno + soma*) – The female human body, or that which is specific to a woman, specialized in the animal reproduction of the intraphysical life of the intraphysical consciousness; the aphrodisiac body.

Gynothosene (*gyno + tho + sen + e*) – The thosene specific to feminine language and communicability.

Hallucination (Latin: *hallucinari*, to err) – The apparent perception of an external object that is not present at the moment; mental error in the perception of the senses, which is baseless in an objective reality.

Helper – The extraphysical consciousness which is auxiliary to one or more intraphysical consciousnesses; extraphysical benefactor. Archaic equivalent expressions that have been outworn through continued use: *guardian angel; angel of light; guide; mentor; spirit guide*.

Heterothosene (*hetero + tho + sen + e*) – The thosene of another in relation to ourselves.

Holobiography – The multidimensional, multiexistential personal history of the consciousness.

Holochakra (*holo + chakra*) – The energetic parabody of the human consciousness.

Holochakral existence – Intraphysical life or the lifetime of the human consciousness.

Holochakral seduction – The energetic action of one consciousness upon another (or others) with a more or less conscious intention of domination.

Holochakrality – The quality of the manifestations of the intraphysical consciousness deriving from the holochakra or energetic body.

Holokarma (*holo + karma*) – The grouping of the 3 types of consciential actions and reactions – egokarma, groupkarma and polykarma – within the principles of cause and effect, that are active in the evolution of the consciousness.

Holomaturity (*holo + maturity*) – The condition of integrated maturity – biological, psychological, holosomatic and multidimensional – of the human consciousness.

Holomemory (*holo + memory*) – The causal, compound, multimillenary, multiexistential, implacable, uninterrupted, personal memory that retains all facts relative to the consciousness; multimemory; polymemory.

Holo-orgasm (*holo + orgasm*) – Holosomatic orgasm; maximum ecstasy generated by the energies of the entire holosoma.

Holosoma (*holo + soma*) – The set of vehicles of manifestation of the intraphysical consciousness: soma, holochakra, psychosoma and mentalsoma; and of the extraphysical consciousness: psychosoma and mentalsoma.

Holosomatic homeostasis – The integrated, healthy state of the holosoma's harmony.

Holosomatic interfusion – The state of maximal sympathetic assimilation between two consciousnesses.

Holosomatics – The specific study of the holosoma. It is a subdiscipline of conscientiology.

Holotheca – Compilation of information from artifacts of knowledge.

Holothosene (*holo + tho + sen + e*) – Aggregated or consolidated thosenes.

Homo sapiens serenissimus – The consciousness which is integrally experiencing the condition of lucid serenism. Popular synonym: *serenissimus*.

Homothosene (*homo + tho + sen + e*) – The thosene of telepathic transmission and reception; the *unit of measurement* in telepathy, according to conscientiometry.

Hyperacuity – The quality of maximum lucidity of the intraphysical consciousness, achieved through the recuperation – to the maximum degree possible – of cons.

Hyperthosene (*hyper + tho + sen + e*) – Heuristic thosene; original idea of a discovery; neophilic thosene; *unit of measurement* of invention, according to consciometry.

Hypnagogy (Greek: *hipnos*, sleep; and *agogos*, leader, bringer) – The transitional twilight condition of the consciousness between the ordinary, physical waking state and the state of natural sleep. It is an altered state of consciousness.

Hypnopompy (Greek: *hipnos*, sleep; and *pompikós*, procession) – The transitional condition of natural sleep, introductory to physical awakening, during the semi-sleep state that precedes the act of awakening. This state is characterized by oneiric images with auditory effects and hallucinatory visions that continue after awakening. It is an altered state of consciousness.

Hypothosene (*hypo + tho + sen + e*) – The same as protothosene or phytothosene.

Immanent energy (IE) – Energy that is primary, vibratory, essential, multiform, impersonal, diffuse and dispersed in all objects or *realities* of the universe, in an omnipotent fashion. Immanent energy has still not been tamed by the human consciousness. It is too subtle to be discovered and detected by existing technological equipment.

Incomplete couple – The couple composed of a man and a woman who do *not* form an intimate couple (a couple that practices the complete sex act), but who, nevertheless, maintain strong affectionate ties.

Integrated maturity – The state of a more evolved consciential maturity, beyond biological (physical) or mental (psychological) maturity; holomaturity.

Inter vivos apparition – Appearance of the consciousness of the projected human projector to intraphysical consciousnesses.

Interconsciential climate – The condition of multi-understanding in an interconsciential encounter, established through similar thosenes, especially those *with an emphasis* on consciential energies (CEs). There are interconsciential climates, *mini-climates* and *maxi-climates*.

Interdimensionality – Interaction, interrelation or interconsciential communication between intraphysical and extraphysical dimensions.

Intermissibility – The quality of the period of intermission between two intraphysical lives of a consciousness.

Intermission – The extraphysical period of the consciousness between two of its physical lives; intermissive period.

Intermissive course – The set of disciplines and theoretical and practical experiences administered to an extraphysical consciousness during the period of consciential intermission. This course occurs when one has achieved a certain evolutionary level within one's cycle of personal existences. The intermissive course objectifies consciential completism (existential completism) of the upcoming intraphysical life.

Intraconsciential compensation – The consciometric technique based upon the greater use of a consciential attribute that is more developed (strong trait) over another, or other less developed consciential attributes (weak traits) in the micro-universe of the intraphysical consciousness.

Intraconsciential recycling – Intraphysical, existential, *intraconsciential* recycling or the cerebral renovation of the intraphysical consciousness through the creation of new synapses or interneuronal connections. The newly created synapses are capable of allowing the adjustment of the existential program, execution of existential recycling, existential inversion, the acquisition of new ideas, neothosenes, hyperthosenes and other neophilic conquests of the self-motivated human consciousness.

Intraconscientiality – The quality of the manifestations specific to the intimacy of the consciousness.

Intraphysical assistant – The intraphysical guardian of the projector's inactive human body that is emptied of the consciousness during lucid projection.

Intraphysical consciousness – Human personality; citizen of intraphysical society. Outworn synonym: *incarnate*.

Intraphysical euphoria – The condition of euphoria experienced before somatic deactivation that is generated by the reasonably satisfactory completion of the existential program; *pre-mortem* euphoria. The ideal condition predisposing one to have a positive existential moratorium.

Intraphysical melancholy – The condition of intraphysical or *pre-mortem* melancholy generated by incompleteness of the existential program.

Intraphysical society – The society of intraphysical consciousnesses; human society.

Intraphysicality – The condition of human, intraphysical life, or of the existence of the human consciousness.

Intrathosene (*intra + tho + sen + e*) – The *intra*consciousness of the human consciousness.

Intruder – The perturbed, ill, needy, anticosmoethical consciousness; especially an extraphysical consciousness when performing a thosenic intrusion upon an intraphysical consciousness.

Intrusion – Invasion of a consciousness by another; this can be through consciential energies (CEs) or the holochakra, psychosoma, holosoma, or thosenes. It can also be interconsciousness or *intra*consciousness.

Intrusive stigma – An evolutionary failure or derailing that is always dramatic and often pathological, generally stemming from consciential self-obscuration. This process generates either intraphysical or extraphysical melancholy and often results in parapsychic accidents.

Intrusiveness – Ill, interconsciousness thosenic intrusion. Archaic equivalent expression: *obsession*; many intraphysical consciousnesses are defensive regarding this word.

Joint projection – An experience outside the human body in which two or more projected intraphysical consciousnesses participate.

Locked existence – Human experience or lifetime without the production of lucid projections (LPs); tropospheric human life with only unconscious, vegetative projections that are characteristic of the state of evolutionary paracoma; locked lifetime.

Looseness of the holochakra – The condition of relative freedom of action of the energetic parabody of the intraphysical consciousness, relative to the psychosoma and soma.

Lucid projectability (LPB) – The lucid, projective parapsychological quality of the consciousness that is capable of provoking its disincarnation or taking its vehicles of manifestation out from the alignment of its holosoma, even through the impulsion of its willpower.

Lucid projection (LP) – Projection of the intraphysical consciousness beyond the soma; extracorporeal experience; out-of-body experience (OBE).

Lucidity-recall binomial – The set of the two conditions that are indispensable to the intraphysical consciousness for his/her achievement of a fully satisfactory lucid projection (outside the soma).

Macrosoma (*macro + soma*) – The soma that is *supercustomized* for the execution of a specific existential program.

Matherthosene (*mater + tho + sen + e*) – The mother-idea or matrix for the complete development of a thesis, theory or analysis, the *leitmotif*, major pillar or predominant thosene in a holothosene.

Maxifraternity – The most evolved, universalistic, interconsciousness condition that is based on pure fraternity on the part of a self-unforgiving and heteroforgiving consciousness. Maxifraternity is an inevitable goal in the evolution of all consciousnesses. Synonym: megafaternity.

Maxithosene (*maxi + tho + sen + e*) – The thosene specific to FCs or free consciousnesses.

Megagoal – The consciousness' greater self-evolutionary objective.

Megapower – The evolved condition of great, cosmoethical lucidity of the consciousness.

Mega-strong-trait – The maximal strong trait of the consciousness.

Megathosene (*mega + tho + sen + e*) – The same as orthothosene.

Mega-weak-trait – The maximal weak trait of the consciousness.

Mentalsoma (*mental + soma*) – Mental body; *parabody* of discernment of the consciousness.

Mentalsomatic cycle – The evolutionary cycle or course of the consciousness that begins when it is an FC, or free consciousness, in which it definitively deactivates its psychosoma (third death), and lives only with the mentalsoma.

Metasoma (*meta + soma*) – The same as psychosoma, the extraphysical instrument of extraphysical and intraphysical consciousnesses.

Minithosene (*mini + tho + sen + e*) – The thosene specific to the child, sometimes due to his/her still developing brain.

Mnemonic intrusion – The collision of the intrusive memory of an intrusive extraphysical consciousness upon the cerebral memory or biomemory of an intraphysical consciousness who is suffering from intrusion (*para-amnesia*).

Mnemosoma (*mnemo + soma*) – The soma, when considered specifically in relation to the consciousness' memory, in all of its forms.

Monothanatos – Same as *desoma*; *first desoma*.

Monothosene (*mono + tho + sen + e*) – Repetitive thosene; monoideism; fixed idea; mental echo; rethosene.

Morphothosene (*morpho + tho + sen + e*) – A thought or a set of thoughts when gathered and expressed, in some manner, as a *form*. Archaic expression now in disuse: *thought-form*. The accumulation of morphothosenes composes the holothosene.

Multidimensional self-awareness (MS) – The condition of mature lucidity of an intraphysical consciousness in terms of conscial life in the evolved state of multidimensionality. This condition is achieved through lucid projectability (LPB).

Multi-existential cycle – The system or condition – at our current, average evolutionary level – of continuous alternation of one period of intraphysical rebirth (*lifetime*) with another extraphysical post-somatic deactivation period (*intermission*).

Near-death experience (NDE) – Projective occurrences that are involuntary or forced due to critical human circumstances of the human consciousness, common in cases of patients with terminal illnesses and survivors of clinical death.

Neophilia – The ready adaptation of the intraphysical consciousness to new situations, things and occurrences. The opposite of neophobia.

Neothosene (*neo + tho + sen + e*) – The thosene of the intraphysical consciousness when manifesting using new synapses or interneuronal connections, capable of generating *intraconscial* recycling; *unit of measurement* of conscial renovation, according to conscientiology or, more precisely, conscientimetry.

Oneirothosene (*oneiro + tho + sen + e*) – The same as pathothosene.

Orgastic aura (Latin: *aura*, wisp of air) – The holochakral energy of *facies sexualis* of the man or woman at the precise moment of sexual orgasm or the climax of the sex act.

Orthothosene (*ortho + tho + sen + e*) – The *correct* or cosmoethical thosene, pertaining to conscial holomaturity; the *unit of measurement* of practical cosmoethics, according to conscientimetry.

Pangraphy – Ample and sophisticated multimodal parapsychic writing.

Para – The prefix that signifies *beyond* or *beside*, as in *parabrain*. It also signifies *extraphysical*.

Parabrain – The extraphysical brain of the psychosoma of the consciousness in the extraphysical (extraphysical consciousness), intraphysical (intraphysical consciousness) and projected (when projected in the psychosoma) states.

Paragenetics – The genetics restricted to the inheritance of the consciousness, received through the psychosoma, from the previous life to the human embryo. It is a subdiscipline of conscientiology.

Paraman – The extraphysical consciousness having the appearance of a man or a projected male intraphysical consciousness. Synonymous expression outworn through use: *male spiritual entity*.

Parapathology – Pathology of the vehicles of manifestation of the consciousness, excluding the human body or soma. It is a subdiscipline of conscientiology.

Paraphysiology – Physiology of the vehicles of manifestation of the consciousness, excluding the human body or soma. It is a subdiscipline of conscientiology.

Parapsychic – That which is paranormal or multidimensional in nature.

Parapsychic accident – Physical or psychological disturbance generated by sick energetic, interconsciential influences, generally of an extraphysical or multidimensional origin.

Parapsychic signage – The existence, identification and self-aware use of the energetic, animic, parapsychic and extremely personal signs (indicators) that every intraphysical consciousness possesses.

Parapsychism – Parapsychic capacities of the consciousness.

Parapsychophysical repercussions – Reactions between 2 vehicles of consciential manifestation, when they come into contact with each other. This can occur between different vehicles of one consciousness or between similar vehicles of two or more consciousnesses. These repercussions can be intraphysical and extraphysical.

Parasaniary encapsulation – Assistential isolation and the temporary, energetic annulment of thosenic manifestations – notably energetic or intrusive ones – from one or more ill intraphysical and/or extraphysical consciousness, in the manner of sanitary isolation (quarantine) wards in hospitals for infectious and contagious illnesses with patients who present a high potential for disease, radioactive or toxic contamination.

Parathosene (*para + tho + sen + e*) – The thosene specific to the extraphysical consciousness.

Parawoman – The extraphysical consciousness having the appearance of a woman or a projected female intraphysical consciousness. Synonymous expression outworn through use: *female spiritual entity*.

Pathothosene (*patho + tho + sen + e*) – The pathological thosene or the thosene of consciential dementia; *mental peccadillo*; pathological will; sick intention; *cerebral rumination*.

Penile aura – The sexochakral energy around the penis, notably when in erection, perceivable by any motivated individual, especially by the sexually excited man.

Penta (*p + ene + ta*) – The multidimensional, daily, personal energetic task that receives continuous assistance from the helpers on a long-term basis or for the rest of one's life. Outworn expression: *passes-to-the-void*.

Personal experience (PE) – Practical, personal, direct, non-transferable experimentation of the intraphysical consciousness on his/her evolutionary way.

Personal principles – The set of guiding values and initiatives of consciential life which are chosen by the consciousness based upon holomaturity, multidimensionality and applied cosmoethics.

Petifree – The intraphysical consciousness who is permanently and totally free of intrusion, and is completely self-aware of being in this condition.

Petifreeness – The consciential quality of the petifree being.

Phenomenon concomitant with LP – That which occurs either inside or outside the time-space *continuum*, but does so simultaneously with the experience of the lucid projection, in a spontaneous and unexpected manner.

Physical base – The safe location, chosen by the intraphysical consciousness for leaving the soma stationary or resting while lucidly projecting to other, external, consciential dimensions; *duodrome*. A domiciliary projectiogenic holothosene. It is directly related to: the energetically shielded chamber; penta; consciential epicenter; extraphysical clinic; *projectarium*; *precognitarium*; and *retrocognitarium*.

Phytothosene (*phyto + tho + sen + e*) – The rudimentary thosene of a plant; the *lexical unit* of a plant, according to conscientiology.

Podosoma (*podo + soma*) – The soma, when considered specifically in regard to the application of the feet or work performed with the feet, as in the case of a soccer player.

Polykarma (*poly + karma*) – The principle of cause and effect, active in the evolution of the consciousness, when centered in the sense of and the experience of cosmic maxifraternity, beyond egokarma and groupkarma.

Polykarmality – The quality of the polykarmic manifestations of the consciousness.

Postsomatic intermission – The extraphysical period of the consciousness immediately following somatic deactivation.

Precognitarium – The physical base which is technically prepared for the production of precognitive LPs (lucid projections).

Pre-couple – The preliminary, initial or flirting stage of human sexuality, a practice within intraphysical society.

Pre-intraphysical mandate – The existential program for human life, planned before the intraphysical rebirth of the consciousness; existential program.

Prekundalini – The secondary plantar (sole of the foot) chakra. There are 2 plantochakras in the holosoma of the intraphysical consciousness. This is an expression pertaining to conscientiology.

Pre-serenissimus – The intraphysical or extraphysical consciousness that does not yet live a life of lucid serenism.

Presomatic intermission – The extraphysical period of the consciousness immediately preceding its intraphysical rebirth.

Primothosene (*primo + tho + sen + e*) – The same as the *primary cause of the universe*; the first compound thought. This term has no plural form.

Projectarium – The physical base which is technically prepared for the production of projections of the consciousness (PCs).

Projectiocritique – Critiquing performed with a projectiological perspective. It is a subdiscipline of conscientiology.

Projectiography – The technical study of projectiological registers. It is a subdiscipline of conscientiology.

Projectiology (Latin: *projectio*, projection; Greek: *logos*, treatise) – The science that studies projections of the consciousness and their effects, including projections of conscial energies (CEs) outward from the holosoma. It is a subdiscipline of conscientiology.

Projectiotherapy – The science of the prophylaxes and therapies derived from the research and techniques of projectiology.

Projective mental target – The predetermined goal that an intraphysical consciousness plans to reach using the will, intention, mental focus and decision, upon finding itself lucid outside the body.

Projective phenomenon – The specific parapsychic occurrence within the scope of projectiology research.

Projective recess – The existential phase of the intraphysical consciousness characterized by the spontaneous cessation – almost always temporary – of lucid projective experiences, within a sequence of intensive experiences.

Protothosene (*proto + tho + sen + e*) – The more rudimentary thosene; the same as phytothosene or hypothosene.

Psychosoma (Greek: *psyche*, soul; *soma*, body) – The emotional partbody of the consciousness; the *objective body* of the intraphysical consciousness. Outworn expression: astral body.

Rethosene (*re + tho + sen + e*) – The repeated thosene. The same as *monothosene*, fixed idea, or monoideism.

Retrocognitarium – The physical base which is technically prepared for the production of retrocognitive lucid projections (LPs).

Retrocognition (Latin: *retro*, back; *cognoscere*, to know) – The perceptive faculty through which the intraphysical consciousness becomes aware of facts, scenes, forms, objects, successes and experiences that pertain to a time in the distant past. These issues are commonly related to one's holomemory.

Retrothosene (*retro + tho + sen + e*) – The thosene specific to self-retrocognitions; the same as the *engram* of mnemotechnics; the *unit of measurement* of retrocognitions, according to conscientiometry.

Self-consciality – The quality of the level of self-knowledge on the part of the consciousness; megaknowledge.

Self-mimeticity – The conscial quality of existential self-mimicry.

Self-projection – Departure of the intraphysical consciousness to another conscial dimension in the mentalsoma or the psychosoma, when intentional or provoked by the will.

Self-thosene (*self + tho + sen + e*) – The thosene of the consciousness itself.

Self-unforgiver – The intraphysical consciousness who, in the individual's self-discipline, does not pardon his/her own errors or omissions, in order to eliminate conscious self-corruption. This healthy condition is contrary to the likewise healthy condition of *heteroforgiver*, a sincere *universal forgiver* of all beings, forever – *a basic principle of maxifraternity*.

Semilucid projection (SLP) – The oneiric experience in which the projected intraphysical consciousness finds itself to be partially lucid, in a disordered manner. It is not an ideal consciential projection; lucid dream.

Sene (*sen + e*) – Sentiment and consciential energy.

Serenissimus – Popular name for *Homo sapiens serenissimus*.

Seriality – The quality of the consciousness subjected to existential seriation (rebirth cycle).

Sexochakra (*sex + o + chakra*) – The root or basic sexual chakra of the human consciousness. An ancient expression related to the consciential energy (CE) of this chakra: *kundalini (the serpentine fire)*.

Sexosoma (*sex + o + soma*) – The soma when considered specifically in relation to its sex.

Sexosomatics – The specific study of the soma in regard to its sex, or sexosoma, and its relations with the intraphysical consciousness, whether male or female. It is a subdiscipline of conscientiology.

Sexothosene (*sex + o + tho + sen + e*) – The sexual fantasy; the *unit of measurement* of mental adultery, according to conscientiometry.

Shielded chamber – The energetically defended and extraphysically “aseptic” private room in a house or apartment, especially a bedroom; intrusion-proof bedroom.

Silver cord – The energetic connection between the soma and the psychosoma which is present in a projection of the consciousness, resulting from the holochakral energies.

Sleep – The natural state of rest in humans and superior animals that is especially characterized by the normal and periodic suppression of perceptive activity, voluntary motor activity and daily interpersonal exchanges, through the relaxation of the senses and muscles, a reduction in the heart and respiratory rates, as well as by oneiric activity, during which the organism recuperates from fatigue.

Soma – Human body; physical body. The body of the individual of the *Animal* kingdom, *Chordata* phylum, *Mammiferous* class, *Primate* order, *Hominidae* family, *Homo* genus, and *Homo sapiens* species, being the most elevated level of animal on this planet; nonetheless, this is the most rudimentary vehicle of the holosoma of the human consciousness.

Spermatic intrusion – The introduction of a man's sperm into a woman's sexosoma during the sex act.

State of suspended animation – That state in which the essential vital functions of the cellular body of the intraphysical consciousness are temporarily suspended, whereupon its normal physiological conditions later return. In certain cases, this occurs without any damage being done to one's personal health, the cells surviving in a metabolism of human hibernation.

Strong trait – The strong trait of the personality of the intraphysical consciousness; the positive component of the structure of the consciential micro-universe that impels the evolution of the consciousness.

Subthosene (*sub + tho + sen + e*) – The thosene having an emphasis on consciential energy restricted to the abdominal brain, notably energy of the umbilicochakra; the *unit of measurement* of the abdominal brain, according to conscientiometry.

Sympathetic assimilation – The willful assimilation of consciential energies (CEs). This condition is often accompanied by the decoding of a set of the thosenes of one or more consciousness.

Sympathetic de-assimilation – Cessation of sympathetic assimilation of consciential energies (CEs) performed through the impulsion of one's will, normally by installing the vibrational state (VS).

Tachythosene (*tachy + tho + sen + e*) – The rapid flowing thosene, pertaining to the tachypsychic (quick-thinking) intraphysical consciousness.

Telethosene (*tele + tho + sen + e*) – The same as homothosene.

Theorice (*theor + ice*) – The experience of combined theory and practice, on the part of the intraphysical or extraphysical consciousness.

Thosen (*tho + sen*) – Thought and sentiment.

Thosene (*tho + sen + e*) – The practical unit of manifestation of the consciousness, according to conscientiology, that considers thought or idea (concept), sentiment or emotion, and CE (consciential energy), as being 3 inseparable elements.

Thosener – The instrument through which the consciousness manifests its thoughts and acts. In the specific case of the intraphysical consciousness, the fundamental thosener is the soma.

Thosenity – The quality of one's thosenic awareness.

Thosenization – The process whereby the consciousness generates thosenes.

Trithanatosi – The deactivation and discarding of the psychosoma with the subsequent entrance of the consciousness of the *Homo sapiens serenissimus* into the condition of free consciousness (FC); *third desoma*.

Umbilicochakra (*umbilic + o + chakra*) – The umbilical chakra (located above the navel) or that chakra related to the (abdominal) physiology and parapsychology of the human consciousness.

Universalism – The set of ideas derived from the universality of the basic laws of nature and the universe which, through the natural evolution of the consciousness, inevitably becomes its dominant philosophy; cosmism.

Vehicle of the consciousness – The instrument or body through which the consciousness manifests in intraphysicality (intraphysical consciousness) and in the extraphysical dimensions (projected intraphysical consciousness and extraphysical consciousness).

Verbaction (*verb + action*) – The practical interaction of what is said and done in the coherent behavior of the consciousness; a result of one's word being ratified by example through the testimonies experienced by the intraphysical consciousness.

Vibrational state (VS) – The technical condition of the maximal dynamization of the energies of the holochakra, through the impulsion of the will.

Virus of intraphysical society – Any social weak trait in the intraphysical life of the human consciousness.

Volitional intrusion – Invasion of the will of one consciousness upon another by way of heterosuggestion or heterohypnosis.

Waking discoincidence – The parapsychic condition of the intraphysical consciousness projector in which one perceives that the psychosoma is outside the state of coincidence, while in the full ordinary, physical waking state, without feeling completely integrated in the soma. This generates the intensification of paraperceptions and energetic and parapsychic phenomena.

Weak trait – The weak trait of the personality of the intraphysical consciousness; the negative component of the structure of the consciential micro-universe that the consciousness has still not been able to discard or rid itself of.

Xenophrenia (Greek: *xenos*, strange; *phrem*, mind) – The state of the human consciousness outside the normal pattern of the ordinary, physical waking state, induced by physical, physiological, psychological, pharmacological or parapsychic agents; altered state of consciousness.

Xenothosene (*xeno + tho + sen + e*) – The intrusive thosene of the intruder in the occurrences of thosenic intrusion or intrusiveness; *mental wedge*; *unit of measurement* of interconsciential intrusion, according to conscientimetry.

Zoothosene (*zoo + tho + sen + e*) – The thosene of the sub-human animal lacking self-conscientiality; *unit of measurement* of the consciential principle of the sub-human animal, according to conscientimetry.

ABBREVIATIONS, ACRONYMS AND SYMBOLS
--

Observations. The following are 145 acronyms and abbreviations used in the texts of this book.

A.D.	= <i>Anno Domini.</i>
add.	= address or addresses.
AIDS	= <i>Acquired Immunological Deficiency Syndrome.</i>
alph.	= alphabetical index by subject; remissive index.
app.	= appendix.
apps.	= appendices.
B.C.	= before Christ.
bibl.	= bibliography.
BO	= body odor; unconscious perspiration of the soma.
CD	= compact disc.
CD-ROM	= compact disc - read only memory.
CE	= consciential energy.
CEs	= consciential energies.
chap.	= chapter.
chaps.	= chapters.
CHSC	= Center for Higher Studies of the Consciousness.
CIS	= Computing Inspection Service.
cm	= centimeter or centimeters.
Co.	= company.
com.	= commentator.
COOIIP	= <i>Cooperative of Volunteers of the International Institute of Projectiology.</i>
CP	= consciential projection.
CPs	= consciential projections or consciential lucid, semilucid and nonlucid projections.
cs	= cartoon strip.
Dan.	= Danish language.
def.	= definition or definitions.
dic.	= dictionary.
dj.	= dust jacket (of a book).
Du	= Dutch language.

ed.	= edition or editions.
EHE	= <i>Exceptional Human Experience</i> .
elec.	= electricity.
Elvis	= to be dead (in war).
ene	= consciential energy or CE.
Eng.	= English language.
enu.	= numbered enumerations.
epil.	= epilogue.
EQ	= encephalic quotient.
Es.	= Esperanto language.
ESP	= extrasensory perception.
etc.	= <i>et cetera</i> (and others).
ex.	= example.
FAO	= Food and Agriculture Organization.
FC	= free consciousness.
FCo	= fiscal computer
fig.	= figure or figures.
Fr.	= French language.
geo.	= geographic index.
Ger.	= German language.
glos.	= glossary.
Gr.	= Greek language.
graph.	= graphic.
graphs	= graphics.
hb.	= hardback edition.
Hi-fi	= high-fidelity; sound recording or playing equipment.
HR	= human resources (personnel department in a company).
HRP	= Human Remains Pouch
ICPRO	= International Congress of Projectiology.
ICU	= Intensive Care Unit (of hospitals).
IE	= immanent energy.
IEs	= immanent energies.
IIPC	= International Institute of Projectiology and Conscientiology.
illus.	= illustrated with photos and/or drawings; illustration; illustrations.

INAMPS = Instituto Nacional de Assistência Médica e Previdência Social (Brazilian Social Security Institute).

INAN = Instituto Nacional de Alimentação e Nutrição (Brazilian Food & Nutrition Institute).

indig. = indigenous.

introd. = introduction.

IQ = intelligence quotient.

It. = Italian language.

JLP = joint lucid projection.

JLPs = joint lucid projections.

Jpn. = Japanese language.

Lat. = Latin language.

LP = lucid projection.

LPB = lucid projectability.

LPs = lucid projections.

LPU = Least Publishable Unit of a scientific work due to be published.

LSD = Lysergic Acid Diethylamide.

m = meter or meters.

mg = milligram or milligrams.

MS = multidimensional self-awareness.

N. = number or numbers.

NDE = near-death experience.

NDEs = near-death experiences.

NGOs = *Non-Governmental Organizations*.

NP = nonlucid projection.

NPs = nonlucid projections.

OBE = **Out-of-Body Experience**; extracorporeal experience.

ono. = onomastic index; index of names.

OOBE = **Out-of-the-Body Experience**; extracorporeal experience.

p. = page.

pp. = pages.

pb. = paperback.

PE = personal experience.

PEE = personal extraphysical experience.

PEEs	= personal extraphysical experiences.
PEs	= personal experiences.
PIE	= personal intraphysical experience.
PIEs	= personal intraphysical experiences.
PK	= psychokinesis; parapsychic physical effect phenomena.
PMR	= progressive muscular relaxation.
Port.	= Portuguese language.
postf.	= postface.
pref.	= preface.
pres.	= presentation.
print.	= printing.
prol.	= prologue.
prfr.	= proof-reader.
pseud.	= pseudonym.
quest.	= questionnaire.
refs.	= bibliographic references.
rel.	= religious.
rep.	= reprint.
Rus.	= Russian language.
S.	= São.
Sansk.	= Sanskrit language.
sci-fi	= science fiction.
sen	= sentiment or emotion.
senes	= sentiments and consciential energies (CEs).
SLP	= semilucid projection.
SLPs	= semilucid projections.
Sp.	= Spanish language.
spi.	= spiral binding.
syn.	= synonymy.
tab.	= table.
tabs.	= tables.
tho	= thought or idea.
thosens	= thoughts and sentiments.

- transl.** = translator; translators.
- TV** = television.
- U.S.A.** = United States of America.
- UFO** = *Unidentified Flying Object*.
- UN** = *United Nations*.
- UNESCO** = United Nations Educational Scientific and Cultural Organization.
- UNICEF** = United Nations International Children's Emergency Fund.
- vol.** = volume or volumes; tome or tomes.
- volun.** = volunteering.
- VS** = vibrational state.
- VSs** = vibrational states.
- WHO** = *World Health Organization*.
- WIA** = wounded in action.
- wod.** = without date; without indication of a date.
- wopl.** = without indication of the place of the publisher.
- wopub.** = without publisher; without indication of a publisher.
- wot.** = without indication of the translator.

INDEX OF ILLUSTRATIONS

Observations. The following is a listing of the 43 illustrations in this volume. Nine of the illustrations are included within the text of each respective chapter and the remainder are found together on pages 1121 to 1152.

Fig. 1 (Essential Concepts of Science)	16
Fig. 3 (Essential Concepts in Conscientiology)	35
Fig. 4 (Subdisciplines of Conscientiology)	38
Fig. 12 (Precognitions Regarding Projectiology)	69
Fig. 39 (Consciential Self-Bilocation, p. 123)	1121
Fig. 60 (Traveling Clairvoyance, p. 166)	1122
Fig. 80 (Extraphysical Telekinesis, p. 193)	1123
Fig. 103 (Types of Holosomatic Vehicles, p. 239)	1124
Fig. 111 (Holochakra, p. 257)	1125
Fig. 116 (Human Aura, p. 264)	1126
Fig. 120 (Spheres of Action of the Silver Cord, p. 275)	1127
Fig. 132 (Chakras, p. 299)	1128
Fig. 143 (Relativistic Space-Time)	319
Fig. 155 (Relationships Between Consciential Vehicles and Consciential Phenomena)	341
Fig. 160 (Theory of the Leading-Edge Relative Truths of Conscientiology)	351
Fig. 190 (Dorsal Position, p. 419)	1129
Fig. 203 (Imaginative Escape Technique, p. 437)	1130
Fig. 204 (Projective Visualization Technique, p. 438)	1131

Fig. 209 (Projective Self-Image Technique, p. 446)	1132
Fig. 223 (Assisted Projection Technique, p. 468)	1133
Fig. 225 (Fragmented Lucid Projection Technique, p. 473)	1134
Fig. 244 (Vibrational State, p. 497)	1135
Fig. 252 (Takeoff, p. 514)	1136
Fig. 255 (Trace of Light, p. 519)	1137
Fig. 270 (Tropospheric Extraphysical Dimension, p. 545)	1138
Fig. 287 (Mobilization of Consciential Energies, p. 584)	1139
Fig. 288 (Closed Circulation of Energies Technique, p. 587)	1139
Fig. 290 (Absorption of Extraphysical Energies Technique, p. 590)	1140
Fig. 291 (Exteriorization of Consciential Energies, p. 591)	1140
Fig. 293 (Penta Technique, p. 594)	1141
Fig. 303 (Extraphysical Self-Luminosity, p. 615)	1142
Fig. 304 (Extraphysical Self-Permeability, p. 617)	1143
Fig. 305 (Extraphysical Elasticity, p. 619)	1144
Fig. 323 (Extraphysical Self-Transfiguration, p. 640)	1145
Fig. 347 (Extraphysical Hetero-Awakening Technique, p. 677)	1146
Fig. 357 (Energization by Three Technique, p. 696)	1147
Fig. 367 (Assistential Consciential Projection, p. 723)	1148
Fig. 420 (Exoprojection, p. 808)	1149
Fig. 424 (Double Consciential Projection, p. 814)	1150
Fig. 436 (Joint Lucid Projections, p. 830)	1151

Fig. 482 (Lucid Projection and Successive Intrapysical Lives)	916

CONSCIENTIOCENTRIC INSTITUTIONS – CIs
--

CIs. Conscientiocentric Institutions - CIs - are organizations whose purposes, methodologies of work and organizational models are based on the *Consciential Paradigm*. The main activity of CIs is to support the evolution of consciousnesses through the *clarification task* as guided by the *leading edge relative truths* found in the science of conscientiology and its subfields.

Volunteer. Every Conscientiocentric Institution is an independent association, private and non-profit in character, and is maintained predominantly by the volunteer work of teachers, researchers, administrators and professionals from various areas.

CCCI. The set of Conscientiocentric Institutions and Conscientiology volunteers on the planet composes the *International Cosmoethical Conscientiological Community* (from Portuguese: *Comunidade Conscienciológica Cosmoética Internacional – CCCI*) which currently consists of 22 CIs.

AIEC – INTERNATIONAL ASSOCIATION FOR THE EXPANSION OF CONSCIENTIOLOGY

(Associação Internacional para Expansão da Conscienciológica)

Foundation: 22/04/2005
