PROJECTIOLOGY

A Panorama of Experiences of the
Consciousness outside the Human Body

Translators:
Kevin de La Tour
Simone de La Tour

Foz do Iguaçu, PR – Brazil

2016

Printing History	English	1 st Edition: 2002	4,500 copies
		Special Edition: 2002	500 copies
	Portuguese	1 st Edition: 1986	5,000 copies
		2 nd Edition: 1990	500 copies
		3 rd Edition: 1992	5,000 copies
		4 th Edition: 1999	4,500 copies
		Special Edition: 1999	500 copies
	5 th Edition: 2002	1,500 copies	
Total		22,000 copies	

2nd Edition: 2016

Revised by:

Cristina Arakaki, Derrick Guy Phillips, Katia Arakaki,
Leonardo Firmato and Luis Minero.

Bibliography:

Cristiane Ferraro.

Electronic editing and typographic revision:

Ernani Brito and Gisele Salles.

Photos and illustrations:

Brasílio Wille, Fernando Alberto Santos and Francisco Mauro.

Card Catalog Information

V658p Vieira, Waldo, 1932-2015

Projectiology: a panorama of experiences of the consciousness outside the human body. / Waldo Vieira ; Translators: Kevin de La Tour, Simone de La Tour. – Foz do Iguacu : Editares, 2016.

xvi, 1,210 p. ; il.

Includes bibliography.

ISBN 978-85-8477-057-1

1. Conscientiology. 2. Projectiology. 3. Out-of-body experiences. I. Title.

TABLE OF CONTENTS

Introduction	01
I – SCIENTIFIC FOUNDATIONS OF CONSCIENIOLOGY	11
01. Essential Concepts of Science	11
02. New Consciential Paradigm	22
03. Essential Concepts in Conscientiology	33
04. Subdisciplines of Conscientiology	37
05. Essential Concepts in Projectiology	44
06. Projectiology and Terminology	46
07. Sciences	52
08. History of Projectiology	57
09. Periods of Projectiology	58
10. Ancient Period of Projectiology	58
11. Esoteric Period of Projectiology	59
12. Precognitions regarding Projectiology	62
13. Exoteric Period of Projectiology	73
14. Laboratorial Period of Projectiology	74
15. Pioneerism in Projectiology	75
16. Chronology of Projectiology	79
II – RELATIONSHIPS BETWEEN PROJECTIOLOGY AND OTHER SCIENCES	83
17. Projectiology and Interdisciplinarity	83
18. Projectiology and Other Sciences	85
19. Projectiology and Parapsychology	88
20. Projectiology and Psychology	91
21. Projectiology and Biology	93
22. Projectiology and Medicine	94
23. Projectiology and Anthropology	96
24. Projectiology and Sociology	97
25. Projectiology and Physics	98
26. Projectiology and Astronomy	99
27. Projectiology and History	100
28. Division of Projectiology	103
29. Lucid Projection and the Human Consciousness	104
30. Human Lucid Projection	107
31. Lucid Paraprojection	111
32. Animal Projection	111
33. Plant Projection	113
34. Laws of Projectiology	113
35. Paradoxes of Projectiology	115
36. Projective Limitations	117

III – PHENOMENA OF PROJECTIOLOGY	121
37. Classification of Projective Phenomena	121
38. Subjective Projective Phenomena	122
39. Conscial Self-Bilocation	123
40. Projective Autoscopy	126
41. Internal Autoscopy	127
42. External Autoscopy	128
43. Comparisons between External Autoscopy and Lucid Projection	129
44. Projective Catalepsy	130
45. Extraphysical Clairvoyance	133
46. Cosmoconsciousness	133
47. Projective Déjà Vu	140
48. Near-Death Experience (NDE)	141
49. Pre-Final Projection	146
50. Resuscitative Projection	147
51. Extraphysical Intuition	149
52. Extraphysical Precognition	151
53. Extraphysical Psychometry	152
54. Extraphysical Retrocognition	153
55. Projective Panoramic Vision	154
56. Ambifaceted Projective Phenomena	156
57. Self-Psychophony	157
58. Physical Bilocation	158
59. Comparisons between Lucid Projection and Physical Bilocation	165
60. Traveling Clairvoyance	166
61. Lucid Projection and Traveling Clairvoyance	168
62. Comparisons between Traveling Clairvoyance and Lucid Projection	169
63. Projective Ectoplasmy	170
64. Semimaterialization	173
65. State of Suspended Animation	174
66. Exteriorization of Motricity	181
67. Exteriorization of Sensitivity	182
68. False Arrival	182
69. Projective Heteroscopy	184
70. Physical Multilocation	184
71. Projective Parapyrogenesis	185
72. Projective Pneumatophony	185
73. Projective Poltergeist	185
74. Farewell Conscial Projection	187
75. Projective Psychophony	189
76. Human Projective Psychophony	190
77. Extraphysical Projective Psychophony	190
78. Projective Psychography	191
79. Projective Raps	192
80. Extraphysical Telekinesis	193
81. Extraphysical Telepathy	194
82. Human Parateleportation	195
83. Phenomena Concomitant with Lucid Projection	198
84. Preliminary Phenomena	199

IV – ALTERED STATES OF CONSCIOUSNESS	202
85. Xenophrenia	202
86. Classification of Xenophrenic States	204
87. Mechanisms of Lucid Projection	205
88. Lucid Projection and Daydreams	206
89. Comparisons between Daydreams and Lucid Projections	208
90. Lucid Projection and Sleep	209
91. Evolutionary Vacuum Theory	212
92. Lucid Projection and Somnambulism	215
93. Lucid Projection and Dreams	217
94. Oneiric Images	219
95. Comparisons between Dreams and Lucid Projections	221
96. Ordinary Dreams about Lucid Projection	224
97. Semilucid Projection	225
98. Lucid Projection and Nightmares	230
99. Comparisons between Nightmares and Extraphysical Intrusion	232
100. Lucid Projection and Hallucination	233
101. Comparisons between Hallucination and Lucid Projection	235
V – VEHICLES OF MANIFESTATION OF THE CONSCIOUSNESS	237
102. Ego	237
103. Types of Holosomatic Vehicles	239
104. Pre-Resoma	243
105. Resoma	244
106. Lucid Projection and the Human Body	245
107. Pineal	251
108. Extraphysical Examination	254
109. Holosomatic Coincidence	255
110. Discoincidence of the Vehicles of Manifestation	256
111. Holochakra	257
112. Para-Anatomy of the Holochakra	258
113. Paraphysiology of the Holochakra	259
114. Looseness of the Holochakra	261
115. Parapathology of the Holochakra	263
116. Human Aura	264
117. Silver Cord	267
118. Para-Anatomy of the Silver Cord	268
119. Paraphysiology of the Silver Cord	271
120. Spheres of Action of the Silver Cord	275
121. Reduction of the Silver Cord	276
122. Parapathology of the Silver Cord	277
123. Ectoplasm and the Silver Cord	278
124. Comparisons between Ectoplasm and the Silver Cord	279
125. Psychosoma	282
126. Para-Anatomy of the Psychosoma	284
127. Parapsychophysiology of the Psychosoma	285
128. Parapsychopathology of the Psychosoma	289
129. Comparisons between the Soma and the Psychosoma	292

130. Theory of Irruption of the Psychosoma	295
131. The Soma and Consciential Prioritization	296
132. Chakras	299
133. Para-Anatomy of the Chakras	300
134. Paraphysiology of the Chakras	303
135. Parapathology of the Holochakra and Vampirism	305
136. Theory of Interchakral Relationships	307
137. Lucid Projection and the Golden Cord	309
138. Para-Anatomy of the Golden Cord	310
139. Paraphysiology of the Golden Cord	311
140. Comparisons between the Silver Cord and the Golden Cord	311
141. Lucid Projection and the Mentalsoma	312
142. Parapsychophysiology of the Mentalsoma	315
143. Relativistic Space-Time	318
144. Parapsychopathology of the Mentalsoma	320
145. Predominance of a Consciential Vehicle	324
146. Desoma	326
147. First Desoma	327
148. Second Desoma	331
149. Third Desoma	332
150. The Three Desomas	332
151. Comparisons between Occasional and Final Projection	334
152. Comparisons between the Psychosoma of the Intraphysical and Extraphysical Consciousness	335
153. Comparisons between the Psychosoma and the Mentalsoma	337
154. Comparisons between the Mentalsoma of the Intraphysical and Extraphysical Consciousness	339
155. Relationships between Consciential Vehicles and Consciential Phenomena	341
156. Relationships between Chakras and Consciential Phenomena	343
VI – PHILOSOPHICAL PERSPECTIVES	344
157. Projectiology and Philosophy	344
158. Theory of Projectability	346
159. Theory of the Leading-Edge Relative Truths of Projectiology	348
160. Theory of the Leading-Edge Relative Truths of Extraphysical Conscientiology	350
161. Cosmoethics	352
162. Extraphysical Code of Ethics	355
163. Lucid Projection and Materialism	357
164. Universalism	360
165. Evidence of Consciential Maturity on Earth	364
166. Holomaturity	366
167. Technique for Acquiring a Universalistic Sense	374
168. Theory of Consciential Self-Control	378
169. Theory of Essential Wisdom	380
170. Consciential Era	382
171. Holokarmic Accounts	384
172. Theorie of Human Assistential Tasks	386
173. Self-Critique of the Projector	390
174. Lucid Projection and Abdominal Brainwashing	393

VII – PRE-PROJECTION PHYSICAL WAKING STATE	398
175. Chronological Analysis of Lucid Projection	398
176. Stages of Lucid Projection	398
177. Doorways to Lucid Projection	399
178. Date of the Projective Experiment	400
179. Meteorological Conditions prior to Lucid Projection	400
180. Physical Base of the Projector	401
181. <i>Projectarium</i>	407
182. Ambient Light	408
183. Ambient Temperature	408
184. Ambient Noise	410
185. Intraphysical Assistant	413
186. Physiological States prior to Lucid Projection	414
187. Conscial States prior to Lucid Projection	415
188. Ordinary Physical Waking State	416
189. Physical Position prior to Lucid Projection	417
190. Dorsal Position	418
191. Conditions of the Human Body prior to Lucid Projection	420
192. Objects of the Projector	420
193. Clothes of the Projector	421
194. Causes of Lucid Projection	422
195. Lucid Projection and Distance	423
196. Starting Time of the Projective Experiment	423
VIII – LUCID PROJECTION TECHNIQUES	425
197. Preparation for Lucid Projection	425
198. Generalities on Projective Techniques	426
199. Projective Psychophysiological Crutches	429
200. Psychophysiological Self-Relaxation Technique	432
201. Mental Concentration Technique	434
202. Rhythmic Respiration Technique	435
203. Imaginative Escapes Technique	437
204. Projective Visualization Technique	438
205. Projective Postures Technique	440
206. Classification of Lucid Projection Techniques	441
207. Opening Door Technique	444
208. Projective Sex Act Technique	444
209. Projective Self-Image Technique	446
210. Self-Visualization with Open Eyes Technique	447
211. Step Counting Technique	448
212. Carbon Dioxide Technique	448
213. Projective Factor Technique	452
214. Projective Hetero-Hypnosis Technique	453
215. Projective Self-Hypnosis Technique	456
216. Projectiogenic Images Technique	457
217. Lucid Projection through Fasting Technique	458
218. Projective Mantras Technique	461
219. Projective Massage and Visualization Technique	463
220. Projective Music and Visualization Technique	464
221. Triggering Object-Factor Technique	465

222. Musical Physical Awakening Technique	466
223. Assisted Projection Technique	468
224. Lucid Projection through Dream Technique	470
225. Fragmented Lucid Projection Technique	473
226. Projection in the Isolated Mentalsoma Technique	475
227. Pineal Projection Technique	477
228. Change in Routine Technique	478
229. Projective Repetition Technique	479
230. Rotation of the Psychosoma Technique	479
231. Rotation of the Human Body Technique	481
232. Projective Mental Saturation Technique	483
233. Projection through Thirst Technique	484
234. Transference of the Consciousness Technique	485
235. Projective Transmissibility Technique	486
236. Projective Diagnosis Technique	486
237. Projectiotherapy	488
238. Psychological Conditioning Techniques	490

IX – EXTERIORIZATION OF THE CONSCIOUSNESS STAGE 492

239. Signals Precursory to Lucid Projection	492
240. Projective Aura	492
241. Physical Torpidity	494
242. <i>Ballonnement</i>	495
243. Pre-Takeoff	496
244. Vibrational State	497
245. Hypnagogy	500
246. Transitional State	506
247. Double Awareness	507
248. Extraphysical Double Vision	508
249. Extraphysical Bradykinesis	509
250. Parapsycholepsy	510
251. Intracranial Sounds of Takeoff	512
252. Takeoff	514
253. Sinking Takeoff	517
254. Instability of the Psychosoma	518
255. Trace of Light	519
256. Respiration during Takeoff	521
257. Conscial Hibernation	522
258. Extraphysical Opening	523
259. Extraphysical Elongation	525
260. Extraphysical Awakening	526
261. Extraphysical Self-Awakening Technique	527

X – EXTRAPHYSICAL PERIOD OF THE CONSCIOUSNESS 529

262. Extraphysical Self-Awareness	529
263. Scale of Lucidity of the Projected Consciousness	532
264. Conscial Lucidity and Perceived Time	534
265. Illumination of the Extraphysical Environment	536
266. Vehicle of Manifestation Identification Technique	537
267. Expansion of the Projected Consciousness Technique	538

268. Orientation of the Projected Consciousness	539
269. Extraphysical Environments	541
270. Tropospheric Extraphysical Dimension	545
271. Extraphysical Communities	548
272. Extraphysical Dimension Per Se	550
273. Mentalsomatic Dimension	552
274. Extraphysical Sphere of Energy	553
275. Human Brain	556
276. Parabrain	560
277. General Extraphysical Perceptions	562
278. Extraphysical Vision	565
279. Extraphysical Attention	567
280. Scale of Observation of the Projected Consciousness	568
281. Performance of the Projected Consciousness	571
282. Inabilities of the Projected Consciousness	573
283. Extraphysical Impossibilities	574
284. Immanent Energy	575
285. Consciential Powers	577
286. Consciential Energy	580
287. Mobilization of Consciential Energies	584
288. Closed Circulation of Energies Technique	587
289. Reception of Consciential Energies Technique	589
290. Absorption of Extraphysical Energies Technique	590
291. Exteriorization of Consciential Energies	591
292. Exteriorization of Consciential Energies Technique	593
293. Penta Technique	594
294. Theory of Energetic Sympathetic Assimilation	600
295. Abuses in the Use of Consciential Energies	602
296. Theorice of Morphothosenes	604
297. Comparison between Lucid Projection and Morphothosenes	608
298. Morphothosene Creation Technique	608
299. Sexual Factors Favorable to Lucid Projection	610
300. Sexual Factors Unfavorable to Lucid Projection	611
301. Extraphysical Romances	612
302. <i>Congressus Subtilis</i>	613
303. Extraphysical Self-Luminosity	615
304. Extraphysical Self-Permeability	617
305. Extraphysical Elasticity	619
306. Extraphysical Imponderability	620
307. Extraphysical Inaudibility	621
308. Extraphysical Invisibility	621
309. Extraphysical Invulnerability	622
310. Extraphysical Multiplicity	624
311. Extraphysical Translocation	625
312. Mechanisms of Extraphysical Translocation	627
313. Speed of the Projected Projector	628
314. Lucid Volitation Technique	628
315. Extraphysical Energy Currents	631
316. Extraphysical Rain	633
317. Extraphysical Fire	634

318. General Extraphysical Emotions	635
319. Extraphysical Euphoria	636
320. Extraphysical Forms of the Projected Projector	638
321. Extraphysical Clothing	638
322. Uniform of the Projected Projector	640
323. Extraphysical Self-Transfiguration	640
324. Zoanthropy	643
325. Extraphysical Mutation	645
326. Extraphysical Mimicry Technique	645

XI – RELATIONSHIPS OF THE PROJECTED CONSCIOUSNESS 647

327. Consciential Communicability	647
328. Interconsciential Experiences	648
329. Conscientese	649
330. Extraphysical Communicability Technique	652
331. Extraphysical Acquisition of Original Ideas	652
332. Historical Original Ideas	654
333. Current Original Ideas	656
334. Avoidable Extraphysical Ideas	659
335. Projective Mental Targets	660
336. Techniques for Reaching the Mental Target	662
337. Prohibited Locations	663
338. Extraphysical Telekinesis Production Technique	666
339. Scale of Extraphysical Contacts	667
340. The Projected Intrapysical Consciousness and the Human Body	668
341. Consciential Self-Bilocation Technique	669
342. The Projected Consciousness and Intrapysical Beings	670
343. The Projected Consciousness and Extraphysical Beings	672
344. The Projected Consciousness and Other Projected Beings	674
345. Extraphysical Disappearances	675
346. Extraphysical Approach Technique	676
347. Extraphysical Hetero-Awakening Technique	677
348. Unapproachable Beings	680
349. Extraphysical-Physical Self-Touch Technique	681
350. Auric Couplings	682
351. Extraphysical Helpers	687
352. Lucid Projection and Evocation	691
353. Conscious Evocation Technique	693
354. Unconscious Evocations	694
355. Extraphysical Manifestations of the Sensitive-Projector	695
356. Physical Manifestations of the Communicant-Projector	695
357. Energization by Three Technique	696
358. <i>Inter Vivos</i> Communication Technique	699
359. <i>Inter Vivos</i> Apparition	700
360. Reactions of Intrapysical Consciousnesses to the Apparition of the Projector	701
361. Extraphysical Attacks upon the Projector	702
362. Self-Defense Techniques of the Projector	704
363. Extraphysical Intruders	707
364. Possessive Consciential Projection	715

365. Deintrusive Consciential Projection	717
366. Deintrusive Projection Technique	720
367. Assistential Consciential Projection	723
368. The Projector and Desomants	727
369. Prolonged Consciential Projection Technique	730
370. Extraphysical Agenda	731

XII – INTERIORIZATION OF THE CONSCIOUSNESS STAGE 733

371. Return to the Physical Base	733
372. Interiorization of the Projected Intraphysical Consciousness	734
373. Semidiscoincidence of the Vehicles of Manifestation	737
374. Post-Interiorization	737
375. Psychophysical Repercussions	738
376. Extraphysical Repercussions during Consciential Projection	739
377. Physical Repercussions during Consciential Projection	740
378. Self-Telekinesis	742
379. Intracranial Sounds during Interiorization	743
380. Hypnopompy	744
381. Physical Awakening	745
382. Physical Awakening Technique	746
383. Post-Projective Energetic Shower	746
384. State of Waking Discoincidence	747

XIII – POST-PROJECTION PHYSICAL WAKING STATE 750

385. The Physical Mind	750
386. Consciential Projection Recall	753
387. Fragmentary Recall	756
388. <i>En Bloc</i> Recall	757
389. Factors Favorable to Consciential Projection Recall	757
390. Factors Unfavorable to Consciential Projection Recall	758
391. Extraphysical Event Recall Techniques	759
392. Fragmentary Recall Technique	760
393. Quadruple Memory	761
394. Finishing Time of the Projective Experiment	763
395. Meteorological Conditions after the Lucid Projection	764
396. Duration of the Lucid Projection	764
397. <i>Conscientiological</i> State after the Lucid Projection	765
398. <i>Physiological</i> State after the Lucid Projection	766
399. Period of Loss of Physical Wakefulness	766
400. Physical Position after the Lucid Projection	767
401. Conditions of the Human Body after the Lucid Projection	767
402. Projectiography	768
403. Final Register of the Lucid Projection	769
404. Diary of the Projector	770
405. Technical Notes of the Diary of the Projector	772
406. Confirmations after Lucid Consciential Projections	773
407. Factors Unfavorable to Post-Projective Confirmations	774
408. Analysis of the Paraperceptions of the Projector	776

XIV – THE PROJECTOR AND PROJECTIONS	778
409. Types of Projectors	778
410. Dazzled Projectors	780
411. Techniques for Development of the Projector	782
412. Projective Recess	785
413. Projective Questionnaire	788
414. The Ideal Projector	795
415. Animism	798
416. Parapsychism	799
417. Comparisons between the Sensitive and the Projector	803
418. Comparisons between Lucid Projection and Parapsychic Trance	804
419. Parapsychism and Lucid Projection	805
420. General Classification of Consciential Projections	807
421. Basic Categories of Lucid Projection	809
422. Extraphysical Lucidity-Subsequent Recall Binomial	810
423. First Lucid Projection	812
424. Double Consciential Projection	814
425. Educational Consciential Projection	816
426. Theory of Intermittive Courses	817
427. Natural Consciential Projection	821
428. Forced Lucid Consciential Projection	822
429. Comparison between Natural and Forced Consciential Projection	823
430. Escape-Projection	823
431. Instantaneous Consciential Projection	824
432. Consciential Projection of the Compound Double	825
433. Post-Natal, Regressive, Semilucid Consciential Projection	827
434. Sonorous Consciential Projection	828
435. Extraphysical Visual Projection	830
436. Joint Lucid Projections	830

INTRODUCTION

Information. This is a strictly technical work, the scope of which is to research a serious and specialized subject, as proposed and defined in the title and subtitle. Its objective is to share information with the scientific community and those interested in the topic.

Advice. The author, being practical in this technocentric era, recommends at the beginning of this book that those whose intention in consulting these pages is to pursue an objective other than the dispassionate and detailed study of its proposal – whether seeking a pastime, leisure, frivolity or *pleasure* – are best advised to abandon their efforts after this introductory topic. It will therefore not be worthwhile for them. It is better to stop reading, close the book, return it to the shelf and forget it, in order not to be disappointed, or waste time and consciential energy.

Experimentation. In spite of the *relatively small amount of structured knowledge* available on the projection of the consciousness from the human body, this book gathers the information that seems to be important for an understanding of the subject and individual, laboratory or group experimentation on the themes according to their complexity and ramifications, giving an overview as complete as circumstances allow.

Panorama. This work is an attempt to reveal an ample, integrative *comprehensive charting* of the proposed theme, or a panorama of contemporary projectiology and the secondary issues related to the main subject, which encompass an extensive field of investigation, as well as presenting hundreds of practical and useful procedures in the different stages of research and consciential projective exercises.

Sources. The massive amount of disparate, discordant and concordant data gathered here was obtained from 8 sources:

1. **Projections.** All types of spontaneous and provoked consciential projections experienced by the author since 1941 (at nine years of age) up until March 1985, totaling over 1,100 self-analyzed lucid projections.

Subsidies. This analysis was made as a theoretical and practical (theoretical) researcher who is entirely independent, unencumbered and free, and has never been favored by official subsidies of any kind, whether municipal, state, national (federal) or international.

Accountability. Therefore, the author neither needs nor feels obligated to account for this work to any individuals or legal entities. This does not imply isolation in the research or a lack of technical updating (*small science*). It does, however, imply freedom of personal expression which, according to his retrocognitions, has never occurred in his holobiography.

2. **Discussions.** The gathering of ideas and experiences in analyses and round-table discussions at fortnightly meetings with the specialized non-professional team of lucid projectors from the Center for Continuous Consciousness (disbanded) in the city of Rio de Janeiro, Brazil and monthly meetings with the general public in the cities of São Paulo, Brazil and Ribeirão Preto, Brazil, as well as other locations.

3. **Correspondence.** Personal correspondence, letters, dissertations, e-mails and reports received with essays, descriptions and responses to detailed questionnaires on lucid projection sent in by hundreds of lucid consciential projectors of all levels from around the world. All this material is currently kept on file at the International Institute of Projectiology and Conscientiology (IIPC).

4. **Intraphysical consciousnesses.** Personal interviews with both visited and visiting intraphysical lucid consciential projectors residing close to and distant from the work performed in Rio de Janeiro, Brazil.

5. **Extraphysical consciousnesses.** Direct extraphysical contact with ex-human-lucid-consciential-projectors, authors and readers of the subject – all currently members of extraphysical societies in the intermissive period – through direct evocation and, more intensively, indirect, *spontaneous evocation* achieved through *rapport* established from researching their works, reading new or, more frequently, used books that were written or merely read or thumbed through by them in their most recent human existences (lifetimes).

6. **Meetings.** Repeated personal meetings and parapsychic field research conducted in Brazil and abroad, especially in the United States of America and Europe, with directors, editors, researchers and members of institutions, laboratories, studios, bookstores, as well as private and public university and institutional libraries.

7. **Consultation.** Consultation of technical works, erudite works (papers), encyclopedias, dictionaries, anthologies, treatises, manuals, biographies, magazines (journals), dailies (newspapers), periodicals, bulletins, reports, expositions, dissertations, proceedings and documents in general. The respective authors of these works are from various countries, according to the collection listed in the International Bibliography of Projectiology at the end of this book.

8. **Additions.** Enhancements, revisions and additions made to the first edition of this book account for over 40% of its current volume.

CHSC. Approximately 92% of the titles of the international bibliography currently (2002) make up part of the collection of *artifacts of knowledge* in the holotheca at the Center for Higher Studies of the Consciousness (CHSC) in Iguassu Falls, Brazil. It now also includes 52,000 volumes or items on these specialized subjects which are available for bibliographic consultation and research by those interested in Brazil and abroad.

Objectives. This book is organized with 6 clear objectives in mind:

1. **Guide.** It serves as an introductory guide for the reader who is not familiar with the subject.

2. **Systematization.** It helps in systematically organizing technical findings in the experimental field, as well as providing guidance for those who are interested in producing lucid consciential projection for the first time without any greater preconceptions and neophobia.

3. **Responses.** It provides answers to questions, as far as currently possible, from those who have already experienced the state of the consciousness projected with lucidity and wish to develop in this area with correlated knowledge and efficient applications.

4. **Research.** It proposes new and as yet unanswered questions for subsequent study and theoretical and experimental research (*techniques*). This can contribute to a desirable union among specialists who are thus far working independently and in isolation, performing their research unaware of the efforts of other researchers.

5. **Data.** It provides assistance and offers data and suggestions to studious individuals, teachers and academics of parapsychology universities, transpersonal psychology centers, institutions dedicated to lucid dream research, notably the centers of scientific investigation of the consciousness (conscientiology) and the current 22 offices of the IIPC, in spite of the inevitable inconvenience of this survey's intentionally excessive bulkiness. For example: this massive book does not lend itself to be read in bed.

6. **Bibliopoles.** It cooperates – through bibliographic information – with bibliophiles, librarians, publishers, book salespersons, printers, encyclopedists, cybernauts and I.T. adepts, and even international book merchants of all types and origins (*bibliopoles*).

Amplification. Regarding this point, the reader is advised to consult the more current (1994) and expanded international bibliography of the book entitled “700 Conscientiology Experiments,” composed of 5,116 titles, of editions originally published in 20 languages, from 37 different countries, where the books listed in this volume are also included.

Phenomenology. In this book, the author accepts the *hypothesis of the objective body* as being valid. Through the entire overview of projectiology, he endeavors to demonstrate that it is the most adequate hypothesis for explaining a greater series of consciential phenomena (phenomenology)

which are currently considered to be parapsychic. This is, perhaps, the crucial point (*crux*) of this volume.

Hypothesis. Developing this research hypothesis, the coadjutant and confluent facts are presented that engender a convergence of evidence based not only upon observations and personal experiences, but also on the work of lucid projectors, researchers, projector-researchers and international authors in the West, with their research of the *external world* of the human being, the macrocosm, as well as those in the East, with their research into the *inner world*, the microcosm or micro-universe of the consciousness.

Model. As a corollary, it was possible to point out the immediate practical ramifications of such evidence as well as the consequent current short-term and future long-term effects produced by and upon the intraphysical consciousness. Finally, a factual theoretical model of the consciousness is presented.

Reader. Out of respect for the reader – who demands quality and equanimity, who should not be underestimated and is always alert to any *conscientiological slip* indicating a lack of balance, discernment, precision or sensibility – an endeavor was made to perform impartial, non-factional research or that which is far from being automatic.

Avoidances. The author avoided taking undue liberties with any religion, group, corporation, individual, language or *line of preconceptions*, endeavoring to encompass the entire range of this research without concealing facts and even confronting the more delicate issues while maintaining an independent position. For this, a broad exposition of the basic theme was made and different opinions, whether in agreement or otherwise, have been pointed out.

Conditions. The author also endeavored to act as efficiently as possible and to report faithfully, even selecting the sources cited. He was concerned at all times with the best way to examine relative truth and how to describe it clearly, separating the role of researcher from that of participant in a specific event or experiment.

Treatment. So-called *opinionated journalism* was avoided by seeking out as scientific a treatment of the theme as possible or, in other words, an approach devoid of preconceptions, with an open mind and without ingenuousness but, instead, employing all possible consciential acuity.

Coherence. The following are two coherent illustrations of the effort made to maintain an honest, impartial and fair standpoint:

1. **Distinction.** The clear distinction established between information, opinion and personal experience, according to the specific subject.

2. **Universalism.** The furnishing of the detailed International Bibliography of Projectiology that is thoroughly democratic and universalistic, enabling the reader to research the subject by him/herself and form his/her own opinion, irrespective of that of the author.

Improvement. This “do-it-yourself” book also suggests ideas, concepts and possibilities at the end of each topic regarding many fields of thought, allowing the reader to judge, develop, improve, and adapt them to his/her personal research problems and hypotheses.

Opinion. In this way, the reader is offered the possibility of arriving at his/her own opinion about the theme presented in each chapter.

Volume. Besides the dozens of suggested research hypotheses throughout the text, there are chapters which, by themselves, can be technically explored, developed and enlarged upon, resulting in an entire book with a specialized bibliography already available, as well as various other technical components on the subject in question, serving as a point of departure for further research.

Student. The main intention here is that the novice student of lucid projection (existential inverter, existential recycler) should have his/her thoughts clarified and personal life enriched by the information in this book.

Transmitter. As observed in the first topics of this introduction, the author – as a transmitter of information – has no intention of emotionally imposing upon, convincing or converting anyone. With the exception of concepts and research hypotheses, he has nothing to sell.

Rationality. On the other hand, while constantly endeavoring to vehemently defend rational scientific analysis, the author does not harbor the illusion that this text is always antiseptic or, in other words: politically, morally or socially neutral.

Pre-serenissimus. The author is human, a pre-serenissimus and is not a *Homo sapiens serenissimus*. He has sought in this text to eliminate the influence of subconscious elaborations from personal preconceptions (apriorisms), or dogmatically affirm anything (peremptoriness).

Intention. If this has occurred in any passage, as a result of imprecise terminology, it was clearly not the author's intention, as he was constantly striving to provide a *unified perspective*.

Values. An effort has been made to eliminate *non-scientific data* from scientific activity as far as possible.

Discussion. It is clear that projectiology constitutes an open theme for constructive discussion.

Proposal. The proposal of this book was elaborated over a period of 19 years (1966-1985) of specialized studies during which the author concentrated his efforts on rationalizing the phenomena of projectiology as far as possible. He has gathered as many definitions, equivalent expressions, hypotheses, theories, paradigms and existing classifications as possible through experiences, both personal and those of others, as well as through general reports and published works.

Ideas. The author once again suggests the plausibility of this compilation of ideas, reaffirming their basic premises now after more than 33 years (1966-1999) of full-time investigation, recognizing that they can be discussed and always fully admitting anyone's right not to accept them.

Complexity. Each intraphysical consciousness is extremely complex, having multiform individual experiences and unique evolutionary opportunities.

Balance. A highly concerted effort has been made to achieve a fair balance of *universal thought*, of consensus in relation to the themes through the study, comparison (confrontation of thosenes) and contrast of ideas.

Continuity. The gathering of knowledge is a continuous process.

Questions. New information begets new questions.

Discoveries. Today, in this era of acceleration of human history, new discoveries follow hard on the heels of others at such an unprecedented rate and with such a torrential volume, intensity and accumulation that it is beyond our ability to keep up with them.

Specialization. The *ocean of scientific information* that each specialist must have a command of is so vast that, besides the learning period being insufficient, an entire intraphysical life (lifetime) can be too short. One resource used here is the cosmogram.

Ignorance. This is why the more one knows, the higher one's level of ignorance, as questions arise faster than the amount of information processed and accumulated. With regard to this point, the number of questions will always be greater than the number of answers.

Truth. At his present level of *literate ignorance*, the author does not intend to give the final word, make definitive statements, or offer *final truth*, *absolute truth*, *total truth* and, much less, the truth about *everything*.

Search. The author merely submits himself to the purposes of science, which is not the act of *discovering* the truth but simply the obligation of *searching* for the truth, even though it be partial and temporary, and then disseminating it in the form of hypotheses in order to be analyzed, discussed and refuted.

Multidisciplinarity. Whenever possible, the problems of projectiology were examined from different standpoints, in a multidisciplinary (interdisciplinary, transdisciplinary) or universalistic manner. Aspects of lesser importance relative to the subject were also included, although a scientific approach was maintained through the strict observance of careful examination and ongoing research, in line with the language used on the eve of the twenty-first century.

Areas. The variety of fields that lucid projection touches on is astonishing.

Facts. An effort was made here to emphasize facts, observations and precise research, always intentionally isolating philosophical, theological or religious theories or placing them in a secondary position.

Database. After assembling an exhaustive, generalist and polyglot *database* on projectiology, an effort was made to interpret the data, rearrange and organize all the material into various categories – highlighting interrelationships, configurations, patterns and convergences of different perspectives – so as to clarify some of their implications which, if treated otherwise, would remain obscure.

Scope. The in-depth study of consciential projections in this book was undertaken with the aim of having as broad a scope as possible in order to clarify and help to structure data which would otherwise appear unrelated.

Self-Sufficiency. The purpose of gathering all the information in a single volume, including the International Bibliography of Projectiology, was to present the context of projectiology in a unified, massive, monobloc and self-sufficient text.

Priorities. The chapters were initially classified according to importance of subject such that the breakdown of details would reduce the complexity of the *structural model*.

Approach. The scientific approach here is based on the formal establishment of 14 aspects related to each parapsychic phenomenon in the projectiological field. Each aspect is analyzed by itself, in a separate *chapter-analysis*:

1. **Definition** (or definitions).
2. **Synonymy** (terminology, nomenclature).
3. **Description** (reports, scrupulous observations, case studies).
4. **Causes** (intrapysical somatic, extrapysical holosomatic).
5. **Effects** (consequences, derivations, results).
6. **Mechanisms** (physiology, parapsychology).
7. **Characteristics** (particular specifications).
8. **Types** (categories, types).
9. **Rational classification** (systematization, codification, decoding).
10. **Enumerations** (enumerology lists).
11. **Correlations** (associations of ideas, panoramic vision of holomaturity).
12. **Comparisons** (confrontations, contrasts).
13. **Technical scales** (natural, logical, chronological, alphabetical or others).
14. **Specific bibliography** restricted to the International Bibliography of Projectiology (exhaustive).

Criterion. Using synthetic language eschewing oversimplification or overgeneralization, the expository criterion aims to clarify precisely the greater and lesser angles of the phenomena based on definitive norms defined by multiple technical processes in comparisons of similar characteristics, where possible.

Disparities. Disparities and discrepancies in conflicting themes were also pointed out. There is an inevitable overlapping of some subjects.

Remissive. The more exhaustive Remissive Index of Subjects permits rapid consultation of specific themes.

Text. The long and inquiring text, which is necessary for interfacing of the approaches, was kept uniform in order to facilitate its reading and, at the same time, to prevent subjects of lesser relevance being developed more than those with greater importance.

Sections. The text of this book is divided into 18 sections, or *mini-books*, which are entitled and numbered with *roman numerals*, and grouped into correlated themes.

Chapters. The sections divide the 525 chapters, treatises or booklets that define a specific subject and are entitled and numbered with *arabic numerals*. They are composed of thousands of limited topics, each one headed by a title-synthesis, like the ones on this page, in order to enrich computer databases.

Phases. The sections, chapters and topics develop coherently along the chronologically sequential stages of a hypothetical entire, lucid projection of the human consciousness.

Dictionary. The definitions and synonymies form a compilation of over 3,300 different terms and expressions that, by themselves, comprise a *small dictionary of projectiology* inserted into the text, beyond and independent from the various indexes and the Glossary of Projectiology.

Totals. The following are 3 examples of totals obtained through theoretical and practical, personal, laboratorial, group and bibliographical research:

1. **Relations.** Fifty-five chapter-analyses directly relate projectiology and lucid projection with fundamental topics for the human consciousness.

2. **Energies.** Forty-four chapters address consciential energetic manifestations.

3. **Techniques.** Sixty-six chapters exclusively address projective techniques.

Meaning. The compilation of over 300 working definitions – the first topic of all chapters that allow definitions – has the purpose of concisely expressing the precise meaning of the idea analyzed in the general context.

Didactic. It is common knowledge that there are never two perfect definitions for a single reality or thing. Nevertheless, all definitions which are not very similar in meaning among themselves were added for didactic purposes of consultation.

Standardization. The compilation of the more than 300 listed synonymies – the second item of the chapters with definitions – has the purpose of standardizing, as far as possible, equivalent concepts or *interchangeable terms* found in the extensive projectiological bibliography. They only differ in name and not in essence, and exist within the diverse schools of human thought regarding the material under analysis.

Terminology. These expressions, including technical terminology and ordinary words, many of which are considered unnecessary and undesirable, can have different shades of meaning and interpretation according to one's cultural background. Consequently, the most adequate, or universally more accepted terms were chosen in order to avoid entropy, confusion, misinformation or misunderstanding.

Thesaurus. The *Thesaurus of Projectiology* is already available for private use by the researchers of the International Institute of Projectiology and Conscientiology. It was specifically created in order to standardize the use of the most accurate terminology.

Summary. The synonymies also aim to better clarify the theme at hand and to expand its definition through derivations, meanings and new angles, besides offering a summary of the subject heretofore.

Patterns. The *extensive synonymy*, by itself, shows the initial patterns of the phenomonic occurrence. One of the synonymies alone includes 184 terms.

References. The total of more than 400 lists of projectiological bibliographical references on specific themes that end many chapters, interconnected with the general list inserted at the end of the book, only show the first author and the first page of the subject under analysis.

Citations. These exhaustive bibliographies list precise citations and add up to a total of 5,388 references.

Translations. One of the reasons for indicating the number of chapters in the bibliography is to provide a comparison between the originals and the translations, as well as between different translations.

Selectivity. Each specific bibliography, which is subordinated to the theme under analysis, is selective. In other words, it is exclusively restricted to the works that make up the International Bibliography of Projectiology.

Evidence. The *long projectiological bibliographies* highlight the popularity of certain themes, although serving, by themselves, as significant indicators of the convergence of experimental and observational evidence for dozens of parapsychic phenomena and the achievement of the broadest possible consensus on the subject through the similarity of testimonials supplied by the works listed (association of ideas, panoramic vision, *interconnection*, cosmogram technique).

Specific. The specific bibliographies, listed together with the projectiological bibliographies, at the end of certain chapters, refer exclusively to the theme of that chapter and are not related to other chapters, nor do they refer to the International Bibliography of Projectiology. These specific bibliographies, which raise the cultural level of this book, add up to a total of several dozen works.

Works. One of the specific bibliographical lists alone includes 118 works, or 6.18% of the total number of projectiological works originally cited.

Concentration. The intention here was to gather relevant information from clippings, written reports, books, magazines, journals, index cards, databases, diskettes, CD-ROMs, libraries, archives and other sources of knowledge. They provide a maximum concentration of data, ideas, facts and experiences assembled in a single *portable object*, in the smallest possible format or, in other words, this book. If this goal was not completely achieved and put into practice, at least the intention behind the effort required to generate it is placed on record at this juncture.

Confirmations. Some specific bibliographies include an *italicized* number indicating their position in the international bibliography, showing the best work on that subject according to current consensus, as well as the citations that are most frequently encountered at an international level.

Convergence. The bulk of chapters with a *reduced* projectiological bibliography are the result of the author's firsthand experiences and personal observations. They require ratification by experiences of other consciential projectors in order to reach a *convergence of evidence* through the universality of personal reports.

Flexibility. Various procedures have made the text adaptable to different purposes. The chapters can be viewed out of sequence and many can be entirely omitted without losing the technical panoramic vision. This flexibility with regard to the material was intentional.

Search. All chapters with reduced bibliographies, which may be considered by some readers as being excessively speculative or lacking in value, could have been excluded from this book. In case you are one of these readers, you should simply skip them.

Knowledge. The criterion adopted here is the principle that *circumspect technical speculation* is something that is always necessary in any field of investigation, and also within the scope of pure science. It is better to have such information than to ignore it.

Neophilia. It is far more intelligent to seek out leading-edge relative truth without respite rather than to remain indifferent – with arms crossed or withholding information, hypotheses and suggestions – to open-minded persons (neophiliacs). These chapters demand inquiry, impartial analysis and research, in the quest for rational support for the topics presented.

Pages. The International Bibliography of Projectiology was compiled only of works that *always* refer to the subject of “consciential experience outside the human body,” even if only on one of its pages.

Themes. On the other hand, each book in the specific bibliography of each chapter, while *always* being an integral part of the International Bibliography of Projectiology, evidently *does not always* refer to the chapters or pages referred to in the international bibliography, as the themes can vary.

Dates. Dates of *resoma* and *desoma* (birth and death) of persons mentioned are *almost always* found only in the first citation so as to avoid repetition.

Program. The first outlines of this book were already being used over a decade ago as an “educational program” (curriculum) in the periodic projectiology meetings held in the cities of Rio de Janeiro, and São Paulo, Brazil. Thus, in order to maintain an educational orientation, enumerations of analytical aspects were made in a logical, chronological or alphabetical order whenever possible in order to provide a comprehensive view of each theme.

Topics. The chapters are composed of over 6,500 limited topics, each being headed by a brief title-synopsis.

Location. The division of the text into topics within each chapter, despite making prolonged reading arduous due to the fragmentation of the subjects, greatly facilitates the search for and location of a specific item, which is a highly important consideration in a massive book such as this.

Enumeration. More than 200 larger enumerations have numbered topics.

Redundancies. There are redundant topics and references including texts from other chapters. These have been included intentionally in order to improve the processing of ideas within this bulky volume.

Questionnaires. The author again extends his acknowledgement to those correspondents who have responded in writing to the questionnaires on lucid projection that were recently distributed.

Catalog. The data provided currently constitutes an invaluable catalog and contributes decisively towards the achievement of 4 objectives:

1. **Observation.** Establishment of convergent points of observation.
2. **Methodology.** Improvement of the methodology used in the production of lucid consciousness projection.
3. **Popularization.** Popularization, without superstitions or excesses, of technical projectiological practices or those at rational (theoretical) levels.
4. **Science.** The consequent development of projectiology as a science, a specialized area within the ample world of conscientiology.

Affirmations. The enlightened reader will readily note that this book includes personal affirmations, observations resulting from exhaustive experimentation, transitory conclusions from laboratorial research, as well as prevailing speculative theories. They are gathered from various sources, never assembled before, in search of consistent, working hypotheses albeit still lacking conclusive or assertive proof that comprise reliable paradigms and more enduring theories.

Field. Summing up: this volume is indicative of the shifting sands, or minefield, of pioneering *frontline* research that is still very open to unexpected surprise and alteration.

Recommendation. It is recommended that theoretical researchers of any scientific background who are impatient and impetuously studious individuals produce lucid consciential projection by themselves – avoiding, whenever possible, the use of drugs, which adulterate the intraphysical and extraphysical perceptions of the consciousness – and investigate extraphysical issues firsthand, *in loco, de visu*, as eyewitnesses, or firsthand witnesses of the extraphysical events. They will consequently be able to reach firm conclusions and make statements on their own and without apriorisms, thereby helping everyone.

Participation. Participatory research seems to be indispensable to projectiology. At the moment, there is no ideal process for researching consciousness projection that does not rely on the participation and the consistent use of the *consciential paradigm*.

Independence. It must also be borne in mind that experience confirmed by independent evidence is far more valuable than any amount of illustrations taken from the pages of history, however authenticated that information may be.

Experience. One grain of experience is worth one bushel of theory.

Perfection. The reader will be forced to agree that, strictly speaking, just as there is no perfect human being, neither does the perfect author, writer, reader, nor much less the perfect work (in this case a book), without lapses, exist.

Paradox. This observation is highly pertinent in a book as bulky as this one which, above all, is paradoxically a *synthesis*, constructed by selection and condensation of the elements of the general database of projectiology that have been gathered up until now.

Revision. That is why, in spite of the overwhelming desire to succeed, it is not possible to construct a truly definitive, correct, accurate or perfect work, regardless of the efforts the author makes, as deficiencies, omissions and mistakes inevitably occur.

Reedition. It is imperative to insist upon revision, collection of new data, and the continued improvement of any serious intellectual work. This is the reason for this edition, which has been revised, updated and enlarged to assume an ever more didactic format.

Inventory. From an academic standpoint, it would be ideal to periodically revise and update this *inventory-book* in a process of constant development, where it would be continually updated, not only with regard to textual accuracy, but also notably with respect to the addition of new terms, techniques, experiments and other bibliographical entries.

Update. For this reason, the author intends, when possible, to revise, correct, update, establish new connections between themes and continually improve the text, particularly that involving theoretical studies, experimental techniques and bibliographies.

Quality. This will pursue the objective of eliminating any gaps, and rectifying any factual error, misinterpretation, imprecision and imperfection, in an attempt to arrange this book in the most objective manner possible and concisely in line with its information and didactics.

Ombudsman. It is hoped that an independent, uncommon, unusual, more interested and dispassionate reader of this book will appear – a type of ombudsman, a general auditor, a defender of the reader, a (volunteer) provider of justice, a monitor of the author's thoughts, a public attorney, a representative of the interests of the ordinary citizen, a bridge between reader and author, a critic who is attentive to everything published on these pages – noting each error in form or content, inaccuracy or false step (ethical or otherwise), representing other readers' complaints and observations.

Critiques. In light of the above and, in advance, the author would also like to thank the helpful reader, student and researcher of good will who is willing to contribute to this end through *heterocritiquing analyses*, contrathosenes, suggestions or information which will not be in vain but, quite to the contrary, will be warmly welcomed and studied with interest in order to be utilized in a future edition.

Form. It is common knowledge that no book is ever definitive.

Immaturity. While working on it, we are aware of the extent to which it is incomplete at the time of going to press.

Finalization. *This is the type of book that is never completed.*

Self-experiences. In spite of the didactic style of the text, which may be considered excessively normative by the more demanding reader, the most rational approach is to question all statements made in this technical work and prove everything possible by yourself through personal experiences or self-experiences. The content is what matters most in *confor*.

Repercussion. From the repercussion of the first edition of this book, in Portuguese, the 5,000 copies of which were distributed free of charge to interested intraphysical consciousnesses, libraries and specialized institutions in Brazil and abroad, it was possible to found the International Institute of Projectiology and Conscientiology (IIPC) – which replaced the Center for Continuous Consciousness (long-since disbanded) – in Ipanema, Rio de Janeiro, Brazil, where the author formally proposed the sciences of projectiology and conscientiology.

IIPC. After *1 decade of intense activities* already accomplished, the IIPC is active in *7 countries*, besides Brazil, with a total of *22 active offices* that promote studies, research and multiple, ample, educational activities. The IIPC has a mailing list of over 105,000 intraphysical consciousnesses.

Dedication. This didactic first edition in English, which is the translated version of the revised, updated and enlarged fourth edition in Portuguese, is dedicated to all veteran, new and anonymous volunteers with employment ties and/or consciential bonds with the Institute. Where possible, the topics in the current edition were listed or enumerated (enumerology), giving most chapters a form similar to a *technical booklet*. This was done in order to facilitate comprehension by younger students. The author hopes this work will prove of some benefit to all, and willingly accepts any other type of *help* or *self-thosene* that can assist in new research or future investigation in the fields of projectiology and conscientiology.

Waldo Vieira

Rio de Janeiro, March 29, 2002.

I – Scientific Foundations of Conscientiology

01. ESSENTIAL CONCEPTS OF SCIENCE

Definitions. Science (Latin: *scire*, to know): organized set of knowledge related to a specific object, especially that obtained through observation, verification and experience relative to the facts and the method per se; system of rigorously demonstrated, constant, general propositions that are interconnected through subordinate relationships; knowledge that does not merely comprehend or register facts, but demonstrates them through their determinant or constituent causes.

Synonymy: organized set of knowledge; systematized knowledge.

Civilization. *Civilization* has existed on this planet for less than 100 centuries.

Infancy. Strictly speaking, science, as we know it, is a *human creation* of the last 4 centuries. It is therefore still in its infancy, as it has existed for only 4% of recorded human existence or terrestrial civilization.

Human. The person of science is, inevitably, a *human being* first and a scientist second. There are, for example, scientists who endeavor to *deify* science.

Geniuses. The greatest geniuses of science also become ill, can go insane, become senile, and even commit suicide. They are not immune from any defect or human weak trait.

Immaturity. From this arises the fact of a predominance of *immature* scientists who still maintain an incomplete science – one that is immature with regard to the consciousness – dominating the scientific “world”.

Partiality. *Incomplete science* is that which restricts its research to the intraphysical dimension, being indefensibly partial or immature in the face of the holosomatic, multidimensional and multiexistential realities of the consciousness.

Limitations. As a *human undertaking*, equal to many others, scientific research, in its controlled observations, which are sometimes dry, monotonous, expensive and prolonged, depend upon availabilities and accidents. It is often limited by preconceptions, apriorities, stereotypes, conventions and prosaic *human realities*.

Theorice. There are researchers who are essentially practical, with anti-theoretical preconceptions (psychomyology or psychomotricity, the cerebellum, the predominance of endorphins, adrenaline and muscle fibers).

Neosynapses. There are theoretical researchers with anti-experimental preconceptions, lacking neosynapses (epistemology or the philosophy of science, a predominance of neurons and interneuronal networks).

Disciplines. Science establishes itself into numerous disciplines.

Categories. There are, among others, physical, chemical, biological, economic, historical, formal, factual, psychical and parapsychical sciences, generally speaking.

Opening. Distinct scientific disciplines, in turn, establish themselves into different schools of thought.

Oligarchies. Scientific schools, when incomplete, immature and oligarchic, are *humanly* similar to religious sects.

Scientificness. The level of scientificness varies from one science to another. The biologist, chemist and cosmologist see the same theory differently.

History. The history of science is not a linear one. It consistently shows 4 distinct results, upon which our accurate reflection is worthwhile:

1. Victories (intraphysical successes).
2. Progress (technological advances).
3. Failures (irrefutable defeats).
4. Mistakes (errors and omissions).

Experiments. The history of science includes useless experiments, data leading to errors, false theories, discrepancies, micro-hypotheses, controversy, counter-examples, disagreements, discontinuity or progress and setbacks.

Omniscience. The growth or progress of scientific knowledge is not an entirely logical, rational and continuous process. Not even this knowledge is omniscient.

Speculation. Many *speculative and dislocated theories* are capable of indicating the way toward new ideas, discoveries and inventions.

Hybridism. As beings who are naturally paradoxical, hybrid or two-sided, we are simultaneously two intraphysical realities:

1. **Thighs.** Cerebral-human-animals (biology; sexology; neurology), *evolving between the thighs* (belly-brain or abdominal sub-brain, sexochakra), when we still err more often than not.

2. **Ears.** Consciential-mental-animals (psychology; projectiology; conscientiology), *evolving between the ears* (brain, frontochakra, coronochakra), when we endeavor to make fewer errors.

Entanglement. Persons of science often become entangled with problems.

Chain. There are theories, for example, that explain 3 facts and contradict 2 facts having the same origin, order or nature, demanding another theory to explain these last facts, thereby forming a chain of events, experiments and an expenditure of time, health, consciential energy, finances, perseverance and a maximum of patience.

Considerations. From this, 2 facts arise which are also worthy of our consideration:

1. **Fragmentation.** There are more fragmentary theories than complete ones.

2. **Errors.** There are more erroneous theories than correct ones.

Career. The career scientist, logically, is careful to not expose his/her *bad work*.

Uncertainty. A *cloud of uncertainty* surrounds most scientific generalizations.

Necessity. Science originates from the need to know and understand.

Questioning. *Questioning* is the essence of science.

Questioning. Questioning is necessary for the continued elaboration of original ideas.

Conformity. The scientist does not seek conformity.

Questionnaire. The following 4 classic, irreplaceable questions need to be constantly used by the scientist:

1. **Who.** Who said this?

2. **Quid.** Why?

3. **Data.** What data is available?

4. **Proof.** Where is the proof?

Desacralization. Neither technical rules, nor formulated principles or even the facts are sacralized (sanctified or sacrosanct) in science.

Degeneration. Science can reach a level of complete degeneration.

Program. A vast scientific research program can degenerate and ruin its promoters, persons and institutions.

School. Even an entire scientific school can degenerate to *pseudoscience* or to shameless commercialism.

Evaluation. There are defined attitudes that cannot be violated in research, because they allow the researcher to separate science from non-science and critically evaluate speculations, suppositions, information, data, conjecture, experiences, concepts, hypotheses and findings.

Attitudes. The following 4 technical attitudes are considered to be basic elements indispensable for the achievement of all scientific knowledge:

1. **Empiricism.** The necessity for observing phenomena before arriving at any conclusion regarding them (*conditio sine qua non*).

2. **Probabilism.** Accept as true the probabilistic determinism that, on earth as in the universe, order and functional relationships exist (“scientific dogma”).

3. **Parsimony.** Propose a complex or abstract scientific explanation only after all simpler explanations have been shown to be false or inadequate (“Occam’s razor”).

4. **Manipulation.** In the verification of two things that are assumed to be associated – either by a causal or merely accidental factor – the occurrence of one event must necessarily be altered or manipulated while observing what is occurring with the second.

Norms. Aside from the above-cited attitudes, 5 main norms are postulated in order to orient scientific activity:

1. **Knowledge.** The scientist must evaluate new knowledge critically and objectively.
2. **Disinterest.** The scientist must use the findings in a disinterested manner, from an economical-financial standpoint.
3. **Merit.** Scientific merit must be evaluated regardless of the scientist’s social or personal qualities.
4. **Findings.** The findings are not the scientist’s property, it being prohibited to keep them a secret.
5. **Neutrality.** Emotional neutrality with regard to the work is expected from the scientist.

Characteristics. Within science (which is still immature and insufficient), there are at least 18 characteristics of *scientific knowledge*, listed here in alphabetical order:

1. Accumulation.
2. Analysis (re-analysis).
3. Clarity.
4. Communicability.
5. Dependence upon methodical verification (exhaustibility).
6. Explicitness.
7. Factuality (reality).
8. Fallibility.
9. Generality.
10. Objectivity.
11. Openness.
12. Precision (in form and content).
13. Prediction (predictive science).
14. Rationality (logic, discernment, reason).
15. Systematization (coding, decoding, recoding).
16. Transcendence of the facts.
17. Utility (application, practicality, technology, technoscience).
18. Verifiability (reverifiability).

Cycle. Modern scientific method is based upon a sequence of 9 procedures, comprising the *cycle of investigation*, in the following natural or chronological order:

1. **Problem.** Discovery of the problem.
2. **Positioning.** Adequate positioning of the problem.
3. **Search.** Search for correlated knowledge.
4. **Solution.** Initial attempt at a solution.
5. **Hypotheses.** Hypotheses and speculation.
6. **Improvement.** Achievement of a better solution.
7. **Analysis.** Analysis of the consequences.
8. **Proof.** Proof of the solution.
9. **Improvement.** Improvement of the theory.

Steps. The scientific *corpus* is gradually composed through 6 steps:

1. **Fact.** The fact suggests the ideas.
2. **Conjecture.** Conjecture indicates experimentation.
3. **Experiment.** The experiment controls the hypothesis.

4. **Modifications.** The hypotheses and theories are gradually rejected, modified or confirmed.
5. **Law.** It is in this way that the goal of so-called *natural law* is arrived at.
6. **Model.** An advanced model (paradigm) is thereby established.

Contents. Data and hypotheses are the contents of science.

Methodolatry. *Methodolatry* is not allowed in science.

Attributes. Aside from the cold methodology within the scientific context, intuitive attributes, or trans-rational, parapsychic resources, are decisive in discoveries.

Concepts. There are two categories of concepts in science:

1. Concepts of postulation.
2. Concepts by intuition.

Accidentalism. The vigorous intellect does not underestimate the role played by accidentalism (*serendipitia*, serendipity) in scientific progress.

Evidence. The majority of scientific discoveries have been preceded by theories lacking the support of any solid evidence. This happens over the course of many exhaustive years of waiting and experimental research.

Reverification. Scientific work is performed on the basis of conjectures which, through successive verifications (reverification), undergo adjustments until they result in hypotheses or propositions. Finally, when verification is relatively complete, they arrive at consecrated theories.

Elimination. Science thus develops by way of hypotheses and consecrated theories which, in turn, eliminate and substitute each other.

Generations. Theories generate other hypotheses.

Derivations. Not all hypotheses are derived from theories.

Components. Among the components of science, 3 can be singled out:

1. **Objective.** The *objective* or concern in distinguishing the common characteristics or general laws which govern specific events.
2. **Function.** The *function* or improvement of the relationship of the consciousness with its existential dimension.
3. **Object.** The *object*, be it material, namely that which is to be researched; or formal, i.e. the special focus in the presence of diverse sciences having the same object.

Theory. A theory is a precise, detailed report of nature that is valid for one specific area.

Filling. All scientific theories serve to fill a gap.

Intolerance. Science is inherently *intolerant* in the sense that a new hypothesis excludes an older one if it is clearer, more adequate or far simpler.

Deduction. The *refined* scientific theory consists of a rigorous, logical deduction, based upon the defined postulates of that which should be observed under specific conditions.

Veracity. No theory is completely true. Not even the leading theory (dominant paradigm).

Useful. To the extent that a theory is, in practice, more useful and has different possibilities, the more rapidly and completely it will be reviewed and retested (refutation, verification of the theory).

Refutation. A theory is a working model and should be put to the test. Therefore, all possible means are used to *refute it* – make note – *not confirm it*.

Revisions. Hypotheses are always submitted to tests, rejected, improved and subjected to continual revisions.

Megarefutation. It is reasonable, therefore, that the dominant scientific paradigm also be refuted – *megarefutation* – when necessary, being changed or substituted by a better available alternative (leading theory).

Affirmation. In science, it is permissible to affirm *something* without knowing *everything*.

Totality. Some scientists are of the opinion that working toward total knowledge, researching global equations, in the complete description of the forces that govern the universe, or in the manner of a *unified field theory*, may be a fundamental mistake. In this case, it would be a waste of effort, time and consciential energy, a position lacking scientific significance.

Option. They think that the more practical, productive option is to endeavor to extract the maximum of that which is known and add new elements to this nucleus of knowledge, when possible.

Response. Nevertheless, there is no scientific response that is *strictly conclusive*.

Enunciations. Scientific enunciations are, in theory, the only ones which lead to safe, correct knowledge, because they are based on observational and experimental evidence and, as such, are based on facts, as far as possible.

Circumstance. There are no arguments against facts in this circumstance.

Method. The normal method of scientific thought is hypothetical-deductive-experimental.

Formulation. Theories need to be formulated as unambiguously as possible, so as to be completely open to refutation.

Risk. A genuinely scientific theory puts itself permanently at risk.

Refutability. Experimental refutability is the unanimously accepted *standard-measure* (consensual criterion) of the demarcation between science and non-science (myth).

Subjective. The method which demonstrates subjective reality by way of objective data has still not been discovered.

Denial. Nevertheless, there is no need to deny the subjectivity or inter-subjectivity between intraphysical consciousnesses – that of the evolutionary duo, for example.

Demonstration. Nor is there a method that demonstrates objective reality to someone.

Proof. Only the individual, on his/her own, decides to subjectively accept objective proofs. Thus, objectivity is based upon the subjective, and not the contrary.

Subjectivity. That which is subjective can come to know that which is subjective and objective. Nevertheless, that which is objective cannot come to know that which is subjective. It is currently known that, in any experiment, the observer takes part in the experiment which is being observed (holochakrology).

Machines. Strictly speaking, no science is completely objective. The data gathered by machines are only considered to be data from the moment that someone *subjectively* determines that they are important.

Interpretation. Even so, these data are meaningless as long as they have not been *subjectively interpreted*.

Technique. The scientist works based upon models acquired through education or technical literature.

Scientists. There are two categories of scientific minds (mentalsoma):

1. **Mathematical.** The *analytically-minded scientist* who has mathematical reasoning and uses equations or calculations.

2. **Imagistic.** The *pictographically-minded scientist* who has imagistic reasoning and uses diagrams or collections of reports.

Reliability. As reliable as they may be, human machines, apparatuses, artifacts, devices, inventions, instruments or equipment obviously do not think for themselves – not even the most evolved robots or microcomputers, including the computer that beats the world chess master.

Mega-strong-traits. There are two categories of scientist in regard to their mega-strong-traits or their overall qualification:

1. **Conventional.** The qualified, conventional scientist.

2. **Revolutionary.** The revolutionary, innovating, *paradigm creating* scientist.

Contemporaneity. The scientists of our time are equal, if not superior, to the competent scientists of the past; if not in their intellectual capacity, then at least in their methods, research, scope of concepts or the simple accumulation of information (stimuli).

Present. There are currently more scientists alive (intrapysical consciousnesses) than throughout the rest of human history. Immature science is still often reactionary, obscurantist and intolerant in regard to non-scientific knowledge.

Ineptitude. Ineptitude is not an attribute of uneducated, illiterate, robotized or ignorant persons. It is common in artistic, political, religious and scientific circles as well. Human nature never fails.

Perspectives. More than ever, the destructive possibilities, perverse aspects and terrifying perspectives of the high technology derived from science (technical-scientific sectors) become evident – and are cause for heated debate.

Technology. Technology (Greek: *téchne*, art or ability; *logos*, treatise) is not neutral and seeks efficiency. There are technologies which are stillborn.

Character. Science has a *universal* character, allows free access and its cogitations regarding original ideas are published.

Comparison. The following are 9 characteristics or a comparison of technology and science:

1. **Universe.** Technology is essentially local (economy, business).
2. **Development.** It seeks to develop a product (innovation).
3. **Access.** It does not offer free access, in the manner of science.
4. **Communication.** It is not published.
5. **Protection.** It is protected by patents (inventions, discoveries, improvements).
6. **Competition.** It develops through competition in the economy.
7. **Market.** It is acquired according to the quotation of the international market.
8. **Inducement.** It is induced by an economic or social demand.
9. **Spontaneity.** Technological research is rarely spontaneous which, on the other hand, often occurs with science (*serendipitia*, serendipity).

Confidence. In this particular reality, what gives inner peace to projectiologists or conscientiologists and confidence in what they do is that everything is under wise extraphysical controls that are more evolved than the human minds restricted by *resoma* (rebirth).

Discoveries. It is necessary to stimulate the discovery and improvement of the gifts of human intelligence.

Inventors. Over 90% of sages and inventors are of our time.

Intervals. The time gap between science and technology is closing in our anthropotechnocentric intraphysical society. The following illustrates the gap between 28 discoveries and their applications, notably in the physical sciences:

Electric motor:	65 years (1821-1886)	Teletype:	18 years (1931-1949)
Television:	63 years (1884-1947)	Stainless steel:	16 years (1904-1920)
Photography:	56 years (1782-1838)	Automatic transmission:	16 years (1930-1946)
Telephone:	56 years (1820-1876)	Transistor:	16 years (1940-1956)
Silicon:	38 years (1904-1942)	Frozen food:	15 years (1908-1923)
Helicopter:	37 years (1904-1941)	Photocopy:	15 years (1935-1950)
Radar:	35 years (1904-1939)	Nylon:	12 years (1927-1939)
Neon light:	33 years (1901-1934)	Nuclear reactor:	10 years (1932-1942)
Pacemaker:	32 years (1928-1960)	Ballpoint pen:	7 years (1938-1945)
Vacuum tube:	31 years (1884-1915)	Roll-on deodorant:	7 years (1948-1955)
Antibiotics:	30 years (1910-1940)	Atomic bomb:	6 years (1939-1945)
Radio:	24 years (1890-1914)	VCR:	6 years (1950-1956)
Instant coffee:	22 years (1934-1956)	LP record:	3 years (1945-1948)
X-ray tubes:	18 years (1895-1913)	Solar battery:	2 years (1953-1955)

Fig. 1: TIME GAP BETWEEN SCIENCE AND TECHNOLOGY

Potentialities. It is intelligent to wish that the potentialities of the knowledge and discoveries of science are always employed in favor of humanity.

Teaching. It is necessary to teach *what science really is*, in order for individuals to learn to use it.

Holomaturity. A day will come when mature science will be able to change humankind and renew its personal principles, which are still marked by ancestral immaturity.

Senselessness. In this way, it will be possible to avoid the senseless use of the potential of incomplete science in causes which are not in the interest of consciential evolution and universal well-being.

Objective. Scientists generally have the achievement of some accurate descriptions of their object of study as their primary objective. Their intention is to subsequently proceed to explanation, and/or prediction, and/or control. It is evident that not all scientists (or sciences) do all this.

Professionals. The following are 3 examples of scientific professionals:

1. **Astronomers.** Astronomers are adept at predicting their object of study, although they do not control it.

2. **Historians.** Historians are good at explaining, but do not predict.

3. **Physicists.** Physicists do not foresee if the 14:20 train will arrive 10 minutes late.

Source. A metaphysical enunciation frequently leads to a scientific enunciation or can even become one. An enunciation regarding *other realities* is always, potentially, a source of scientific progress. Above all, there has never been a science which has not had a specific *metaphysical measurement* in support of it.

Presuppositions. The entire human community needs an unverified set of metaphysical presuppositions to orient its research. This does not signify or imply that science is based upon metaphysics or supports itself upon affirmations of unverifiable absolute truth.

Logic. A considerable collection of restrictions to science can be raised, with unquestionable rationality and logic, when it is based upon the *ethics of the jungle*.

Institution. Nevertheless, being the most recent, aggressive and rigid human institution – although still not being the ideal way – science is the *least undesirable way* among the diverse forms of thought developed by humankind.

Hyperacuity. Science is the most noble of all works. It is the best of all the *arts* on the earth today for the consciousness to obtain a greater level of consciential expansion in the direction of evolutionary serenism (hyperacuity, holomaturity, serenology).

Rationalism. Rationalism, generated by consciential maturity, is the most important sphere in which humankind can proceed in a fertile manner with regard to its evolution.

Favor. If you, the reader, know of a theoretical and practical process (theorice), or a way toward the accessing of real (factual) knowledge capable of offering: freedom from secondary issues; the hastening of consciential discernment; the practical performance of the integral maturity of the personality; and the degree to which one truly experiences the universalistic sense in human existence; that is greater or more evolved than those supplied by the directives of science – when mature – will be doing the author a favor by informing him, as he is unaware of it.

Processes. In attempting to respond to the proposed question, you can present, for example, the following 4 arguments:

1. **Sense.** One says: “*Popular knowledge* exists (common sense, good sense, common knowledge or the *school of life*).” True, nevertheless, this is an inexact and unsystematic experiential selection based on moods and emotions.

2. **Philosophy.** Someone proposes, “*Philosophy* exists.” True, but it is knowledge that can be neither confirmed or refuted, is merely a theoretical coadjutant, a *gray eminence* of science.

3. **Theology.** Another reader says, “*Religion* exists.” True, but it is an imposed, infallible doctrine (theology) that absurdly dogmatizes and imposes impossible, unverifiable, absolute, definitive truths.

4. **Ideology.** Another affirms, “Turn to an *ideology* (straight-jacket). True, nevertheless, as historically (when not *hysterically*) conditioned thought, it does not embrace the necessary universalistic

overview of the proposed perspective, finally becoming narrow-minded, sectarian or parochial, opposed to pluralism, a provincial view; another *gray eminence* (worse) of science.

Strategies. Often, within civilization, the neutrality of incomplete science is still a myth. Even so, science has been a source of progress and authority in the determination of the basic strategies of life.

Unification. Science – as incomplete as it is – has turned the world into a single community some time ago. This cannot be said about any other way that humankind has taken, in the search for a world that is balanced and directed by order.

Movements. The nationalist and racial movements are the combative forces that most attempt to attract persons. Nevertheless, both negate precisely the universalistic principle of science.

Infantility. On the other hand, we always hope that religion will exercise its life-unifying function, being the most ample and integrative of all orientations of value. But this generally does not happen.

Religiosity. Invariably, religious sentiments are clearly more immature, reminiscent of infancy, being *ego-centralized constructions* in which a useful divinity is adopted in order to aid the immediate interests of the individual, like a Santa Claus or an excessively benevolent father.

Particularism. Religious sentiment can also be very particularistic. *My church is better than yours. God prefers my people.* In these cases, religion is utilitarian, being merely incidental in human existence.

Pride. Merely pandering to personal or group pride, religion often serves as a defense or escape mechanism. It neither embraces nor gives direction to life as a whole.

Prejudice. Racial prejudice is more common among those who attend church.

Self-comprehension. Religious practice supports exclusion, prejudice, hatred, holy wars and crusades that negate all of the simplest criteria of consciential maturity. In this way, the consciousness does not grow. There are no affectionate relationships with others. There is no emotional security, neither is there realistic perception, nor self-understanding, nor humor.

Divisiveness. It can be seen that the facts demonstrate that religion is frequently *a form of dividing* and not uniting intraphysical consciousnesses.

Subcourse. Strictly speaking, and with all due respect to the subject, religion is a kindergarten *subcourse*, with a low degree of consciential information, where the religious person (faithful, follower) is the student-consciousness, in the manner of these 3 examples:

1. **Subphylum.** The protochordate is an animal of a *subphylum*.
2. **Subclass.** The prototheria is a mammal of a *subclass*.
3. **Suborder.** The protomecoptera is an insect of a *suborder*.

Maturity. Why remain fossilized, repeating the same subcourse year after year? The maturity of the consciousness requires more evolution.

Protoknowledge. Religion is *fetal*, kindergarten, rudimentary *protoknowledge* for the intraphysical consciousness, as can be seen in the following 7 facts:

1. **Proto-history:** a *primitive*, initial history of the earliest historical periods.
2. **Protophony:** an orchestral introduction or a simple *opening* of a great work.
3. **Protocol:** a *note* that allows access to a megalibrary (holotheca).
4. **Proto-revolution:** the beginning of a revolution or a first, *initial*, primitive revolution.
5. **Protoxide:** an oxide that is *less* rich in oxygen.
6. **Proto-ore:** a *lower* grade ore, lacking economic value, that requires enriching.
7. **Protopathy:** a *primary* illness.

Class. Besides this *fetal* knowledge, there is other more developed, advanced and enriched knowledge. Why stop, dazzled by the light of the first class in the terrestrial school?

Subcourse. In religion, the *proto-understanding* of a subcourse – the religious one – holds the *student-consciousness* back, as can be observed with the following 6 facts:

1. **Protonaut:** that person who first navigated to certain parts (unknown).
2. **Proto-revolutionary:** the first revolutionary.

3. **Protopope:** the first pope.
4. **Protist** or protozoan: the single, one-celled (unicellular) organism.
5. **Protophyte:** the primitive plant, with an extremely simple organization, in need of improvement.
6. **Prototype:** the first, incipient type.

Consciousness. As can be seen, the consciousness deserves greater inner illumination. It cannot always continue being a *protoconsciousness* or a *subconsciousness*.

Cooperation. Based on the very universality of its supranational attributes, science offers its own favorable terrain – perhaps the firmest of all – upon which to create the cooperation of pure fraternity (megafraternity) among humankind.

Confinement. Literature and art can remain confined to a province, or even to a city. Science and technology cannot. That which they produce can be immediately understood and applied by all people. Secret science does not exist.

Citizens. Persons of science generally feel that they are *citizens of the world*, just as lucid consciential projectors feel they are *citizens of the cosmos*.

Education. Scientists – open disseminators – serve to educate the people with regard to science and its consequences.

Literate. In 1989 (the twentieth century), the population of England *officially* had an illiteracy rate of only 1%.

Literacy. Literacy is a condition that demands the *verification of quality*.

Illiteracy. In fact, in this same period (1989), 2/3 of Britons did not know that the earth takes 1 year to revolve around the sun. One third believed that *the sun revolves around the earth*.

Habits. It is imperative to teach people to formulate logical questions, change defective points of view and modify bad habits or mental laziness.

Colleagues. It is also imperative to educate colleagues (immature scientists) when they are narrow-minded (restricted mentality), shortsighted or conscientially myopic.

Dogmatism. Dogmatism is responsible for scientific anemia.

Recycling. Incessant consciential recycling (intrapysical recycling, existential recycling) affects all lucid beings.

Distinction. Religions are established upon and stagnated with simplistic thought, aiming to serve everyone, achieving understanding by the *populace*.

Popularization. Without any elitist intention, it is reasonable to suppose that it will always be very difficult for science to become entirely popular (popularization of rational knowledge).

Essential. Nevertheless, educational programs need to enable students with regard to certain essential facts of high quality, relevance or priority, relative to the individual's well-being and evolution.

Word. The distinction between science and pseudoscience is unmistakable. The written or typed word, regardless of its origin, is not self-corroborated. *Any paper will take ink*; the computer monitor also accepts everything.

Emphasis. Emphasis must be given to the *quality of the source* of information.

Question. It is necessary to observe whether each question helps the principles of science or exists in an isolated manner.

Rationality. Science emphasizes rationality and favors objectivity.

Occurrences. Thus, science endeavors to separate 4 occurrences or realities:

1. **Truth.** Truth from fiction (self-discernment).
2. **Reality.** Reality from imagery (imagination).
3. **Fabrication.** Fact from artificiality (fabrication).
4. **Accuracy.** Accuracy from logical errors (exactness).

Support. That is why science is the main support that humankind has against irrationality, obscurantism, mega-immaturities and all manner of *abdominal brainwashing*.

Prophylaxis. A prophylactic understanding of the persuasive techniques of rhetoric and eloquence relative to logical fallacies (deceitfulness, cunning, perfidy, cynicism), avoids errors in perspective.

Probability. Scientific laws are probable, at the highest possible level of conceiving probability.

Explanations. Scientific law is not simply a summary of the facts. It should go beyond the evidence to explain it. It interprets the results of observation.

Leading-edge. In science, there is never sufficient reason to believe that we have reached the truth. It is always advisable to work with vanguard or *leading-edge relative truth*.

Matrix. The scientist acknowledges that no theory can be taken as being definitive, final or absolute truth.

Remain. Scientific theories should always remain hypotheses.

Interminability. Nothing in the *interminable* edifice of science is permanently established. There is nothing in science that is inalterable, including the dominant paradigm (disciplinary matrix).

Attempt. Strictly speaking, all scientific discovery is, above all, considered to be an *attempt*. Nevertheless, science advances little by little, gradually increasing the minimal percentage of leading-edge relative truth.

World. In view of the ignorance of extraphysiology, the world of humankind (or intraphysiology) is invented more than discovered.

Rehearsal. The *rehearsal experiment* is an imaginary experiment used to clarify a theoretical idea.

Anticipation. Scientific reality, at times, surpasses even science fiction (imagery).

Power. The power of humans, through science, is equal to, and in some fields superior to, that of the *gods of ancient times* (mythology). The following are 8 technical endeavors, among others, in alphabetical order:

1. Artificial communication satellites.
2. Supersonic flight.
3. Television.
4. The achievements of computer science (multimedia).
5. The exploration of Mars (planet).
6. The exploration of the Moon (natural satellite).
7. The Hubble telescope.
8. The laser.

Accumulation. Science is the only aspect of human history that is truly cumulative. It progresses, accumulating units from among facts that are apparently separate and disparate.

Rework. In science, through bibliographic research, documentation, heuristics, analysis, the critiquing of important or valuable works and abstracts, one investigates thought which has been gradually accumulated over time – despite cycles, changes, recyclings, stages, errors and idiosyncrasies – and arrives at the large collection of reworked scientific results, connecting the scientific past and present.

Reading. The student who *reads just two hours* a day, at a speed of 350 words per minute, will, in 1 decade, read 1,800 books of 70,000 words each (whether they are printed works or eBooks).

Multimedia. It is worth reflecting upon this fact with regard to the theoretical enrichment of everyday life, which is even easier today through the use of the personal computer, multimedia and CD-ROMs.

Journal. Besides the invisible colleges of science, symposia, congresses, forums, encounters, seminars, conventions and fairs, the specialized technical magazine (journal) is the main product of scientific research. It is more useful from the point of view of technical updates because it presents more recent information (monthly, quarterly), as opposed to books, which present older information (yearly).

Book. *Technical books* generally give a more complete overall view of the subject, as compared to technical magazines (journal).

Renown. However, it is more likely to compromise the renown of a scientist. This is why it takes more time to be published, thereby losing much of its up-to-dateness.

Works. There are standards in science – when considered chronologically since antiquity – which have intrinsically defined the authentic problems and the methods of diverse fields of research for successive generations of researchers.

Qualifications. The following are 6 authors, having different qualifications, along with their respective classic works, according to ancient standards:

1. **Aristotle.** Aristotle, of Stagira (384-322 B.C.) Greek philosopher: *Physica*, wherein he developed the principles of nature.

2. **Ptolemaeus.** Claudius Ptolemaeus (90-168) Greek astronomer and mathematician: *Almagesto* (mathematic composition).

3. **Newton.** Isaac Newton (1642-1727), English mathematician and physicist: *Philosophia Naturalis Principia Mathematica*.

4. **Franklin.** Benjamin Franklin (1706-1790), North American physicist: *Experiments and Observations on Electricity*.

5. **Lavoisier.** Antoine Laurent de Lavoisier (1743-1794), French chemist: *Opuscules Physiques et Chimiques*.

6. **Lyell.** Charles Lyell (1797-1875), Scottish geologist: *Principles of Geology*.

Drawbacks. It is, however, worth considering 4 drawbacks of contemporary incomplete or mundane science, arising precisely from these and other works/standards:

1. **Qualification.** Scarcity of a qualified work force.

2. **Interdisciplinarity.** Growing specialization or absence of interdisciplinarity.

3. **Literature.** The immense quantity (plethora or avalanche) of technical literature.

4. **Works.** The tendency toward a deterioration in the quality of scientific works.

Periodicals. According to statistics, the number of specialized periodical scientific publications reached a total of 100 in 1800, approximately 1,000 in 1850, and approximately 10,000 in about 1900. In 1950, 100,000 of this type of publication existed. Today, there are more than 141,000.

Quantity. The quantity of scientific literature is doubling approximately every decade.

Megalibraries. The literature of physics, for example, is now (in 1987) doubling every 8 years. The size of the megalibraries (holothecas) doubles every two decades.

Magazines. Some authors foresee that the number of scientific magazines will increase to one million by the year 2000.

Internet. Moreover, the Internet is also spreading information.

Excesses. Academic success, university boards, professional career promotions and approval of proposals by government divisions, all demand that the modern scientist possess a long list of technical publications to his/her credit.

Pressure. This pressure to *publish or perish* has continued to generate an excess of useless research projects, increasingly insubstantial, pretentious, low quality articles with flawed investigations, politically motivated publications, fraudulent works, and the practice of listing dozens of researchers as authors of a disseminated work (*clique*, corporatism).

Quality. For every first-rate *scientific article*, there are 4 second-rate articles, 9 third-rate articles, and so on. For example: 40% of the publications in the area of mathematics are never cited.

Selectivity. For this reason, science is now endeavoring to reduce the demands for the quantity of technical articles in order to prioritize the scientific *quality* of the works, thereby facilitating a greater selectivity of publications.

Composition. Strictly and theoretically speaking, advanced science will be composed of science/technology, art/training, philosophy/cosmoethics and parapsychism/serendipity. It will be neither technocentric nor sacralized, but conscientiocentric, predictive/prophylactic and multidisciplinary.

Bibliography: Edge (459, p. 295), Taylor (1666, p. 20), Wolman (1863, p. 600). More recent works by the author: *700 Conscientiology Experiments* (in Portuguese); *200 Conscientiology Theories* (in Portuguese).

02. NEW CONSCIENTIAL PARADIGM

Definition. Basic scientific paradigm: model that orients the criteria of the activities and norms of scientific research in general, as a whole.

Synonymy: disciplinary matrix; emerging paradigm; fundamental scientific decoding; *leading theory*; main scientific model; standard-theory.

Dying out. As previously shown (see chap. 1), it can be seen that the essential Newtonian-Cartesian-mechanistic paradigm of conventional incomplete science is currently dying out, despite all the resistance of various origins and sources.

Corruption. Humankind's self-defensive nature leads it to hide information or remain silent when faced with incomprehensible issues regarding the problems regarding which it is incapable or does not yet possess the resources to solve.

Pathothosenes. The following are 3 examples of intraphysical complacency or collective, tacit pathothosenes:

1. **Consciousness.** Conventional science avoids directly researching *the consciousness* as an object, which is a contradiction or irrationality.
2. **Monoglotism.** North Americans avoid talking about their basic monoglotism, which creates gaps in their culture and affects the areas of science in general, based upon the English language.
3. **Hunters.** The majority of armed forces, in all countries, do not refer to their own reality: of being professional-technical people hunters.

Unawareness. The Newtonian-Cartesian-mechanistic paradigm has systematically kept scientists profoundly ignorant of parapsychism, interdimensionality of the intraphysical consciousness or conscientiology, its realities, principles and laws.

Soma. In their obstinate unawareness of parapsychism, they affirm that the enigmas of life are entirely based in the natural sciences and only in the development of the cells of the human body (soma).

Gap. This is the great, deplorable gap in human understanding. Scientists voluntarily and blindly distance themselves from the deeper and more productive reality of consciential evolution (even from themselves) which is capable of further accelerating the *inner* progress of humankind, under the pretext of only employing positive, objective – but superficial or *epidermic* – methods.

Priorities. Among the follies and resistance of the still immature and materialistic scientific community, we can single out the regrettable absence of discernment and perspective in the establishment of priorities for basic or pure research, which could lead to a *more consciential technology*.

Subsidies. Even in Brazil, for example, considerable official subsidies, financial grants and support – coming from resources provided by all of us who make contributions – are currently earmarked for the sometimes useless, absolutely non-priority and even repetitive technical studies of the *tiny hairs of the sexual organs* of some small, unknown animal. This research does not have the slightest chance of providing immediate aid to starving children, young non-students, or adult consciousnesses who are at odds with themselves, all of whom pertain to the minorities of intraphysical society.

Report. According to UNESCO's *World Science Report 1996*, the paper/patent ratio in developed countries is 2:1. In developing countries in Asia the ratio is inverted, or two patents per paper. In Brazil, we have the shameful record of one patent for every 40 articles published.

Sponsorship. Up until the present, in Brazil, no person or governmental organ has been encountered that would sponsor the most promising research project for the sophisticated parapsychic analysis of the consciousness, a vital, priority subject for everyone, in all places, times or circumstances. The International Institute of Projectiology and Conscientiology completed one decade of work without having been granted any official subsidy. It has now, in 1998, become a national "public utility" institution (officially considered by the Brazilian government to be of benefit to society).

Number. Those wishing to bear this out need only observe the number of traditional, costly technical magazines in Brazil.

Sensibleness. A somewhat greater degree of sensibleness on the part of upcoming human generations is to be hoped for. Those alive at the time will see.

Ignorance. Low-level interests can turn science into a negative discipline. Examples: bellicosity; atomic bombs; anti-ecological endeavors; anti-bioethical realizations. Other human objectives also impair scientific development.

Prey. Those who diligently combat, restrain or omit new scientific conquests – whether they are religious persons, politicians, militarists, industrialists, merchants, lobbyists or even certain immature scientists – when doing so in a criminal manner, behave atavistically like birds of prey.

Oligarchy. The delinquent plunderers intend to maintain the ignorance of *brainwashed*, robotized beings who live under the control of their social influence (oligarchy).

Privileges. The maintenance of the *status quo* of profit and the expansion of privileges that the oligarchy enjoys, and to which it is addicted, are dependent upon the manipulation of these beings and this blind ignorance and consciential control. Misonicists or neophobic individuals, not having these advantages and privileges, would not know how to live the human experience, arising from renewal in other bases, which are generated precisely by these new scientific conquests.

Lobbyism. Thus the current *vicious circle* of dominating-dominated intraphysical consciousnesses continues (corporatism, lobbyism, nepotism, ethnocentrism) in many fields.

Revision. All scientific laws, as rigid as they may be, are susceptible to revision.

Response. In science, it is impracticable to offer a general, exhaustive response that fully answers a question.

Dynamism. Scientific truth is dynamic, corrects itself and does not purport to be definitive. *Scientific knowledge remains fresh for as short a period of time as fish.*

Impermanence. There is no permanence for scientific concepts.

Obsolescence. The life of a scientific work (paper) is very short.

Pressure. The obsolescence of the materials available to us is continually more intensive and pressuring.

Foreknowledge. Little of that which the author affirms today will be correct ten years from now. Articles published a decade-and-a-half ago are almost useless in many scientific fields.

Decades. The bulk of what we learn now will not be sufficiently correct within 5 decades.

Acceleration. In the world of today or the increasingly rapidly mutating intraphysiology, the phenomenon of acceleration of human history, in which we are immersed and rooted, is irreversible and overwhelms neophobic and anachronistic minds in all lines of intraphysical knowledge.

Shortening. On the other hand, the acceleration of history promotes the democratization of information and the *shortening* of the period of infancy, puberty, adolescence and the generation gap. Intraphysical consciousnesses mature at an earlier age. Today, there are 9-year-old mothers. There are 10-year-old assassins and drug dealers.

Creativity. What is of the greatest importance is to create and maintain a scientifically alive, open and creatively stimulating environment.

Neophobia. In science, one needs to elude *conceptual straightjackets* (neophobia).

Omniscience. Only in a world of amateurs can an individual intend to possess monolithic omniscience or absolute certainty.

Fortification. Science has the *magic wand* of being eternally new. The revision of a theory does not necessarily weaken it. It can even strengthen it.

Victory. When we find ourselves obliged to modify our conceptions in this manner, it does not constitute a loss for our scientific point of view, but a useful victory.

Step. In science, each former abandoned point of view signifies a new step forward in scientific vision.

Dilemma. The consciousness is not a product of matter. Nevertheless, the infantile and infantilizing *mind-matter* (consciousness-brain) *dilemma* continues.

Comprehension. Despite resistance from traditional scientists, parapsychic research is calling for drastic revision of the conventional structures of various segments of mechanist science with regard to the comprehension of human nature and the nature of reality itself.

Parapsychism. In psychic and parapsychic areas, there are many phenomena which are currently subject to intense controversy. Examples: the phenomenological complex of unidentified flying objects (UFOlogy); the theory of existential seriation.

Documentation. Other facts have been described, verified and documented with such frequency by scientific observers that they are no longer the subject of heated debate. Examples: hypnosis; telepathy.

Obscurity. However, deep obscurity still persists for us regarding the essence of these phenomena, including those which are more accepted or, more to the point, less stigmatized.

Subsociety. Besides this, it is necessary to definitively destroy the link between pure parapsychism and the following 4 spurious realities:

1. Occultism or popular group autism.
2. Inappropriate commercialism.
3. Sensationalism.
4. Shrewd mystification.

Disconnection. As difficult as this may prove to be, it has to be done. As things are, unfortunately, serious persons distance themselves and a field as promising as this is characterized as an ingenuous, *simplistic subsociety*.

Significances. One cannot enter into a world of significances without formulating the necessary postulates.

Ingenuousness. In religion, these postulates are called *blind or rationalized faith*. In the majority of religions, the *sacred*, infallible truth is decreed through doctrine (dogmatization, dogmatics, theology). Its acceptance is based on the unquestionable faith of ingenuous religiosity.

Heresy. Any sign of *doubt* or *questioning* is considered heresy or dissidence, when not bordering on *anathema*.

Ethics. In ethics, postulates receive the names of norms or ideals.

Postulates. In science, postulates are hypotheses or theories.

Sermons. Science does not give sermons on unverifiable truths.

Demagogy. The following are 5 spurious products of unverifiable, absolute and imposed truths pertaining to the religious demagogies of the great *theological empires*, ancient, traditional and modern sects:

1. **Clan.** Exaltation of the spirit of the clan and of nationalism.
2. **Sectarianism.** Subtle inculcation of sectarian belief through the channels of social welfare.
3. **Palliatives.** Palliative social welfare, in appearance only, with no real remissive intention (primary consolation task).
4. **Catechism.** Manifest or masked indoctrination, catechism, subordination, proselytism and brainwashing, aiming at *mystical salvationism*.

5. Sacralization. Imposition of static principles and sacralizations, without a right to question anything (anathema).

Advantages. We are aware of a greater number of advantages than disadvantages, in the scientific discoveries that we have up until now. On the other hand, scientific investigation has to be pure.

Limits. There should not be limits to scientific research.

Goal. What is scientifically done, or produced in a laboratory, should not always be realized with a predetermined goal.

Philosophy. Nevertheless, in light of the above, we can neither exclude philosophy as a useful coadjutant, nor ethics as a wise rule of behavior (cosmoethics) from science.

School. Every school has its specific policy.

Contention. Philosophy and ethics, as well as logic, are indispensable for restricting the excesses of human immaturity in the process of brutalization stemming from the abuses of applied science in technology (technicians, technological torture, technophobia/technolatry, technovictims/technodependents), and the actions of the public opinion agencies.

Biotechnology. The following are 19 examples, from 1997, of the so-called *monstrous threats* of biotechnology, *the great economic vector of the twenty-first century*, involving the 2 extremes of human life, the fetus/cradle and the elderly/grave:

1. Everyday and cutting-edge bioethics.
2. Artificial insemination.
3. Pre-embryos.
4. Rejected human embryos.
5. The Australian physician who had 10,000 children.
6. Human genome research.
7. Human abortion.
8. Euthanasia.
9. *Kidney-transplant* tourism.
10. The human market or the marketing of human life.
11. The removal of organs from adopted children.
12. The exportation of children.
13. The genetically engineered rat.
14. The fly with 15 pairs of eyes.
15. The cloning of Dolly the sheep.
16. The cow Rose that produces human milk.
17. The cloning reproduction of the human being.
18. The bioethical question of arms.
19. The indiscriminate and careless use of nuclear energy.

Cosmoethics. Immature scientists avoid discussing *ends*. They only discuss *means*. Therein, the maturity of *cosmoethics*, which is still completely inexistent, should come into play.

Identity. Science, per se, does not have an identity. It has to be free and prospective.

Uses. The manner in which we use science is very important, as is its ethical utilization (cosmoethics).

Honesty. Scientific means should be perfectly honest. Let us observe what occurs in this world of modern bioethics. Ethics is not quantitative, but qualitative.

Technologism. For example, as military security measures (top secret), the ideologues (technocrats) of the technologistic (computerization of society) system, divide scientific projects into as many functional parts as possible, delivering their solution to separate groups.

Domestication. The scientist – usually a first-rate experimenter – *domesticated* in this manner, works in total ignorance of the *reason behind* his/her project.

Distortion. He/she is not aware of the true ideological determinants that govern his/her personal process (minicog), as a part of an entire structure or system (maximechanism), the primary

proposal of which is the technologization of society. It is the distorted, *amoral*, model of scientific knowledge.

War. In war, evil is organized bureaucratically, through the interaction of science and technology, so that no one *beneath their superiors* can be held responsible for that which occurs.

Dilution. The *pointers of cosmoethical consciousnesses* become diluted.

Error. The cold application of Aristotelian and Newtonian concepts, tempered with Cartesianism, has drenched this planet with human blood, notably in the twentieth century.

Industry. Besides the *death industry*, which is maintained by political leaders and military technicians, the greatest error committed by the scientists of incomplete science, which is regulated by the still dominant Newtonian-Cartesian-mechanistic paradigm, is the myopic decision made by the majority of the professional community to continue to entirely ignore the extraphysical nature of the human consciousness.

Resistance. This is the absolute and absurd resistance to interdimensional or multidimensional relative truth. Scientific knowledge can be canonical, preconceived and pretentious.

Superficiality. Myopic researchers devote all of their attention exclusively to the physical, organic, peripheral or superficial areas of the personality, which are far more complex when addressed in a comprehensive manner. They thus feel vindicated.

Dermatology. Sheltered within *crippled-semiscience*, in the mutilation of knowledge and the explosion of fragmented knowledge, researchers with *temporal power* paralyze scientific research projects by establishing a lowest common denominator and committing their efforts to the *dermatology of the consciousness*, where they feel more secure and have greater economic and social support.

Dichotomy. Orthodox science (purism) and orthodox religion (fundamentalism) have both been institutionalized and frozen within a *mutually exclusive dichotomy*.

Sociopathy. This is a pathological, or a drastic sociopathy, because it maintains subcultures and selective blindness.

Protoknowledge. On the one hand, the author has therefore sought to eliminate all conditioning resulting from cultural development over decades, notably in regard to religion, a *protoknowledge* which is as outdated, in the phase of consciential maturity, as any other line of knowledge or *kindergarten-like course*.

Present-future. On the other hand, he guides himself through secularism, rationalism and empiricism, although based upon an integrative, greater, holosomatic, multidimensional, evolutionary universalism, endeavoring to see *today* and *tomorrow*, the here and now and *elsewhere*, the present-future.

Personal. The interdimensional, *transphysical* phenomena of projectiology surpass the current resources for the *physical* detection of universal occurrences that are utilized by conventional science. So far, they allow only the interested individual to directly access the processes and orientations developed here.

Empiricism. In summary: only *personal empiricism* is executed. They are still unable to offer traditional, direct, scientific replicability of consciential phenomena or, in other words, *public*, universal, easy or common *empiricism*.

Difference. When we compare knowledge gained through conventional, orthodox science with the knowledge gained through projectiology and conscientiology, we can identify the fundamental difference between one and the other.

Universal. *Traditional or conventional scientific knowledge* is contingent. Its propositions or hypotheses have their veracity or falsity perceived through non-participatory, *universal*, replicable experimentation. It is not obtained merely through reason, as occurs with philosophical knowledge.

Individual. The veracity or falsity of the propositions or hypotheses of *projectiological knowledge* are also currently based on experimentation, with the only difference being that it is a personal, *individual*, participative, non-universal and *non-public* (intraconsciential) experimentation.

Verifiability. Parapsychic knowledge allows only personal verifiability, the employment of reason and the mutual critiquing of experiences between experimenter projectors. This helps the exemplificative intraphysical consciousness.

Systematization. Despite the differences, similarities also occur. Traditional or conventional scientific knowledge, as well as projectiological knowledge, are *systematic*.

Connections. They stem from logically organized knowledge, forming systems of ideas or theories and not disperse, disconnected knowledge. The interested individual can bear out this fact with the projective techniques included in this book.

Fallibility. Both traditional scientific knowledge, as well as projectiological knowledge, constitute *fallible* knowledge, by virtue of the fact that they are not definitive, absolute or final. For this reason, they are *approximately exact*.

Propositions. New propositions and the development of conventional and projective techniques can reformulate the collection of existing theories.

Generality. Science cannot be limited in its research. Nevertheless, pure science always endeavors to be a *general science* and not an *individual science*.

Nomothetic. Science likes universals, not particulars. It deals only with broad, preferably universal (nomothetic) laws.

Idiography. Individuality cannot be studied correctly through existing conventional science (as will be seen in the next chapter), but by history, art or biography, the methods of which are not nomothetic or, in other words, involve the formation of general laws or seek out universal laws. They are, however, *idiographic*, namely, those which endeavor to study individual cases (reports, experiences, experiments).

Contradiction. This *scientific dogma* of universality is a contradiction because it places an arbitrary limitation upon the unlimited range of scientific investigation.

Evolution. Conventional scientists lack the priority module of *evolutionary intelligence*.

Problem. The consciousness is, nevertheless, a phenomenon, even when it is encountered only in individual forms. The *consciousness*, as an object, is an unwavering *trans-knowledge* that is before us.

Feelings. Conventional science, in an illogical and partial manner, does not take into account that which we really feel: the subjective experience (individual and collective). It describes the cosmos or a world of things that have no value, interacting as though humanity did not exist. It describes nature in a cold, incomplete and unsatisfactory manner.

Conscientiology. Individuality creates unique problems for conventional science. It may be the greatest relevant problem that conscientiology represents for the person of conventional science (participative consciousness).

Inconvenience. The *consciousness* is therefore a disturbance or an inconvenience for *incomplete science*.

Coherence. As the consciousness is a universal phenomenon, science – although remaining frozen in an exclusively nomothetic manner of thinking – has to study this nuisance in order to maintain its coherence. Nevertheless, *it cannot study it correctly*, except when it seeks the *individuality of standardization* (a paradox).

Alienation. This is the essential dilemma of incomplete or alienating science over the last 2 centuries, represented by the separation of subject and object. This began the logical exhaustion of the Newtonian-Cartesian-mechanistic paradigm, which is still in force.

Authority. From this point forward, the conventional scientist, who still possesses neither the authority nor the experience to *correctly* study the universal phenomenon of personality or the consciousness, also lacks the authority to *correctly* judge the research and findings of conscientiology or the personality, when considered in its *entirety* (holosomatic, multidimensional, pluri-existential, holobiographical). These are the facts.

Concessions. The individual who makes more concessions to intraphysical powers fairs better at that moment and in the world of superficial discoveries.

Conscientiality. The individual who seeks to transcend the common standard of scientific mediocrity, limiting personal concessions, is the only personality who will be able to attain the leading-edge relative truths of projectiology and obtain a better level of conscientiality in regard to personal intraconsciential and extraconsciential realities. This will allow the individual to overcome the dispensable self-mimicries that constantly attempt to monopolize that which we do in human life.

Events. Events directly related to human beings never repeat themselves the same way twice.

Individualities. There are no two similar or identical individualities.

Subjacency. Events can, however, have a subjacent determinism.

Replicability. This definitively makes the basic scientific determination of replicability of facts or laboratorial research inviable.

Partiality. This also eliminates material instruments or physical resources as being inadequate. It furthermore removes pure science and immature scientists from the scientific investigations of conscientiology – the science of the *whole* psychological individuality – and, consequently, from projectiology, both of which demand participative research (consciential energies, parapsychism) in order to reduce the current partial nature of incomplete science.

Individual. The idiographic or individual study of the personality or the consciousness, in an isolated manner, is extremely complex.

Isolation. In practice, it is extremely difficult to study an isolated individual, because *nobody exists alone* (a fundamental three-word megathosene).

Absurd. On the other hand, every time we measure, we are introducing a general or nomothetic law. If taken literally, the idiographic perspective is absurd. We can, however, accept it as an appeal to not neglect the individual in our search for general laws.

Foundation. The facts of projectiology definitively convince *only* the lucid projector through self-thosenization. Thus far, projectiology does not have a foundation capable of persuading non-practitioner or non-participant researchers.

Guiding myth. It is hoped that this possibility shall arise one day, with the development of refined technology applied to consciousness research. At this point, the mechanistic paradigm – the guiding myth of contemporary incomplete science – will have already been substituted by a new consciential paradigm defined by projectiology.

Ambiguities. This is the thought that progresses beyond the ingenuous logic of current human society, a less precise paradigm that is still contaminated with ambiguities that need to be eliminated.

Transition. Scientifically speaking, we are currently undergoing the crisis of transition, the pains of integration, the ethics of the interim, toward the primacy of a new paradigm.

Doubleness. There are even holistic researchers who think that we are currently living in a *post-paradigmatic period*, wherein 2 scientific paradigms – the depleted and the new – somehow peacefully coexist.

Challenge. Projectiology currently has little to offer the researcher who is a purist and a mechanist, in regard to the impersonalization of science and the inviolability of the principle of direct, systematic replicability, impeded from conducting experiments of a participative nature and, consequently, developing him/herself regarding the consciential aspect, whether it is due to temperament, mesological repressions, personal conditioning or an inability to tolerate crises of ambiguities.

Extraphysical melancholy. The author recommends the study (pattern-behavior *versus* exception-behavior) of post-desomatic parapsychoses and extraphysical melancholy to all colleagues, with a maximum of self-critique and heterocritique.

Instrumentation. The use of adequate, sophisticated instrumentation can one day substitute personal projectiological experiments in consciousness research. This instrumentation has not yet

been invented. This is a challenge to our intelligence, which has remained undefeated since the nineteenth century.

Instrument. Today, in experimentology, the consciousness is the most efficient instrument of choice at hand in consciousness research. This, however, is not as bad, deficient or inefficient as it may seem to those less attentive individuals.

Adversaries. There are those – the adversaries of the consciential paradigm – who affirm that we should not research the consciousness by way of another consciousness, but instead, through the use of material apparatuses or physical instruments.

Questions. At this point, it is worth posing 4 rational questions and presenting their respective answers:

1. **Creation.** Who created these apparatuses and instruments? The creative human consciousness.
2. **Research.** Who performs research in all the areas of traditional and modern science? The human consciousness as researcher.
3. **Brain.** With which instrumentation, for example, does neurology research the human brain itself? Precisely with the brains of neurophysiologists or neuroscientists, researching the brains of human beings through the functioning of their own brains.
4. **Virus.** If the human consciousness cannot research itself and other consciousnesses, inevitably in a participative manner, who is it that these arguers and conventional science itself hope that will research it? The virus? This is *nonsense* or an absurdity.

Irrationality. As can be seen, this is an undoubtedly irrational argument. We can thereby rationally perceive how conventional science is indefensibly contradictory, omissive, immature and *mundane* (tropospheric).

Evasion. For 2 centuries, science has been irrationally and habitually concealing resources and constantly evading – a collective, group, lobbyist or corporatist defense mechanism – the direct, chakra-to-chakra, pore-to-pore research of the consciousness or the participative research of the researcher-object. We cannot dispute the facts.

Observation. The scientist is not merely a camera lens, recorder or computer. After all, direct observation is the best source of knowledge. This is so even when – or still when – this direct observation is multidimensional or is performed with the *para-eyes*.

Substitute. In regard to all this, there is one invariable reality: there is no substitute for personal experience.

Right hand. The reader knows that his/her right hand has 5 fingers and, furthermore, knows how to operate it to his/her benefit. No one needs to give this person lessons in this regard.

Techniques. Everything in our transitory life in this intraphysical dimension requires a technique. Even avoiding a sneeze.

Understanding. Nowadays, there are also logical, rational techniques for anyone who is interested in understanding him/herself in an integral or holosomatic manner.

Neosynapses. Fortunately or unfortunately, the fact is that conventional science, which remains myopic, does not possess these techniques. The interested individual endeavors to change paradigms and create neosynapses, devoid of neophobia.

Presuppositions. On the one hand, many of our propositions are still not science, being merely *scientific hopes*, in the sincere opinion of the mechanistic scientist, who is fearful of losing his/her professional security, being dependent on *financed survival* from conventional science, under the pressure of which he/she has been living (the author has been an independent researcher for the past 4 decades).

Semiscience. On the other hand, as with conventional, incomplete science, these projectiological propositions still constitute *handicapped-semiscience*.

Darkness. For this reason, the best way to facilitate the advent and the full implantation of matured science will be to understand how dense the darkness that we touch is – regarding conventional science, on the one hand, as well as regarding projectiology, on the other hand.

Provisional. Never forget, however, that the presuppositions of conventional natural science, with which we began, are provisional and subject to revision.

Debates. In scientific debates, a theory cannot be defended in an irrational manner, notably one which is old or antiquated.

Classification. Science requires classification.

Similarities. We are not able to obtain general knowledge unless we group phenomena on the basis of similarities (identities, affinities, interactions).

Enumerations. In this way arose the projective techniques, didactic enumerations, specialized terminology and the panorama of this book, which is quite rigid up to a certain point (all didactic *annotations* notwithstanding).

Losses. Through matured science, the individual who defends the theory of existential seriation will be able to prophylactically defend him/herself against the causes of repetitive existential lifetimes or unconscious self-mimicries.

Self-mimicries. Self-mimicries generate loss in energy, effort, mental time and evolutionary opportunities in the micro-universe of our consciousnesses.

Perspective. The great difference between conventional, mechanistic, physicalist science and conscientiology (a world of consciential and multidimensional research) is a matter of priority with regard to two perspectives:

1. **Scientist.** The conventional, materialist, four-dimensional or parochial scientist feels incompetent because he/she still *dies* in the transitory human body. This scientist would like to take shortcuts, living forever in an illusory matter, through the elixir of eternal youth.

2. **Serenissimus.** The *serenissimus*, having a multidimensional, holosomatic, maxi-universalistic perspective, feels incompetent because he/she still needs to *live* in the transitory human body. He/she would like to skip steps, living forever disconnected from matter, in his/her infinite self-evolutionary career.

Syntheses. The (universalistic and *interdimensional*) scientist, within the world of conscientiology research is, above all, as a first step, interested in attaining the most difficult of the last (but always relative) syntheses of the most essential (priority) analyses and investigations of the consciousness, or human personality, within the globalizing context of the physical universe.

Interest. This interest allows the individual to finally achieve, at a later stage, the context of the consciential universes that exist and can be reached by the ego that is restricted and immersed in the process of resoma.

Stages. These stages of more sophisticated – and the most important – investigation can only be achieved by the lucid consciousness through its intelligent performance, proceeding from the mentalsoma, controlling its holosoma, in order to control a truly more ample range of consciential dimensions, while in the mature human body.

Repetitions. The following are 13 factors, among many others, that predispose unnecessary repetitions in existential seriation or multiexistential experiences, presented here in alphabetical order:

1. Bad information, subinformation and disinformation.
2. Concealment of data.
3. Conditioned repressions.
4. Deeply rooted taboos.
5. Erudite charlatanism.
6. Exploitation of public credulity.
7. Fictional occultism.
8. Instinctive mysticism.
9. Irrational sacralizations.
10. Manipulation of vulnerable consciousnesses.
11. Popular beliefs.
12. Professional esoterism.
13. Subtle *abdominal brainwashing*.

Hopes. Faced with life's problems and the need to understand human nature and the structures of the consciousness, individuals tend to place excessive hope, or have *faith*, in conventional, mechanistic, incomplete science, as though it could solve *all* of humankind's problems.

Modes. To a considerable extent, many of these problems can be resolved in other ways of understanding reality, or other modes of cognition. For example: esthetic, religious forms or non-empirical suppositions.

Integration. The author nevertheless recommends, in all honesty – as always – the integration of conventional science with the simple consciential paradigm of projectiology.

Simplicity. All things being equal, we should prefer the simpler theory or that which resorts to fewer presuppositions and paradigms. This is a concept of conventional science itself: “Occam’s razor.”

Whims. At this point, it is valuable to understand our whims, in increasing order, which manifest in 3 ways:

1. **Biomemory.** The mind – in this case the intraphysical consciousness or the consciousness with its personal cerebral dictionary and biomemory – is *less* whimsical.
2. **Will.** The will is always *moderately* whimsical.
3. **Emotion.** The emotion is always *overly* whimsical.

Forms. As previously argued, the scientific form is a singular one, among many existing alternatives, for understanding our inner and external reality.

Mentalsoma. Science shows itself to be better, because it is founded on the bases of the *evolved* mental body or mentalsoma (the consciousness).

Discernment. This signifies: logic, rationality, discernment, refutation and vanguard, relative truth.

Priority. In summary: what is presently lacking in conventional science is the more refined discernment of priority. The majority of conventional scientists have still not discovered the existence of *evolutionary intelligence*.

Psychosoma. Other lines of knowledge and human inquiry, e.g., art, esthetics and religion, establish their bases in the *less evolved* emotional body or psychosoma.

Manipulation. This signifies systematic emotionality, dogmatism, perverse indoctrination, *abdominal brainwashing*, distorted truth (subinformation, disinformation) or disguised will (the quality of intention), in order to manipulate consciousnesses or social beings.

Anticosmoethical. This troublesome, anticosmoethical work has been efficiently performed throughout the twentieth century by opinion shapers, agitators, multifaceted demagogues, merchants of many origins and the shameless manipulators of robotized consciousnesses (existential robotization).

Religious person. The religious person, when based only in the emotional body and moved by sectarianism, repudiates, with violent suspicion, the consciential qualities coming from the mentalsoma. This individual combats open education, universalistic knowledge, the intellect and science.

Piety. This individual erroneously considers these things to be destroyers of instinctive sentiment, innate intuition, *natural piety* and innocent perspicacity. This does not, however, correspond to the reality of multidimensionality and applied cosmoethics.

Tranquility. Those who merely possess *natural good sense*, lacking the logical bases of scientific research, are afraid of expressing themselves and are anxious to demonstrate that their points of view are correct. They use all their passions and sophistic weapons to this end.

Decider. The rational decider, the pointer of the discerning consciousness, cannot be moved by emotions.

Serenity. Consciousness research only becomes established in the more serene researcher.

Whys. As previously affirmed, the main mechanistic model of conventional science is presently heading toward exhaustion. It alone cannot answer all of your (the reader’s) questions and *whys* regarding the comprehension of your own complex personality. The simple intraphysical consciousness does not exist.

Self-control. For example, science still cannot explicate the following 3 aspects with reasonable explanations or techniques:

1. **Behavior.** Greater control of your personal behavior.
2. **Decisions.** Making of wiser choices in your daily life.
3. **Self-control.** The brilliant scientist's lack of emotional self-control.

Professionals. It should not be forgotten that we still encounter the following 7 categories, among others, of contradictory and embarrassing professionals with relative ease in this intraphysical society:

1. **Cardinal:** the cardinal who smokes (addicted to pipes and cigars).
2. **Dietician:** the obese dietician (addicted to food).
3. **Diplomat:** the monoglot chancellor.
4. **Journalist:** the illiterate journalist (the press).
5. **Nobelist:** the Nobel Prize winner found to be a pedophile.
6. **Lung specialist:** the lung specialist who is an inveterate smoker.
7. **Psychiatrist:** the onychophagic psychiatrist.

Participation. Therefore, if you are disillusioned with conventional science – which explains nothing about the *why*, but only about the *how* – you only stand to gain if, from this point on, you also begin your personal, participative research, in order to help improve this situation that disappoints you.

New. *Come over to science.* Help us to prove the new consciential paradigm, the emerging model, the most recent decoding or scientific systematization.

New perspective. This will signify 3 renovations or innovations:

1. **Life.** A new projectiological perspective on life.
2. **Science.** A recycling of science itself.
3. **History.** An alteration of the perspective of history.

Evidence. This is the clear objective of this book: to emphasize pieces of evidence, however small they may be, of this vanguard reality or this leading-edge relative truth, thereby presenting these ideas, which then no longer need to be reinvented in the near future, either in this human existence or in others.

Researcher. In the practical, daily life of the conscientiology (and the subdiscipline of projectiology) researcher, at least the 3 following scientific priorities, listed here in chronological order, are rationally *indispensable*:

1. **Self-organization.** Organize one's own intraconsciential, intraphysical and extraphysical life: personal discipline.
2. **Self-experimentation.** Accumulate the facts observed in the consciential dimensions: participative personal experimentation.
3. **Fixation.** Present the findings, independent of any other intercurrent factors or variables, placing the less impermanent scientific communications above the ephemeral intraphysical institutions: the fixating of leading-edge relative ideas into human life.

Self-relay. This formula, which is *simple* to present and *difficult* to execute, is a logical way for the consciousness to experience the meshing of healthy multiexistential self-relays, thereby becoming a *minicog* within a multidimensional, interconsciential, interpersonal, assistential *maximechanism*.

Fecundity. The theory defended here - in its first generation - for the integral analysis of the consciousness is stimulating and potentially fecund.

Developments. This theory at least presents a summarily influential structure in preparation for later technical developments.

Bibliography: Azevedo (63, p. 19), Grof (646, p. 1), Tart (1653, p. 153). The author's most recent work: *700 Conscientiology Experiments*.

03. ESSENTIAL CONCEPTS IN CONSCIENTIOLOGY

Definition. Conscientiology: the science that addresses the broad study of the consciousness, executed by the consciousnesses themselves through their consciential attributes, vehicles of manifestation and multidimensional consciential phenomena.

Synonymy: conscientiocentric megascience; *cosmonoetics*; egology; noetics; science of integral consciousness; *spiritology*; integral study of humans (intrapysical consciousness).

Subcourses. As affirmed in the 2 preceding chapters, religion is a kindergarten, infantile or protoknowledge consciential subcourse. Conventional, mechanistic science is yet another primary, immature consciential subcourse with regard to the multidimensionality of the consciousness.

Reinforcement. Philosophy and ideology, in turn, operate only as *gray eminences*, or secondary reinforcements, for the primary consciential evolutionary course of incomplete science.

Courses. Therefore, the study of conscientiology establishes itself as a more advanced course for the consciousness that has an integral approach, wherein the individual applies the better side of all positive knowledge that has been previously obtained throughout time (the periods of human history), in the consciential courses of religion, philosophy, ideology and incomplete science.

Sciences. The position of importance of conscientiology stands out *from all* sciences in light of its vital objectives for the consciousness itself. What is more important for us to study than our own essence? Due to its reach and scope, it transcends the studies of other advanced, correlated human sciences, such as parapsychology, psychology, psychotherapy, psychiatry and other branches or fields of knowledge.

Understanding. All science aims to broaden the understanding of the consciousness.

Anthropocentrism. The scope of human knowledge is essentially anthropocentric.

Relationships. This fact extends and generalizes the relationships of conscientiology to all sciences, without exception.

Projectiology. Of all the sciences, conscientiology's most direct, practical and evolutionary relationship is with its subdiscipline projectiology. This is due to the nature of its specialized study of the third consciential – projected – state, which projectiology researches and promotes.

Practicality. This book seeks to establish the foundations of projectiology, and not those of conscientiology, which, at first sight, might seem more logical. Nevertheless, in this case, it would only be so from a theoretical point of view.

Broadness. Besides the theoretical approach, the interest here is much broader regarding technical, suprascientific and *paratechnological* use for the intrapysical consciousness itself because it is based upon a multidimensional approach in relation to its evolutionary efforts.

Question. Within the scope of conscientiology, through a practical, experiential lens, the question remains: What better specialized study exists, in favor of the consciousness itself, than conscientiology, which has projectiology as one of its subdisciplines or areas of research?

Reflection. Reflect upon this and arrive at your own rational conclusion regarding the subject.

Goal. In this phase of consciential progress on the planet, projectiology, and the possibilities for the acceleration of evolutionary productivity that it offers, arise as the ideal and logical goal of technical investigation.

Inner. It is extremely difficult to obtain adequate data on the inner world (consciential micro-universe) of social beings or consciousnesses.

Subjectivity. Sometimes, important experimental studies can be better conducted, objectively speaking, when that which is occurring *inside* the subjects under analysis is unknown. This does not invalidate the attempt to know what *is* subjectively occurring inside the person under analysis, as well as the experimenter.

Nucleus. Obviously, any science of the consciousness – whether superficial or integral – should encounter a central or focal place for these inner or subjective facts.

Proposition. The term *conscientiology* was launched on page 15 of this book *Projectiology*, in its first edition, in 1986. There, the author categorically proposed conscientiology as a science.

Data. The science of conscientiology aims to engage itself in the study of consciousnesses in all their complexity, including subjective phenomena, whether in a partial or synthetic manner, and in a broad and analytical manner.

Methods. The author understands that there are convincing reasons for debating whether the data should be considered *scientific* while they have not satisfied the severe requirements of conventional scientific criteria. However, he disagrees that a field of study that is primarily interested in understanding human beings (and para-humans) refuses to deal with that which is superlatively human merely because it is difficult to develop conventional scientific methods for studying it, or because it would, in this way, violate expectations that are deeply rooted in any individuals, whoever they may be.

Study. Conscientiology places under scientific scrutiny all the characteristics and possibilities of the consciousness, which essentially include the inner attributes of the ego, its vehicles of manifestation and, finally, its existential, evolutionary and multidimensional consequences.

Attributes. To begin with, in any rational treatment of a subject, the primary mental capacities or the attributes of vast ingenuousness of the consciousness – but those classical, and thus far superficially known, attributes – stand out. The following, for example, are 11 attributes, among others, listed in alphabetical order, with regard to the diverse areas of conscientiology:

1. **Association.** The association of ideas or the most important overview (mentalsomatics).
2. **Attention.** Concentrated attention or concentration of attention (experimentology).
3. **Comparison.** Level of logical comparison.
4. **Comprehension.** Comprehension or understanding (thosenology).
5. **Imagination.** Imagination (paraprophylaxis, psychosomatics).
6. **Intelligence.** Intelligence or personal intelligences.
7. **Judgment.** Judgment or critical judgment, self-critique and heterocritique (conscientiometry).
8. **Memory.** Memory, holomemory or personal memories (mnemosomatics).
9. **Paraperceptibility.** Paraperceptibility or personal paraperceptions (paraperceptiology).
10. **Reason.** Reason (holomaturology).
11. **Reasoning.** Capacity for reasoning or elaboration of thought (mentalsomatics).

Holosoma. Next, we encounter the holosoma, or the 4 basic vehicles of manifestation of the consciousness:

1. **Soma.** The soma, physical perceptions and their potentialities, being the physical object most studied by humankind (somatics); most notably the brain (*mega-black-box*), or the 2 cerebral hemispheres, the most relevant reality for us all.

2. **Holochakra.** The holochakra – consensual energy (CE) and its potentialities – a very obscure territory that challenges our investigation (holochakrology).

3. **Psychosoma.** The psychosoma, emotions and their potentialities, another area that is even more obscure (psychosomatics, paraneurology, parabrain).

4. **Mentalsoma.** The mentalsoma (the body of discernment), integral maturity and its potentialities, a merely incipient technical approach (mentalsomatics), because humankind has, for millennia, dedicated itself more to superficial literature (art and recreation) and the exaltation of its animal or infantile emotions, which maintain merely common good sense and the common social being (existential robotization of the unthinking human masses).

Rationality. The complexity of life and consensual manifestations require that the subtle facts involved with the consciousness be analyzed in the greatest possible detail in order to avoid

confusion between occurrences and possible resulting errors in approach. The indispensable rationality presented here brings inarguably persuasive logic as its final compensation. Let us examine a practical example:

Holomemory. Let us now address a subtlety of holomemory or integral memory, in the micro-universe of the consciousness. For example, the extraphysical retrocognition of an intraphysical consciousness that occurred during a lucid projection which, in turn, took place during a prior resoma (a period of somatic, intraphysical, terrestrial rebirth).

Graphic. Each nuance of the facts needs to be evident and well-defined. Therefore, this *graphic analysis* is organized into 5 numbered blocks (1 to 5), with 3 variables (factors, conditions and phenomena) in each block (A, B and C), resulting in a total of 15 inseparable or interdependent analytical units (see figure 3).

A. FACTORS	B. CONDITIONS	C. PHENOMENA
1. General consciential factors: consciential attributes. They were not the consciential vehicles.	Essential consciential attribute: memory. It was not imagination or another attribute.	Essential mnemonic phenomenon: extraphysical retrocognition. It was not simulcognition or precognition.
2. General consciential state: an altered state of consciousness. It did not occur during the physical waking state.	Specific consciential condition: <i>transitory projective state</i> . It was not the intraphysical or extraphysical state.	Coadjutant projectiological phenomenon: human lucid projection (ALP). It was not para-human.
3. Factor that is most active in the consciousness: first consciential time (phase), present. It was not the consciential space.	Consciential evolutionary condition: current intraphysical state. It was not any desomatic or intermissive state.	New evolutionary phenomenon: <i>current intraphysical state</i> . The retrocognition did not occur in the past.
4. Factor most active in the consciousness: second consciential time (phase), past. It was not the consciential space.	Consciential evolutionary condition: prior intraphysical state. It was not any desomatic state.	Old evolutionary phenomena: <i>prior intraphysical state</i> . The earlier lucid projection did not occur in the current lifetime.
5. Pattern-consciential-phenomenon: recurring lucid projection. Beyond recall.	Pattern-consciential-condition: meshing of 3 lucid projective states (ALP, RLP and PLP).	Phenomena which are inset in the consciousness: recurring lucid projection (RLP) about lucid projection (PLP).

Fig. 3: GRAPHIC ANALYSIS OF AN EXTRAPHYSICAL RETROCOGNITION

Descriptive. Let us now summarize the facts in a *descriptive analysis*, from 5 different angles:

1. **Projectability.** An intraphysical consciousness, today, projects with lucidity (ALP or assisted lucid projection).

2. **Retrocognition.** During the lucid projection, the consciousness experiences an extraphysical retrocognition.

3. **Resoma.** The extraphysical retrocognition refers to a prior human existence of the projected intraphysical consciousness.

4. **Evocation.** The prior resoma (lifetime) which is recalled evokes a human lucid projection that was experienced in that period (RLP or retrocognitive lucid projection).

5. **Projection.** The lucid projection, which occurred in that previous human existence, refers precisely to the phenomenon of lucid projection (PLP or precognitive lucid projection).

Subtlety. The greatest subtlety lies precisely in the fact that 1 altered (xenophrenic) state of consciousness – the human lucid projection (no. 2C) – promoted interference in 3 evolutionary states of the same consciousness: the current intraphysical state (no. 3C); a transitory projective state (no. 2B); and a prior intraphysical state (no. 4C).

Multiplicity. Therefore, in this case, the same consciousness simultaneously analyzes the *omniplucent*, progressive, multiple vision in its internal consciential time, or 3 of its own lucid consciential projections that are encased in diverse periods and conditions.

Recollections. Chronologically, from the present to the past, 3 consecutive *recollections* also occurred:

1. **ALP.** The first, retrocognitive, current lucid projection (ALP or assisted lucid projection).
2. **RLP.** The second lucid projection (RLP or retrocognitive lucid projection) of the recalled previous human existence.
3. **PLP.** The third lucid projection inset in the other lucid projection (PLP or precognitive lucid projection), recalled in the previous intraphysical life.

Self-critique. In projective analyses, the use of self-critique is imperative.

Expectations. The contents of the extraphysical experiences can be shaped by the expectations of the projector.

Factors. In this process, 3 self-critiquing preponderant factors come into play:

1. **Bi-lucidity.** Firstly, the percentage of *extraphysical lucidity* and, secondly, the percentage of *physical lucidity*.
2. **Morphothosenes.** The knowledge of the extraphysical shapes of morphothosenes (thought-forms).
3. **Will.** The strength of the impulsion of the consciousness' will during the entire process.

Directions. But, that is not all. In any direction to which we direct the *pointer of our consciousness* in a rational search, within the consciential micro-universe, whether in the *infinity of the past*, the exploration of the present, or the *infinity of the future*, we will always encounter even more subtle and sophisticated occurrences.

Occurrences. Consciential occurrences tend to repeat themselves according to their own patterns, which are progressively encased, one inside the other, in an endless complex succession.

Processes. Still with regard to memory, other subtleties can be detected in different mnemonic processes. Examples: retrocognition of the lucid projection of our consciousness, when an extraphysical consciousness during an intermissive period; a common dream in which we dream about lucid projection; and many others.

Logic. The logic of commercial success, or shameless merchandizing (statistics, public opinion research, public opinion poll, *audience-mentality-index*, bestseller list), can neither impose the production of works in scientific institutions nor can it impose the production of works on conscientiological clarification tasks.

Truth. The rigid criterion that impels the clarification task is the *leading-edge relative truth* or polykarmality in the evolution of consciousnesses. This was the intention behind the production of this book.

Samples. The entire analysis was developed in this context without addressing the other consciential attributes, beyond memory and paraperceptibility, nor was a discrimination made of other manifestations of the vehicles of the consciousness, their actions and consequences in each circumstance.

Complexity. From the material presented above, we have only seen some samples of the complexity of the consciousness and, thereby, of conscientiology research, in its multiple areas or subdisciplines, in which projectiology is situated.

Bibliography: Vieira (1762, p. 15). The author's most recent works: *700 Conscientiology Experiments; 200 Conscientiology Theories; Conscientiogram*.

04. SUBDISCIPLINES OF CONSCIENTOLOGY

Integrity. In holomaturology, *conscientiology* is the science that studies the consciousness in an integral, holosomatic, multidimensional, multimillenary, multiexistential manner and, above all, according to its reactions in regard to immanent energies (IEs) and consciential energies (CEs), as well as in its multiple states of manifestation (thosenology).

Pulverization. It was not the intention to break up the world of conscientiology research into subdisciplines. However, in view of the broad scope of the relevant subjects that involve the intraphysical consciousness, the author could find no other educational resource than to confront this issue.

Criterion. The analysis of the synoptic table considered the *spatial presentation* of the subdisciplines into 6 logical orders as the criterion for their organization. In this case, each subdiscipline includes its successors in a logical subsequent order, each subdiscipline representing one area of delimited study within the subdiscipline of the previous logical order. For example: *holosomatics* proposes the study of the vehicles of manifestation of the consciousness: *soma*, *holochakra*, *psychosoma* and *mentalsoma*. Each of these vehicles is a very complex object of study, which makes the creation of the specific subdisciplines of each one very pertinent (see fig. 4).

Anatomy. According to the spatial criterion, the elaboration of the synoptic table is analogous to an anatomic study, through which we place each element (subdiscipline) accurately in relation to the others (parts) and the whole (conscientiology).

Evolution. Another argument that justifies this table is the *evolutionary criterion*: each subdiscipline is superior, from an evolutionary point of view, to the subdiscipline of the previous order. For example: *egokarmology*, *groupkarmology* and *polykarmology*. The evolutionary criterion does not allow its application in all cases. This is why the spatial presentation was the criterion most used in the elaboration of the synoptic table, as it is applicable in all cases.

Areas. The following are 70 areas (second version), or scientific subdisciplines, within the broad world of conscientiological research, and its main scientific subdisciplines:

1. **Androsomatics.** Androsomatics is the subdiscipline of conscientiology that studies the soma, specifically in regard to the male sex, or the *androsoma*, and its relationships to the human consciousness (intraphysical consciousness). It is a scientific subdiscipline of sexosomatics.

2. **Assistentiology.** Assistentiology is the subdiscipline of conscientiology that studies the techniques of interconsciential assistance, notably in reference to its effects for the consciousness when considered in an “integral,” holosomatic and multimillenary manner, with holomaturity in view, a work of lucid solidarity between consciousnesses on the way to megafraternity. It is a scientific subdiscipline of coexistology.

3. **Coexistology.** Coexistology is the subdiscipline of conscientiology that studies consciential communicability, with respect to the dynamics of interrelationships that are established between consciousnesses or consciential principles that coexist in any dimension as well as their holokarmic and evolutionary consequences. It is a scientific subdiscipline of communicology.

4. **Communicology.** Communicology is the subdiscipline of conscientiology that studies all natures and forms of communicability of the consciousness, including interconsciential communication between consciential dimensions, taking lucid consciential projectability into account and addresses the “entire” consciousness. It is a scientific subdiscipline of experimentology.

5. **Conscientiocentrolology.** Conscientiocentrolology is the subdiscipline of conscientiology that studies social philosophy focusing its objectives on the consciousness and its evolution through the establishment and maintenance of the *conscientiocentric institution* within conscientiological intraphysical society, based on employment and consciential bonds of intraphysical consciousnesses, in the manner of a consciential cooperative. It is a scientific subdiscipline of parasociology.

Synoptic Table - 70 Subdisciplines of Conscientiology

1st Logical Order	2nd Logical Order	3rd Logical Order	4th Logical Order	5th Logical Order	6th Logical Order		
thosenology	evolutiology	experimentology	parabiology	parabotany			
				parazoology			
				coexistiology	assistentiology		
			communicology	projectology	projectiography	projectiocritique	
				cosmo-analysis			
				parapedagoogy	infocommunicology		
			holoresomatics	intraphtsycology	resomatics	existential programology	
					existential invertology		
					existential recyclology		
			extraphtsycology	desomatics	intemissiology		
					parageography		
					paratechnology		
			parasociology	conscientiocentrology	parahistory		
					paraprophyaxis		
					parasemiology		
paratherapeutics	projectiotherapy	paratherapeutics					
		paraprophyaxis					
		parasurgery	para-anesthesia				
parakarmology	egokarmology groupkarmology polykarmology	parakarmology	para-asepsis				
		parakarmology	parahemostasis				
		parakarmology	paracicatization				
holomaturology	conscientiometry	petifreeology					
		serenology

			mentalsomatics	mnemosomatics			
			para-anatomy				
			paraphysiology	paraphenomenology	paraperceptiology		
				pararegeneration		cosmoconscientiology	
			parapathology				
homeostatics							

6. **Conscientiometry.** Conscientiometry is the subdiscipline of conscientiology that studies conscientiological (of the consciousness) measurements, through resources and methods that address the “entire” consciousness, capable of establishing the possible bases for the *mathematical analysis of the consciousness*. One example is the conscientiogram. It is a scientific subdiscipline of holomaturology.

7. **Conscientiotherapy.** Conscientiotherapy is the subdiscipline of conscientiology that studies the treatment, alleviation and remission of disturbances of the consciousness, through resources and techniques derived from addressing the “entire” consciousness, in its pathologies and parapatologies. It is a scientific subdiscipline of experimentology.

8. **Cosmo-analysis.** Cosmo-analysis is the subdiscipline of conscientiology that studies the practical application of the *cosmogram* or the technical data sheet for the evaluative determination of the realities of the universe, filtered by the multidimensional principles of conscientiology, through the maximal association of ideas (panoramic vision), stemming from the facts (phenomenology) that reach and involve the holothosene of the self- and heterocritiquing human personality. It is a scientific subdiscipline of communicology.

9. **Cosmoconscientiology.** Cosmoconscientiology is the subdiscipline of conscientiology that studies the expansion of the consciousness, or the phenomenon of cosmoconsciousness, in the mentalsoma. It is a scientific subdiscipline of paraperceptology.

10. **Cosmoethics.** Cosmoethics is the subdiscipline of conscientiology that studies ethics or reflection upon multidimensional, cosmic morals, which define consciential holomaturity, situated beyond social, intraphysical morals or that which is presented under any human label, in the form of a maximum, moral and emotional discernment stemming from the intimacy of the micro-universe of each consciousness. It is a scientific subdiscipline of evolutiology.

11. **Desomatics.** Desomatics is the subdiscipline of conscientiology that studies the physical contexts of desoma (biological death), and the consciential, psychological, social, medicolegal and multidimensional contexts associated with the deactivation of the soma (human body), as well as the second and third desomas and their consequences. It is a scientific subdiscipline of intraphysiology.

12. **Egokarmology.** Egokarmology is the subdiscipline of conscientiology that studies the relationships or principles of cause and effect active in the evolution of the consciousness when centered exclusively on the ego itself. It is a scientific subdiscipline of holokarmology.

13. **Evolutiology.** Evolutiology is the subdiscipline of conscientiology that studies the evolution of the consciousness at a high-level, considered in an integral, holosomatic, multi-existential and multidimensional fashion, a subject matter specific to the evolutionary orienter or evolutiologist. It is a scientific subdiscipline of thosenology.

14. **Existential invertology.** Existential invertology is the subdiscipline of conscientiology that studies the philosophy, technique and practice of *existential* (human) *inversion*. It is a scientific subdiscipline of intraphysiology.

15. **Existential programology.** Existential programology is the subdiscipline of conscientiology that studies the *existential program* of intraphysical consciousnesses, in general, and its evolutionary consequences. It is a scientific subdiscipline of intraphysiology.

16. **Existential recyclology.** Existential recyclology is the subdiscipline of conscientiology that studies the philosophical, technical and practical aspects of existential recycling, within intraphysicality, which begins with intraconsciential recycling. It is a scientific subdiscipline of intraphysiology.

17. **Experimentology.** Experimentology is the subdiscipline of conscientiology that studies all forms and categories of evolutionary experiments of the consciousness. It is a scientific subdiscipline of evolutiology.

18. **Extraphysiology.** Extraphysiology is the subdiscipline of conscientiology that studies the relationships and experiences of the intraphysical consciousness in other dimensions beyond intraphysicality. It is a scientific subdiscipline of holosomatics.

19. **Groupkarmology.** Groupkarmology is the subdiscipline of conscientiology that studies the relationships or principles of cause and effect active in the evolution of the consciousness when centered on the evolutionary group. It is a scientific subdiscipline of holokarmology.

20. **Gynosomatics.** Gynosomatics is the subdiscipline of conscientiology that studies the soma, specifically in regard to the female gender, or *gynosoma*, and its relationships with the human consciousness (intrapysical consciousness). It is a scientific subdiscipline of sexesomatics.

21. **Holochakrology.** Holochakrology is the subdiscipline of conscientiology that studies the quality of the manifestations of the human consciousness (intrapysical consciousness) deriving from the holochakra or energetic parabody. It is a scientific subdiscipline of holosomatics.

22. **Holokarmology.** Holokarmology is the subdiscipline of conscientiology that studies the holokarmic account of the consciousness in evolution encompassing egokarmality, groupkarmality and polykarmality. It is a scientific subdiscipline of evolutiology.

23. **Holomaturology.** Holomaturology is the subdiscipline of conscientiology that studies the holomaturity of the human consciousness – or integral, biological, psychological (mental) and multidimensional or holosomatic maturity – in all of its forms of manifestation and evolutionary consequences. It is a scientific subdiscipline of evolutiology.

24. **Holoresomatics.** Holoresomatics is the subdiscipline of conscientiology that studies existential seriality and evolutionary multiexistential cycles or successive intrapysical resomas, along with their implications for and repercussions upon the human consciousness, also relative to interplanetary transmigration. It is a scientific subdiscipline of experimentology.

25. **Holosomatics.** Holosomatics is the subdiscipline of conscientiology that studies the holosoma (the set of vehicles of manifestation), its functions and applications by the (intrapysical or extrapysical) consciousness. It is a scientific subdiscipline of thosenology.

26. **Homeostatics.** Homeostatics is the subdiscipline of conscientiology that studies the theorice of *holosomatic homeostasis* or the integrated, healthy, harmonic state of the holosoma, in order for the intrapysical consciousness to live better and with greater efficiency in the execution of his/her existential program. It is a scientific subdiscipline of holosomatics.

27. **Infocommunicology.** Infocommunicology is the subdiscipline of conscientiology that studies information technology applied the contexts of communication and the didactics of the consciousness, when considered as a “whole.” It is a scientific subdiscipline of parapädagogy.

28. **Intermissiology.** Intermissiology is the subdiscipline of conscientiology that studies the *period of intermission* of the consciousness in evolution, situated between two of its personal lifetimes, within its multiexistential evolutionary cycle. It is a scientific subdiscipline of extrapysicology.

29. **Intrapysicology.** Intrapysicology is the subdiscipline of conscientiology that studies the relations and experiences of the intrapysical consciousness in this intrapysical or human dimension. It is a scientific subdiscipline of holoresomatics.

30. **Macrosomatics.** Macrosomatics is the subdiscipline of conscientiology that studies the macrosoma, the *extraordinary* soma suitable for the execution of a specific existential program. It is a scientific subdiscipline of somatics.

31. **Mentalsomatics.** Mentalsomatics is the subdiscipline of conscientiology that studies the mentalsoma (the parabody of discernment) and its evolutionary consequences for the consciousness. It is a scientific subdiscipline of holosomatics.

32. **Mnemosomatics.** Mnemosomatics is the subdiscipline of conscientiology that studies the soma specifically in relation to the intrasomatic memories, spanning from the cerebral memory or basic biomemory of the human being, up to the point of achieving holomemory. It is a scientific subdiscipline of mentalsomatics.

33. **Para-anatomy.** Para-anatomy is the subdiscipline of conscientiology that studies the anatomy that transcends intrapysicality, when considering the vehicles of manifestation of the consciousness other than the soma. It is a scientific subdiscipline of holosomatics.

34. **Para-anesthesia.** Para-anesthesia (para-anesthesiology) is the subdiscipline of conscientiology that studies the anesthesia that transcends the resources of intrapysicality, through parapsychism. It is a scientific subdiscipline of parasurgery (conscientiotherapy).

35. **Para-asepsis.** Para-asepsis is the subdiscipline of conscientiology that studies the asepsis that transcends the resources of intraphysicality, through parapsychism. It is a scientific subdiscipline of parasurgery (conscientiotherapy).

36. **Parabiology.** Parabiology is the subdiscipline of conscientiology that studies living beings, in their multidimensional and multivehicular relationships. It is a scientific subdiscipline of experimentology.

37. **Parabotany.** Parabotany is the subdiscipline of conscientiology that studies the manifestation of consciential principles in the primary condition of plants, or paraflora. It is a scientific subdiscipline of parabiology.

38. **Parachronology.** Parachronology is the subdiscipline of conscientiology that studies the chronology of manifestations of consciousnesses beyond intraphysicality, as well as the other consciential dimensions, holobiographies and multidimensionality. It is a scientific subdiscipline of holosomatics.

39. **Paragenetics.** Paragenetics is the subdiscipline of conscientiology that studies compound and integral genetics, encompassing all of the consciousness' holosomatic inheritances from the retrosomas of previous lives – through the psychosoma and mentalsoma – up to the current human embryo as an intraphysical consciousness. It is a scientific subdiscipline of psychosomatics.

40. **Parageography.** Parageography is the subdiscipline of conscientiology that studies the description of the paratroposphere, including its parageographic accidents and extraphysical environments, as well as the relationships between this environment and the parapopulation (autochthonous and/or transient). It is a scientific subdiscipline of extraphysiology.

41. **Paracicatrization.** Paracicatrization is the subdiscipline of conscientiology that studies the healing which transcends the resources of intraphysicality, through parapsychism. It is a scientific subdiscipline of parasurgery.

42. **Parahemostasis.** Parahemostasis is the subdiscipline of conscientiology that studies the hemostasis that transcends the resources of intraphysicality, through parapsychism. It is a scientific subdiscipline of parasurgery (conscientiotherapy).

43. **Parahistory.** Parahistory is the subdiscipline of conscientiology that studies the history of the consciousness and the cosmos, beyond the autobiography of the intraphysical consciousness in the current human life, as well as human history, in a multidimensional manner through extraphysiology, retrocognitions and lucid consciential projectability. It is a scientific subdiscipline of parachronology.

44. **Paraneurology.** Paraneurology is the subdiscipline of conscientiology that studies the parabrain and its relationships with the physical brain, the nervous system and the other vehicles of the holosoma. It is a scientific subdiscipline of psychosomatics.

45. **Parapathology.** Parapathology is the subdiscipline of conscientiology that studies the pathology of the vehicles of manifestation of the consciousness or the holosoma (holochakra, psychosoma and mentalsoma), excluding the human body (soma). It is a scientific subdiscipline of holosomatics.

46. **Parapedagogy.** Parapedagogy is the subdiscipline of conscientiology that studies the philosophy of education and pedagogy beyond the resources of intraphysicality, through lucid multidimensionality, projectability of the human consciousness, and its consequences in human life. It is a scientific subdiscipline of communicology.

47. **Paraperceptiology.** Paraperceptiology is the subdiscipline of conscientiology that studies the paraperceptions of the consciousness, beyond the perceptions restricted to the human body (soma), its phenomena and evolutionary consequences. It is a scientific subdiscipline of paraphenomenology.

48. **Paraphenomenology.** Paraphenomenology is the subdiscipline of conscientiology that studies the parapsychic manifestations of the human consciousness, whether they are of a subjective (intraconsciential), ambivalent or objective (perceptible to the external environment) order, through the use of the holosoma and mobilization of consciential energies. It is a scientific subdiscipline of paraphysiology.

49. **Paraphysiology.** Paraphysiology is the subdiscipline of conscientiology that studies the functions of the vehicles of manifestation of the consciousness or holosoma (holochakra, psychosoma and mentalsoma), excluding the human body (soma). It is a scientific subdiscipline of holosomatics.

50. **Paraprophylaxis.** Paraprophylaxis is the subdiscipline of conscientiology that studies the prophylaxis that transcends the limits of intraphysiology in order to prevent the consciousness from errors and inconveniences in all dimensions wherein it manifests. It is a scientific subdiscipline of paratreatment (conscientiotherapy).

51. **Pararegeneration.** Pararegeneration is the subdiscipline of conscientiology that studies the anatomic and/or functional regeneration of the vehicles of manifestation of the consciousness (holosoma), beyond the human body, in which paracitrization and paratransfiguration are included. It is a scientific subdiscipline of paraphysiology.

52. **Parasemiology.** Parasemiology is the subdiscipline of conscientiology that studies the investigation and identification – beyond intraphysicality – of para-symptomatology and the paraisms of disturbances and parapathologies of the consciousness, when considered as a “whole,” (holosomatic, integral), through parapsychism and paraperceptiology. It is a scientific subdiscipline of paratreatment.

53. **Parasociology.** Parasociology is the subdiscipline of conscientiology that studies the philosophy, techniques and practices of conscientiological intraphysical society and extraphysical societies of extraphysical consciousnesses, as well as their consequences in human, extraphysical and projective life. It is a scientific subdiscipline of holoresomatics.

54. **Parasurgery.** Parasurgery is the subdiscipline of conscientiology that studies the surgery that transcends the resources of intraphysicality, through parapsychism (paraperceptiology). It is a scientific subdiscipline of conscientiotherapy.

55. **Paratechnology.** Paratechnology is the subdiscipline of conscientiology that studies the technology of the consciousness – when considered as a “whole” – and its consequences, applying all the specific methodology for the expansion of the intraphysical consciousness’ self-knowledge, including projective techniques, in general. It is a scientific subdiscipline of extraphysiology.

56. **Paratherapeutics.** Paratherapeutics is the subdiscipline of conscientiology that studies the therapeutics or treatment of ill consciousnesses, as developed by conscientiotherapy. It is a scientific subdiscipline of paratreatment (conscientiotherapy).

57. **Paratreatment.** Paratreatment is the subdiscipline of conscientiology that studies the clinical practice or the care of sick patients beyond intraphysicality, through parapsychism. It is a scientific subdiscipline of conscientiotherapy.

58. **Parazology.** Parazology is the subdiscipline of conscientiology that studies the manifestation of the consciential principles which are in the condition of subhuman animals, or parafauna. It is a scientific subdiscipline of parabiology.

59. **Petifreeology.** Petifreeology is the subdiscipline of conscientiology that studies the petifree condition or the evolutionary, consciential quality of the awakened human being who no longer suffers from pathological interconsciential intrusions and all harmful evolutionary consequences of this uncomfortable condition. It is a scientific subdiscipline of conscientimetry (holomaturology).

60. **Polykarmology.** Polykarmology is the subdiscipline of conscientiology that studies the relationships or principles of cause and effect active in the evolution of the consciousness, when centered in the understanding and experience of cosmic maxifraternity, beyond egokarma and groupkarma. It is a scientific subdiscipline of holokarmology.

61. **Projectiocritique.** Projectiocritique is the subdiscipline of conscientiology that studies *projectiological critique* in general, which is extremely relevant within the consciential paradigm. It is a scientific subdiscipline of projectiology.

62. **Projectiography.** Projectiography is the subdiscipline of conscientiology that performs the technical study of projectiological accounts. It is a scientific subdiscipline of projectiology.

63. **Projectiology.** Projectiology is the subdiscipline of conscientiology that studies projections of the consciousness and their effects, including projections of consciential energies outside the

holosoma. This represents the subject and object of study of this book. It is a scientific subdiscipline of communicology (interdimensionality).

64. **Projectiotherapy.** Projectiotherapy is the subdiscipline of conscientiology that studies the prophylaxis and therapies derived from the research and techniques of projectiology. It is a scientific subdiscipline of paratreatment (conscientiotherapy).

65. **Psychosomatics.** Psychosomatics is the subdiscipline of conscientiology that studies the emotions of the consciousness stemming from the psychosoma, the parabody of desires. It is a scientific subdiscipline of holosomatics.

66. **Resomatics.** Resomatics is the subdiscipline of conscientiology that studies the somatic rebirth of the extraphysical consciousness which passes over to the temporary condition of being an intraphysical consciousness or, in other words, leaves extraphysicality for intraphysicality. It is a scientific subdiscipline of intraphysiology.

67. **Serenology.** Serenology is the subdiscipline of conscientiology that studies the *Homo sapiens serenissimus (serenissimus)*, its personal traits, characteristics and evolutionary consequences. It is a scientific subdiscipline of conscientimetry (holomaturology).

68. **Sexosomatics.** Sexosomatics is the subdiscipline of conscientiology that studies the soma specifically in regard to its gender, or the *sexosoma*, and its relationships with the human consciousness, whether it is a man or woman. It is a scientific subdiscipline of somatics.

69. **Somatics.** Somatics is the subdiscipline of conscientiology that studies the soma (human body) within the holosoma, or in relation to the other vehicles of manifestation of the consciousness, in its multidimensional evolution. It is a scientific subdiscipline of holosomatics.

70. **Thosenology.** Thosenology is the subdiscipline of conscientiology that studies *thosenes* (thoughts, sentiments and energies), *thosenity* and the *thosenators* of the consciousness, its paraphysiology and parapatology. *Self-thosenity* is the mechanism of incessant expression of the consciousness in all of its manifestations, in any consciential dimension, thosenology consequently being the concept (theory) and substratum (practice) of the establishment of the science of *conscientiology*, an area not yet (2002) discovered by conventional sciences.

Course. According to mentalsomatics, a standard conscientiology course, within formal education, needs to include at least these 70 areas of study or disciplines and their most notable scientific subdisciplines.

Originality. Within these areas, there are 12 which are more original and more relevant in regard to their technical objectives and consequences. They are listed below, with their salient points for research:

1. **Conscientiocentrology:** the consciential bond in conscientiological intraphysical society.
2. **Conscientiotherapy:** the daily practice of *penta* (assistentiology).
3. **Cosmoethics:** evolutionary consciential incorruptibility.
4. **Existential invertology:** the performance of the *clarification task* by the evolutionary duo.
5. **Existential programology:** the self-aware conquest of *existential completism* and *existential moratorium*.
6. **Holomaturology:** the recuperation of *cons* or hyperacuity in human existence.
7. **Macrosomatics:** the intraphysical consciousness who has a *macrosoma*, being an active minicog in an assistential, interconsciential and multidimensional maximechanism.
8. **Paragenetics:** innate ideas and their consequences in intraphysical life.
9. **Petifreeology:** the lucid *consciential epicenter*.
10. **Projectiology:** the condition of multidimensional self-awareness (MS).
11. **Serenology:** *Homo sapiens serenissimus (serenissimus)* as an evolutionary model.
12. **Thosenology:** the personal or group *holothosene* and its fundamental *materthosene*.

05. ESSENTIAL CONCEPTS IN PROJECTIOLOGY

Definitions. Projectiology (Latin: *projectio*, projection; Greek: *logos*, treatise): the science that addresses the passage of the intraphysical, or extraphysical, consciousness to the projected state, as well as the conditions of the consciousness in this state; the human science that investigates the energetic projections of the consciousness using the energetic body and projections of the consciousness using the psychosoma and mentalsoma outward from the human body or, in other words, the actions of the consciousness operating outside the state of intraphysical cerebral restriction and the entire biological body.

Synonymy: discoincidentiology; holosomology; OBEology; projectionics; projectionism; projectionistics; projectionomy; projectiotronics; science of interdimensionality; study of extracorporeal phenomena; study of projections of the consciousness; systematized self-revelation; unfoldology.

Unity. According to existing didactic principles, the infancy of all science is characterized by focusing upon the search for relevant variables, singular data, unconnected classifications and hypotheses that subsequently establish relationships between these variables and explain the data.

Semi-empiricism. Here, the quest is precisely to overcome this initial, semi-empirical stage of science, which the author calls *projectiology*, a subdiscipline or area of conscientiology, giving it a logical unity.

Gaps. Although the phenomenon of lucid projection has been known for millennia, projectiology is a relatively new area of study that is still developing, because its systematic research is recent. There are thus a considerable number of gaps in its scientific field that will certainly be filled over time through the accumulation of investigations and judicious technical analysis.

Provisory. The data currently available on projectiology, albeit numerous, are provisory to the degree that they almost always represent tentative approaches to projective phenomena and their consequences.

Publications. A considerable number of scientific literary publications contain defects in structure, errors in statistical analysis and misleading interpretations.

Methods. Methods of experimentation and analysis are, nevertheless, constantly being improved.

Estimates. Quantitative estimates are gradually becoming more exact. However, this does not signify that previously developed work was not *scientific* or important for its time.

Evolution. The dynamic of science constantly changes and evolves.

Imagination. It only, erroneously, achieves the status of absolute truth in popular imagination.

Cycle. The *cycle of science* is the process of *selection* and comparison, which occurs on an ongoing basis in areas of research.

Truths. Thanks to the cycle of science, renovations and new leading-edge (vanguard) relative truths arise.

Research. On the other hand, what has been shown thus far, does not imply that existing individual studies and laboratory research on projectiology lack value or significance. Quite to the contrary, the continued analysis of these data – still valid – constitutes precisely the way which is currently adequate and ideal for achieving continuous progress.

Critique. With the critiquing of existing inconclusive data, there will doubtless arise new conditions and situations for which new research and data will be necessary, in a continuous process of inquiry and temporary solutions, as has occurred and will continue to occur in the evolution of any science.

Directions. At *best*, the experiments of today will determine new directions. At the very *worst*, they will prove to be fruitless.

Pseudoproblems. Nevertheless, many experiments will serve to remove *pseudoproblems*, the controversies of lesser value and the *methodological fallacies* that impede each stage of scientific advancement.

Results. In fact, there is no such thing as a negative or unsuccessful result in a scientific experiment. All data obtained offers information for the ready mind of the intraphysical consciousness, who respects the findings and does not allow the hypotheses to impede research and new investigations.

Security. In order for a science or a theory to be operational, it does not have to be attack-proof.

Medicine. Let us consider medicine, for example. It is based upon a vast body of concrete facts and sound theories. Nevertheless, it *cannot be applied* with mathematical certainty in many of its areas or subdisciplines.

Errors. Errors can be and are committed, even by the most experienced researchers and specialists in the medical field. There is and will always be a necessity for estimating possibilities, exercising critical judgment and applying intuitive perception, just as much in diagnostics as in therapeutics.

Reason. However, this fact does not constitute sufficient reason for abandoning medicine, returning to the days in which it was still not a science per se.

Hypotheses. Even though many hypotheses proposed by projectiology are still in a phase of research and experimentation, they possess the characteristics that scientific method requires, in terms of quality.

Manner. Projectiology is science, although it is not science in the same manner as physics, mathematics, or even biology.

Humanism. Projectiology is a human science, with its own scientific profile, characterized by a new, more evolved scientific model. As a human science, projectiology also needs to be complemented in the philosophical arena.

Complement. The comprehensive view of projectiology involves a treatment that is simultaneously scientific and philosophical, as both are complements of an organic and logical whole.

Singularity. Scientific projectiology cannot be reduced to experimental projectiology.

Experimentation. Science is not synonymous with experimentation. If some aspects of projectiology can be controlled experimentally, others do not fit within this type of model.

Scope. Projectiology is *also* science, but *not only* experimental science. It requires theories and methods that are adapted to the singularity of its scope – the human being – when considered in a broad, comprehensive, integral, holosomatic, multidimensional, multiexistential, holomnemonic manner.

Neoparadigm. Projectiology experiments are based upon the leading theory or the consciential neoparadigm.

Establishment. In spite of the aforementioned precedents, the author endeavors to clearly and rationally present and establish 9 objectives in this book:

1. Essential or theoretical concepts.
2. Postulates.
3. Parameters.
4. Objects of study.
5. Collimation of objectives.
6. Pragmatic, empirical and scientific applications.
7. Operational or pragmatic concepts.
8. Experiments.
9. The theoretical and scientific body, which defines the sphere of action of projectiology and differentiates it, making it distinct from other sciences.

Criteria. The author considers it unnecessary to explain scientific criteria and the epistemological validity of a given branch of human knowledge. This would be tiresome, as the average reader can easily evaluate them.

Naturalist. The characteristic aspect of the individual, subjective phenomenon of the human lucid projection experience, establishes the conditions for the existence of *subjective projectiology*. However, certain occurrences – such as physical bilocation – also speak in favor of a *naturalist* projectiology, or one of objective, ostensive, physically visible manifestations that stem from the consciousness, when projected.

Universalism. The truth and validity of knowledge has no boundaries. *Scientific* nationalism and *cultural* nationalism, in general, inevitably lead to stagnation.

Universal. Science is one thing only: it is either universal (international) or it is not science.

Limitations. Science in general, just as psychology or parapsychology in particular, and projectiology itself, are areas or branches of human knowledge that are entirely broad and universalistic. They cannot accept labels or limitations and should be developed without temporal human obligations, devoid of scientific or philosophical sectarianisms, or any kind of castrating ideologies.

Uncommitted. The dispassionate object of study and rational methodology of projectiology has no implicit or explicit commitment to any particular psychic, social, political, economic, philosophical or religious area.

Monopoly. In summary: projectiology should neither be monopolized by cults nor co-opted by competing or rival governments, whether from an ideological or military point of view.

Foundations. We present, in this book, the foundations of a science – projectiology. The attentive observer, based on the immaturity of every new science, may consider it inopportune or premature to ponder the *foundations* of projectiology.

Search. However, it is reasonable and fair to think about projectiological foundations, because other sciences, even those which are most *venerated*, continue to struggle in the search for their solid foundations, as can be seen with these two examples:

1. **Mathematics.** Mathematics, for example, is faced with its non-solid foundations, as it is still in search of a position regarding the irrational, abyssal inscrutability – which we cannot comprehend – of *whole natural numbers*, the fundamental parts upon which this science is essentially based.

2. **Physics.** Physics – hard science – dedicates itself to the area of the uncertainty principle, along with the probability theory (the *background* of the possible), the challenge of entropy and other worthy concepts, in order to overcome the immeasurability of the illimitable.

Presupposition. In physics, when applied to technology, the real experiment, e.g., a particle in a cyclotron, is a case of “more or less,” of irrational, statistical presupposition. It does not adapt itself perfectly to calculated probability, therefore making it impossible to effect concrete, accurate and real predictions.

Senses. Many of the themes addressed and concepts cited here are treated more *descriptively* and not *explanatorily* due to the new and often unexplored globalizing nature of the perspectives themselves.

Bibliography: Recent work by the author: *700 Conscientiology Experiments* (in Portuguese).

06. PROJECTIOLOGY AND TERMINOLOGY

Definition. Terminology: the set of terms characteristic of a science.

Synonymy: jargon; nomenclature; professional slang; technical language.

Organization. Until now, a consensus has not been achieved, at an international level, regarding the problem of composing and organizing international terminology, such as parapsychological terms.

Phenomena. The incongruity and multiplicity of existing names for the phenomena of projectiology show the uselessness and subsequent necessity for the use, creation or adoption of its own terms.

Discoveries. No one denies the need for new words, or acceptance of old distended words, in order to name new facts and new ideas. As with other sciences, projectiology needs its own words. How can the newness of its discoveries and conceptions be formulated without using new terms? The absence of preconceptions, even in terminology, is a condition for true discovery.

Precision. Science demands very precise language.

Language. Everyday language is not the ideal medium for parapsychic subtleties.

Sense. Any scientific discovery takes shape, not by molding to common sense, but by going beyond it or against it.

Senses. Ordinary language (colloquialism) does not have words for defining consciential structures and movements which do not exist according to common sense and are not restricted to the scope of the 5 basic senses of the human body (soma).

Polysemy. The same thing that happens with many other languages occurs with projectiological terminology: the inevitable incidence of polysemy and semantic overlap.

Barbarisms. The barbarisms and binomial expressions that exist within the scope of parapsychology – e.g., *psychometry* and *autoscopy* – sometimes require observations regarding their use, in order to avoid confusions regarding their meaning, especially when they refer to psychopathologies.

Systematization. It was necessary to invent new words having their own, general, systematic nomenclature in light of the reasons presented, for the sake of convenience, in order to avoid confusion, and to form a practical and functional vocabulary, in an effort to supply rationalization and organization for those occurrences that require it.

Neologisms. Therefore, a cast of coherent, inevitable neologisms, and their cognates, were proposed in a compilation of compound expressions, or umbrella terms, for phenomena which have no name or have no denomination within projectiology, such as the following 64: *adenoprojection; archeoprojection; audioprojection; barioprojection; biprojection; carbonoprojection; cephaloprojection; cephalosoma; chakroprojection; colorprojection; conscientiogram; conscientiologist; cosmoethics; cosmoprojection; deuteriosoma; echocephalous; egokarma; electropjection; epiprojection; groupkarma; gyropjection; holochakra; holokarma; holosoma; hydroprojection; hypnopjection; libidoprojection; megamaturity; musicoprojection; narcoprojection; nephoprojection; oligoprojection; omnicooperation; oneirojection; paraperceptibility; parapsychosphere; pedoprojection; pneumoprojection; podoprojection; polykarma; primoprojection; projectability; projectarium; projectiatry; projecting; projectiocritique; projectiography; projectiolatry; projectiologist; projectionalia; projectionate; projectionism; projectionomy; projectiophobia; projectiorrhoea; projectiotherapy; projectiotoxin; psychomyology; self-hypnopjection; stroboprojection; theorice; traumatoprojection; trithanatosism; verbaaction; and others.*

Uninominality. As will be seen in the texts, the neologisms were not conceived arbitrarily. Preference was always given to the shortest possible uninominal expressions.

Problem. The problem is that there is not always a *less undesirable short expression*.

Encyclopedia. No encyclopedia can encompass the current world. More than half of the terms and concepts that the reader uses to speak about the present on an everyday basis, did not exist a century ago. These are of greater interest, because they direct your future. They are also the ones that the reader is frequently less familiar with.

Meanings. It will always be important to clearly differentiate expressions and the meanings of words, in order to avoid misunderstanding, subinformation and misinformation.

Tedium. Over time, terms bore people. We need to understand each other in order to comprehend the events around us.

Expressions. Words and expressions have a relative importance. As long as the necessary conventions, permitting an easy and accurate identification of the object named or the exact phenomenon under analysis are established, there is, in fact, no argument against the use of this or that nomenclature or terminology.

Glossary. This is why the *Glossary of Projectiology* was included at the end of this volume and the majority of chapters have their own synonymy in reference to their theme.

Fragmentation. Science is an engine that propels our intraphysical society. Nevertheless, it is being fragmented into more and more subdisciplines.

Codification. Each of these subdisciplines creates and uses its own coded language, obscure idiom or particular jargon.

Segregation. In ancient times, the precursors of science used Latin as a form of communication and, at the same time, as a way of distancing themselves from that which was popular. Today, specialized, scientific language *first* divides scientists into small *esoteric groups*. Closed off within the walls of university and research centers, researchers, professors and students work in premature and uninterrupted segregation. *Later*, the same *esoteric language* distances them from the public. These are the facts as they stand.

Myths. The *raison d'être* of science is to eliminate myths and mysteries. Unfortunately, however, we can conclude that science paradoxically creates its own myths and mysteries for the populace.

Divisiveness. In addition to the terminology of projectiology, and in order to minimize this great divisive problem of language, the technique of using the most universalistic (exhaustibility) definitions and copious synonymies, tending to establish a cohesion of ideas and efforts, with descriptive expressions, was used in this book. This aims to facilitate comprehension by the general reader.

Basis. We have named the phenomena and occurrences around us in a manner that is most adequate, according to our concepts, preconceptions and conditioning. Choose your favorite expressions. It will, however, be a measure of intelligence if one does not fail to understand the text and the experiments (basis, content, essence) because of the words.

Meanings. Words do not have meaning per se. Only concepts and experiences have significance. Here, background (content) does not deserve to be sacrificed in favor of form (frame), according to the intelligent premises of *confor* and *theorice*.

Symbol. Any word, however valid or appropriate it may be, is only a symbol of something that is behind it.

Word. Science does not have a word cult, nor does it perform *linguistic circumlocution*.

Fact. Words (linguistic symbols) rarely completely and accurately represent the fact or phenomenon to which they refer.

Content. Endless controversies regarding words (*word traps*) constitute a loss of resources, effort, time, attention and consciential energy.

Substance. It is essential that the priority questions of substance be studied.

Exoticism. Do not be surprised by the expressions. In the glossaries of technical terms, the interested individual will easily encounter expressions such as, “ageostrophic advection,” “solstitial colure,” or “hypergolic propergol” which, although exotic for the lay reader, are rational, coherent, precise and fluently employed in their fields, even in colloquial or everyday language.

Gongorism. The facts indicate that there is an inevitable international *technical Gongorism*.

Coherence. It is to be hoped that someone will appear in the near future and rename all parapsychic facts in a more adequate manner, establishing a coherent and even more concordant terminology.

Term. The author proposed the term *projeciologia* (projectiology) to name (or denominate) the science of consciential projection, on page 40 of the book *Projections of the Consciousness: A Diary of Out-of-Body Experiences*, published in São Paulo, Brazil, in 1981.

Translations. The following is the term *projeciologia* (Portuguese language) translated to 5 other languages:

1. **English:** *projectiology*;
2. **French:** *projectiologie*;
3. **German:** *projektiologie*;
4. **Spanish:** *proyecciología*;
5. **Italian:** *proiettologia*.

Certificate. The first edition of this book in Portuguese (*Projectiology: Panorama of Experiences of the Consciousness Outside the Human Body*), published in Rio de Janeiro, in 1986, constituted the birth certificate of this new science – *projectiology* – an area or subdiscipline of conscientiology.

Semantics. Semantics alters nothing in the structure of phenomena.

Conditioning. However, the conditioning and repression of the immature human being arises in all sectors of human existence.

Euphemisms. Researchers, even when *more advanced*, but *less* audacious, in the field of science, coin scientific euphemisms. They aim, with this attitude, to *sugarcoat* that which is non-orthodox (unorthodox, heterodox) or make it more acceptable or respectable.

Jargon. Thus, *fake technical jargon* is born. This is what generally happens nowadays in snobbish intraphysical societies or in the *dictionary of politically correct expressions*.

Glossed. The following, for example, are 13 *glossed* terms, or glossed expressions. They are *easier to swallow* for those who still prefer to maintain their narrow mindedness in regard to parapsychic phenomena:

1. **Autotelediplosia** – instead of physical bilocation.
2. **Biocommunication** – instead of telepathy or thought transmission.
3. **Dermo-optic vision** – instead of transposition of the sense of vision or extra-retinal vision.
4. **Ectesthesia** – instead of exteriorization of sensitivity.
5. **Ectometaplasia** – instead of materialization of the extraphysical consciousness.
6. **Electrodermic points** – instead of acupuncture points.
7. **Electrophotography** – instead of *Kirlian photography*.
8. **Non-verbal communication** – instead of extrasensory perception.
9. **OBE** – instead of out-of-body experience.
10. **Parapsychology** – instead of metapsychics.
11. **Psychotronics** – instead of psychokinesis (parapsychology).
12. **Remote viewing** – instead of extracorporeal experience or departure of the consciousness from the human body with perceptions at a distance.
13. **Sophrology** – instead of mesmeric passes or animal magnetism.

Conscientiology. Projectiology remains definitively, structurally linked to the vast field of conscientiology (egology), namely to the center of sciences and the center of philosophies.

States. The study of conscientiology can be divided into 3 states:

1. **Extraphysiology.** The state of the extraphysical consciousness.
2. **Intraphysiology.** The state of the intraphysical consciousness.
3. **Projectiology.** The state of the projected consciousness (projective state).

Discoincidence. Projectiology presents a sufficiently broad field of research of manifestations if we include the exteriorization of energies, the *appendices* and exterior actions stemming from the consciousness. Nevertheless, all this occurs without the consciousness going along or, in other words: without it temporarily leaving its base in the cerebral hemispheres. Examples: the projection of the isolated

holochakra (an energetic projection that some individuals confuse with projection of the mentalsoma); projections of the human aura; projection of the isolated *silver cord*; the common phenomenon of psychophony; and others.

Amplitude. In summary: only in regard to the occurrence of *discoincidentiology* is the world of projectiology research far more ample than it appears upon first analysis.

Autonomy. Those who wish to help make projectiology an entirely independent and autonomous science, with its own object and method, will need to use a *phenomenological perspective* (paraphenomenology) from this point forward.

Ordering. This will be done in the sense of updating, highlighting, delimiting, differentiating, describing and the systematic panoramic ordering – even greater than that which is indicated in this context – of the subjective (non-objectified) projectiological phenomena, as well as objective phenomena, per se.

Dispense. With the greatest of clarity, and under the permanent focus of scientific observation, projectiology presently assigns to a secondary status and will (in the near future) forever dispense with the submission of consciousnesses to religion, religionism or religiosity of any type, as practiced today, as well as parapsychism in any of its manifestations, when considered to be a vital, indispensable resource for consciential exchange (the interested individual can consider practicing penta, for example); besides many other aspects of nature and human life.

Number. Do not be surprised to find the circumstantiated presentation of a new scientific discipline in this book. The amount of sciences, which were far fewer at the beginning of the modern age, currently number approximately 2,000 and this figure grows moderately every year.

Approaches. This multiplication in the number of sciences implies the need to integrate them, uniting their research within interdisciplinary, transdisciplinary and multidisciplinary approaches.

Exchange. This is one of the objectives of this work: the exchange of information.

Rejection. New sciences should not be rejected based on the allegation that they contain many errors. An effort should be made to find grains of leading-edge relative truth among the chaff.

Culture. The singular cultural aspect inspired by projectiology places equal value on knowledge (consciential maturity), financial condition as a psychophysical anchor and the immortality of the nucleus of personal reality (personal evidence of survival of desoma), therefore attributing indispensable value to intellectuals, researchers and scholars in general.

Youths. This system of values has been strongly motivating more talented and ambitious youths or the new generations (group of existential inverters) to study this science.

Role. All this suggests that projectiology will occupy an important position in the set of human sciences and will eventually play a significant role in other sciences, as will be seen in the explicit arguments in various subsequent chapters.

Self-analysis. A profound study of the human consciousness (rational and circumscribed consciential self-analysis) can be efficaciously performed in 2 distinct ways or 2 senses:

1. **Qualification.** By the person in search of raw empiricism or by the researcher of modern science.

2. **Vision.** According to the development of an external, superficial, *centripetal* view, from outside inward; or in an internal, deep, *centrifugal* view, from inside outward.

Decompositions. In the first case, what occurs is the decomposable process of *humankind*; in the second case, the decomposable process of the *consciousness* is achieved.

Inner. Although, in both cases, all the data of the studies can be obtained by observing other personalities, each one of us has an inner life at hand that is open to our detailed inspection, the inspection of which is inalienable at no cost.

Categories. These self-analyses can fit within two basic categories: external and internal.

1. **External.** Rudimentary consciential self-analysis (decomposition of the human being-body) can be performed in a crescendo based upon 3 progressively more complex perspectives:

A. **Sociology.** Through sociology (including anthropology or somatics), or as an intelligent unit situated in various systems, such as the family and the state.

B. **Biology.** Through biology (including ancient natural history), or in its place among the known subhuman animals, in the natural order of physical or biophysical-chemical evolution.

C. **Physiology.** Through physiology (including human anatomy), or the functions of the chemical structure of its densest and most evident vehicle of manifestation, the human body (soma).

2. **Internal.** Sophisticated consciential self-analysis (decomposing of the consciousness-mind) can be performed in a crescendo based upon 3 progressively more complex approaches:

A. **Psychology.** Through psychology (including obscure psychoanalysis), or the way in which a personality presents itself.

B. **Parapsychology.** Through parapsychology (including the former science of metapsychics), or through its extrasensory manifestations (parapsychism) as individuality, beyond the 5 basic organic senses.

C. **Projectiology.** Through projectiology (including the condition of cosmoconsciousness), or through its integral self-awareness (animism, intraconscientiality) regarding meta-organisms and the latest, greatest *experimentum-crucis* with itself, arriving at the essence of the self, the final citadel of the intelligent principle, when the observer and the observed are the same object.

Holomaturity. Only at this point does the consciousness achieve true discernment regarding consciential maturity (holomaturity) and its consequences.

Position. This succinct, initial picture of the acquisition of *high priority knowledge*, or consciential self-analysis (conscientiogram) – *which is of supreme importance* – already allows the studious individual an initial, logical approach to the precise and unswervingly salient position of projectiology among the other sciences, as well as the extremely important role that this discipline will play in the existence of the human or social being from now on.

Forecast. Today, in 2002, thousands of persons – volunteers of the International Institute of Projectiology and Conscientiology (IIPC), the Center for Higher Studies of the Consciousness (CHSC), the International Academy of Conscientiology (IAC), the International Association for Evolution of the Consciousness (Aracê) and the International Campus of Conscientiology (ICC), active in 8 countries – can attest to this fact, which was forecast in 1985.

Polymathy. Let us be realistic: a culminant erudition or a plethora of encyclopedic knowledge (polymathy) of the entire human environment or all current philosophy, does little good without the individual becoming aware of the plenitude of consciential self-analysis (inner reform, self-overcoming).

Knowledge. The personal, direct knowledge obtained through projectiology, makes the following 11 occurrences dispensable, anachronistic, obsolete and outdated:

1. Theological faith.
2. Rationalized faith (self-corruption).
3. Revealed knowledge.
4. Theological knowledge.
5. The argument of authority (*magister dixit*).
6. Historical critiquing.
7. Acceptance of the explanations of others (belief).
8. Attitudes of faith.
9. Revealers of all types.
10. Incomplete ultra-specializations (*hemiplegic specialists*).
11. Non-universalist stagnated pseudosciences (factional, sectarian).

Path. Science is not the ideal way, but it is the *least undesirable*. It is also not the easiest, but it is the *most evolutionarily profitable* for the intraphysical consciousness.

Socialization. Projectiology does not have the slightest intention of emphasizing elitism in its procedures and research. We need to socialize our investigations as much as possible.

Square. However, the intraphysical projector, upon becoming self-aware on the face of the earth, is like the visitor who arrives at a *town square under siege*, where there is a *great* number of wounded persons and a *small* number of healthy persons and, albeit unwillingly and with great unease, is obliged to prioritize healthy persons.

Projectiologist. The *ideal projectiologist* is the individual who possesses a *refined* consciential tri-endowment or 4 professional strong traits in his/her human personality structure:

1. **Researcher.** The researcher with *spatial intelligence*, dedicated to the self- and hetero-investigation of intraphysical and extraphysical consciousnesses. He/she has a *mentalsomatic ego* (mentalsomatics), aiming at the realization of the existential maxiprogram, the clarification task and polykarmality.

2. **Sensitive.** The sensitive with *parapsychic intelligence*, dedicated to participative investigations of the multidimensionality of the consciousness. He/she possesses an *energetic ego* (holochakrology), aiming at conscientiotherapeutic self- and hetero-evaluations (consciential epicenter).

3. **Teacher.** The teacher with *communicative intelligence*, dedicated to conscientiological pedagogy and teaching. He/she possesses a *charismatic ego* (paragenetics), aiming to teach and publish books or produce consciential gestations.

4. **Philosopher.** The philosopher with *logical intelligence*, dedicated to studies, reading and debates. He/she possesses a *philosophical ego* (cosmoethics), aiming at the interdimensional experience or exemplification of cosmoethical principles.

Lines. Rationally speaking, the conscientiologist, in his/her consciential evolution – libertarian conscientiality – needs to respect the principles (and followers) of all lines of human knowledge while, at the same time, studying them deeply in order to be free of them, in this intraphysical life and in the next ones. The following 13 are examples: Cabalism, Christianity, Gnosis, Holistics, Orientalism, the Principles of Krishnamurti, the Principles of Pietro Ubaldi, Religious Syncretisms, Rosicrucianism, Spiritism, Theosophy, Umbandism, and Yoga. All were useful during a certain period for millions of intraphysical consciousnesses, but are now obsolete. Lucid projectability establishes a new level for consciential self-discernment. The execution of the advanced existential program requires *neophilia*, renovation, logical prioritizations within a personal universalistic holothosene without factiousness, and incessant *intraphysical recycling*.

Bibliography: Andrade (27, p. 146), Barros (86, p. 126), Bret (203, p. 21), Carvalho (253, p. 14), Franklin (548, p. 97), Green (632, p. 17), Paula (1208, p. 55), Vieira (1762, p. 40). The author's most recent works: *Conscientiology Redaction Manual*; *Miniglossary of Conscientiology*; *Conscientiogram*.

07. SCIENCES

Manners. Science can be performed in 2 manners:

1. **Orthodox.** First: orthodox, purely technological, mercantile or deep-rooted materialist (human body, soma). *Transitory* matter is the rudimentary representation of energy.

2. **Heterodox.** Second: universalistic, purely participative (heterodox or non-orthodox), evolutionary or deep-rooted consciential (mental body, mentalsoma, body of discernment).

Choice. For the scientific research of projectiology, in this context, the second, more advanced mode, was chosen.

Energy. The consciousness, when considered to be eternal, is more than mere energy.

Classification. In the generally accepted scheme of classification, sciences are divided into 4 categories:

1. Mathematical sciences.
2. Physical-chemical sciences.

3. Natural or biological sciences.
4. Moral and social sciences.

Social. The human moral and social sciences can be subdivided into 4 categories:

1. Logical.
2. Esthetical.
3. Moral.
4. Psychological.

Derivations. Parapsychology derives from psychology. Projectiology derives from parapsychology, or the earlier metapsychics.

Subdiscipline. Projectiology is currently (2002) more directly connected to and derived from conscientiology – the broadest world of sciences – as one of its dozens of areas or subdisciplines.

Principle. The fundamental principle of the scientific work is the rigid integrity of thought that accompanies the evidence of the facts wherever the evidence wishes to take this scientific work, within the limits of experimental error and the *honest mistake*.

Human. The human sciences, e.g., psychology, parapsychology, projectiology and conscientiology, fulfill all conditions required in order to be sciences.

Phenomena. The phenomena studied by human sciences are real and distinct from those addressed in experimental natural sciences.

Laws. The causes and laws discovered in the areas of human sciences express necessary relationships between facts and actions.

Conclusions. Its conclusions have an undeniable character of *approximations of certainty*, although of a different order from the approximations of certainty, which are characteristic of experimental natural sciences.

Observation. According to that which has been presented, experimental, natural science is generally based on careful observation. All scientific investigation must proceed from observed facts.

Inertia. In physical and biological sciences, the observed facts are, as a rule, *inert* facts. In this case, they are understood from the outside by an observer, who is neither disturbed by them, nor are they affected by the process of observation.

Microphysics. The uncertainty principle in microphysics tells us that the processes of observation disturb the field of that which is observed.

Mathematics. There are techniques in mathematics that keep the observer in a certain type of *relationship of exteriority* with that which is observed and, strictly speaking, even to his/her own techniques of observation.

Disturbance. However, in sciences of *personal interaction*, e.g., psychology, parapsychology, projectiology and conscientiology, the *self-psychic facts* develop in another manner. Not only is the reciprocal disturbance between the observer and the observed inevitable in all cases, but it is the reciprocal disturbance itself – and not the disturbed or disturbing personal entities – which produces the primary facts upon which the theory is based.

Ontology. In natural sciences – physics, for example – the observer-observed relationship is ontologically discontinuous. That is to say, the subject is faced with the object (inert totality), which allows a purely exterior description of the field that is observed (*heteropsychic facts*).

Replicability. There are 2 aspects that must be considered regarding the replicability of scientific experiments:

1. **Possibility.** In the *natural sciences*, where analysis implies the supposition of a perspective of complete exteriority, the verifiability and *falsifiability of hypotheses* depends upon the replicability of situations.

2. **Impossibility.** In the *human sciences*, however, the repetition of a vital-historical situation of an individual or group becomes impossible, in principle. These are the facts.

Rationality. In the natural sciences, analytical rationality is applied where the propositions are formed outside the reality to which they refer.

Passivity. Another antagonistic condition occurs. In this case, it is a dual passivity:

1. **System.** The observed *system* – regardless of the actions and reactions that are occurring within this system – is passive with respect to the observer.

2. **Observer.** The *observer*, in turn, is passive in relation to the system which is observed and those observed facts are registered within, from outside. The *observer* is also passive in relation to the inference that is made from these facts.

Dialectic. In human sciences, however, dialectic (concrete) rationality is applied, in a totalizing activity (interaction), where the act of knowing relates to the object that is known.

Supposition. The *scientific world* never completely reflects the *real world*, but certain of its selected characteristics that are organized based upon suppositions which are accepted as true.

Precision. Human sciences, including projectiology, doubtless occupy the last place in the hierarchy of the sciences, with regard to their relative degree of precision and the rigor of their results. Their study is thus far more difficult.

Stability. Although its laws are more flexible and less rigorous, they express sufficient stability and constancy, to the degree that they can establish true sciences.

Exactness. For this reason, human sciences are not pseudosciences. In the strictest sense, there is no truly exact science.

Intervening. In light of what has been presented, the following 4 intervening factors in the world of human sciences merit attention:

1. **Achievement.** Many factors pertinent to human sciences are not achieved directly. For example: psychic and parapsychic phenomena which only manifest within the consciousness (intraconsciential micro-universe) and in human behavior. This creates difficulties for making generalizations.

2. **Complexity.** Human factors (psychic and parapsychic) imply greater complexity than quantitative or physical facts. As complexity increases, so do difficulties and the consequent occasion for error, omission, confusion or entropy. This is the source of a variety of sometimes disconcerting opinions on essential subjects within human sciences in general and parapsychic areas in particular.

3. **Liberty.** Physical phenomena, as they are directed by defined laws, can be foreseen and some provoked in order to be better observed. Meanwhile, freedom, which interferes somewhat in human acts and extraphysical experiences, impedes any exact forecast, making calculations in human sciences generally only approximate, and more specifically so in the areas of paraperceptibilities (paraperceptiology).

4. **Evaluation.** Natural sciences deal with material facts and objects which can be weighed and measured, at least indirectly. Thus, this intervention of measuring translates into results which have some degree of mathematical precision.

Quantification. The facts of human beings and their supposed extraphysical experiences, as they are qualitative, cannot have any extremely rigorous quantitative evaluation applied to them.

Causes. Causes in science can be: necessary, sufficient, contributory, contingent, alternative, and others. However, we cannot expect that a single cause, by itself, is sufficient to produce phenomena.

Conjunction. It is necessary to have a conjunction of causes (interaction, confluence) which, when mutually influencing each other, creates a situation where the phenomenon is able to manifest.

Factors. Therefore, one of the extremely important works in the research project is to define the factors that are present and influence the situation.

Universality. On the one hand, there is always the vital component of universality in the phenomenological field of projectiology.

Exceptions. On the other hand, it will be essential to endeavor to classify the exceptions when addressing projectiological phenomena.

Variables. Science is, by its very nature, inexhaustible. There are many variables which remain hidden in all sectors of projectiology research and await discovery. This *state of affairs* will continue for many human generations to come.

End. There is no end to the amount of knowledge we can acquire.

Dimensions. All things external to the physical universe hold no significance for conventional, materialistic, incomplete science and its practical realization, namely technology. Nevertheless, projective consciential phenomena prove – particularly for the consciousness of the researcher-object – the existence of parallel universes, hyperspaces, and the mental dimension or the dimension of cosmoconsciousness.

Theories. Theories are essential parts of science (see chapter 1). The theory referring to a system which is necessarily singular, in the manner of the physical universe of the physicalist scientist, cannot – and should not – be complete.

Unification. The condition would be much worse in relation to any theory that endeavors to embody and unify all systems of parallel universes where it is supposed that the consciousness gravitates in a condition of continuous evolution.

Scale. With the support of the aforementioned criteria for basic research in projectiology, or in all fields of conscientiology, there is an endeavor to delve deeper into known consciential phenomena, correlated to the research, that evolve in a delimited manner along a clear scale, or in a nucleus of knowledge that spans from the point at which the consciousness becomes human (individualized) to the point at which it is presumed to discard its vehicles of manifestation and evolve isolated in the pure mental dimension (trithanatos, mentalsomatic dimension, free consciousness or FC).

Boundaries. The origin of the consciousness, at one extreme, and its evolution in the pure mental dimension, at the other extreme, constitute the farthest boundaries of our current, absolute ignorance of the diverse worlds, planes, dimensions, environments, communities, conditions, consciential states and activities of interworld consciential exchanges (between communities and *existing paracomunities*).

Undefined. Everything which was left behind in the evolutionary progression of the consciousness, or which occurs beyond this, constitutes the unknown – *the preserved undefined* – which offers itself as a priority megachallenge for continued research for other terrestrial generations or, if possible, for all of us, in other probable lifetimes, resomas, somas and desomas, in individual and group consciential self-relays.

Scientists. Productive scientists generally present 6 characteristic personality traits that enrich their lives with each discovery:

1. **Curiosity.** Intellectual curiosity.
2. **Motivation.** Enthusiasm or motivation in their works.
3. **Independence.** Independence and mental flexibility.
4. **Dedication.** An inclination toward long hours of dedication.
5. **Credit.** The ambition to struggle to achieve credit for their realizations.
6. **Benefits.** The desire to benefit humanity.

Control. Scientists do not seek conformity. Nor are they merely attempting to repeat the experiments of others, or placing the experimental data that others have obtained in doubt. Far from it. It is simply that the more we develop the similarities and the ordered relationships between events, the closer we are to the prediction and effective control of our science.

Approximations. Science is not conducted using only common sense. Scientific knowledge is not satisfied only with *opinions*. It needs *approximations of certainty*.

Verifications. In the experimental verifications of projectiology, whether they be instrumented or based on personal research, the projectiologist, since the investigated subjects are humans, cannot make facts of interest repeat themselves at will, using the comparative system more often.

Statistics. Nevertheless, statistical means can be used that, in the end, will provide a relative quantitative vision, whether in averages, percentages, curves or other resources.

Involvements. One of the oldest ideals of science is to make it such that researchers avoid any type of personal involvement with that being researched. Nevertheless, according to what has been analyzed, it will always be very difficult to completely remove participative research from projectiology and all of the subdisciplines of conscientiology.

Communion. Generally speaking, the subject and the object always need to somehow commune with each other in order for the events to occur. One cannot completely exclude the other.

Openness. What should be sought, then, is maximum neutrality, impersonality, impartiality and universality in relation to the object of study, facing the facts in the effective condition of an *open-minded* ego, as though it were a *blank sheet of paper*, or a *tabula rasa*, that will receive the external impressions without influencing them.

Participation. The observer is participatory when he/she is part of the situation and performs a function or role in it.

Ambivalence. The observer can begin in the non-participatory condition and later become participatory, and vice versa.

Objectivity. The more someone is participatory, the more possible it is to be emotionally involved, losing objectivity and thus jeopardizing the observation. However, at least in certain circumstances, the observation of situations in which the individual does not participate becomes very difficult or very superficial.

Impersonalization. Science is always the result of an individual's experience. Despite everything that has been written, the pure impersonal experience truly does not exist.

Experience. It is important to register some crucial observations at this point. All knowledge of reality comes from experience and refers to it.

Senses. Conventional, physicalist science is based upon the 5 basic senses of the human body (soma). These senses permit anyone to have knowledge about reality through direct, personal experience.

Questions. What blame can be attributed to the author, or you, the reader, as a projectionist or conscientiologist, if we can employ other senses beyond the 5 above-mentioned basic senses?

Intelligence. What responsibility can be attributed to the author, or to you, the reader, if we are able to spontaneously obtain knowledge from other realities through other experiences beyond the experiences and existences of many other individuals? Besides this, we can be independent researchers, since we have the most hard earned freedom, which is the expression of that which we think, feel and experience, with regard to self-persuasive phenomena, in our thosenity or the union of idea, sentiment and personal energies. The *evolutionary* responsibility is far greater in this case. We are already starting to use *evolutionary intelligence*.

Coexistence. Based upon these facts, how should we coexist with contemporary conventional science? How can we reconcile our experiences, the author's and yours, which enrich and gratify us, with the current conventional experiences of others?

Dilemma. This book is an attempt to respond with the greatest possible discernment and logic to those dilemmic issues of the advanced projector, projectiologist or conscientiologist.

Youths. It is hoped that, in the future, this conflictive, human and parapsychic dilemma will be definitively eliminated from upcoming generations, notably those parapsychic youths with some innate wisdom, paragenetics or those arriving from more recent intermissive courses.

Hopes. Our hopes are pinned on these new generations.

Bibliography: Tart (1660, p. 177). The author's recent works: *700 Conscientiology Experiments*; *200 Conscientiology Theories*.

08. HISTORY OF PROJECTIOLOGY

Definition. History of projectiology: chronological exposition of projectiological facts.

Synonymy: historical exposition of projectiology; projectiological parahistory.

Phenomenology. The experience of the consciousness outside the human body is an ancient, universal phenomenon of all epochs, races and peoples, even those considered “non-intellectualized,” underdeveloped or primitive.

Paraphysiology. Lucid projection is encountered in the first narratives of classic antiquity, in Biblical, Egyptian and Babylonian antiquity, in the sacred chronicles of the East; appearing as much in the lives of ignorant individuals as in the existence of sages and intellectuals as a natural or biological faculty or, in other words, one of physiological origin or, more precisely, paraphysiological origin, according to the historical registers of the experience of humanity; it is similar, in many aspects, to various other altered states of consciousness, such as: daydream, nightmare, somnambulism, dream, sleep and others.

Universality. Human history (pastology) shows that, since time immemorial, human lucid projection has been common in all countries and was registered in an ample, universal manner in all cultures and intraphysical societies, as well as in the most ancient tribal societies, and even those in prehistoric eras, at the dawn of all civilizations.

Patterns. Narratives of lucid projections follow similar patterns, the same thing happening with the process through which the individual’s consciousness leaves the physical body, the conditions of the mind and the human body, depending upon the experience. There are frequently identical reasons and motivations for the phenomenon to occur.

Consensus. Despite differences in culture, epoch, religion, nationality and language, there has been an invariable, persistent substantial uniformity over time, in all places, among all civilizations, throughout the course of history, thus arriving at similar conclusions with respect to the reality of the departure of the consciousness from the human body, in another vehicle of consciential manifestation, always following the same basic constants.

Archetypal. The universal distribution in different cultures throughout history, as mentioned above, makes lucid projection an archetypal experience, that is to say: it is potentially found in many members of the human race only by virtue of being human.

Confirmation. From this, we can also confirm the typically physiological, or paraphysiological, origin of the human lucid projection experience as a consciential state.

Personalities. The abovementioned uniformity derives from the practical affirmations of persons with disparate cultural backgrounds and origins, equal to the following 72, which are readily found in the reports of works including mentions of projective cases: aboriginal Americans, African healers, alchemists, Anglican devotees, animists of the East, anthroposophists, apostles of the New Testament, ascetics, Australian Indians, authors, *brujos*, businesspersons, Catholic devotees, Christian mystics, *civilized persons*, computer programmers, computer scientists, conscientiologists, dissident sages, sundry Spiritualists, engineers, environmentalists, executives, existential inverters, existential recyclers, exoterists, fakirs, feminists, fortune-tellers, Greek philosophers, gurus, healers, initiated Indians, inspired writers, journalists, *mahatmas*, magicians, medicine men, members of the clergy, metapsychics, Mexican Indians, military researchers, nurses, occultists, parapsychologists, peais, penta practitioners, physicians, physicists, physiologists, pilots, poets, politicians, prisoners, professors, prophets of the Old Testament, psychologists, Rosicrucians, *sadus*, scientists, seers, sensitive-researchers, sensitives, Siberian shamans, Spiritists, teachers, technologists, Theosophists, Tibetan Lamas, Western mediums, witch doctors, yogis.

09. PERIODS OF PROJECTIOLOGY

History. The history of projectiology can be divided into 4 distinct periods:

1. The ancient period.
2. The esoteric period.
3. The exoteric period.
4. The laboratorial period.

Pre-history. Since the beginning of recorded human history, one persuasive factor has withstood all skepticism: the extraordinary sum of projective phenomena of the human consciousness and its continued repetition from century to century, from country to country, from one intraphysical society to another.

Legends. There are legends, stemming from prehistoric times, that tell of sages whose *souls* would leave their human bodies and communicate with the *gods*.

Classics. In each of the great classics of ancient culture, lucid projection was known, even by the ancient people of Israel, Persia and India.

Egypt. Beginning with the most primitive cultures, human consciousnesses have been practicing rituals in order to leave the dense body. In Ancient Egypt (5004-3064 B.C.) the worship of the dead was performed through the *ka* or the double, which we now call the *psychosoma*.

Practices. Nowadays, the frenzied pursuit of this same objective is sought in the gyratory dances of the dervishes, the gyrations of *Umbanda* (*Umbanda* is an Afro-Brazilian, spiritist, religious practice), besides innumerable other religious, syncretic, esoteric or animic-parapsychic (intra and extraconsciential) practices.

Greece. For centuries, the Ancient Greeks sought the way to inner illumination through the ceremonies at the temple of Eleusis, where they felt spiritually reborn after participating in rituals – considered to be sacred – for days on end.

Rituals. A great part of these rituals consisted in the experience of lucid projection of the consciousness, which was induced to leave the human body or the coincidence of its vehicles of manifestation.

Losses. However, the genuine secret techniques used in these projective rites were lost, leaving only the oral traditions on the subject which ended up in India and Tibet.

Bibliography: Currie (354, p. 78).

10. ANCIENT PERIOD OF PROJECTIOLOGY

Definition. Antiquity: the people, human beings, and beliefs of other eras or primeval times in the history of humanity.

Synonymy: remote historical era; ancient historical period.

First. The first historical, ancient or empirical period of projectiology begins with humanity itself and ends at the end of the fourteenth century.

Mythology. The first historical period includes spontaneous and provoked lucid consciential projections registered in the mythology of primitive societies, which still remain in the folklore of many nations, and even in multiple initiations in various temples, ever since tribal religions have existed in all terrestrial civilizations.

Initiations. In this phase, lucid consciential projections were hidden under the generic name of *initiations*. They were extremely restricted to the recesses of the temples, in all religions, the *simple*, primitive ones, as well as those more *developed* (and currently existing) ones. Their processes had profound mystical connotations, partly as a resource for the physical and social survival of their chiefs (believers, followers, acolytes, confreres).

Persecution. Of course, in this period, in many cases, those who produced the experience of lucid consciential projection suffered from the pressures of the fanaticism of that time, being labeled as crazy or demented and accused of witchcraft.

Condemnation. Parapsychic practices in general, classified as spurious practices, were routinely and severely condemned, as can be confirmed in the following passages from the Bible's own text:

1. **Witches.** Witches and magicians should be summarily executed (Exod. 22:18).
2. **Parapsychism.** The exercising of parapsychic faculties were strictly prohibited (Lev. 19:26).
3. **Exile.** Active animists and mediums (sensitives) were detested and exiled (Deut. 18:10).
4. **Prophets.** Prophets and soothsayers were summarily expelled from the places where they appeared (2 Kings 21:6).
5. **Books.** Books about magic, animism and parapsychism were exemplarily burned, in public, in autos-da-fé (Acts 19:19).

Bibliography: Vieira (1747, p. 20).

11. ESOTERIC PERIOD OF PROJECTIOLOGY

Definition. Esotericism: ancient doctrine or antiquated attitude that advocated reserving the teaching of (scientific, philosophical or religious) truth to a restricted, closed number of chosen persons, generally through limited and secret initiations.

Synonymy: group autism; hermetism; occultism.

Autism. Esotericism or occultism was a type of *group autism*.

Second. The second historical (esoteric or pre-scientific) period of projectiology spans from the fifteenth to the nineteenth century.

Esoteric. It is common knowledge that the term *esoteric* refers to all things requiring initiation limited to a reduced circle of people in order to be understood (segregation, discrimination, sectarianism, factionalism, elitism, *fetal corporatism*).

Withholding. In this phase, lucid consciential projection was characterized by the prejudicial aspect of widespread withholding of adequate pertinent information from the public (populace).

Fascination. Bound by ignorance regarding effective means for its voluntary production, the projective phenomenon was always covered up by a *thick smoke screen*, being maintained as an instrument of political domination, through the mystical fascination of the masses by the medieval obscurantist climate, a reflection of previous centuries or, perhaps more precisely, *millennia*.

Concealment. The theme of lucid projection was kept concealed, being criminally prohibited to the public – the *populace* – circulating only through the most restricted avenues of information.

Reactionism. In this phase, at the hands of extremely powerful legions of reactionaries, the implacable persecution of sensitives and projectors, generalized *witch* hunting (most notably throughout Europe) and the predominance of beliefs, dogmas, preconceptions, superstitions, taboos and erroneous traditions arose as never before.

Monopoly. The methods employed to project with lucidity through the centuries and successive generations were prohibited from public scrutiny in this esoteric period, in adherence to an orthodox, monopolizing, segregationist, caste policy.

Policy. This policy, based on censure, concealment of information and the intentional covering up of facts, permitted the truth to be stifled, thus prohibiting adepts and initiates from speaking about their projective experiences in public. These individuals would never say or register everything they experienced and knew regarding parapsychic phenomena.

Remnants. Remnants can still be seen today of the cover-up of facts and the misanthropic hermetism of lucid projection induction techniques stemming from Tibetan yogis, where misinformation is highlighted with the clear intention of discouraging newcomers to the subject.

Adulteration. The dissimulation of facts becomes clear through the undisguised adulteration of precepts and the creation of cover-ups performed using the following 4 intentional, spurious resources:

1. Excessively refined methods (circumlocutions).
2. Ridiculous practices (superimposed rites).
3. Abstruse rituals (infantilisms).
4. Confused terminology (primitive jargon).

Subinformation. The same occurs, for example, with two categories of subinformation:

1. The information supplied by the International Rosicrucian Society, with respect to *psychic projection* (seventh and eleventh stages).
2. The phenomenon of physical bilocation in the field of the hagiology of the Vatican (Catholic clericalism).

Occultism. Up until that time, the teachings on lucid projection remained in the shadows, in obdurate silence, behind the wall of secrecy, in the hands of only those fervent autistic adepts of esotericism (Eastern and Western), or occultism, in the hermetic societies, which were closed around their members, who always harbored repugnance towards performing proselytism and spreading their knowledge.

Principle. The occultists operated from the apparently logical principle – the strategy of occultation – which holds that their doctrine should be deliberately kept hidden and secret, as, upon being revealed, it would obviously no longer be occult.

Repression. In fact, revealing this would eliminate repression (indoctrination, conditioning, *abdominal brainwashing*, sacralization, intellectual coercion) in society and the segregationist and discriminatory spirit that kept the initiates gathered around the same principles, in a manner similar to social forms of control, reward and punishment that help to preserve, protect, mask and reinforce the system of inequalities or the norms of any other underdeveloped intraphysical society in general.

Time. However, time went on until the point where these segregationist reasons no longer existed, thus ending the boycott by the clearly esoteric aspect of projective practices, thereby allowing rationality, the sense of fraternity and the freedom of manifestation to prevail.

Clarification. Lucid projection experiences have thus provided clarification, comfort and a reasonable degree of certainty regarding extraphysical or multidimensional reality to many people.

De-occultism. As with all sciences, *projectiology* has the precise purpose of revealing occult issues (*de-occultism* or consciential openness) and never withholding them.

Universalism. Consciential or universalistic institutions do not defend the *exclusion* of consciousnesses, but defend the *excluded* of two origins and two types:

1. **Somatic.** The *hetero-excluded*: dispossessed humans assisted through the consolation task.
2. **Mentalsomatic.** Those *self-excluded* by leading-edge relative truths: intruders, blind guides and minidissidents who are assisted through the clarification task.

Stop. After lucid projectors were ridiculed, persecuted, imprisoned, castigated, cremated and canonized, in that order, lucid projection gradually stopped being characterized as a mere gross manifestation of witchcraft.

Hagiography. For a period of time, this phenomenon was included in the mystical visions of devotees and theologians, and in the paintings, biographies and narratives of hagiography (Roman Catholicism).

Define. Besides the cases of consciential bilocation listed among the phenomena of hagiography throughout the course of time, 2 projectors from the eighteenth century, who helped define the history of projectiology, deserve a special mention:

1. **Say.** First, the American Quaker minister, Thomas Say (1709-1796), who left a detailed report of a lucid projection, produced while he was in a coma in 1726.

2. **Swedenborg.** The second milestone in the history of projectiology comes to us from the Swedish philosopher, theologian and seer from the eighteenth century, Emanuel Swedenborg (1688-1772).

Precursor. Swedenborg was the precursor of projectiology, the greatest lucid projector that had arisen at that time, a pioneer in receiving the messages of extraphysical consciousnesses or helpers.

Diaries. As an author, Swedenborg left numerous volumes that included reports of his experiences, notably “*Diarii Spiritualis*” (5 volumes), in which he narrated many of his lucid projections, beginning in 1745, that continued in an uninterrupted series until 1765. They included lofty expressions regarding the double life of the intraphysical consciousness (intraphysiology) when projected in the consciential dimensions (projected intraphysical consciousness, extraphysiology).

Prophet. The brilliant French writer, Honoré de Balzac (1799-1850) – the prophet of projectiology – clearly and incontrovertibly announced the appearance of a *new science*, even before the advent of spiritism, metapsychics, parapsychology and psychotronics, in 1832.

Sesquicentennial. In 1982, the author privately commemorated the 150th anniversary of this precognition.

Affirmations. Balzac used the character *Louis Lambert*, in his psychological, autobiographical novel by the same name, to voice the following questions and affirmations:

1. **French.** “Si j’étais ici pendant que je dormais dans mon alcôve, ce fait ne constitue-t-il pas une *séparation complète* entre mon corps et mon être intérieur?” “Or, si mon esprit et mon corps ont pu se quitter pendant le sommeil, pourquoi ne les ferais-je pas également divorcer ainsi pendant la veille?” “Ces faits se sont accomplis par la puissance d’une *faculté* qui met en oeuvre un *second être* à qui mon corps sert d’enveloppe ...” “Si, pendant la nuit ... dans la plus parfaite immobilité j’ai franchi des espaces, nous aurions des facultés internes, indépendantes des lois physiques extérieures.” “Comment les hommes ont-ils si peu réfléchi jusqu’alors aux accidents du sommeil qui accusent en l’homme une double vie? N’y aurait-il pas une *nouvelle science* dans ce phénomène?” (p. 71 and 72, Gallimard Editions, 1980. Some expressions were italicized here).

2. **English.** “If I was here while sleeping in my bedroom, does this fact not constitute a *complete separation* between my body and inner being?” “Well, if my spirit and my body could separate during sleep, why could I not equally divorce them while awake?” “These facts are verified by the power of a *faculty* which puts in movement a *second being* for which my body serves as a housing.” “If, during the night... in the most absolute immobility I went through space, then humans have inner faculties which are independent from external physical laws.” “Why have humans reflected so little until now upon the accidents of sleep that indicate a double life? Will there not be a *new science* in this phenomenon?”

Translation. As can be read in the text of this volume by Balzac, we can now *technically translate* some expressions that he used:

1. **Discoincidence.** *Complete separation* is now called *discoincidence* of the vehicles of manifestation of the consciousness or intraphysical consciousness.

2. **LPB.** The *faculty* he refers to is now called *lucid projectability (LPB)*.

3. **Psychosoma.** The *second being*, in this case, is the *psychosoma*, the parable of emotions.

4. **Projectiology.** The *new science* was named *projectiology*, one of the many subdisciplines of conscientiology.

Facts. As can be logically concluded, all this occurred according to natural facts, in the exact and rational manner in which it was forecast. This subject will be addressed in greater detail in the next chapter (p. 67, 73).

Spiritism. Finally, the lucid projection experience was established in the supernatural condition of “physical bilocation” or “bicorporeity” in the studies of the “emancipation of the soul,” expressions which were frequently used by authors of the nineteenth century, including the codifier of Spiritism in France, Allan Kardec, or Leon Hypolite Denizard Rivail (1804-1869).

12. PRECOGNITIONS REGARDING PROJECTIOLOGY

Definition. Precognition: the phenomenon of foreseeing (prediction) future facts, performed by a precognitor. These names formerly were: *prophecy, prophet.*

Synonymy: foreseeing; foretelling; paragnosis; prediction; prognosis; presaging.

Futurology. Projectiology, as a science, is obviously not based on any doctrine founded on prophecies or *prophetism*, much less in incipient futurology, which is still not entirely reliable. Anyone who has a calendar can be a futurologist or begin to work with forecasting.

Documentation. It is clarifying and educational, however, to document the facts relative to the esoteric period in the history of projectiology. That is why this chapter is included in this volume.

Nostradamus. Out of healthy curiosity, or responsible intellectual speculation, let us first analyze two quatrains from the book *Centuries*, by Michel de Nostradamus (1503-1566), the celebrated French astronomer and physician.

Self-critique. Personally, the author is not a *nostradamist*, nor does he consider himself, in this analysis, to be an astute exegete against the possible *nostradamian traps*, which are ever-present for the commentator or translator of his texts.

Logic. We have merely used some logic here within the labyrinth that constitutes his extremely *entropic* quatrains.

Clouds. Interpretation of *Centuries*, at first sight, is very similar to the interpretation of the shapes of clouds in the sky: any fertile imagination arrives at the most delirious conceptions, finding whatever they wish in the pictorial composition of the clouds.

Translation. Thus it is best that the aware reader be forewarned regarding the aspect of “*si non é vero, é bene trovato*,” which should not be disregarded in these considerations, with respect to nostradamian quatrains.

Distortion. Here, the analyst can adjust the meaning of the texts to the facts, also distorting the sense of the message in order for it to coincide with his/her own ideas.

Characteristics. In research performed using theorice and confor, we can easily arrive at the characteristics of nostradamian texts, in which we can detect at least 7 variables, with regard to their *form*:

1. **Quatrains.** The quatrains were not written in chronological order with respect to the events upon which they focused, there being only a few consecutive *series of quatrains*.

2. **Chronology.** He predicts the events, always remaining confused regarding the period and chronological order of the precognitive facts.

3. **Phraseology.** The nebulous phraseology demonstrates vagueness, ambiguity and double meaning.

4. **Languages.** There is a purposeful confused mixture of languages, always generating controversy.

5. **Epoch.** His profound involvement with the sociocultural environment (habitat) – the epoch of paradoxes, the sixteenth century – becomes clear.

6. **Pressure.** There was always his life as a convert – a converted Jew – under the constant, implacable pressure of the Inquisition.

7. **History.** The historic facts related to the subsequent centuries resulted in the majority of the episodes he referred to having already lost the interest that they could have had.

Publications. Nevertheless, we should not forget the fact that, four-and-a-half centuries after his desoma, an average of 30 new specialized publications or works have been published every century, commenting either favorably or unfavorably upon his works.

Culture. Still within confor, we can see, in relation to *content*, that he paradoxically described the world of the future using elements of his time, being a person of polymorphous culture, according to the following 5 intellectual aspects:

1. **Metaphors.** He constantly and deliberately used anagrams, symbols, metaphors, periphrases, Latinisms, enigmas and wordplay.

2. **Grammar.** He used metaplasms as well as poetic and rhetorical grammatical resources, such as: aphaeresis, apocopes, elipses, epentheses, hyperbole, metastases, protheses, syncopes and synecdoches.

3. **Repetitions.** He used phonetic spellings and intentional repetitions, which were sometimes quite intelligent and pertinent.

4. **Polyglotism.** In his polyglotism, he included archaic French, Latin, Provençal, Greek, Spanish and Hebrew.

5. **Polyvalence.** It should not be forgotten, in this context, that Nostradamus was a doctor of medicine, pharmacologist, astronomer, mathematician and historian, as well as being a hermetic philosopher attaché to the courts of that time.

Parapsychic. Regarding parapsychism, Nostradamus showed the following 4 noteworthy strong traits, among others:

1. **Paraperceptiology.** He accepted the reality of hauntings or poltergeists, according to observations in the historical registers in reference to him and as written in Century 7, Quatrain 41.

2. **Serenology.** He knew of the existence of *serenissimi* (*Homo sapiens serenissimus*), at that time referred to as the *celestial deities* or *angelic beings*.

3. **Paratechnology.** He evoked extraphysical beings using the bronze tripod, the ancient 3-legged table used by the Pythia of the Oracle of Delphi, the same classic furniture of the *gyrating tables* phenomena from the epoch of Allan Kardec.

4. **Desomatic.** Some suspect that he deliberately sponsored his *self-desoma*.

Probabilities. Even when attributing the data of his predictions to coincidence, synchronicity or the law of mathematical probability, Nostradamus gave details: names of persons; names of places; references to buildings still not constructed or even imagined at that time; correct future time periods; precise dates, with the exact months of future events; and other details that, for him, were of future history which, in fact, leads any rational, unbiased observer to seriously deliberate upon his precognitive lucubrations, that are exempt from the influences of mysticism, sacralization, occultism, folklore, delirium, surrealism and exploitations of all types that his works have endured for the last *four-and-a-half centuries*.

Transcendence. There are two occurrences that show logical aspects of profound transcendence and subtlety in the rational analysis of the precognitions of Nostradamus:

1. **Comprehension.** First occurrence: certain visions of facts that he foresaw were not understood even by himself, the precognitor, as occurs with contemporary precognitors.

2. **Words.** Second occurrence: certain expressions in the verses of the quatrains of the *Centuries* were used in an apparently confused or inadequate manner for the exposition of the thoughts, even for Nostradamus' epoch. Nevertheless, they appeared to be perfectly adequate at the exact time in the future for which they were destined and to which they referred.

Meanings. This occurs due to psychological, mesological and natural changes in the meaning or significance of the words occurring in the succession of human generations and the passing of centuries.

World. This emphasizes that the world of precognitive vision, of that time, was far more ample and subtle than it appeared.

Capsules. Not only in regard to the essence, the future facts that were foretold, but, beyond this, even with regard to printed matter, the new meanings that certain terms would have – *mental time capsules* – in reference to the future epoch.

Coin. In this case, the statements of precognition, much like an old coin, increase in value with the passage of time; that which had an insignificant *face* value, in its own time, later, when it is already out of circulation, has an enormous *intrinsic* value. In this semantic aspect, Nostradamus exhibits a singular ability among all precognitors registered by human history. The second event referred to confirms and clearly explains the first event.

Positivity. Let us decipher only 2 quatrains of the *Centuries*, being among the most obscure, which are routinely avoided by the exegetes, perhaps because they are *positive* or pacifying, and thereby do not furnish disastrous, catastrophic or terrifying elements, being highly powerful explosive ammunition in the hands of the *prophets of chaos*, such as: calamities, floods, droughts, earthquakes and wars (battles, invasions, genocides and assassinations), thus remaining without commercial appeal to sensationalist minds.

Original. Let us begin with an analysis of the original version of a strophe of 4 verses, namely Quatrain 27 in Nostradamus' Century 2, published in 1555:

“*Le divin verbe será du ciel frappé,
Qui ne pourra procéder plus avant:
Du resserant le secret estoupé,
Qu'on marchera par-dessus & devant.*”

Archaicism. The following are the meanings of expressions in this Quatrain 27 in Nostradamus' Century 2, written in the archaic French of the sixteenth century:

Le divin verbe: the divine verb; the divine word. It is an expression having a double meaning, which can also mean mantra, verbal formula, cryptic verse. The univocal nature of the adjective *divin* in the *Centuries: Le divin mal*, Century 1, Quatrain 88, the sacred hatred (the opposite of the use in the quatrain under analysis); the sacred evil; the epileptic attack; or, nowadays, the convulsive syndrome.

Frappé: beat; give punches; attack; knock down; strike. This verb is also used in Century 3, Quatrain 59 and C. 4, Q. 33.

Du ciel frappé: stricken from above; fallen from the sky; struck by lightning; knocked down from the sky. An expression also used in Century 1, Q. 27 and C. 2, Q. 56.

Pourra: could. An expression also used in Century 8, Q. 53 and C. 10, Q. 32.

Procéder: result in; lead to.

Avant: before, the first of.

Reserare: discover; unveil; open; reveal.

Estouper or estoper (étoupé): guard; close; shut someone up. Archaic French.

Marchera: march; walk; go (infinitive: *marcher*).

Par-dessus: walk over someone; insult; walk past; walk on; hover over.

&: et: and; conjunction.

Devant: in front of someone; precede.

Translation. The following is a synthetic, simple, literal translation of the verses of Nostradamus' 2, Quatrain 27 to English:

“*The divine word will be revealed from the sky,
And can no longer be any other way:
Unveiling the guarded secret,
It will go upward and forward.*”

Prose. The following is an analytical interpretation, in prose, of the same Quatrain 27 in Century 2, which could be the *prophecy of Nostradamus regarding projectiology*.

The divine word (relative truth; projectiology; the extraphysical, multiexistential, self-defensive mantra) **will be attacked** (stricken from above) **from the sky** (extraphysical dimension), **unveiled but which can no longer be any other way** (nothing will succeed against it): **unveiling the guarded secret** (projectability, part of the physiology of the consciousness; the projection of the lucid consciousness), **will go upward** (will influence all intraphysical and extraphysical things) **and forward** (beyond; through multidimensionality).

Research. The following are 5 detailed expressions from Quatrain 27, according to the research of projectiology:

Le divin verbe: projectiology; a mantra, one of the projective techniques.

Ciel: the extraphysical dimension; multidimensionality.

Resserant le secret: unveiling the *paraphysiological* secret; the opening of multidimensional life coming to light; the elimination of fears (projectiophobia) and antiprojective conditioning.

Secret estoupé: the discovery of the occult faculty, projectability; nonlucid consciential projection, the secret that was guarded for millennia, which was found to be latent, becomes conscious and explicit for the life of human beings.

Marchera par-dessus & devant: will go upward, through the consciential dimensions, and forward with cosmoethics, serenism and endless evolution.

Comparisons. The interested reader can make comparisons between the translation and the interpretation of this quatrain, with various authors: Béatrice, p. 256; Cheynet, p. 151; Dinotos, p. 48; Fontbrune, p. 235; Hutin, p. 132; Leoni, p. 168, 169, 589; Piobb, p. 60; Roberts, p. 52.

Author. Of these authors, the one who most closely approximates the projectiological interpretation is Cheynet, who writes: “The secret, which has been kept in silence for so long, will finally be unveiled and established.” “Humankind will discover occult faculties pertaining to it and which were found to be in a latent state.”

Confirmation. A possible confirmation of the *prophecy on projectiology* was also made by Nostradamus, further on, in the middle of the *Centuries*. In this case, the same facts already presented in the previously analyzed quatrain were then seen from another angle, in a later, complementary quatrain, a technique that was much used by the physician-astrologer regarding countless subjects. Let us take a look at Century 3, Quatrain 2.

Strophe. The following is the original text of Nostradamus’ Century 3, a strophe of 4 verses or Quatrain 2, published in 1555:

*“Le divin verbe donra à la substance,
Comprins ciel, terre, or occult au faict mystique:
Corps, ame, esprit ayant toute puissance,
Tants soubz ses pieds comme au siège Célique.”*

Semantics. The following are some meanings of expressions in the French language of the sixteenth century, from Nostradamus’ Quatrain 2 of Century 3:

Donra: variant of *donnera*, will give. This is a technical use of syncope. This expression was used frequently in *Centuries*, e.g.: C. 6, Q. 56; C. 7, Q. 2; C. 8, Q. 7 e C. 10, Q. 45.

Substance: the substance of spirit; the consciential being; the essence of the consciousness, as opposed to the material being (social being, intraphysical consciousness).

Or: gold. Noun also used, for example, in *Century 7*, Q. 32, e *C. 10*, Q. 46. Some have translated the expression as *ore*.

Laict. Faict: done; fact; phenomenon. The univocal nature of the noun in the *Centuries: Au faict bellique:* C. 3, Q. 30; C. 6, Q. 61. A typographical error occurred here, in certain editions of the *Centuries*, using the noun *laict* (milk) in the place of *faict*.

Puissance: power; authority.

Soubs: underneath; under.

Célique: Celestial; paradisiacal; in the sacred sense. Archaic French. The univocal nature of the adjective in the Centuries: **Du grande temple Célique:** C. 6, Q. 22.

Au siège Célique: on the celestial throne; the papal palace of the Apostolic Roman Catholic Church.

Confirmation. The following is a synthetic, simple, literal translation of the verses of Nostradamus' Century 3, Quatrain 2:

*“The divine word will give the substance,
Encompassing the sky, earth, hidden gold in the mystical act:
Body, soul, spirit having all power,
Under its feet, as well as on the celestial throne”.*

Interpretation. An analytical interpretation, in prose, of the same Quatrain 2, Century 3, of what could be a *confirmation of Nostradamus' prophecy regarding projectiology:*

The divine word (the relative truth of projectiology; the self-defensive, extraphysical, pluri-existential mantra) **will give the substance** (the consciousness; the insubstantial being of humankind), **encompassing the sky** (extraphysical dimension), **earth** (intrapysical human life; crustal or tropospheric existence) **mystical** (symbolic): (showing that) **body, soul, spirit** (the body, the soul or human being, and the consciousness, the command of the holosoma; holosomatics; conscientiology) **having all power** (over the human body or soma), **under its feet** (in life *under* and *above* the crust of the earth; intraphysical existence, laic, secular) **as well as** (regarding) **on the celestial throne** (in the extraphysical dimension; the papal palace of the church, the Vatican, the clergy, including hagiology and the phenomenon of physical bilocation, or advanced projectability).

Projectiology. The following are 7 expressions, presented in detail, from Quatrain 2, Century 3, according to projectiology research:

Substance: the consciousness in evolution.

Or: the leading-edge relative truth of human lucid projectability.

Faict: the inevitable, physiological, or paraphysiological, phenomenon of consciential projection which was nonlucid and mystical, and which becomes lucid and addressed scientifically without dogmatism; the reformulation of values.

Corps: the soma; the human body; the *coarse extremity* of the holosoma.

Ame: the intraphysical consciousness, when temporarily connected with energy in matter.

Espirit: the extraphysical consciousness, its true, more permanent condition at our evolutionary level.

Siège Célique: extraphysical reality; the true origin (extraphysical hometown) of the consciousness that is temporarily manifesting mainly in the intraphysical dimension.

Conclusions. The interested reader can make comparisons between the translation and the interpretation of this Quatrain 2, Century 3, under analysis, with various authors: Allgeier, p. 126, 127, 170; Andreis, p. 126; Avenel, p. 46; Dinotos, p. 69; Fontbrune, p. 234; Houge, p. 31; Hutin, p. 147; Leoni, p. 192, 193, 602; Palhano Jr., p. 94; Robert, p. 76.

Approximation. Of these authors, the one who most closely approximates the projectiological interpretation is Allgeier, who writes: “Human beings will have access to worlds which have until now been considered occult and mystical.” “They will learn how to overcome the boundaries of time and space. They will witness events in distant locations.” “Their spirits will be capable of periodically being absent from the body.”

Mantra. This is an opportune point to inform the reader that, over a decade ago, the author was performing an assistential task, while lucidly projected outside the body in the psychosoma, when he was the victim of a violent attack by a group of 8 powerful intrusive extraphysical consciousnesses. When he felt he was at the point of desoma, under the vassalizing energetic pressure of his pursuers, unable to

change the environment or extraphysical dimension, he suddenly received providential help from the retrocognition of a mantra having self-defensive, energetic objectives, which – he now knows – was used by him in the past, as an alchemist, and with which he was able to free himself from this mortal energetic involvement.

Expressions. For this reason, these two quatrains by Nostradamus retain a special, personal, impactful significance that is far greater for the author, being well beyond that which has been presented here.

Synthesis. Cosmoethically speaking, it is not suitable to involve the reader with the pressure of the negative energy of these unhealthy consciential groups by revealing the impressive expressions of the mantra, which is, strictly speaking, an exact synthesis of Quatrain 27 of Century 2, the first one deciphered above.

Alert. Some time later, a helper called the author’s attention to the research and location of this mantra in Michel de Nostradamus’ Centuries, this being the reason why these considerations were made.

Critique. Are the number of *exact hits*, in these 8 analyzed verses sufficient to distance them from simple chance? Is it possible that the solutions presented for the two quatrains of Nostradamus’ text from four-and-a-half centuries ago are “mere historical coincidence” with regard to the facts? Or could it be that all these considerations are only another “use of Nostradamus,” “a self-corruption of personal vanity” or “a mere egoistical excrescence of personalism”? Let us leave the final, pondered heterocritique, as well as the competent final conclusion, to the conscientious reader.

Analysis. The analysis of Nostradamus’ cryptography, inserted above, had the primary purpose of serving as a paradigm, or an element for technical comparison. This is also the case with the following study of the precognitive text of Honoré de Balzac, from the nineteenth century. This one is more direct, clearer and practically incontestable, in the sense that it refers to a precognition, foresight or “prophecy” in regard to projectiology – perhaps because it is more recent, having only existed for *one-and-a-half centuries*.

Multidimensionality. Neither time nor the future will expose the structure of the phenomenon of precognition logically. This parapsychic phenomenon conflicts deeply with conventional science. The basis of traditional scientific reason consists in explaining tomorrow through today, the *essence of forecasting*; and never today through tomorrow, the *essence of precognition*. Only multidimensionality and discoincidentiology are able to clarify the occurrences of precognition within *today-tomorrow*, a singular reality. Strictly speaking, tomorrow does not exist.

Balzac. In the specific case of Honoré de Balzac, the facts should not be excluded due to the incredible precision and appropriateness of their detail, within the historical context, in an *intermezzo* of one-and-a-half centuries. It is opportune to repeat that arguments are useless against facts.

Microbiography. Honoré de Balzac, the brilliant French writer, was born in 1799 in Tours, the Capital of Touraine. He wrote a monumental cycle of 86 novels, besides other philosophical works and died in Paris in 1850. He was the “main” precognitor of projectiology. Let us endeavor to demonstrate this with facts.

Rationality. Honoré de Balzac was the precognitor of projectiology, not in the sense of nostradamian, mystical or irrational pre-messiahs, but in the sense of a foreseeing pre-parascientist, who is rational and foresighted within the world of the current prospective.

Announcement. He clearly and incontrovertibly announced the appearance of a *new science* in 1832, even before the advent of spiritism (1848), metapsychics (1875), parapsychology (1888) and psychotronics (1950). The 150th anniversary of his projectiological precognition (precognitive projection) occurred in 1982.

Affirmations. Balzac used the character *Louis Lambert*, in his autobiographical novel by the same name, to voice the following questions and affirmations (pages 71 to 73, Gallimard Editions, 1980):

French. “Si le paysage n’est pas venu vers moi, ce qui serait absurde à penser, j’y suis donc venu. Si j’étais ici pendant que je dormais dans mon alcôve, ce fait ne constitue-t-il pas une séparation

complète entre mon corps et mon être intérieur? N’atteste-t-il pas je ne sais quelle faculté locomotive de l’esprit ou des effets équivalant à ceux de la locomotion du corps? Or, si mon esprit et mon corps ont pu se quitter pendant le sommeil, pourquoi ne les ferais-je pas également divorcer ainsi pendant la veille? Je n’aperçois point de moyens termes entre ces deux propositions. Mais allons plus loin, pénétrons les détails. Ou ces faits se sont accomplis par la puissance d’une faculté qui met en oeuvre un second être à qui mon corps sert d’enveloppe, puisque j’étais dans mon alcôve et voyais le paysage, et ceci renverse bien des systèmes. J’ai marché, j’ai vu, j’ai entendu. Si, pendant la nuit, les yeux fermés, j’ai vu en moi-même des objets colorés, si j’ai entendu des bruits dans le plus absolu silence, et sans les conditions exigées pour que le son se forme, si dans la plus parfaite immobilité j’ai franchi des espaces, nous aurions des facultés internes, indépendantes de lois physiques extérieures. La nature matérielle serait pénétrable par l’esprit. Comment les hommes ont-ils si peu réfléchi jusqu’alors aux accidents du sommeil qui accusent en l’homme une double vie? N’y aurait-il pas une nouvelle science dans ce phénomène? ajouta-t-il en se frappant fortement le front; s’il n’est pas le principe d’une science, il trahit certainement en l’homme d’énormes pouvoirs; il annonce au moins la désunion fréquente de nos deux natures, fait autour duquel je tourne depuis si longtemps. J’ai donc enfin trouvé un témoignage de la supériorité qui distingue nos sens latents de nos sens apparents! *Homo duplex!*”

Translation. The following is a translation into English of the above passage, from Honoré de Balzac’s report in French:

English. “If the scenery did not come to me, which would be an absurd thought, then I went to it. If I was here while asleep in my bedroom, does this fact not constitute a complete separation between my body and my inner being? Does it not attest to a locomotive faculty of the spirit or equivalent effects of the locomotion of the body, about which I have no knowledge? Well, if my spirit and my body could separate during sleep, why could I not equally divorce them during the waking state? I cannot clearly see a middle ground between these two propositions. But let us go further and study the problem in detail. These facts were verified by the power of a faculty which puts into movement a second being for which my body serves as a housing, because I saw the scenery while in my bedroom and this destroys many systems. I walked, saw and heard. If, during the night, with my eyes closed I saw colored objects within myself, if I heard sounds in the most absolute silence, and without the conditions necessary for their formation, if in the most absolute immobility I went through space, then humans have internal faculties which are independent from external physical laws. The material world would then be penetrable by the spirit. Why have humans reflected so little until now upon the accidents of sleep that indicate a double life? Will there not be a new science in this phenomenon? If it is not the basis for a science, then it certainly shows that humans have incredible powers; it at least illustrates the frequent separation of our two natures; a fact regarding which I have pondered for such a long time. I have finally found the perfect piece of evidence for the superiority which distinguishes our latent senses from our apparent senses! *Homo duplex!*”

Precision. It is impressive how all that was foreseen by Honoré de Balzac has occurred in the same way, in an unquestionable manner. Those selfsame recent, natural facts of life precisely and rationally confirmed early registered observations.

Ideas. At least 16 ideas registered in the literary expressions of Balzac, in 1832, were transformed into technical postulates of projectiology, more than one-and-a-half centuries later, in 1986. In a detailed analysis, “let us study the problem in detail” (see fig. 12).

Projector. If we consider that the novel “Louis Lambert” was autobiographical, as was registered by Laure Surville, the sister of the author, this demonstrates that Honoré de Balzac was the protagonist lucid projector of the reported precognitive lucid projection. Facts are facts. Within the world of his literary creativity, he was a vigorous sensitive (paraperceptiology), with unmistakable manifestations of extraordinary intuition.

LITERARY EXPRESSIONS: BALZAC, 1832	TECHNICAL EXPRESSIONS: PROJECTIOLOGY, 1986
1. "I went through space" (<i>J'ai franchi des espaces</i>) (p. 72)	Extraphysical volitation (see chap. 314)
2. "Destroys many systems" (<i>renverse bien des systèmes</i>) (p. 72)	New consciential paradigm (see chap. 2)
3. "Frequent separation" (<i>désunion fréquente</i>) (p. 73)	Consciential projections in series (see chap. 438)
4. "Sleeping in my bedroom" (<i>Je dormais dans mon alcôve</i>) (p. 71)	Physical base of the projector (see chap. 180)
5. "Double life" (<i>double vie</i>) (p. 72)	Multidimensional self-awareness (see chap. 262)
6. "Locomotive faculty of the spirit" (<i>faculté locomotive de l'esprit</i>) (p.71)	Projectability (see chap. 158)
7. "Inner faculties" (<i>facultés internes</i>) (p. 72)	Paraphysiology of the holosoma (see chap. 103)
8. <i>Homo duplex</i> (p. 73)	<i>Homo projectius</i> (see chap. 333)
9. "Penetrable nature of matter" (<i>nature matérielle pénétrable</i>) (p. 72)	Extraphysical self-permeability (see chap. 304)
10. "New science" (<i>nouvelle science</i>) (p. 72)	Projectiology (see chap. 05)
11. "Second being" (<i>second être</i>) (p. 72)	Psychosoma (see chap. 125)
12. "Latent senses" (<i>sens latents</i>) (p. 73)	Paraperceptibility (see chap. 263)
13. "Complete separation" (<i>séparation complète</i>) (p.71)	Holosomatic discoincidence (see chap. 110)
14. "Separate during the waking state" (<i>se quitter pendant la veille</i>) (p. 72)	Diurnal lucid projection (see chap. 196)
15. "Separate during sleep" (<i>se quitter pendant le sommeil</i>) (p. 72)	Nocturnal lucid projection (see chap. 196)
16. "Saw the scenery" (<i>Je voyais le paysage</i>) (p. 72)	Extraphysical vision (see chap. 278)

Fig. 12: Comparison of 16 Confirmatory Expressions from the Prophecy

Precognitor. As well as being a lucid projector, Balzac was a precognitor. For those who are accustomed to “solving an enigma with concepts,” trying to take a shortcut with simplistic reasoning, it is worth mentioning that the author did not propose projectiology as a whim, only to endorse the ideas of Honoré de Balzac.

Projection. Let us look at the facts. The author’s first lucid projection, being among those studied in this volume, occurred in 1941, when he was 9 years of age. He later studied the theme of lucid projection full time, on a continuous basis, beginning in 1966. By that time, he had a fairly sizeable specialized library on the subject.

Identification. The author identified the prophecy on his own in 1982, while reading the novel, within his routine of uninterrupted bibliographic research, performed during that period.

Gratification. The bibliographic discovery of the prophecy was extremely gratifying, representing, in some way on that occasion, a veritable endorsement of a lifetime of work as an independent researcher, without any official subsidy of any type.

Note. Some of the entries in the following bibliography refer to books translated into Portuguese. This is because the current work was published in Portuguese.

Bibliography (Nostradamus).

1. **ALLGEIER, Kurt;** *As Grandes Profecias de Nostradamus* (“*Die Grossen Prophezeiungen des Nostradamus in Moderner Deutung*”); transl. Maria Madalena Würt Teixeira; 138 pp.; 31 illus.; 13 refs.; 20.5 x 15.5 cm; pb.; Rio de Janeiro, R.J.; Brazil; Editora Tecnoprint; 1983; pp. 126-127.

Bibliography. Readers wishing to deepen their research for themselves, on the precognition of Balzac analyzed here, can refer to the translation in English of the short novel entitled *Louis Lambert*.

13. EXOTERIC PERIOD OF PROJECTIOLOGY

Definition. Exoterism: the more recent doctrine, or modern attitude, that aims to transmit the teachings (scientific, philosophical) of truth directly to the public in an unrestricted manner (popular dissemination, popularization of knowledge).

Synonymy: anti-hermetism; exteriorism; openness.

Third. The third historical period – the exoteric period or initial-scientific period of projectiology – extends from 1905 (Turvey) to 1965 (Crookall), in which 7 personalities or authors and their works stand out, as presented in the following chronological order:

1. **First:** the publicly verified lucid projections of Vincent Newton Turvey (1873-1912), in England.

2. **Second:** the original clarion calls of Prescott Farnsworth Hall, in 1916, in the United States of America.

3. **Third:** the publication of the experience of Hugh Callaway (1886-1949) under the pseudonym of Oliver Fox, again in England, in 1920.

4. **Fourth:** the Dane, Johannes E. Hohleberg, who presented his personal projective experiences at the First International Congress of Psychic Research in Copenhagen, Denmark, in 1921, a fact that is nowadays generally forgotten.

5. **Fifth:** Sylvan Joseph Muldoon (1903-1971), starting in 1929, in the United States of America.

6. **Sixth:** the book by Marcel Louis Fohan (“Yram”), in France.

7. **Seventh:** the detailed work of Robert Crookall, notably from 1960 to 1965, in England.

Demythologization. This period was characterized by an openness, or exoterism, of a relative knowledge of the phenomenon of lucid projection to the public (*populace*), demythologizing (demythologization) and demystifying the subject, which was already well established at this time under the term *astral projection*.

Metapsychics. This phase saw the beginning of projections induced by animal magnetism produced by researchers Hector Durville (1848-1923) and Charles Lancelin (1852-1941), from the

French school in Paris, and the popularization or democratization of lucid projection through individual experiences, which were better received by open minds and referred to in dozens of works of profound significance and authenticity.

Decade. The second decade of the twentieth century was characterized by a more solid appearance of the lucid consciential projection phenomenon, which can be recalled, with some repetition, through the following 6 authors and their popular works (see International Bibliography of Projectiology).

1. **Fox.** In 1920, the above-cited case of Oliver Fox.
2. **Hohleberg.** In 1921, the Dane, Johannes E. Hohleberg, also cited above.
3. **Morrell.** In 1924, Ed Morrell publishes his book, which caused a shakeup in the United States penal system, based on his lucid projections in the dungeon at San Quentin, California.
4. **Larsen.** In 1927, Caroline D. Larsen publishes her book *My Travels in the Spirit World*, which addressed her impressive extraphysical experiences as an active sensitive.
5. **Pelley.** In May of 1928, the author William Dudley Pelley publishes his article “Seven Minutes in Eternity”, in *The American Magazine*, narrating a lucid experience outside the human body which proved to be a veritable publicity phenomenon, causing an immense stir on the subject.
6. **Muldoon.** Lastly, in 1929, Sylvan Joseph Muldoon (1903-1971) releases the work which became a major (and more technical) classic on the theme: *The Projection of the Astral Body* (coauthored with Hereward Hubert Lavington Carrington).

Parapsychology. It is here that metapsychics ended and parapsychology began, with the Congress of Utrecht, Holland, in 1953.

14. LABORATORIAL PERIOD OF PROJECTIOLOGY

Definition. Laboratorial experimentation: scientific method that consists of observing a natural phenomenon under predetermined conditions, which allows increased knowledge of the manifestations or laws that regulate this phenomenon.

Synonymy: laboratorial experience; scientific assay.

Fourth. Lastly, the fourth and last historical period of projectiology is the contemporary period, initiated by Charles Theodore Tart (1937), in 1966, in the United States of America, when this researcher conducted the first attempt to remove lucid projection from the restricted arena of individual experiments and take it into the laboratory, performing experiments with the still unidentified young projector, Miss Z.

Present. This period extends up to the present.

OBE. In this phase, astral projection was euphemistically coined as OBE (out-of-body experience), or projection of the consciousness outside the physical body, a less romantic term currently used by many parapsychologists and introduced to the sophisticated laboratories of the scientific world by parapsychology.

Statistics. There is a consequent intensification of statistical public opinion polls on correlated phenomena, the use of the most sophisticated laboratory instrumentation, ranging from maps, graphs and tables to equipment that measures epidermal reaction (BSR and GSR), electroencephalograph (EEG), electrocardiograph (EKG), *electroopticograph* (EOG), the digital photoplethysmograph and various polygraphs, as well as intercoms, cassettes, videocassettes, diskettes, CD-ROMs and other computer-related resources.

Precision. The precision of the layout of the historical periods of projectiology is debatable.

Cultures. According to geographical areas, customs, uses and cultural levels, the ancient, esoteric and exoteric periods progress, continue to exist and have representatives among us.

Perspectives. However, the laboratorial period beckons with truly optimistic, motivating perspectives, presenting terrestrial humanity with new horizons in the direction of a synthesis and

greater comprehension of the facts established by projectiology, with innumerable positive consequences that are projected throughout the upcoming centuries.

Importance. There are 2 aspects which should be considered in parapsychic research:

1. **Cases.** Spontaneous parapsychic cases are important to the degree that they provide indicators (clues) for laboratorial experimentation.
2. **Experiments.** Laboratorial experiments are significant because they demonstrate, under different conditions, what is actually occurring (facts) in the human experience.

Hierarchy. In this way, the hierarchy of importance between these two approaches (positions) is exactly inverse (contrary).

Preference. In parapsychic practices, as a consciential laboratory, the cozy energetic environment (carpet, shoeless, cushions and air conditioning) of the *ashram* (emotional body) is always preferable to the socially solemn, sterile, cold (mentalsoma) and distant environment of the professional religious temple.

Psychosomatics. This is due to the fact that the psychosoma still predominantly controls the behavior of the average member of the human population (a total of 5.9 billion persons in 1997) or the crustal, tropospheric, and extraphysical or paratropospheric population (the parapopulation is 9 times larger than the human population) of this planet.

Phase. With this laboratorial period, projectiology frees itself from the *bookish pre-scientific* phase.

Hermetisms. Projectiology shows those more alert consciousnesses the irrelevance of religions, beliefs, faith and so-called *hermetic sciences* or hermetisms, nowadays including the daily practices of the personal energetic task, or penta, for the rest of the active life of the more lucid, mature intraphysical consciousness.

Bibliography: Balzac (71, p. 71), Castro (265, p. 7), Crookall (388, p. 3), Fox (544, p. 32), Greenhouse (636, p. 13), Hammond (674, p. 210), Kardec (824, p. 213), Muldoon (1105, p. 55), Swedenborg (1639, p. 1), Turvey (1707, p. 14), Vett (1738, p. 379).

15. PIONEERISM IN PROJECTIOLOGY

Definition. Pioneerism: the character or quality of the individual who is the first to anticipate, open or discover ways for other persons, through an unknown region or pioneering endeavor.

Synonymy: pioneering; precursory exploration; trail blazing.

Precocity. Listed below are some precocious moments in the history of projectiology and its protagonists, who are worthy of being considered pioneers in the formation of this science.

Hermetimus. Hermetimus of Clazomenae, a philosopher belonging to the Ionic school, from the sixth century *before Christ*, was apparently able to induce the lucid consciential projection experience at will, using this ability to investigate the nature of the consciential states after death or deactivation of the human body (desoma).

Herodotus. Writers, philosophers, clergy and statesmen/stateswomen of many countries of the ancient world referred to the lucid consciential projection experience. Among them are Gautama Buddha (563-483 B.C.) and Herodotus (485-425 B.C.).

Plato. Plato (428-347 B.C.) related the story of Er, son of Armenius, Pamphylian by birth, a soldier who was taken for dead in combat. At the end of 10 days, when they retrieved the already putrefied dead from the battlefield, they removed him in apparently good condition. They took the body home in order to bury it, when, on the twelfth day, while on the pyre, Er returned to life and reported what he had seen in *the great beyond*.

Interiorization. After leaving the human body, he found his consciousness together with many others in both good and bad condition according to his detailed report. In the end, he did not know how he reached the human body (interiorization) but, upon abruptly opening his eyes early that morning, he saw that he was lying on the pyre.

Bible. The Bible includes some expressive cases that suggest the study of the departure of the consciousness outside the body. The following 3 are examples:

1. **Ezekiel.** Through an assisted lucid projection, Ezekiel's consciousness was lifted up (extracted from the human body) and transported by a *spirit* (helper) to another place (Ezekiel 111:14).

2. **Apocalypse.** The phenomenon of lucid consciential projection was mentioned in the Apocalypse of John (1:10 and 11; 4:2).

3. **Epistles.** Also, Paul of Tarsus (?-67), in his Epistles (2 Corinthians 12:2), mentions the projective phenomenon.

Writers. The following individuals also wrote about consciential projections: Gaius Suetonius Tranquillus and Plinius the Younger (61-113).

Plutarch. Plutarch of Chaeronea (50-120) registered the report of Aridanaeus of Soles, of Cilicia, Asia Minor, a man of precarious morals, according to the opinion of that time, who was given up for dead in 79 A.D. after a violent fall.

Aridanaeus. Just when they were about to bury Aridanaeus' human body, 3 days after the accident, he reentered his body, regained full consciousness and related his lucid experience outside the human body during that 3-day period (prolonged lucid projection) in detail to Protogenes and other friends.

Recycling. From this point forward, Aridanaeus was transformed into a highly virtuous man. He even changed his name, according to the accounts of his contemporaries (projective existential recycling).

Greek. The following are some passages, in Greek, of Plutarch's report (p. 164-172, Societé D'Édition "Les Belles Lettres", 1974):

Τὰς μὲν οὖν πολλὰς ἡγνόμενοι
γνωρίμους, ἐπειρᾶτο πρὸς
οὐτ' ἤκουον οὐτ' ἦσαν παρ
διεπτοημένοι, πᾶσαν ὄψιν

Ἐνταῦθα μίαν ἔφη
μέντοι σαφῶς ἄποθανεῖν
ἐκείνην προσαγαγοῦσαν ἐγ
θαυμάσαντος δ' αὐτοῦ κα
ἀλλ' Ἀρδιαῖος ἐστὶ, « πρ
τουδὲ Θεσπέσιος. Οὐδὲ γι
τινὶ θεῶν ἤκεις δεῦρο τῷ φ
ὥσπερ ἀγκύριον ἐν τῷ σώ

Οὕτως οὖν ἔφην ὅτι ὁ Σολεὺς Θεσπέσιος, ἀνὴρ ἐκείνου τοῦ γενομένου μεθ' ἡμῶν ἐνταῦθα Πρωτογένους οἰκεῖος καὶ φίλος, ἐν πολλῇ βιώσας ἀκολασίᾳ τὸν πρῶτον χρόνον, εἶτα ταχὺ τὴν οὐσίαν ἀπολέσας, ἤδη χρόνον τινὰ καὶ διὰ τὴν ἀνάγκην ἐγένετο πονηρός, καὶ τὸν πλοῦτον ἐκ μετανοίας διώκων, ταῦτό τοῖς ἀκολάστοις ἐπάσχε πάθος οἱ τὰς γυναῖκας ἔχοντες μὲν οὐ φυλάττουσι, πρόεμενοι δὲ πειρῶσιν αὐτὴς ἀδίκως ἐτέροις συνούσας διαφθείρειν. Οὐδενὸς οὖν ἀπεχόμενος αἰσχροῦ φέροντος εἰς ἀπόλαυσιν ἢ κέρδος, οὐσίαν μὲν οὐ πολλήν, δόξαν δὲ πονηρίας ἐν ὀλίγῳ πλείστην συνήγαγε, μάλιστα δ' αὐτὸν διέβαλεν ἀνευχεθεῖσά τις ἐξ Ἀμφιλόχου μαντεία. Πέμψας γάρ, ὡς ἔοικεν, ἡρώτα τὸν θεὸν εἰ βέλτιον βιώσεται τὸν ἐπίλοιπον βίον· ὁ δ' ἀνείλεν ὅτι πράξει βέλτιον ὅταν ἀποθάνῃ. Καὶ δὴ τρόπον τινὰ τοῦτο μετ' οὐ πολὺν χρόνον αὐτῷ συνέπεσε. Κατενεχθεῖς γὰρ ἐξ ὕψους τινὸς εἰς τράχηλον, οὐ γενομένου τραύματος, ἀλλὰ πληγῆς μόνον, ἐξέθανε, καὶ τριταίος ἤδη περὶ τὰς ταφὰς αὐτὰς ἀνήνεγκε.

Ταχὺ δὲ ῥωσθεὶς καὶ παρ' αὐτῷ γενόμενος, ἀπιστόν τινα τοῦ βίου τὴν μεταβολὴν ἐποίησεν. Οὔτε γὰρ δικαιότερον περὶ τὰ συμβόλαια γινώσκουσιν ἕτερον Κίλικες ἐν τοῖς τότε χρόνοις γενόμενον, οὔτε πρὸς τὸ θεῖον ὀσιώτερον οὔτε λυπηρότερον ἐχθροῖς ἢ βεβαιότερον φίλοις· ὥστε καὶ ποθεῖν τοὺς ἐντυγχάνοντας αὐτῷ τὴν αἰτίαν ἀκοῦσαι τῆς διαφορᾶς, οὐκ ἀπὸ τοῦ τυχόντος οἰομένους γεγονέναι διακόσμησιν εἰς ἦθος τοσαύτην, ὅπερ ἦν ἀληθές, ὡς αὐτὸς διηγείτο τῷ τε Πρωτογένει καὶ τοῖς ὁμοίως ἐπεικέσι τῶν φίλων.

Ἐπεὶ γὰρ ἐξέπεσε τὸ φρονοῦν τοῦ σώματος, οἷον ἂν τις ἐκ πλοίου κυβερνήτης εἰς βυθὸν ἀπορριφεὶς πάθοι τὸ πρῶτον, οὕτως ὑπὸ τῆς μεταβολῆς ἔσχεν· εἶτα, μικρὸν ἐξαρθεὶς, ἔδοξεν ἀναπνεῖν ὅλος καὶ περιορᾶν πανταχόθεν, ὥσπερ ἐνὸς ὄμματος ἀνοιχθείσης τῆς ψυχῆς.

English. The following is a translation of these passages to English:

“Here, then, is the report that I made: Thespesios of Soles, close friend of Protagoras, who lived here with us, spent the first part of his life in complete dissipation and consequently rapidly lost his material wealth.

“Later, necessity led him to vice; thus, in search of that wealth which he lamented having lost, he came to behave like those libertines who, instead of caring for the women they have, abandon them and later try to corrupt them in order to fraudulently reprehend them when they have already had new unions.

“He soon refused no dishonorable act, as long as it provided him with pleasure and gain. He was thereby able to make a fortune, albeit a mediocre one, and quickly gained a reputation for great dishonesty.

“But what caused him the greatest damage was the oracle given by Amphilocus: he had told him to ask God if the rest of his life would be better; the oracle responded that he would be better when he was dead. Actually, in a sense, it was in this manner that things occurred.

“Falling from a certain height, he landed on his neck and, in spite of not being wounded, was in a state of shock and taken for dead. Thus it was that, three days later, at the precise moment he was to be buried, he returned to life.

“Upon becoming reanimated and reestablished, he quickly underwent an unbelievable change in lifestyle; in fact, the Sicilians knew of no one among their contemporaries who was more scrupulous in his obligations, more pious in regard to divinity, more disturbing to his enemies, more trustworthy to his friends.

“He changed in such a manner that those who knew him wanted to know the reason for this change, as they said it was such a radical transformation of character that it could not have occurred by chance. It was in fact true, as he told Protogenes and other equally reliable friends.

“Ever since his thinking soul left his body, his first impression was similar to that of a diver who is projected outside of his boat in the abyss; let us see, then, the effect of this change.

“Emerging a bit, it appeared that his whole being breathed freely, and that he could see in all directions at once, his soul being open like one singular eye.

“Most of these souls were unknown; however, he saw two or three which he knew and endeavored to approach and speak to them; but they did not understand him, as they were not themselves, being crazed, in panic, and evading being seen and having any contact.

“In this environment, he recognized the soul of a cousin; in other words, he was uncertain, because this cousin had died when he was still a child; but the soul approached him, saying: ‘Good day, Thespesios.’ He became frightened, saying that he was not called Thespesios, but rather, Aridanaeus. The other replied, ‘Yes, before, but from now on you are Thespesios.’

“In truth, you are not dead, you came here by a decree of the gods, with the thinking part of your soul; you left the rest in your body as an anchor. Know, through these signs, how to conduct yourself now and later on: the souls of the dead do not cast a shadow and their eyes do not blink.

“All the while, Thespesios had been a simple spectator, however, as he was capable of recovering, a great fear enveloped him; a certain enormous woman of great beauty held him and said: ‘I come here in order to better record within you each one of your memories.’ She approached him with a small reddish stick, the color of fire, like those used by painters.

“But another woman intervened and stopped her. Then he suddenly, as though sucked by a violent, irresistible blast from a siphon, returned to his body and opened his eyes, when he was about to be lowered to his grave.”

New perspective. After his prolonged lucid projection, Aridanaeus of Soles became transformed into a highly virtuous man and even changed his name to *Thespesios* (2 egos in a single intraphysical life), as suggested by the helper during the extraphysical experience. This is a typical case of new perspective or existential recycling with a genuinely projective origin, an event that occurs with the same characteristics nowadays in the most diverse societies.

Curma. A senator of Numidia, North Africa (now Algeria), named Curma, in the fifth century after Christ, as reported by Augustine of Tagaste (354-430), remained in a state of coma for several days and, upon awakening, told of having consciously lived outside his human body.

Seers. In ancient times, human lucid projectors, or those in whom the sight of the consciousness separated from the human body was opened, were called seers and later called prophets (1 Sam. 9:9).

Terms. In more recent times, the myths, mythologies, traditional cosmologies, mystical practices, beliefs, sagas and folkloric legends of many people have been presenting their own terms for characterizing, in one way or another, for better or for worse, the condition and personality of the contemporary lucid projector, or projectionist. The following 18 expressions serve as examples:

1. *Ataí* (Melanésians).
2. *Benandanti* (Lorena; sixteenth and seventeenth centuries).
3. *Delog* (Tibetans).
4. *Doppelgänger* (Germans).
5. *Doshi* (the Botswana people of the Bantus).
6. *Dovidja* (Hindus).
7. *Homo duplex* (Honoré de Balzac).
8. *Iruntarinia* (the Ngtataras of Australia).
9. *Kelah* (the Karens of Myanmar).
10. *Mora* (Slavs).
11. *Mzimu* (the tribes of the Lake Nyasa area, Africa).
12. *Navujieip* (Wild River Shoshone of Wyoming).
13. *Ort* (Syrians, Finnish people of Oriental Russia).
14. *Sky-walker* (Hindus).
15. *Sunäsun* (Mongolian Buryats of Siberia).
16. *Tamhasg* (Scots).
17. *Vardöger* (Norwegians).
18. *Wairua* (Maoris of New Zealand).

XI), Currie (354, p. 78), Delanne (381, p. 22), Durville (436, p. 41), Eliade (475, p. 117), Frost (560, p. 31), Greenhouse (636, p. 13), Guilmot (661, p. 57), King (846, p. 107), Knight (851, p. 273), Martin (1002, p. 34), Mitchell (1059, p. 37), Muldoon (1105, p. 45), Plato (1261, p. 487), Plutarch (1264, p. 39), Prieur (1289, p. 93), Sculthorp (1531, p. 133), Vieira (1762, p. 217), Walker (1781, p. 1).

16. CHRONOLOGY OF PROJECTIOLOGY

Definition. Projectiological chronology: treatise of the historical data, noteworthy facts and notable works of projectiology.

Synonymy: establishment of projectiological dates.

Events. The following is a list of the most notable events to date, 2002, in the still recent existence of projectiology, including the historical data prior to its proposal as a science:

347 B.C. – Plato writes about the case of the *human lucid projection* – an *extraphysical excursion* – of Er, the Armenian, proving the universality of this consciential phenomenon.

79 A.D. – In Cilicia, Asia Minor, Aridanaeus of Soles undergoes an experience now called near-death, with extraphysical experiences that remained as the first more detailed report registered for posterity. It came to us through Plutarch of Chaeronea.

100 A.D. – Plutarch of Chaeronea registers the *projective report* of the lucid projection experienced by Aridanaeus of Soles, of Silesia, Asia Minor.

1743 – In Stockholm, Sweden, the work *Diarii Spiritualis* by Emanuel Swedenborg is started. He would consequently become the *precursor* of projectiology and the first projective diarist, who recorded his experiences over a period of twenty years.

1832 – The publishing of the autobiographical, psychological novel *Louis Lambert* in Paris, that acclaims its author, Honoré de Balzac, as the first *prophet* (precognitor) of projectiology.

1832 – Honoré de Balzac, in Paris, gives the name of *Homo duplex* to the human lucid projector.

April 18, 1857 – The first edition of *Le Livre des Esprits*, by Allan Kardec, is published in Paris. In its eighth chapter, topics 153 to 171, it studies the emancipation of the soul (intrapysical consciousness) during corporeal life (projectiology), an aspect of the phenomena of the spirits which was forgotten in *spiritism*, whether in the French movement or those in other countries, when extrapysical consciousnesses and their phenomena generally received preferential attention.

1929 – Publication in the United States of America of the work *The Projection of the Astral Body*, by Sylvan Joseph Muldoon and Hereward Hubert Lavington Carrington, which became the first classic of projectiology.

1939 – The Russian Semyon D. Kirlian presents *again* the controversial *electrographic irradiations*.

1946 – The conscientiological technique of *existential inversion* (existential invertology) – already self-researched by the author in a theoretical manner – was launched for the first time, although having little impact on intrapysical society,

1962 – The Russian Iosif M. Goldberg rediscovers the “novelty” of *dermal-optical perception* (skin sight).

1966 – The author begins to give priority and full-time dedication to the *research of projectiology/conscientiology* in his work (experimentology).

1966 – The interconsciential assistential technique of *penta* (*personal energetic task*), popularly called *passes to the void*, which is a daily practice performed for the rest of the individual’s life, is launched.

1966 – At the University of California at Davis, in the United States of America, the researcher Charles Theodore Tart performs the first *laboratory* experiment with human lucid projection.

1970 – The Theory of *Homo sapiens serenissimus* and its corollaries is officially proposed (serenology).

1971 – The work *Journeys Out of the Body* by Robert Monroe is launched in New York, NY. Many editions have been printed, making it the first international bestseller of projectiology.

1975 – In the United States of America, the book *Life After Life*, by Raymond A. Moody Jr., with preface by Elisabeth Kübler-Ross, became an international bestseller. This small work achieved worldwide attention, for the first time, for the near-death experience (NDE) and, consequently, for extracorporeal phenomena. This opened a new and unexpected field within the area of medicine for projectiology research.

1978 – In Storrs, Connecticut, in the United States of America, *The International Association for Near-Death Studies (IANDS)* is founded. It is an international organization of scientists and the public, dedicated to exploring near-death experiences (1 of the 54 phenomena in the basic phenomenological complex of projectiology) and its implications.

1979 – The conscientiotherapeutic technique of prophylaxis and self-defense, the *vibrational state* (VS), including the prophylactic VS (paraprophyllaxia), is launched.

1980 – The theory of the *cosmoethical megaparadigm*, cosmoethics – popularly called the cosmic moral – is proposed.

1980 – The theory of *interassistentiality*, or *the consolation task* (the primary task of consolation) and *the clarification task* (the evolved task of clarification) is proposed within conscientiological intrapysical society.

1980 – The conscientiotherapeutic technique of *auric coupling* (holochakrology) is launched.

1981 – In Storrs, Connecticut, in the United States of America, *IANDS* launches the first periodical publication, journal or technical magazine, *Anabiosis – The Journal for Near-Death Studies*, dedicated specifically to the publication of near-death experience research.

1981 – In Storrs, Connecticut, in the United States of America, *Vital Signs*, is launched by *IANDS*. It is the first bulletin (quarterly digest) dedicated to reporting on works and tasks performed by the research team of the first organization exclusively dedicated to the investigation of the near-death experience.

September 6, 1981 – In Rio de Janeiro, Brazil, the *Center for Continuous Consciousness* is founded, with the presence of 19 persons. This served to call particular attention, for the first time, to continuous consciential lucidity and would trigger the creation of dozens of other centers in various locations.

1981 – In Rio de Janeiro, Brazil, the book *Projections of the Consciousness* is published – currently in its 5th edition (Portuguese), as well as having editions in Spanish and English – in which the term *projectiology* is proposed for the first time.

1982 – The conscientiometric work hypothesis of *cons*, or the units of lucidity of the consciousness (holomaturology), is proposed.

1982 – According to research estimates, 8 million *near-death experiences* (NDE) occur every year.

November, 1982 – Sebastião Mendes de Carvalho, on the research team of the Center for Continuous Consciousness in Rio de Janeiro, Brazil, published the first *article* in the popular press with the term *projectiology* in the title of the work. Publication: *Reincarnation*, a monthly magazine published in Porto Alegre, capital of the state of Grande do Sul, Brazil, p.14, 15.

June, 1983 – In São Paulo, São Paulo, Brazil the monthly column *Bulletin of Projectiology Number 1*, is published in the *Jornal Espírita*. This bulletin published 83 editions in the following years (communicology).

1983 – In São Paulo, São Paulo, Brazil, impassioned articles written by ideologically patrolling spiritists, who are extremely purist, orthodox and sectarian, were published against projectiology (Examples: Monteiro; Worm), which served to attract greater attention to the research of the human lucid projection phenomenon. On that occasion, the *Center for Continuous Consciousness* in Rio de Janeiro, Brazil, was not able to respond to the increased number of incoming letters requesting projectiological information.

August, 1983 – In São Paulo, São Paulo, Brazil, on page 6 of the journal *Folha Espírita*, the *Carta Aberta aos Espíritos* (*Open Letter to Spiritists*) is published, in which the author publicly presents his position regarding projectiology to the ideological patrollers of the kardecist movement of Brazil (parapedagogy).

March, 1984 – In São Paulo, São Paulo, Brazil, on page 4 of the *Jornal Espírita*, the article *Maturidade Extrafísica* is published by the author, emphasizing, for the first time, the importance of the integral *maturity* (holomaturology) of the consciousness.

March 29-31, 1985 – In Kansas City, Montana, in the United States of America, the first Convention of *The International Association for Near-Death Studies* (IANDS) is held, being dedicated exclusively to the study and discussion of near-death experiences.

January 31, 1986 – In Rio de Janeiro, Brazil, the first pilot edition of 5,000 copies of the work *Projectologia* (*Projectiology*) – distributed free of charge and now out of print – is launched. It presents the first large international bibliography on projectiological themes (1,907 titles). The first *extraphysical code of ethics* was included in this work in chap. 132, p. 211-213, indicating 16 practical items relative to *cosmoethics*; as well as the 3 basic consciential states, p. 34.

1986 – The theory of the *consciential paradigm* and its corollaries is proposed.

1986 – The theory of *groupkarmic interprison* and its corollaries (holokarmology) is proposed.

1987 – In Bryn Athyn, Pennsylvania, in the United States of America, the bulletin *Revitalized Signs*, the successor to *Vital Signs*, with the same objectives, is launched by IANDS.

June 12-16, 1987 – The *First Projectiology Seminar in Brasilia* was held, being registered in a newsletter authored by Prof. Basilio Baranoff.

December 12,13, 1987 – In the Convention Center at Unicamp, in Campinas, São Paulo, Brazil, the *1st Brazilian Symposium of Continuous Consciousness* (BSCC) was held, in which the author defended the *theory of Homo sapiens serenissimus*. This first, more ample debate on general aspects of projectiology included the participation of 142 persons from 8 different states in Brazil: São Paulo, Rio de Janeiro, Minas Gerais, Bahia, Santa Catarina, Sergipe, Amazonas and the Federal District, and from a total of 7 capitals and 21 cities.

January 16, 1988 – In Rio de Janeiro, Brazil, the *International Institute of Projectiology* (IIP), was founded, being the first *institute* dedicated exclusively to the research, study and teaching of projectiological themes (conscientiocentrology).

- 1988 – The basic techniques of *conscientiotherapy* are presented.
- 1988 – The *Swedenborg syndrome* is diagnosed, according to conscientiotherapy.
- 1989 – The theory of *petifreeness* was proposed as being a theoretical procedure that is of priority and more feasible, in the short-term, in the evolutionary way of the intraphysical consciousness, at our present average stage of intraconsciential progress (petifreeology).
- June, 1989 – The *Bulletin of Information on Projectiology (BIPRO)*, of the International Institute of Projectiology, in Rio de Janeiro, Rio de Janeiro, Brazil, is launched (communicology).
- 1990 – The conscientiological theory of *strong traitism* and its corollaries (strong traits of the consciousness) is proposed.
- 1990 – The conscientiological theory of *thosenes* (thought, sentiment and consciential energy) and its corollaries (thosenology) is proposed.
- 1990 – The *consciential bond* is theoretically (theory and technique) presented and established in conscientiological intraphysical society (parasociology), at the International Institute of Projectiology, in Rio de Janeiro, Rio de Janeiro, Brazil.
- 1990 – The conscientiometric and paraxual technique of the *penile aura* (sexosomatics) is proposed, directed mostly toward youth.
- 1990 – The conscientiological and paraxual technique of the *holo-orgasm* (sexosomatics) is proposed.
- June 4-7, 1990 – The *I International Congress on Projectiology*, in Rio de Janeiro, Rio de Janeiro, Brazil is held (communicology).
- 1991 – The conscientiological theory of *consciential paracomatose* (projectiotherapy, conscientiotherapy) is proposed.
- 1991 – The theory of the *incomplete couple* and its corollaries (intraphysiology) is proposed.
- 1991 – The conscientiometric technique of *intraconsciential balancing* (conscientiometry) is proposed, being a self-help resource of interest to all persons.
- 1992 – The theory of *existential robotization* (intraphysiology) is proposed.
- February 9, 1992 – In Rio de Janeiro, Rio de Janeiro, Brazil, the first *group of existential inverters* is founded, with 17 young inverters (existential invertology) from the team of volunteers of the International Institute of Projectiology (IIP).
- February 22, 1992 – A research project is performed at the International Institute of Projectiology (IIP), in Rio de Janeiro, Rio de Janeiro, Brazil, that proposes 12 attitudes for avoiding the state of *extraphysical catatonia*.
- 1992 – The *International Bibliography of Conscientiology*, including the specific phenomena of projectiology, exceeds 5,000 references from 37 countries.
- May 30, 1993 – The first ample *debate* on the *consciential paradigm* is held at the International Institute of Projectiology (IIP), in Rio de Janeiro, Rio de Janeiro, Brazil.
- 1994 – Twenty percent of conventional *scientists* still dedicate their work and talent to the improvement of techniques for killing their fellow beings.
- 1994 – A high number of parapsychic, multidisciplinary investigators dedicate themselves more intensely to the *research of NDEs*, notably those of children.
- 1994 – Our *human brain* consists of almost 3.3 lb (1.5 kg) of matter, while almost nothing is known about the *parabrain* (paraneurology).
- 1994 – There is still no conventional scientific publication that addresses the issue of *thosene* (thosenology).
- January, 1997 – The magazine *Conscientia* is launched.
- July, 1998 – *The Journal of Conscientiology* is launched.
- October 21-24, 1999 – The *II International Congress on Projectiology is held* in Barcelona, Spain, (communicology).
- May 16-19, 2002 – The *III International Congress on Projectiology and Conscientiology is held* in Manhattan, NY, USA (communicology).

Bibliography: See the author's recent work, *700 Conscientiology Experiments*.

II – Relationships between Projectiology and Other Sciences

17. PROJECTIOLOGY AND INTERDISCIPLINARITY

Definitions. Interdisciplinarity: the common condition referring to or including two or more disciplines or areas of knowledge; existing interaction between two or more disciplines.

Synonymy: integration of wisdom; juxtaposition of diverse disciplines; multidisciplinarity; pluricurricular knowledge; pluridisciplinarity; scientific universality; synthesis of knowledge; transdisciplinarity.

Universalism. Interdisciplinarity, when it represents an integration of learning or a synthesis of knowledge, harmonizes and fits entirely with generalism, holistics and, moreover, with universalism, since it advances toward the total conception of the universe (totalogy) through the integration of all fields of human consciousness research.

Recognitions. Interdisciplinarity – technical intercommunication between specialists of diversified areas of research – avoids the frustration of recognizing, too late, that you reinvented the wheel and other creations, techniques, and theories that have already been consolidated. These frustrations are characteristic of *closed disciplinarity* or *insufficient interdisciplinarity*, typical of schizophrenic or autistic science.

Monoglotism. Monoglotism currently occurs more within the societies that speak English, the language employed more intensely by science in the West. This has a strong effect upon the processes of globalization or the *babelization of knowledge* that is occurring, being the greatest obstacle to an expansion of interdisciplinarity. We can see a good example of this in Moss, Thelma (bibl. 1,096, p. 150).

Exchange. No science is sovereign to the point of disregarding the collaboration of other sciences. Each has its own specific content that characterizes it. Nevertheless, all of them exist and develop in an interconnected manner, in an incessant and irreversible exchange of values.

Isolation. The individual who refuses scientific collaboration commits the grave error of possibly ending up working in isolation. It is always good to clarify postures: independent research is oftentimes a healthy fact; permanent isolation is always a mistake. These are merely logical concepts.

Predisposition. Polyglotism, international education and a multicultural support system predispose the researcher from any scientific area toward positive interdisciplinarity.

Derivations. Thus, as mentioned above, parapsychology is derived from metapsychics and projectiology is derived from parapsychology – these 3 lines of research being included within the vast field of conscientiology or egology.

Stage. Projectiology's experimental research of leading-edge relative truth, within the scope of conscientiology, always aims to move along advanced lines (projected, or through projections) beyond the limits of conventional human knowledge. This signifies stepping beyond all human forms and the traditional, technological, and artificial limitations of the most up-to-date pure scientific investigation.

Holosomatics. This explains the indispensable employment of interdisciplinarity and holosomatics in the emergence of the *science of projectiology*, as well as the decisive role played by universalism and extraphysiology (multidimensionality) in the establishment of the *philosophy of projectiology*.

Elimination. As is generally the case with all sciences, regarding the affirmation of relative truth, projectiology seeks to eliminate the following 28 spurious variables, among others:

1. Absence of critical judgment.
2. Acceptance of appearances.
3. Beliefs.
4. Chimerical ideas.
5. Delirious subjectivism.
6. Easy presumptions.

7. Fallacies, notably those of a logical nature (errors in logic).
8. Futile philosophies.
9. Hallucinations of all types.
10. Illegitimate inquiries.
11. Illuminated mystification.
12. Ingenuous or recherché superstitions.
13. Insecure reasoning.
14. Intellectual stagnation.
15. Irrationalism.
16. A lack of possibilities.
17. Metaphysical abstractions.
18. Mysticism.
19. Mythology.
20. A non-analytical spirit.
21. Paranoia.
22. Preconceptions or apriorisms.
23. Sensory illusions.
24. Sophism (sophistry).
25. A spirit of credulity.
26. Uncalculated shots in the dark.
27. Unverified suggestions (*suggestions based merely on one's own thoughts*).
28. Well-educated ignorance.

Basis. Projectiology is not a doctrinaire ideology or a closed system of ideas (monolithism) based on faith, revelation, dogmas or the creation of heretics.

Neophobia. Projectiology, as a conscientiocentric and theorice-oriented science, will never follow a linear trajectory or submit itself to mental straightjackets, because it combats all types of neophobia through bold, neophilic personal experiences: self-discernment; self-analyses, self-evaluations, multidimensional self-awareness, bioenergetic self-balancing, evolutionary self-organization, self-education, self-research, lucid self-projectability, self-retrorecognitions and continuous self-superceding.

Uncertainties. Conscientiology can delineate the lives of projectiologists and conscientiologists through cosmoethics, the clarification task and polykarmality. Nevertheless, this attitude is the intraphysical consciousness' own; it signifies imprisonment rather than a process of uninterrupted intraphysical recycling that is capable of improving the individual's general ethical, political, scientific and philosophical uncertainties.

Binomial. Projectiology causes intraphysical consciousnesses to become dispassionate about ideas, but eager for evolutionary self-overcoming, detoxifying oneself regarding the homeostasis of the holosoma, including consciential energies, emotions and thosenes. The interested individual learns to coexist with opposites within the context of the *admiration-disagreement binomial*.

Egos. Each of us can have many egos in a single human existence, if we consider the ego as being representative of the personality, the social being or the role that the individual plays in intraphysical society, within his/her evolutionary group or families. In evolutionary terms, it's ideal when the change of egos is for the better, as in the case of Aridanaeus of Soles/ Thespesios.

Case study. In the twentieth century, we can see, as never before in human lives, the changing of egos that is being performed by the same intraphysical consciousness. The following are two examples of changes for the better in different periods – the first and the second – of the individuals' existential programs:

1. **Marxism.** The man who lived armed with the Marxist-Leninist theory of history and had an explanation for everything, was submissive to dogmas, crutches and conditioning, and freed himself through lucid projective experiences with which he feels free, light and happy – a citizen of the cosmos.

2. **Catholicism.** The woman who was a loyal member of the Catholic Church and broke with faith of any origin in order to undertake personal experiments with consciential energies and parapsychic

experiences based on projectiology. This was done without rejection mechanisms toward the original ideas, thereby achieving greater personal confidence and energetic self-defense.

18. PROJECTIOLOGY AND OTHER SCIENCES

Field. The limits of the parapsychic research of projectiology are not defined and its field necessarily presents the ample involvement of other disciplines through a practical interdisciplinarity.

Intersection. In fact, all sciences intersect with projectiology on one or more particularly sensitive point.

Refinement. As with all sciences, projectiology is subsidized by other sciences (*refinement of knowledge*).

Multidisciplinarity. On the other hand, scientists in any field can benefit from discoveries provided by lucid projections. This is because some of the most enriching areas of modern science are those that ignore the limits between the various disciplines and take on interdisciplinary, multidisciplinary or universalistic aspects through scientific teams with diversified knowledge.

Sciences. In the analysis of the phenomenology of projections, it is inevitably necessary to appeal to other correlated sciences, such as the following 6:

1. Biology.
2. Parabiology.
3. Psychobiology and other medical specializations.
4. Medicine.
5. Paramedicine.
6. Psychiatry.

Parapsychobiophysics. When researching projections of the human consciousness and the extraphysical consciousness, projectiology gets to the core of parapsychobiophysics.

Zoology. When studying animal projection and the existence of extraphysical animals – parafauna – projectiology enters fully within the scope of zoology (parazoology).

Botany. When analyzing the projections of plants in general, and the existence of extraphysical plants – parafauna – as well as human lucid projections provoked through the use of plants, projectiology decidedly penetrates into the areas of botany (parabotany).

Implications. Besides the sciences mentioned, projectiology is directly related to anthropology, astronomy, physics, psychology, sociology and history, which are referred to in this section in specific chapters.

Technology. The implications of projectiology with regard to technology and human culture in general are vast and still undetermined. The possibilities of study and practical application are also unlimited.

Areas. The phenomena of projectiology also present close connections with other such diverse areas of human knowledge as: geography, including cartography; oceanography; meteorology; geology; speleology; ecology; science fiction; art; music; and others.

Mathematics. Projectiology has a relationship with the universal language of mathematics when presenting the formulas of its enunciations, models and theories.

Chemistry. It also has a relationship with chemistry when analyzing consensual projections and drugs, both light and heavy, licit and illicit, medications, incense, perfumes and fragrances.

Archeology. The research field of archeology has been utilizing the resources of projective archeology, together with extraphysical psychometry and extraphysical retrocognition, since the nineteenth century. Nowadays there is a wealth of evidence of its efficiency in this area of human knowledge, as well as specialized works on the subject (see *Goodman*, Jeffrey; *Schwartz*, Stephan A.; and *Wilson*, Colin).

Laziness. Faith of any kind also signifies laziness.

Mysticism. Mysticism, existing religions, multiform religiosity, religious professionalism and temporal power, proliferate intensely and establish their lasting roots in human societies due to existential (intrapysical) mental laziness or, more precisely, pluri-existential conscial indolence (intellectual fatigue, mental vacuum).

Complacency. This maintains the intrapysical consciousness inert and complacent, without initiative or motivation to think for him/herself and more inclined to *believe* than to *experience*.

Absolutism. Thus, the consciousness accepts the imposition of a ready-made set of ideas, an *absolute truth* that is imposed upon it by the *savers of souls*, forming a closed, sectarian doctrinaire group that does not allow refutation.

Discovery. In this condition, in which no one asks the individual to reason, and everybody spares the person any mental effort, insisting that he/she remains a component of existential robotization that is immersed in chronic sloth – with a doctrine that is prefabricated, is thought out for the person, is chewed and ruminated, ready to be swallowed (ingested) and blindly followed – the lazy consciousness feels him/herself to be realized, makes him/herself comfortable and retreats into his/her *own little world*.

Psychosoma. This is the evolutionary level at which the emotional body (psychosoma) is predominant over the passive consciousness that has still not discovered the existence of the parabody of discernment, namely the *mentalsoma*.

Self-determination. The experience of lucid projection in other existential dimensions breaks the inertia of this fossilized state, leading the intrapysical consciousness to discover, by itself, and apply the *mentalsoma* with lucidity and self-determination.

Crutches. In other words: the science of projectiology (that seeks refutation) builds up, with expressive naturalness, the revolutionary philosophical proposal of the improvement of the consciousness – which forever dispenses with *crutches* having any mystical connotation, as well as religiosity of any kind. Its application further suggests the practice of penta for those individuals motivated toward interconscial assistance.

Self-discernment. This demonstrates that the evolutionary advancement of the consciousness occurs on a continuous basis after reaching a certain level (that of *Homo sapiens serenissimus*) by rationally, logically, and reflectively applying the measurement of pure self-discernment stemming from the *mentalsoma*.

Influence. All this develops beyond the instinctive-animal influence of the human body's *brain* (or even the *abdominal brain*) and, furthermore, beyond the immature-emotional influence of the psychosoma's *parabrain*.

Key. Therein lies the evolutionary key that is currently being encountered by intrapysical consciousnesses upon awakening from their stagnant, multi-existential, millenary somnambulism through lucid conscial projections.

Religion. Projectiology is ready and able to offer scientific equivalents for many traditional religious concepts, even though it is still in its initial stages and has an endless amount of research before it, as does every science. This is especially true with regard to conscial modes of communication in the following 3 areas:

1. **Confirmations.** Prayer and evocation, that depend on telepathy, can have their results immediately and directly confirmed in the extraphysical dimension by the consciousness, which is projected from the human body at that time.

2. **Experiences.** Viewing, or the revelation of clairvoyance, can be felt or experienced by the projected intrapysical consciousness at the extraphysical location, including those locations in extraphysical communities.

3. **Therapies.** So-called *physical miracles* and those *prodigious cures* generated by psychokinesis or telekinesis (ectoplasmy) – as well as many other concepts – can be verified by the lucid projector through the direct action of the vehicles of manifestation and the use of conscial energy.

Theologians. Modern theologians use emotionally charged words in such a way as to produce a state of consciousness in their listeners and readers in which the persuasive logic of an argument is not very deeply scrutinized. This is a technical subtlety.

Sentimentalism. The intrusion of emotion and sentimentalism, which are characteristic of the psychosoma, the parable of emotions and desires, is always typical of a flawed argument that does not come from the parable of discernment.

Artifice. This philosophical or technical artifice has been deeply employed in the catechisms and conditionings of Buddhism, Christianity, Hinduism, Judaism and Islam as well as in other variants of religious, theological and mystical knowledge.

Substitution. Hence, lucid projection beneficially substitutes belief in general, blind faith, and even so-called *rationalized faith* with knowledge that is direct, personal, incontrovertible and, finally, definitive for the consciousness. In this way, any element that is intermediary or intrusive towards impartial reasoning, holomaturity and greater discernment is eliminated.

Penta. The daily practice (for the rest of the intraphysical consciousness' life) of the personal energetic task (penta), as implemented upon a foundation of lucid consciencial projection, completely replaces the adult individual's need for religion, belief or faith of any kind or origin. Penta confirms, in a practical manner, that which reasoning, self-discernment and logic have already proved to the individual.

Hagiography. Projectiology has a direct relationship with hagiography or hagiology, as there is an entire field of projective hagiography that studies the lives of the so-called *saints*, with evidence of the intercurrency of all main projectiological phenomena.

Expressions. Roman Catholic hagiologists label the visions and extraphysical encounters experienced by the intraphysical projector with infantile expressions, such as the following 4:

1. "Experience of God."
2. "Extraordinary infused grace."
3. "Presence of the absolute."
4. "Visitation by God."

Case study. The compilation of the occurrences of lucid projection that have been recorded up until the present constitutes the historical development of projectiology. This official case study is an impressive collection and involves the interconnection of dozens of diverse areas of human thought, as can be observed in the International Bibliography (See *700 Conscientiology Experiments*, International Bibliography, 5,116 works).

Methods. Despite what has been written, today's sciences – modeled within the structure of the space-time continuum in which we live while in the ordinary, physical waking state – do not possess adequate resources for studying the consciousness' experiences outside the human body, when projected in the isolated mentalsoma in the mentalsomatic dimension.

Neoconcepts. If the space-time model is inadequate to explain these lucid projections, we need to develop new concepts of reality in order to explain them. To this end, the creation of new methods of scientific investigation will be inevitable.

Facts. At this point, if we wish to map out the world of projectiological experiences, we return to an imposition stemming from the facts: ideally, both the researcher and the research subject will produce lucid projective experiences through the impulsion of their will (preferably without the use of drugs), each one maintaining the consciousness totally open to new manifestations, with a minimum of personal emotional and psychological influences, in order to overcome the greatest possible number of discrepancies in their extraphysical perceptions while the consciousness is temporarily projected and free, as well as in their analysis of those experiences realized while outside the human body.

Idiosyncrasies. This participatory research, involving the *researcher-research object*, will maximally eliminate the extremely individual idiosyncratic interpretations stemming from each person's value system. The phenomena will thus be studied in a more objective and transparent manner.

Bibliography: Amadou (21, p. 23), Ancilli (24, p. 264), Black (137, p. 121), D'arbó (365, p. 32), Goodman (618, p. 219), Green (632, p. 93), Greene (635, p. 101), Mitchell (1058, p. 41), Pratt (1285, p. 155), Rouhier (1478, p. 8), Schwartz (1527, p. 67), Targ (1651, p. 13), White (1828, p. 218), Wilson (1856, p. 125), Wolman (1863, p. 929).

19. PROJECTIOLOGY AND PARAPSYCHOLOGY

Definition. Parapsychology (Greek: *para*, beyond, alongside; *psyché*, soul; *logos*, treatise, study): branch of psychology addressing behavior that is still not capable of being described or explained in terms of known physical principles, and which has an assured and irreversible role in humankind's evolution or, in other words, that which transcends psychology.

Synonymy: bio-information; biopsychics; biopsychism; biopsychoneuroenergetics; biosophy; cosmosophy; hyperpsychics; metapsychics; metapsychism; metapsychology; nomothetical psychology; paraneuropsychology; paranormalism; paranormology; paraphysics; parapsychics; parapsychism; parapsychobiophysics; parapsychologism; psilogy; psiology (Carrol B. Nash); psionics; psychic research; psychobioenergetics (Soviet term); psychobiophysics; psycho-energetics; psychotronics (Czech term); science of the paranormal; scientific spiritism; transcendent science; ultraphany (Italian term).

Term. The term “parapsychology” was coined in 1889 by Max Dessoir – a German psychologist and parapsychic researcher.

Psi-gamma. Projectiology, or projective parapsychology, a subdiscipline of consciology regarding its related phenomena, is derived from the phenomenological framework of human parapsychology in the study of subjective phenomena (psi-gamma).

Discoincidentiology. Parapsychology can be divided by separating those phenomena regarded as being pure paranormal phenomena into: those that are produced when the intraphysical consciousness' vehicles of manifestation are coincident (they present a unified body, holosoma); and those produced when the intraphysical consciousness' vehicles of manifestation are out of the condition of coincidence (discoincidentence).

Manifestations. Thus, we can see that a number of so-called pure paranormal occurrences fall within the scope of coincidentiology and others lie within discoincidentiology, namely projectiology. Nevertheless, in practice, the phenomena intermingle in their manifestations stemming either from one condition or another, constantly and intricately alternating and mixing themselves.

Accreditation. Parapsychology was recognized as a science and admitted (with 165 votes in favor and 30 votes against) as a member science to the *American Association for the Advancement of Science* (A.A.A.S.) on December 30, 1969.

Affiliation. The A.A.A.S., an international society founded in 1957, based in New York, NY, brings together approximately 200 researchers of all fields, from 25 countries. It officially accepted, as one of its new divisions, the affiliation or accreditation of the Parapsychological Association (P.A.) – a prestigious association, the membership of which includes the most eminent parapsychologists in the world.

Subdivision. This was equivalent to accepting parapsychology as being a sector of science, with the same rights as other areas.

Courses. There is nothing that cannot be exhaustively researched. Research continues.

Laboratories. There are currently 129 scientific parapsychology courses or laboratories in operation, spread throughout the planet in various institutions.

Institutions. The following are some of these institutions: Augusto Mota Integrated Colleges, Rio de Janeiro, Brazil (post-graduate course in parapsychology); Duke University, Durham, North Carolina, U.S.A.; University of Edinburgh, Scotland; University of Freiburg, Breisgau, Germany;

Long Island University, Greenvale, U.S.A.; University of California, Santa Barbara, California, U.S.A.; Utrecht University, Netherlands; Biopsychic Sciences College at Paraná, Curitiba, Paraná, Brazil.

Facts. The number of facts observed at the beginning of the era of modern science – which has existed for only 4 centuries – was so small that it was not worth dividing it into different sciences. The number of facts later grew to the point that specialization became more and more indispensable. In the current Internet age, the tendency is to continue to grow.

Consensus. In a considerable number of sciences, it is rare that a consensus is reached on any concept. All unanimity indicates ignorance.

Resistance. There is also a resistance, as part of the intraphysical consciousness' nature, towards modifying our concept of the world. This occurs with the author, with the reader, and with scientists in general.

Theories. Innovative theories are only accepted by new generations, or when one or two generations of researchers have already passed through desoma.

Factors. This seems to be due not only to arteriosclerosis, senility, dementia or Alzheimer's disease, but also to considerable influencing human factors that are understandable, to a point, in this pathological intraphysical society in which we live, which is much more of a hospital than a school. The following are 7 examples:

1. **Preconceptions.** Scientific preconceptions that are very well disguised by self-corruption.
2. **Status.** Social *status* (prestige in a small group, political behavior of a *mega-ego*).
3. **Corporatism.** Professional or corporatist interests (*lobbyism*).
4. **Money.** Subservience to economic power or slavery to money.
5. **Seated-on-the-fence.** Personal complacency or a *seated-on-the-fence* attitude.
6. **Washing.** Brainwashing (abdominal brain).
7. **Repressions.** The absence of derepression.

Research. Some time ago, an editor of *New Scientist*, a most prestigious scientific magazine, performed a research project in order to prove that the scientific community opposed the existence of parapsychological phenomena. The result was precisely the contrary. About 75% of those polled said they felt that these phenomena had been proven or were in the process of being proven.

Scientists. The most surprising result of this research was that 40% of the scientists interviewed declared that they accepted the reality of parapsychological phenomena because they had personally experienced them.

Interests. It is ironic and regrettable that the same human interests which limit the development of parapsychic research will be responsible for its inevitable and inescapable development. This with bellicose objectives in view, such as espionage and frank political domination of consciousnesses by superpower nations who are in constant conflict in all areas, including so-called *psychic warfare*, *consciential warfare* or *psychotronic warfare*, in the field of *consciousness technology*.

Sciences. It is important to stress once again that projectiology relates to other sciences and, due to many factors, requires interdisciplinary or universalistic approaches.

Growth. In the case of projectiology, we see, for the first time, that a specific research area within parapsychology requires its independent establishment in order that science as a whole grows as one (see *The Essential Conscientiology*).

Analysis. In the description and analysis of the occurrences of projectiology, only parapsychology (psycho-energetics in Soviet Russia and psychotronics in Czechoslovakia), has greater authority and sufficient technical competence for ponderable applications, making the participation of the latter in this field irrecusable and irreplaceable.

Russia. The Russian Academy of Sciences (the former Soviet Union) officially confirmed the paranormal powers of the sensitive Djuna Davitashvili who was tested in its Physiology Institute on August 26, 1987. Called the *D phenomenon* (D refers to the first letter of the parapsychic woman's name), it is the ability of an individual to heat other bodies and cure illnesses with infrared irradiation (bioenergy) emitted from human hands.

Batrachian. Scientists proved the transmission of bioenergy from the sensitive's hands to a batrachian (frog) heart by using equipment to register a significant slowing of the heartbeat.

Cancer. A member of the Academy of Sciences saw the sensitive, who practices under the official supervision of medical doctors, cure a case of skin cancer in only 15 minutes. (*O Globo*; Rio de Janeiro; newspaper; daily; section: "Ciência e Vida"; year LXIII; No. 19,639; August 27, 1987; one illus.; p. 1, 18).

Register. In this way, the pioneering nature of the Russians was registered in an official, open recognition of parapsychology, parapsychism and, thereby, projectiology. This was due to the projection of bioenergy, as well as the highly developed research of certain advanced phenomena or paraperceptions in Russia, beyond the research of other Western countries, including The United States of America where, until today, there is a great deal of blind and often commercial pressure against institutions dedicated to parapsychology and parapsychic phenomena, with a great amount of euphemism and political and corporatist pretense.

Folklore. At this point it is important to consider 4 categories of folklore:

1. **Alchemy.** Alchemy became the folklore of chemistry.
2. **Astrology.** Astrology became the folklore of astronomy.
3. **Religion.** Religion (mysticism) became the folklore of empiricism (science, replicability).
4. **Occultism.** Occultism (esoterism) became the folklore of parapsychology.

Driving forces. We can consider 3 categories of interconnected evolutionary *driving forces*:

1. **Mind.** The revelation or scientific discovery of the mind (human brain) was the *driving force* of psychoanalysis.
2. **Paraperceptiology.** The revelation or scientific discovery of human paraperceptions (animism-parapsychism) was the *driving force* of parapsychology.
3. **Conscientiality.** The revelation or scientific discovery of the integral consciousness (holosoma, holobiography, multidimensionality, holomaturity) is the *driving force* of projectiology.

Brazil. Brazilian parapsychologists helped to form the universalistic perspective in the approach to projectiology. In this sense, when the greatest names in parapsychology in Brazil over the years are listed, the following 14, among others, should not be overlooked (see International Bibliography of Projectiology):

1. **Andrade**, Hernani Guimarães.
2. **Borges**, Walter Rosa.
3. **Faria**, Osmar Andrade.
4. **Góes**, Eurico de.
5. **Lessa**, Adelaide Peters.
6. **Lyra**, Alberto.
7. **Machado**, Brasílio Marcondes.
8. **Machado**, Mário Amaral.
9. **Montagno**, Elson.
10. **Paula**, João Teixeira de.
11. **Pires**, José Herculano.
12. **Rodrigues**, Henrique.
13. **Tabone**, Márcia.
14. **Tinoco**, Carlos Alberto.

See the author's recent book: *The Essential Conscientiology* (in Portuguese).

20. PROJECTIOLOGY AND PSYCHOLOGY

Definition. Psychology (Greek: *psyché*, soul; *logos*, treatise, study): the science of psychic phenomena and human behavior.

Synonymy: personology; science of the intraphysical consciousness; science of the mind; science of the psyche.

Explanation. The relationships of parapsychology and projectiology with psychology are very deep. The object of these 3 sciences is the study of human nature.

Metapsychics. Without metapsychics, contemporary parapsychology would not exist; but parapsychology is an extrapolation of psychology.

Conscientiology. It is not possible to conceptualize psychology in a manner that satisfies all existing schools. Far from having a single definition, what exists is a complex of theories, each one defined by its adepts and often in disagreement with the others. Here, psychology is presented as being the study of *only* the *intraphysical* consciousness.

Transpersonal. The consciousness, addressed in an integral manner, is the object of study in conscientiology. We can see it is far vaster and more all-encompassing than transpersonal psychology.

Mind-matter. There are researchers locked into the mind-matter dilemma who still insist that the phenomenon of lucid projection is a purely psychological experience and not a parapsychological phenomenon. In other words, they feel its explanation does not require a parapsychic influence, although they do not distance themselves from the possibility of parapsychic phenomena occurring during the projective process.

Unification. There is no single field of psychology. Unlike mathematics, physics or biology, psychology is not a unified science.

Branch. Aside from educational, social, evolutionary, differential, comparative, general, and other lines of psychology, there currently exists a branch of psychology, or more specifically of psychotherapy, called *transpersonal psychology*. This field specializes in the study of altered states of consciousness, including transcendental and parapsychic experiences, as well as projections of the consciousness.

Neurophysiology. On the other hand, the connection between psychology and physics is neurophysiology.

Vehicles. The acknowledgement of the existence of the consciousness' vehicles, namely the ability of the consciousness to think, act and move outside the human body without the use of nerves and muscles, has strong, inevitable implications in the placement of projective phenomena outside the restricted field of *soul-less* psychology.

Series. This is evidenced by the veteran projector, or anyone who produces lucid projections in series without the negative, subversive interference of pharmacological crutches (drugs or medications).

Psychosoma. Transpersonal psychology (Wilber, 1845), or the fourth-power, is more directly connected to projectiology with regard to projections of the consciousness in the psychosoma when projected together with the holochakra. More recently, it includes the achievement of transcendent projections of the consciousness in the mentalsoma, which are highly subjective personal experiences of cosmic consciousness or cosmoconsciousness.

Self-bilocation. The individual who accepts the reality of the phenomena of bilocation and self-bilocation admits the existence of a second, extraphysical, and less dense body. In this case, the evidence transcends the scope of the manifestations of classic psychology.

Soft. It is clear that projectiology (a body of knowledge that is intrinsically coherent and extrinsically useful) cannot constitute a *hard* science. It must be considered a *soft* science, as is psychology, because not all of the concepts that it deals with have been satisfactorily quantified.

Consciousness. On the one hand, it is understandable that the most brilliant psychologist, as well as any other researcher in any field of human knowledge who has not personally experienced expansion of the consciousness in the *mentalsoma*, is neither able to evaluate the phenomenon nor present viable hypotheses regarding this occurrence, which is totally unfamiliar to that individual.

Competence. The individual most competent to deeply judge the matter is the one who has personally had the experience.

Polysonography. On the other hand, psychological influence cannot be disregarded in lucid projection techniques. Current psychological studies in sleep and dream laboratories through the use of polysonography, have brought important help to the clarification of altered states of consciousness, including lucid consciousness projection, the idea of which can even be transmitted through simple *psychological contagion*.

Research. In light of what has been shown, the rational recommendation for projectiology research, that currently goes beyond the limitations of classic psychology, is a fusion of both the psychological and parapsychological lines, without an overlap of their capabilities.

Exchange. It is necessary to maintain an open mind in terms of the findings, with continued interest in the results, regardless of their origin, and a maximal exchange of ideas and conclusions with an interdisciplinary, universalistic attitude.

Conception. The researcher who has still not had the great adventure of finding him/herself alive outside the human body with his/her own lucid, perceptive personality separated from and near the human body, is not capable of forming a clear concept about the practical and positive value of verified evidence, and opinion based on personal experience.

Drugs. Nevertheless, the individual who has consciencial experiences that are brought on by drugs clearly has a tendency to insert the OBE within the scope of common, classic human psychology. This has generated many erroneous ideas among experimenters who are sometimes persons of considerable good will, good intention, intellectual capacity and material means.

Methodology. To experimenters in general, the author recommends endeavoring to produce projective experiences. They should not be those induced by drugs, but spontaneous projections provoked by the will with special training in order to arrive at conclusions, patterns and paradigms that are correct in regard to projectiological phenomena.

Thanatophobia. Another point of close connection between psychology and projectiology is fear research (thanatophobia). This is an area of great interest for both fields, as well as the field of medicine.

Value. The dogma of immature science, concerning itself exclusively with the general and not with the particular, has had the effect of leaving participatory research aside. When individual differences are not taken into consideration, a great deal of the value of experimental discoveries is lost.

Idiography. Projectiology is in the uncommon position of being a science whose exponents are part of its own object of study, in the same manner as occurs with psychology and parapsychology. These 3 sciences are *idiographic* disciplines.

Challenge. Those individuals who are interested in projectiology receive the challenge of opening a new idiographic area of scientific investigation. They are faced with personally exploring that which is, for the most part, still virgin territory, to do this in a meticulous and systematic manner, developing new theories and techniques in line with progress made and, furthermore, offering a new insight into themselves as consciousnesses in evolution.

Differences. Contrary to psychology and orthodox medicine, projectiology seeks to study the following 8 objects of research:

1. **Serenology.** Those who adhere to the general evolutionary laws (*serenissimi*), as opposed to criminals or those intraphysical consciousnesses still lacking a reasonable level of evolution (abnormal psychology; psychiatric disturbances; behavioral disturbances).

2. **Neophilia.** Neophilic courage, as opposed to fear (corporatist neophobia).

3. **Cosmoethics.** Cosmoethical megafaternity, as opposed to hostility (human ethics).

4. **Extraphysiology.** Broad multidimensional vision, as opposed to intraphysical blindness or mere somatics (restricted vision, narrow-mindedness).

5. **Evolutiology.** The present, in relation to the immediate future (consciential evolution or the multidimensional here and now), as opposed to the present in relation only to the past (pastology).

6. **Holomaturology.** The healthy, centered consciousness (paraphysiological holosomatic homeostasis), as opposed to the insecure and disturbed individual (mere physiological organic homeostasis).

7. **Health.** The exaltation of health (prophylaxis) above the exaltation of illness (bioenergetic blockages and imbalances), pertinent to mercantilistic lines of knowledge in the conventional areas of human health.

8. **Paraprophylaxis.** Paraprophylaxis (evolutionary intelligence) first and foremost, and not merely conventional therapeutics (material intelligence) above all.

Emotions. Another difference between psychology and projectiology is that psychologists have always discovered more enthusiasm and self-awareness in the conditions which provoke emotions.

Discernment. Lucid projectors endeavor to master their emotions, without repressing them, by having more discerning reactions that stem from the mentalsoma, as opposed to those stemming from the psychosoma, which is still very animalistic.

Trauma. If, on the one hand, the emotional involvement of the self tends to increase the extent of learning in general, a great intensity of emotional excitement, on the other hand, tends to reduce the scope of learning. When outside the human body – with regard to projective learning in extraphysical consciential dimensions – this fact becomes predominant and, worse still, undesirable, as it can lead to the interruption of the experience or an extraphysical trauma.

21. PROJECTIOLOGY AND BIOLOGY

Definitions. Biology: the science of life in general; the study of living beings in their relationships with each other and their environment.

Synonymy: the science of life.

Parabiology. Lucid projection allows humankind to start studying the external contours and manifestations that derive from the human body or, in other words, the other vehicles of manifestation of the consciousness that parabiology, metabiology or transcendental biology will study in depth in the near future.

Animals. Due to its relationships with other living beings, projectiology enables original observations and analyses of the extraphysical perceptions and extraphysical vehicles of manifestation of animals (zoology) and plants (botany), besides humankind and life forms that are totally unknown here on earth (para-exobiology). This can be accomplished in a direct manner in specific extraphysical environments.

Bodies. Projective experiments demonstrate to the lucid projector that so-called inferior subhuman animals possess extraphysical bodies that emit light, present an aura and, in certain conditions,

also project in their physical bodies' immaterial substrata in a manner similar to that of the human or intraphysical consciousness.

Paraperceptions. Parapsychic facts observed to date suggest that, in the same way that we possess holosomatic, animic and parapsychic paraperceptions which are more accurate than those already discovered, we also possess physical perceptions in the human body that are more sophisticated than those we consciously employ or have so far even imagined and presume to exist.

Perceptions. There are physical potential perceptions, which are more subtle or sophisticated, that have not been entirely discovered or fully employed within the scope of our basic organic senses, such as our common memory, vision and audition.

Potentialities. The discovery of these perceptive and paraperceptive potentialities, that have been unknown until now, as well as other physical senses (geographic instinct and geological or radiesthetic instinct), will further clarify the boundaries between the limits of the human-animal phenomenological complex (psychology) and those of the consciential and interdimensional-based phenomenological complex of projectiology.

Overlaps. In the same way that overlaps inevitably occur among physics, mathematics and astronomy, there are also inevitable overlaps between projectiology, parapsychology and psychology. In spite of all interdisciplinary or pluri-scientific relationships, projectiology proceeds independently in the same manner that physics and the other abovementioned sciences evolve.

Themes. The following are 12 projectiology themes, among others, that are related to biology and are addressed to a greater or lesser degree in this book:

1. Asomnia.
2. Biofeedback.
3. Bioluminescence.
4. Cellular regeneration.
5. Cenesthopathy.
6. Exobiology.
7. Human body.
8. Human brain.
9. Human epiphysis.
10. Organicism.
11. Spontaneous human combustion.
12. Sthenobiosis.

Bibliography: Andrade (29, p. 67), Geley (581, p. 270), Greene (635, p. 100), Russell (1482, p. 112), Steiger (1601, p. 209), Watson (1801, p. 305).

22. PROJECTIOLOGY AND MEDICINE

Definition. Medicine: the art or science of curing or attenuating diseases.

Synonymy: clinical medicine (branch); medical science; medical surgery (branch); science of curing.

Areas. Through experiments performed with the intraphysical consciousness projected in the psychosoma, projectiology will, sooner or later, radically alter the following 4 areas of research, at the very least:

1. **Medicine.** The pillars upon which medicine are based, especially clinical anamnesis.
2. **Physiology.** Physiology, when able to complete the existing knowledge of the physiology of the brain, for example.
3. **Therapeutics.** Therapeutics in general.
4. **Psychiatry.** Psychiatry, in particular, aside from other classic sectors.

Knowledge. The knowledge of projectiology can amplify the fields of medicine. This is especially true of psychiatry, or more appropriately, metapsychiatry.

Holosoma. Instead of treating patients simply as physical organisms, they can be addressed as complete entities which are in a coincident state regarding the vehicles of manifestation of the consciousness (unified body, holosoma), through the paranatomy, paraphysiology and parapsychopathology of these vehicles.

Energies. A deeper understanding of bioenergy, the human aura, the chakras, the energetic points of acupuncture (acupuncture points), and the absorption and exteriorization of consensual energies, will be of immense value in the greater understanding of physical and mental disturbances that affect the human personality.

Projective. In the same way that internal, nuclear, allopathic, homeopathic, legal, space and other areas of medicine exist, the author hereby registers the launching of *projective medicine*, that studies the cause of diseases through the use of lucid projections, and which inevitably, either now or in the future, will be used by medical colleagues.

Publications. As a result of bibliographical research, the reader will find 20 technical articles on projectiological themes in the specific bibliography of this chapter. These articles are edited through 9 different recognized, specialized, medical periodicals published between 1934 and 1982. They are the following:

1. *American Journal of Psychiatry.*
2. *American Medical Association Archives of Neurology and Psychiatry.*
3. *Archives General of Psychiatry.*
4. *British Journal of Medical Psychology.*
5. *The Edinburgh Medical Journal.*
6. *The Journal of Nervous and Mental Disease.*
7. *The Journal of the American Medical Association.*
8. *New England Journal of Medicine.*
9. *Psychiatry Journal for the Study of Interpersonal Process.*

Proof. This fact, in and of itself, proves the direct relationships that exist between the research of modern medicine and the research of projectiology.

Techniques. The following 3 techniques, described in another part of this book, already comprise a part of projective medicine:

1. Extraphysical anamnesis.
2. Projective diagnostics.
3. Projective therapeutics or projectiotherapy.

Para. As we can see by the context of this book, projectiology has already taken the first steps in the unexplored fields of human paranatomy, paraphysiology and parapsychopathology. There is still much to be done regarding the para-embryology of the psychosoma, the para-histology of ectoplasm, and in relation to the genetics of the psychosoma (paragenetics).

Occurrences. The following, aside from others – including some already referred to – are 12 irrefutable relationships of projectiology with diverse areas of medicine. They are practically imposed as a result of a variety of human lucid projection experiences:

1. Illnesses in general: clinical medicine.
2. Physical pain: clinical medicine.
3. Anesthesia and surgery: clinical surgery.
4. State of suspended animation: clinical surgery.
5. Near-death experiences (NDEs): clinical surgery.
6. Parasurgery: clinical surgery.
7. Heart and heartbeat: cardiology.
8. Drugs: pharmacology.

9. Parturition: obstetrics.
10. Hemiplegics: traumatology.
11. Mutilated persons: traumatology.
12. Therapeutics: projectiotherapy.

Field. It is easy to see that lucid projection opens up an entirely new field of scientific exploration that is just as vast and complex as the world of biomedical sciences or that which researches the objective life of the human consciousness in the ordinary, physical waking state.

Projectiatry. The medicine of consciential projection – when it is present as a xenophrenic state, being a consequence of the human attribute of projectability – is designated as *projectiatry*.

Quality. The innumerable theoretical doubts, or those queries raised out of simple ignorance, never cast doubt upon modern medicine as a science. The research portrayed by this book aims to lead projectiology to this same superior level of advanced science, at the appropriate time.

Bibliography: Blacher (136, p. 229), Cerviño (271, p. 59), Coleman (291, p. 254), Ehrenwald (471, p. 151), Fodor (526, p. 66), Gabbard (564, p. 374), Geddes (578, p. 365), Greene (635, p. 100), Greyson (643, p. 188), Heine (706, p. 263), Irwin (791, p. 244), Laubscher (890, p. 27), Lief (925, p. 171), Lippman (934, p. 345), Ludwig (956, p. 225), Lukianowicz (957, p. 199), Mc Harg (1021, p. 48), Mello (1032, p. 34), Mendes (1033, p. 31), Neppe (1123, p. 1), Noyes Jr. (1141, p. 19; 1142, p. 174), Paim (1182, p. 226), Ring (1404, p. 273; 1406, p. 27), Sabom (1486, p. 15; 1487, p. 1071; 1488, p. 29), Schnaper (1519, p. 268), Schul (1522, p. 216), Souza (1584, p. 11), Steiger (1601, p. 209), Stevenson (1619, p. 152; 1621, p. 265), Todd (1689, p. 47), Twemlow (1710, p. 450), Vieira (1762, p. 110), West (1824, p. 274).

23. PROJECTIOLOGY AND ANTHROPOLOGY

Definition. Anthropology: the natural science, the scope of which is the study and classification of the physical and cultural characteristics of human groups.

Synonymy: anthropologism; anthropometry.

Vehicles. Lucid projection – when it studies, identifies and endeavors to apply the various vehicles of manifestation of the consciousness through parapsychism – creates profound implications for anthropology.

Terms. It is also easy to verify the close relationship between projectiology and anthropology through an analysis of the terms that are used (nomenclature, terminology).

Projectionists. In the literature of scientific parapsychology, those individuals who present various types of parapsychic abilities are called: sensitives, paranormals, subjects, mediums, clairvoyants and projectionists. In the anthropological literature these same individuals are called: magicians, witches, rainmakers, prophets, seers and shamans.

Occurrences. The following are 6 direct relationships, among others, between projectiology and various research fields within anthropology. These relationships are practically imposed, due to projectiological occurrences of various kinds:

1. Autobiographies of projectors.
2. *Congressus subtilis*.
3. Mind-expanding drugs.
4. Possessions and external influences by intelligent entities (extraphysical consciousnesses).
5. Diverse trances.
6. Primitive tribes that produce lucid projections.

Research. In 1978, Dean Shiels compared the beliefs of 60 different cultures through the reference files of the human relations archives maintained by anthropological research. These files contain codified information that is organized in topics and conserved on microfilm.

Double. He extracted some information from each culture regarding the ability of the double or soul to travel without the human body.

Cultures. Of the 54 cultures from which some information of this type was reported, 25 (or 46%) affirmed that most or all of their people could travel in this manner under certain conditions. Another 23 (or 43%) affirmed that some of their members were able to do this, and only 3 cultures did not affirm that they believed in anything of this nature.

Conclusion. We can therefore conclude that belief in projections of the consciousness from the human body is very common.

Projective. Just as physical anthropology and cultural or social anthropology (a branch of sociology) exist, the author hereby launches *projective anthropology*, a branch of anthropology that studies the physical characteristics of human groups through lucid projection. It is reasonable to think that this will inevitably, either now or in the future, become an anthropological research area.

Anthropomaximology. Anthropomaximology is a new branch of anthropology. It is defined as “anthropology directed towards the evaluation of maximal human potential and the consequences of these maximum possible results in relation to humankind.” This field has allowed much greater progress in establishing new athletic records.

Relationship. Based on the premise that the lucid projector is *a transcendental athlete*, projectiology has a close relationship with anthropomaximology, because the development of the projector depends on the improvement of the individual’s physical-extraphysical performance through a general improvement of physical and psychic conditions, the evolution of parapsychic techniques and training, and the valuing of the consciousness’ vehicles of manifestation, in order to set new extraphysical records.

Para-anthropology. We can even speak of “Para-anthropomaximology.” This would be Para-anthropology that respects humankind as being substantially composed of the consciousness and matter (derived from immanent energy).

Bibliography: Alverga (18, p. 138), Angoff (40, p. 241), Blackmore (139, p. 72), Bourguignon (181, p. 12), Bozzano (191, p. 125), Castaneda (255, p. 121), De Mille (386, p. 85), Dubant (419, p. 76), Eliade (475, p. 117), Fontaine (533, p. 71), Hoffman (733, p. 5), Lamont (874, p. 109), Lewis (923, p. 53), Long (946, p. 33), Mc Intosh (1022, p. 460), Neihardt (1121, p. 204), Oesterreich (1145, p. 5), Sangirardi Jr. (1503, p. 181), Shiels (1547, p. 697), Tart (1653, p. 161) Wheeler (1826, p. 118), Wolman (1863, p. 667).

24. PROJECTIOLOGY AND SOCIOLOGY

Definition. Sociology: the objective study of the relationships that are consciously or unconsciously established between people who live in a community or a social group, or among different social groups that live within a larger society.

Synonymy: science of collective behavior; science of social phenomena; social studies; study of human interrelationships; theory of human life in groups.

Areas. The direct relationships between the phenomena of lucid projection and sociology, whether culturalist or structuralist, occur in various areas such as the following 4:

1. In the historical research of projectiology.
2. In the scope of restrictive total institutions.
3. In sociologists’ advanced fields of study.
4. In the study of imitative contagion.

Renovation. Sciences interrelate deeply with each other. In a fundamental comparison, the sociology of the imaginary – through the work of open-minded persons with a very libertarian education – is applying the same approach as that of initial projectiology research, namely specifically studying the aspects of life that are situated outside rationality or that *have another logic*.

Phenomena. In sociology, just as in projectiology, this is only achieved by discovering phenomena and working on their explanation in a manner that is free and does not remain bound to

pre-established, traditional rules. This finally allows the overcoming of barriers to that which can be accounted for and fit into orthodox concepts (fundamentalism).

Position. Although many sociologists do not admit the possibility of macrochanges – and veteran lucid projectors much less so, in light of the wise extraphysical control of all that exists – this position is precisely the same as the renovating directive of the context expressed in the projectiological panorama of this book.

Projective. Just as economic sociology and plant sociology exist, aside from various subdisciplines such as family, political, urban, rural, industrial, demographic and educational sociology, the author hereby launches *projective sociology*, which studies the relationships between people within a social group as well as relationships between social groups and the greater *extraphysical society* through lucid projections. It is reasonable to believe that this will inevitably, whether now or in the future, be an object of study by sociologists.

Bibliography: Castaneda (255, p. 170), Lewis (923, p. 17), Prince (1290, p. 13).

25. PROJECTIOLOGY AND PHYSICS

Definition. Physics: the branch of science that studies natural laws and processes, and the states and properties of matter and energy.

Synonymy: science of matter; science of nature.

Universe. Projection of the consciousness is inseparably related to physics, mainly regarding the current strictly energetic, immaterial and interactive fields of research, such as field theory, the attempt to unify electromagnetism, gravitation and the interaction between elementary particles.

Conjecture. The development of modern physics is based upon many concepts that have so far not been confirmed as being anything more than conjecture.

Axioms. In practice, it becomes almost impossible to differentiate the axioms of modern physics from those of the most ancient philosophies.

Interaction. Bearing in mind that: the implications of the consciousness with energy have already been established; space-time has a complementary physical existence, and in different systems of reference time flows differently; the act of observing or trying to measure intrinsically interferes in the measurement of the atomic world, thereby establishing the cornerstone of quantum mechanics; the consciousness closely interconnects itself with all existing vital districts, affecting the universe, even in a manner relative to the past, present and future, whether as an invisible point or a world of fecund vitality, the need arises for a connection between physics and parapsysics, interconnected with lucid projection, one as an instrument of the other, in complementary interaction.

Parapsysics. Thus, there is currently an emergence of a new natural science – parapsysics – through the marriage of sophisticated research methodology, instruments, new and more ample concepts, and an expansive vision of the nature of humankind, dedicated to the study of the physics of parapsychic processes, including projectiology.

Molecules. In fact, through lucid projection, the physicist can leave the human body, reduce the consciousness down to the size of a single molecule, enter into a specific object and actually *directly* examine the molecules and atoms that compose it. This is in agreement with that which is observed in projections using the isolated mentalsoma.

Mentalsoma. In the future, the lucid projection of an intraphysical consciousness in the mentalsoma will be the most accurate instrument in physics.

Projective. Just as solid physics, fluid physics, plasma physics, molecular physics, quantum physics, statistical physics, mathematical physics, relativistic physics, atomic physics, nuclear physics, elementary particle physics, field physics, tribology or friction physics exist, as well as the physics that is dedicated to cosmology and gravitation (astrophysics), all of which are separated within theoretical, experimental and applied research, the author hereby launches *projective physics* or

projective parapsysics, which studies the states and properties of matter and energy through the use of lucid projection. It is reasonable to suppose that this will inevitably, whether now or in the future, be the field of research of parapsicists.

Bibliography: Bentov (119, p. 3), Greene (635, p. 101), Greenhouse (639, p. 335), Grosso (650, p. 187), Meek (1030, p. 109), Mishlove (1055, p. 279), Mitchell (1058, p. 426), Schul (1524, p. 41), Talbot (1642, p. 162), Toben (1688, p. 63), White (1829, p. 297), Wolman (1863, p. 749).

26. PROJECTIOLOGY AND ASTRONOMY

Definition. Astronomy: the science that studies the position, movements and constitution of the celestial bodies.

Synonymy: cosmological science; science of the stars; uranognosis.

Direct. Through projectiology, the astronomer, instead of being restricted to an optical instrument (telescope) or, in radio astronomy, the reading of radio-frequency radiation, can in fact send his/her own consciousness outside the human body through space in order to observe and directly research things firsthand, without human or physical intermediaries.

Galaxies. The astronomer, through lucid projection in the mentalsoma in the mentalsomatic dimension, can travel to other galaxies (exoprojections) located far beyond the reach of astronomy and even decipher the enigma of extraterrestrial life and various other phenomena that currently remain to be solved.

Astronautics. Astronautics, the science and technique of space flight, derived from astronomy, can also deeply benefit from projectiological studies, in view of the relationships between astronauts, spaceships, space stations, scientists, instruments, and tracking bases on earth.

Projective. Just as cometary astronomy, field astronomy, position astronomy, descriptive astronomy, stellar astronomy, instrumental astronomy, meteoric astronomy, metric astronomy and practical astronomy exist, the author hereby launches *projective astronomy* or parapsychonautics, that studies the celestial bodies through the use of lucid projection, or exoprojection. It is reasonable to assume that astronomers will use them and no futurological prevision is required in order to make this affirmation.

Clairvoyance. Remote viewing (traveling clairvoyance) experiments have already been performed with sensitives who conscientially explored 2 planets. We can say in passing that lucid projection is the most practical, secure and efficient method of space travel.

Similarities. In regard to astronautics – within which various aerospace sciences should be included, such as: aerodynamics, aerologation, aerology, aeronautical navigation, aeronautics, aeronomy, aerostatics, aerostation, astrionics, astronavigation and astrophysics – the curious similarities between projection of the consciousness in the psychosoma and flights made by aircraft and spacecraft deserve to be registered.

Expressions. It suffices to observe the following 18 expressions, among many others, that were, in one way or another, adapted from astronomical terminology by projectiology in order to adequately designate certain aspects of projectiological phenomena. They are used, some more frequently than others, throughout this book.

1. Accompanying body (a portion of the holochakra) = booster (part of the rocket).
2. Animic flight (paratropospheric lucid projection) = cislunar space flight.
3. Astrosoma (astral body) = astro; celestial body.
4. Auric coupling = space docking.
5. Extraphysical flight (volitation) = controlled space flight.
6. Immediate extraphysical translocation = direct flight, without intermediary stops (non-stop flight).

7. Intraphysical assistant = air crew/flight crew; ground crew.
8. Lucid projector's log = flight log.
9. Mental target = flight plan.
10. Physical base = air base; aerodrome; airport.
11. Projected projector in the bedroom = captive balloon.
12. Projective range (duration of the lucid projection) = (flight) range.
13. Rapid consecutive exteriorizations = emergency landings.
14. Sidereal flight (lucid exoprojection) = translunar space flight.
15. Stages of lucid projection = stages of a (space) flight.
16. Stationary flight: the dirigible that *hovers* in the air in order to make scientific observations and the intraphysical consciousness who leaves the soma and positions the *stationary* psychosoma over the human body.
17. Takeoff of the psychosoma = takeoff of the aircraft.
18. Volitative group = squadron (of aircraft).

Energy. There are many other similarities between projectiology and aeronautics. The following are 4 more sophisticated cases:

1. **Tanker.** The transmission of energy from the helper to the projected projector is perfect in its likeness to the in-flight refueling executed by tanker planes (KC-10 Extender, USAF) to the aircraft that will use the fuel.
2. **Blackout.** *Consciential blackout* is the same complete loss of senses experienced by pilots in tight barrel rolls.
3. **Crop duster.** The extraphysical consciousness or projected intraphysical consciousness that exteriorizes restorative consciential energy is reminiscent of a *crop duster* in action.
4. **Joint.** The pregnant woman who lucidly projects together with the consciousness of the fetus is reminiscent of the well-known compound aircraft in which she, the projector (*aeroboat*), has the consciousness of the fetus (*hydroplane, seaplane*) on her *back*. This consciousness later separates from her, in the extraphysical dimension, continuing on with its consciential experience.

Bibliography: Greene (635, p. 101), Mitchell (1057, p. 28), Mittl (1061, p. 5).

27. PROJECTIOLOGY AND HISTORY

Definitions. History: the methodical narration of notable facts that have occurred during the development of peoples' lives, in particular, and during the existence of humankind, in general; the science and method that allow the learning and transmitting of the knowledge acquired through tradition and/or through documents related to evolution and the past of humanity.

Synonymy: chronological report; historical science; narration of facts; pastology, register of occurrences.

Transformations. Although the lucid experience of the consciousness outside the human body is an ancient and universal phenomenon, the technical-scientific study of consciential projections is extremely new and will bring historical structural transformations to society (this still pathological intraphysical society) and human cultures.

Communicology. The direct and interdimensional means of communication afforded by animism (intraconsciential experience) and the parapsychism of lucid projections surpasses the human senses.

Intraconscientiality. By allowing the paravision of new environments, lucid consciential projections expand the mental time and space of the intraphysical consciousness.

Vehicles. This demonstrates that the best means of interconsciential communication are within the consciousness itself.

Impact. Projectiology, like every new science, is gradually becoming consolidated. Nevertheless, it is reasonable to suppose that it will not be devoid of historical impact, and may provoke a peculiar transformation over time in the human consciencial surroundings. This will occur due to its research of the extensions of the body (soma) and the human senses that projectiological research sponsors, thereby dispensing with common or advanced technologies in this electronic age. Let us, then, in this respect, follow the logical concepts in the following sequence of arguments.

Structures. Historically speaking, projectiology is arising beyond material mechanisms with forms that are new, interdimensional, and even contradictory to existing communication modalities, precisely when the previously created structural forms of technology and computer systems are reaching their maximal performance and influence.

Inner. The phenomenon of lucid projection and projectiology itself occur *within the consciousness*, in a direct, personal implosion of knowledge, and not *from outside the human body*, directed to all beings indifferently, as science and communication technology have always sought to do.

Revolution. In the above-mentioned aspect, projectiology is ultra-revolutionary because it positions itself for a head-on confrontation with conventional science (that addresses phenomena as a function of all consciousnesses; the universals), technology (communication technology) and modern history itself, permitting the total and instantaneous understanding of the message by the expanded consciousness.

Extensions. Projectiology creates extensions, not with the material human body in mind, but with all the vehicles of manifestation (holosoma) and the evolutionary enrichment of the consciousness itself.

Material. This is achieved not through primitive, perishable materials but through the sophisticated, non-perishable resources of its own internal structure.

Perspective. The perspective of projectiology exalts the consciencial micro-universe, randomly and simultaneously focusing on the *isolated* consciousness – the responsible agent (egokarmality, holobiography), which is very different from all other consciousnesses – as science does, demanding universal replicability of experiments.

Progression. The soma (cellular body), as well as the individual's senses within it, stand out in human life. For any attentive observer of consciencial self-evolution, the logical development of the intraphysical consciousness' perceptions proceeds apace, acquiring new aspects in the course of human history.

Senses. Humankind's senses are constantly becoming more refined in response to external realities to which they are exposed. They are constantly becoming more enhanced and subtle, regarding all types of perceptive nuances in all areas.

Relationship. This is due more to transformations in the human knowledge of things and humankind's skillful dealings in regard to these things, rather than a physical change in the human sensory equipment itself, which has remained more or less unchanged over the last few millennia.

Paraperceptions. Thus, on the one hand, humankind gradually learns how to employ the physical senses more correctly and capably while, on the other hand, the same occurs with (extraphysical) paraperceptions.

Abilities. The extensions of the human consciousness that have been gradually acquired throughout human history are not in physical instruments per se, but in the essential development of the senses and abilities acquired by the ego, which are represented by the instrument, or through it.

Vision. Let us consider, for example, a basic organic perception and its spatial relationship – the sense of physical vision (optics). Broadly speaking, the human species has been living in the same environment, or has seen objects and geographical features in the same physical setting, since its origin in time immemorial, composed of: earth, oceans, rivers, mountains, day, night, vegetation, animals, air, sky, stars and other resources.

Mark. The consciousness of humankind, generation after generation, through slow alterations, nevertheless leaves its human mark, or its *thosenic signature*, on the external world that it sees.

Changes. The changes in the use of its senses, beginning with vision, lead humankind to develop in 3 concrete directions, or 3 different areas:

1. **Physical.** The division of land promoted the appearance of problems regarding physical space (proxemics), such as: the distribution of plots of land; land invasions; agrarian reform.

2. **Celestial.** Controlled agriculture called humankind's attention to the heavens: the movements of the stars; the changing of the seasons; plantations and harvests. Maritime navigation and commerce also contributed: ships, merchants and navigators.

3. **Beyond.** Locomotion and man-made vehicles, beginning with the wheel, then cars and airplanes, as extensions of the legs, finally took humankind to outer space; to astronautics; to space law; to the moon. We hardly need to mention that the airplane absorbed a multitude of ocean liner passengers.

Stars. Those who look at the stars today see them in the same manner in which they were observed 30 centuries ago.

Agriculture. The movements of the stars were therefore rigorously recorded due to the needs of agriculture and navigation.

Lifetimes. The consciousness, when in the intraphysical condition, has been seeing the same points of light in the dark sky for dozens of lifetimes and holobiographies.

Difference. Nowadays, we say that we see the stars differently, because we know that the earth is a planet in our solar system, and the Sun is a star like many others.

Relations. We relate to this knowledge differently than we did 30 centuries ago when we thought that these stars were inhabited by *gods*. These were, however, quite bestial creations (abdominal brain) on our part.

Space. From a chronological point of view, this same space, seen and studied by humankind, can be scientifically classified into 3 types:

1. **Euclidean.** Euclidean space, initially established through the principles of Euclidean geometry.

2. **Einsteinian.** Einsteinian curved space, discovered by Albert Einstein through the theories of modern physics.

3. **Multidimensional.** The interdimensional or multidimensional space of relative leading-edge truths observed by the lucid projector's paravision and experienced by him/her in the projected state, or the multiple dimensions and hyperspaces currently researched by projectiology.

Fact. It can therefore be concluded that the *evolutionary* phenomenon of the use of human vision is, without a doubt, a historical fact; but there is much more to consider. Let us look at the following 5 items:

1. **Photo.** The photographic camera invaded the professional space of the painter who paints live portraits by copying from the original article.

2. **Cinema.** The cinema – a creation of the twentieth century – reprocessing live theater, absorbed a vast amount of the opera market, which was created in the seventeenth century.

3. **Television.** Television – both recorded and live – replacing the cinema, claimed an immense portion of movie theater activity, resulting in many empty seats.

4. **Clairvoyance.** Clairvoyance – an extra-sensorial or parapsychic perception – invading and enriching the acuity of ordinary human vision, opens *windows* of contemplation to the energetic dimension through states of ecstasy.

5. **Projections.** As a more recent and impressive acquisition, lucid projective experience opens *doorways* for a direct passage of the consciousness to the same energetic dimension and other dimensions that are even more impactful (evolved extraphysical communities).

Self-awareness. These facts bring a deep multidimensional self-awareness to the intraphysical consciousness that interacts everywhere, constituting the greatest transforming objective in history, which is proposed and defended by projectiology.

Impulses. One of the qualities that places human beings above the subhuman animal world is that their actions are no longer simple immediate responses to sensations and impulses.

Understanding. The more that intraphysical consciousnesses replace an ignorance of their inner (intraconsciential) world and the world around them with a true understanding of their holosomatic constitution, their various bodies or vehicles of manifestation and the laws that govern them, the more they will be able to plan the vast repercussions of the interdimensional actions they put in motion.

Parahistory. In the same manner that universal, national, political, religious, economic, narrative, pragmatic, ancient, medieval, modern, contemporary and other areas of history exist, the author hereby launches *parahistory*, that studies the multidimensional history of *para-humanity*, and its consequences, through lucid projections. It is reasonable to think that this will inevitably, whether now or in the future, become an object of study and a useful tool for historians.

Bibliography: Alexandrian (11, p. 288), Doyle (411, p.36), Durville (441, p.22), Inardi (786, p. 148), Inglis (789, p. 24), Knight (852, p. 177).

28. DIVISION OF PROJECTIOLOGY

Segments. In accordance with observations of those beings who project, projectiology is divided into 4 well-defined educational segments, in the following order:

1. **Intraphysical.** Hominal projectiology.
2. **Extraphysical.** Non-human projectiology.
3. **Subhuman.** Animal projectiology.
4. **Botanical.** Vegetative projectiology.

Areas. Hominal (human) projectiology includes the area of projections of the intraphysical consciousness; non-human or extra-human projectiology pertains to projections of the extraphysical consciousness; animal projectiology pertains to the subintelligent projections of animals; botanical projectiology pertains to projections of plants in general. Each of these segments will be analyzed in a specific chapter in this section.

Aspects. The fact that projections include more than one kingdom in nature, the hominal, animal and vegetable, and still reaches extraphysical beings in the extraphysical dimensions, speaks in favor of 4 relevant observations:

1. **Diversity.** The diversity of projective manifestations.
2. **Denominators.** The existence of natural common denominators in projective occurrences.
3. **Physiology.** The physiological aspect of the nature of projective phenomena.
4. **Interdisciplinarity.** The necessity of an approach that is broad, inclusive, interdisciplinary, universalistic and unifying in its scientific analysis.

Vehicles. The areas of projectiology will be extremely useful when the natural components of the vehicles of manifestation of the consciential principle (the consciousness) and the phenomena-related elements that constitute common denominators (main paradigms) are researched in greater detail, according to the categories of projective occurrences.

Areas. It would be unwise here to overlook subjective projectiology, naturalist projectiology, projectiography, projectiocritique and projectiotherapy. These areas are also relevant within the world of projectiology research.

Rescue. Projectiology serves to rescue human consciousnesses from the underdevelopment to which they were relegated, after thousands of centuries of blind and isolationist policies that kept us – evidently with some degree of responsibility on our part – within our evolutionary groups in the condition of human beings in multiple intraphysical societies and myriads of intraphysical experiences (*locked existences* or those lacking lucid consciential projections), set apart from the evolutionary innovations of lucid projectability, existential inversion, penta, the extraphysical clinic, cosmoconscientiology and serenology, and their libertarian consequences.

29. LUCID PROJECTION AND THE HUMAN CONSCIOUSNESS

Definitions. The consciousness: the attribute of inner knowledge of one's own existence and of one's modifications, highly developed in the human species; the number of interconnections of the conscious, unconscious and intuitive memory, as well as interdimensional energetic and informational sensing with discernment, when observing or studying a phenomenon.

Synonymy: brain programmer (intrapysical consciousness, extraphysical consciousness); conditioned awareness; conscious identity of the person; cosmic egoceptor; cosmic transceiver; interiority of the ego; intraphysical awareness; knowledge of one's self (self-psyche); multidimensional egosyntonicizer; palingenetic ecosystem; pluri-existential ecosystem.

Incommunicability. The definition presented here is appropriate, despite the fact that, in psychology, *consciousness* customarily designates only the subjective and *incommunicable* aspect of psychic activity that cannot be known, in a manner apart from the individual, except for the manifestations of behavior.

Properties. At least the following 3 properties are suggested as being inherent to the consciousness:

1. **Continuity.** *Continuity*, or the uninterrupted nature of individual awareness, that forms a continuous chain with current experiences, uniting them with those of the past. Mnemosomatics, biomemory and holomemory are involved here in a specific manner.

2. **Change.** The constant *change* or the perpetual movement of our ideas, representations, sentiments and tendencies that incessantly develop, transform, dissolve and reconstitute. Thosenology and all categories of thosenes are involved here in a characteristic manner.

3. **Contradiction.** The dialectical law of *contradiction*, inherent in all natural phenomena, the excitement and inhibition that occurs constantly in the nervous system of the human consciousness' physical body (soma). The aspects inherent to somatics, genetics and paragenetics are involved here.

Indestructibility. One fact in the field of projectiology that tranquilizes the awakened intraphysical consciousness and gives it cause to think is that: no object or creation of this human world seems capable of destroying the consciousness, neither the use of napalm, nor the employment of other defoliants, nor a hydrogen bomb explosion, nor the use of a neutron bomb. The consciousness itself seems indestructible, *incapable of dying or being killed* in any dimension in which it manifests.

Physicality. The consciousness does not possess physical properties.

Sophistication. As a theory, with the objective of research, it is considered that the more the consciousness evolves, the more sophisticated and complex it becomes, to the point that it gradually annexes the memory of experiences acquired in its cycle of successive lives – or existential seriation (holobiography) and multidimensional cycle – until it becomes aware of possessing the entirety of these experiences and has access to integral, continuous or causal holomemory.

States. From an evolutionary point of view, considering the consciousness as being the ego, the basic consciential states can be classified into 3 distinct categories:

1. **Extraphysiology.** The extraphysical consciential state of the consciousness.
2. **Intraphysiology.** The intraphysical consciential state of the consciousness.
3. **Projectiology.** The projective consciential state of the consciousness.

Projectability. This projective consciential state of the consciousness is subdivided into two distinct conditions:

1. **Intraphysical consciousness.** The *projective* consciential state of the *intrapysical consciousness* (4 vehicles).
2. **Extraphysical consciousness.** The *paraprojective* consciential state of the *extraphysical consciousness* (2 vehicles).

Others. Many different consciential states can be listed in a general manner, such as the following 20:

1. Coma or loss of consciousness.
2. Cosmoconsciousness.

3. Daydream (waking dream).
4. Dream (oneirism).
5. Ecstasy (beatitude).
6. Hyperalertness.
7. Hypnagogy (preamble to sleep).
8. Hypnopompy (intrapysical awakening).
9. Hypnotic dream.
10. Inspiration (serendipity, synchronicity).
11. Lethargy or dormancy.
12. Meditation or deep reflection.
13. Natural dream.
14. Ordinary waking state.
15. Psychedelic state (pharmacology).
16. Regression in time.
17. Semilucid projection or lucid dream.
18. State of hysteria.
19. Stupor.
20. Trance.

Dimensions. In the general study of the dimensions of the consciousness, the various consciential states, that anyone can experience, can be classified into two basic categories:

1. **Psychosomatic.** The unthinking consciousness. The impulsivity and precipitation of the thosenic manifestations of the consciousness that are *more laden with sen* (emotions that prevail upon the personality) are included here.

2. **Mentalsomatic.** The thinking or self-aware consciousness. The most noble attributes of the mentalsoma that lead the intrapysical consciousness to the experience of cosmoconsciousness are included here.

Unthinking. The following 6 conditions, among others, are included in the phenomena of the unthinking consciousness:

1. Organic awareness (mind).
2. The memory bank (cerebral memory, biomemory).
3. The state of coma (comatose).
4. The state of stupor.
5. Sleep without rapid bi-ocular movements.
6. Sleep with rapid synchronous bi-ocular movements.

Introversion. Through the quality of self-perceptibility, in the introversion of awareness, or through centripetal sensations or those that return upon themselves, the consciousness – the thinking being – achieves cognition of its own awareness, or self-awareness – the *awareness of the consciousness* or the subjective awareness of the ego – when it perceives its own functions and rationalizes personal existence, becoming conscious of the existence of its own awareness.

Self-awareness. In the set of states of the self-aware consciousness – in which it is conscious of being aware – the following 8 basic phenomena, among others, are included:

1. The ordinary, physical waking state or pragmatic awareness.
2. Lethargy.
3. State of hysteria.
4. Relaxed awareness.
5. Daydream (waking dream).
6. The trance state induced by any agent.
7. Extraphysically projected awareness.
8. Expanded awareness, the holophotic mind or cosmoconsciousness.

Foundations. All projectiology phenomena can be classified into two basic categories in regard to the condition of physical awareness: with some physical awareness and devoid of physical awareness.

1. **First.** In the first condition, *with* some physical awareness or with the *human brain semi-empty*, the following phenomena occur: traveling clairvoyance; autoscopy; consensual projections with the human body in movement; and others.

2. **Second.** In the second condition, *without* physical awareness or with the *human brain empty*, the phenomena of great projections occur: projection of the consciousness in the psychosoma, with and without the holochakra (dense energies), or wherein the psychosoma has a greater or lesser density; projection of the consciousness in the psychosoma that is partially or completely shaped in its humanoid form (shaping agent of the soma); projection of the consciousness in the isolated mentalsoma; phenomenon of physical bilocation; and others.

Fields. Undoubtedly, 3 fields that show intense research activity favors the studies of lucid projection, unexpectedly bringing inestimable contributions to the development of its research:

1. **NDE.** Near-death experiences (NDE).
2. **SLP.** Lucid dreams or semilucid projections (SLP).
3. **RV.** Remote viewing (RV or traveling clairvoyance).

Role. In the fields of the scientific work of projectiology, the *consciousness* plays a role in research and reasoning that is as important as that played, for example, by the 3 following objects of research:

1. **Cell.** The *cell* in regard to the development of biology.
2. **Atom.** The *atom* in regard to the advancement of physics.
3. **Galaxy.** The *galaxy* in regard to the evolution of astronomy.

Computer. In the research of the consciousness, per se, it is important to consider some of its parallels in relation to the computer in this era of information technology.

Advantages. The human being invented the computer, which possesses 4 basic *advantages* over the human being him/herself:

1. **Speed.** Speed in the execution of certain operations.
2. **Revision.** Exemption from mistakes in revision.
3. **Disposition.** Absence of fatigue.
4. **Tranquility.** Absence of nervous tension.

Shortcomings. Nevertheless, at least for the time being, these advantages are in no way able to compensate for 4 crucial *shortcomings* of the computer, despite its victory over chess players:

1. **Intellectuality.** Lack of intellectual flexibility.
2. **Imagination.** Lack of imagination.
3. **Reasoning.** Lack of logical self-reasoning.
4. **Learning.** Lack of learning.

Attributes. These shortcomings of computers are restricted to 4 qualities (attributes, faculties, mega-strong-traits) which are thus far inherent in the consciousness of its creator, humankind.

Liberty. Lucid consensual projection is not a mere re-invention of the savage capitalistic culture, guaranteed by physiology. Nevertheless, it can doubtless be considered in the 4 following manners:

1. **Consumerism.** An option of consumption.
2. **Freedom.** The practicing of an unsuspected freedom.
3. **Mobility.** The experience of mobility that increases more each time.
4. **Illimitable.** The rupturing of limits for the consciousness.

Bibliography: Bentov (119, p. 71), Besant (134, p. 173), Jacobson (796, p. 217), Kettelkamp (841, p. 89), Michaël (1041, p. 157), Morris (1093, p. 105), Steiger (1601, p. 216), Vieira (1762, p. 198), Walker (1781, p. 97), White (1827, p. 28), Wilber (1845, p. 120).

30. HUMAN LUCID PROJECTION

Definitions. Human lucid projection: the unique experience of perception of the environment, whether spontaneous or induced, in which the center of one's awareness appears to situate itself in a spatial location separate from one's living human body (breathing soma); passage of the consciousness from the intraphysical state to the projected state.

Synonymy: *AKE* (out-of-body experience); androprojection; animic excursion; animic flight; animic migration; animic travel; apopsychic; asomatic experience; astral departure; astral dream; astral duplication; astral experience; astral flight; astral journey; astral migration; astral deambulation; astral peregrination; astral projection; astral separation; astral telemetry; astral travel; astrotraveling; clairvoyant travel; DBE (departure from the human body experience); departure from the body experience; departure of the consciousness from coincidence; detachment of the living person; disassociation; discoincidence; disconnection; disconnection of the body; disembodiment; disjunction; dislocation of the consciousness; dissociation; ECE (extracorporeal experience); emancipation of the soul; escape to the astral; existential liberation; experience exterior to the human body; exsomatic state; exsotation (Greek: *ek*, outside; *soma*, body); exteriorization of the astrosoma; exteriorization of the psyche; exteriorization; externalization; extracorporeal adventure; extracorporeal projection; extracorporeal test; extracorporeal travel; extraphysical journey; extraphysical mini-vacation; extraphysical travel; extrasensory travel; extrusion of the psychic double; extrusion of the psychosoma; flight of the mind; floating dream; gynoprojection; half-death; heterologous projection; hominal projection; homoprojection; human projection; *in spirito* travel (Benandanti; Lorena; sixteenth and seventeenth century); interdimensional projection; interdimensional visit; journey of the soul; liberation of the consciousness; little death; live unfolding; lucid projection of the self; means of extraphysical access; mini-death; movable center of the consciousness; multidimensional travel; mystical travel; natural unfolding of the personality; non-intermediated conscial experience; OBE (out-of-body experience); OBE or OOBE (out-of-the-body experience); OBP or OOBP (out-of-the-body projection); oneiric trance; OOB excursion; otherworldly experience; out of the human body experience; out-of-body episode; parapsychic excursion; parapsychic unfolding; parasomatic experience; perispirit escape; perispirit travel; perispiritual unfolding; *prapti*; pre-discarnation; pre-experience of death; preview of death; prior death; projection of the second body; projection of the self; projection of the soul; projection outside the body; projective experience; provisory death; provisory discarnation; provisory unfolding; psychic projection; psychodynamic travel; rehearsal of death; relocation of the conscial seat; "rising into the sky;" scholastic experience; self-diplois; self-disembodiment; "self-induced depersonalization;" shamanistic flight; sidereal exit; sidereal flight; small death; spiritual detachment; spiritual deambulation; spiritual projection; spiritual travel; state of conscial emancipation; strolling doubles; temporary death; temporary disembodiment; temporary excarnation; thanatoid experience; trans-outflow of the consciousness; transport by the spirit; travel in the dream body; travel to eternity; trip in the beyond; unfolding of the consciousness; unfolding of the person; unfolding; up-anchoring of the consciousness; *videha* (India); voluntary detachment; voluntary unfolding; waking sleep; walking doubles.

Thesaurus. The Thesaurus of Projectiology highlights the expression *human lucid projection* as being the best or most accurate for labeling the phenomenon, from among the dozens of terms listed above.

Summary. The first 9 most frequently asked questions, when initially addressing any new subject, can thus be answered in the following summarized manner, regarding lucid projection in general:

1. **Who** produces lucid projection? The conscial principles, more specifically the intraphysical and extraphysical consciousnesses (extraphysical dimensions, intermissions).
2. **What** constitutes or generates lucid projection? A greater or lesser degree of discoincidence of the consciousness' vehicles of manifestation (holosoma).

3. **Where** is lucid projection produced and developed? In any district or environment of the physical universe, and part of the extraphysical universe, where the consciousness manifests itself.

4. **When** is lucid projection produced? At any time and under any meteorological conditions, because time and meteorology do not necessarily or directly influence the production of lucid projection.

5. **Why** is lucid projection produced and developed? Due to the internal nature of the normal physiology and parapsychology of the vehicles of manifestation of the consciousness, when it temporarily changes its consciential state.

6. **With what** should lucid projection be produced? Initially, by using the psychosoma.

7. **How** is lucid projection produced? By altering the vibratory or energetic frequencies of the vehicles of manifestation of the consciousness.

8. **For what purpose** is lucid projection produced? It has countless objectives, or a variety of uses, according to the specific lucid projection, whether it is produced voluntarily or involuntarily.

9. **To what degree** should lucid projection be produced? To the point of not causing any problems in the daily human life of the consciential projector, thus avoiding alienation toward physical existence or the existential program.

Access. The study of lucid projection is not religion, creed, dogma or religiosity. It represents a direct way toward prioritized self-knowledge or, using other popular expressions, an intracoscience renovation or a *way of inner illumination* that is granted to each of us, a *beachhead* for the exploration and conquest of the extraphysical world by the intraphysical consciousness prior to biological death – beginning with the individual extraphysical sphere of energy (personal holothosene). It is a state of consciousness and a method for human, personal, direct and incontrovertible access for the consciousness to extraphysical dimensions, through the separation of the psyche (mind, psychological maturity) from its dense physical substrate.

Relationships. Projection of the intraphysical consciousness *outside the human body* or, in other words, *further out* than it actually is or lives, has been related to dream, psychological symbolism, hallucination, mental imbalance, traveling clairvoyance, biological disturbances, imitation of the process of biological death and many altered states of consciousness. These aspects will be studied in the context of this book, according to the sequential analysis of the subjects.

Exoteric. The popularization of lucid projection – induced voluntarily – created a situation whereby the phenomenon ceased to be mysterious, esoteric, hermetic, occult and inaccessible to non-initiates of the age of obscurantism, in order to become natural, exoteric, public, accepted as being physiological or parapsychological and accessible to all humanity through evolutionary consciential openness. This reaction began in 1905 and intensified from 1950 onward, with the great demographic explosion and the processes of more ample interconsciential communication, pertaining to the current age of acceleration of human history.

Blockages. There are those who attribute the blocked capacity of the intraphysical consciousness (or the majority of humankind) to temporarily leave the human body in lucid projections – and thereby only have spontaneous nonlucid projection during natural sleep (*locked existence*) – to the idle capacity of the human organism or the non-utilization of about 80% of the potentialities of the cerebral hemispheres and 30% of the potentialities of both lungs, aside from other organs, and the use of only 25% of one's psychic potential, the energy of one's mind, the elaboration of thoughts.

Proof. These affirmations require definitive scientific proof through the research of neurology and projectiology (conscientiology).

Hygiene. From the beginning of humankind on this planet up until the first quarter of the nineteenth century, we deactivated millions of our somas because we were not aware of the existence of pathogenic microorganisms that were understood in greater detail from the time of Louis Pasteur onward. Lucid projectability took a little longer to be discovered and employed with awareness: it was practically unknown to the public until about 1950 (the twentieth century).

Independence. Upon overcoming fear (projectiophobia) and one's motivation being kindled, lucid projection of the consciousness outside the human body occurs regardless of gender, age, race, order of birth, political tendency, faith, religion, religiosity, education, philosophy, financial status or even one's preconceived ideas.

Physiology. This proves that lucid projection is a normal physiological attribute of the human body that is, in many ways, a primary biological phenomenon. It is as natural as sleep, dreams, digestion, the sex act (for women and men), as well as menstruation, gestation, and childbirth (for women).

Universality. In regard to its universality, it is observed that lucid projection, as an intrinsically natural function, occurs with multifaceted variables, such as the following 5:

1. **Age.** With people of all physical ages, from children to those of *advanced age* (80 years and older).
2. **Health.** With physically or mentally healthy or ill individuals of both genders.
3. **Information.** With those who have heard of, read about or studied the subject, as well as with those who are completely unaware of the subject, whether they are uninformed, misinformed, under-informed, or those ignorant existentially-robotized individuals who pertain to intraphysical society.
4. **Life.** With social beings living a routine life, as well as victims of disasters or accidents who are undergoing surgery.
5. **Intentionality.** Through the personality's active force of will and intention, as well as when unwanted, for that individual who experiences an *extraphysical escape*, for example.

Powers. Many religious systems have been promising a pleasant life beyond the grave or beyond the crematorium, teaching that you should suffer current misfortunes with a smile. Lucid projection research not only reaffirms these considerations but goes much further, indicating that the opposite approach is even better. Use the development of your personal powers – will, intentionality and self-organization, for example – in order to immediately improve your current human life. At our evolutionary level, we return to intraphysical life to be happy with lucid evolution. It is no longer worthwhile to cultivate suffering, pain and torment.

Balance. Let us not wait for the decomposition of the human body for our consciousnesses to achieve more agreeable or balanced conditions.

Now. This can be obtained here. *Today is the day; now is the time; this is the moment.* It can be done without any repression, dogmatism, demagoguery or abdominal brainwashing from the protoconcepts of religions or theologies (preschool courses) of which approximately 100 thousand have existed over the span of human history.

Bases. Succinctly, lucid projections present approximately 12 basic common occurrences that people experience spontaneously and, in many cases, exhibit a certain reluctance to mention, due to social repression and conditioning:

1. **Self-projection.** Feel the consciousness (ego, self-lucidity) leaving the human body (soma): lucid projection (LP) per se.
2. **Primoprojection.** Have the experience of leaving the human body, with lucidity, only once: first lucid projection (primoprojection).
3. **Self-discoincidence.** Feel the separation of the consciousness a short distance from the human body: projection in the physical base.
4. **Self-location.** Feel that you are above your own human body: *extraphysical self-location*.
5. **Self-bilocation.** See your own human body below you: *consciential self-bilocation*.
6. **Self-translocation.** Feel that you are moving to a distant point without using the human body: *extraphysical self-translocation*.
7. **Paravision.** Be convinced of being able to observe, *de visu, in loco*, what happens at a distance from your own body: *extraphysical vision (paravision)*.
8. **Telekinesis.** Produce physical effects outside the human body, without using the body, which occurs only occasionally: *extraphysical telekinesis (called psychokinesis by some researchers)*.

9. **Bilocation.** Make other people see you, while in the condition of a projected experimenter, a phenomenon that occurs rarely: *physical bilocation* per se.

10. **Self-apparition.** Make the projected consciousness appear, when sensed or perceived at a distance by other people, through means other than the dense physical presence, a phenomenon that also occurs very rarely: *inter vivos* apparition; extraphysical telepathy.

11. **Self-persuasion.** Be certain that you somehow really *traveled outside* the human body: *projective self-persuasion* regarding facts and experiences.

12. **Self-confirmation.** Prove the authenticity of your own lucid extracorporeal projection to yourself, after a detailed comparison of the places, facts, beings and time frame that you experienced at a distance, without the human body: self-confirmation subsequent to the lucid projection.

Proof. Lucid projection is neither an article of faith, *nor merely* a theme for religious debate. Neither is it a pretext for philosophical observations, nor a process for the enrichment of the meditations of poets or the works of literati. Lucid projection is *individual proof* for the intraphysical consciousness that offers the interested person at least 4 mega-challenges that serve as definitive evidence or multiple pieces of evidence, allowing you to begin your personal research or experiments that are high-priority and have a great recycling effect upon the existential program:

1. **Multidimensions.** The existence of the extraphysical world or the extraphysical dimensions beyond this *dimension of oxygen (existential multidimensionality)*, one of the mega-challenges confronted by *philosophical schools*.

2. **Multibodies.** The existence of the vehicles of consciential manifestation, beyond the soma (holosoma), with the subsequent loss of the fear of death (thanatophobia), one of the mega-challenges in *human health* research.

3. **Multixistences.** *Personal* proof of the theory of successive lives or existential seriation, through retrocognitive projections, one of the mega-challenges of many religions, sects and *theologies* throughout time.

4. **Multipopulations.** Proof of the fact of the habitability of other worlds or planets (*extraphysical multipopulations*), one of the mega-challenges that *astronomy* has always confronted.

Pluralities. There are, in other words, 5 pluralities that lucid projection evidences to the attentive practitioner, as can be seen in the following context:

1. **Vehicles.** The plurality of vehicles (bodies) of consciential manifestation (holosomatics).

2. **States.** The plurality of the consciential states (conditions), including xenophrenia, when healthy.

3. **Dimensions.** The plurality of existential (multidimensionality) dimensions (planes, worlds, communities, colonies, districts, environments), holosomesomatics.

4. **Existences.** The plurality of consciential existences (lives) or stages (holobiography, multi-existential cycle).

5. **Stars.** The plurality of stars (planets) which are inhabited (cosmos).

Book. This book obviously gives special attention to human lucid projections.

Term. It is necessary to distinguish between the different meanings of the term “projection.” For example, lucid projection, analyzed here, should not be confused with “projection,” in the sense employed in psychoanalysis or psychology.

Psychoanalysis. In psychoanalysis, projection is the process whereby the individual expels qualities, sentiments and desires – that one does not recognize or refuses to see in oneself – out from oneself, ascribing them to another person or thing. It is an archaic defense that particularly manifests itself in paranoia.

Psychology. Also, “projection” is generally used in psychology to signify that the individual perceives the environment and responds as a function of what it is. This is the basis of various *psychological projective techniques*.

Expression. The following illustrates the manner in which the expression *lucid projection* is currently most often used in 5 different languages:

1. **Portuguese:** *projeção astral* or *experiência fora-do-corpo*.
2. **French:** *dedoublement*.
3. **Spanish:** *desdoblamiento*.
4. **German:** *astralwanderung*.
5. **Italian:** *proiezione astrale*.

31. LUCID PARAPROJECTION

Definitions. Lucid paraprotection: the experience of the extraphysical consciousness – whether “terrestrial” or “extraterrestrial” – that leaves the psychosoma stationary in the extraphysical dimension, and departs projected in the mentalsoma, in the mentalsomatic dimension; passage of the extraphysical consciousness to the projected state.

Synonymy: extra-human lucid projection; lucid projection of the extraphysical consciousness; para-human lucid projection.

Analogies. In the same way that there are phenomena produced by extraphysical consciousnesses which are analogous to human phenomena (the phenomena of transcendent physical effects, for example), there are consciential projections in the mentalsoma of intraphysical consciousnesses which are analogous to those experienced by extraphysical consciousnesses.

Environment. Pure, mental lucid projections of the intraphysical and extraphysical consciousness are similar to each other. This is because they occur in the same environment, the mentalsomatic dimension – a point of encounter that is common to all consciousnesses – utilizing the same vehicle of manifestation of the consciousness, namely the mentalsoma.

Differences. Up until now, the existence of basic differences in the connection of the mentalsoma with the parabrain of the psychosoma (through the golden cord) has been unknown, when referring to an intraphysical consciousness (connected to the holochakra and human body), as compared to an extraphysical consciousness that has already passed through the second desoma or, in other words, lacks the human body and the holochakra.

Distinction. In practice, however, regardless of the foregoing, the intraphysical consciousness, projected in the isolated mentalsoma, can generally distinguish perfectly between the intraphysical consciousness and the extraphysical consciousness, due to the consciential faculties of the mentalsoma (concentration, attention, association of ideas).

Bibliography: Vieira (1762, p. 73), Xavier (1882, p. 182).

32. ANIMAL PROJECTION

Definition. Animal projection: projection of the rudimentary consciousness (consciential principle in evolution) of the subhuman animal outside its biological body.

Synonymy: subhuman projection; subintelligent projection; *zooprojection*.

Considerations. Based on the premise that the human, or hominid, is an animal; that animals, generally speaking, need to sleep as humans do, a generally accepted point of analysis being the fact that many species even dream; and that the consciousness of humans, during natural sleep, always unconsciously, spontaneously and physiologically projects itself from the human body; *it can logically be deduced* that higher animals, having a well constituted physical structure, possess an extraphysical

vehicle of manifestation and project themselves in this vehicle – although all indications are that this occurs unconsciously – in a manner that is analogous to that of the human personality when it embarks on natural sleep.

Genetics. It should not be forgotten, in this context, that our *human* genetic makeup is 96.7% identical to the *subhuman* genetic makeup of the chimpanzee. There is a genetic difference of only 3.3% between us.

Characteristics. The facts listed thus far allow us to point to 6 characteristics of the projection of subhuman animals:

1. **Unconsciousness.** Subhuman unconsciousness.
2. **Rarity.** Rarity of the occurrence.
3. **Intraphysicality.** Relationship with human life (holothosene of intraphysical consciousnesses).
4. **Fugacity.** Spatially short projection, or in the proximity of the physical body.
5. **Paratroposphere.** In the proximity of the tropospheric environment (paratroposphere) of the human being with which it has affinity (empathy), in the case of domestic animals.
6. **Rudimentary.** The projective phenomenon as an unconscious agent on the part of the rudimentary subhuman consciousness.

Zoanthropy. Animal projection should not be confused with zoanthropy.

Animal-projectors. The most common subhuman animal-projectors are domestic animals, especially dogs and cats, perhaps due to their more intimate, diurnal relationship with social (human) beings, as many of them even sleep on top of, or underneath, the owner's bed.

Roger. While projected on the night of July 29, 1982, in the apartment located on Visconde de Pirajá Street, Rio de Janeiro city, Brazil, the author observed "Roger" the guard dog (also projected at that time) at length. Roger later became the champion of the junior class of the Yorkshire breed. Roger was a 15-month old adult weighing 3.3 lbs. (1.5 kilos), and was affectionate, tame and intelligent for its evolutionary level.

Verification. On this opportunity it was possible to verify 3 distinctive facts:

1. **Aura.** The existence of its aura (energy).
2. **Parabody.** The existence of its extraphysical body (parabody) similar to its physical body.
3. **Miniholochakra.** The slightly luminous energetic connection (miniholochakra), similar to the silver cord of human beings, between its extraphysical and intraphysical vehicle.

Lucidity. At this time, the little projected dog, possibly due to the author's exceptionally felicitous realization of the consensual projection, demonstrated its habitual lucidity and – leaving the living room where its physical body was resting – wanted to follow the author's psychosoma to the bedroom, wishing to lick and rub up against him while wagging its short extraphysical tail (caudal appendix) in an extremely happy manner.

Appendix. When Roger was acquired, its tail or caudal appendix had already been cut, and he was also extraphysically seen to have a cut tail or, in other words, it was seen to be of the same size as when Roger was in the ordinary waking state (intraphysicality).

De-awareness. It is easy to suppose, only as a *research hypothesis*, that the rudimentary consciousness of the subhuman animal which, as it is generally accepted, does not demonstrate well-defined awareness of itself in the ordinary waking state, likewise remains devoid of awareness of itself or, in other words, *de-aware*, when it deactivates its biological subhuman body, as well as during the projections from its physical body.

Mental. All indications are that animals do not project themselves in the rudimentary mentalsoma, but only in the psychosoma, when in a primary phase of evolution, in the tropospheric extraphysical dimension.

Development. This evidence leads us to suppose that the mentalsoma only becomes defined and developed when the consensual principle reaches the *hominal level* and acquires awareness, as we understand it, with full self-awareness, thereby enabling its first incursions into the mentalsomatic dimension.

Dimension. This corroborates the fact that no animal subconsciousnesses which are evolutionarily inferior to the level of the human being (subhuman animals) are found to manifest in the pure (without the interference of other extraphysical dimensions) mentalsomatic dimension.

Psychosoma. The following conclusion can be drawn here: all para-animals encountered in the tropospheric extraphysical dimensions are in contact with extraphysical consciousnesses or projected intraphysical consciousnesses manifesting in the psychosoma.

Senselessness. Strictly speaking, all senselessness of the immature person represents a pathological de-awareness.

Alienation. Everything that separates one from maximum possible acumen of one's ego, today, constitutes alienation from consensual multidimensionality. The best course is for the intelligent intraphysical consciousness to always avoid this alienation, regardless of the circumstance or the defensive pretext.

De-awareness. The alienation, in this case, serves to promote *de-awareness*, generated by a reduction in the level of personal lucidity, a regression to the evolutionary animal stage.

Bibliography: Bayless (94, p. 130), Cornillier (305, p. 43), Crookall (343, p. 40), Delanne (385, p. 100), Easton (451, p. 145), Ebon (453, p. 100), Fugairon (562, p. 153), Green (633, p. 195), Kardec (825, p. 289), Steiger (1606, p. 180), Talamonti (1641, p. 227).

33. PLANT PROJECTION

Definition. Plant projection: projection of the energetic equivalent of the live plant from its botanical physical structure.

Synonymy: phytoprojection; projection of the double of the vegetable.

Kirlian photography. No one contests the vital manifestations of plants. It is for this reason that the highly controversial *Kirlian photography* merely confirmed the old suppositions that the double of plants also exteriorize in their own way.

Cord. The controversial *phantom appendage*, detected by special *Kirlian photos*, appears in plant projections and looks like a cord connected to the plant.

Verification. Lucid projection experiences allow the projected human consciousness to personally verify the energetic counterpart of the plant and its exteriorization when *injured* by the projector using the parahands of the psychosoma.

Bibliography: Moss (1096, p. 174).

34. LAWS OF PROJECTIOLOGY

Definition. Law: constant relationship between phenomena of a given order that expresses their nature or essence.

Synonymy: generalization; norm; postulate; prescription; principle.

Consideration. Leaving its birthplace, projectiology, a relative newcomer among the already established conventional academic studies, has not yet arrived at the point of establishing ample and complex generalizations or laws regarding human behavior that are analogous to the laws and principles presented by chemistry, astronomy or physics, for example. Nevertheless, something worthy of consideration can already be offered in this sense, despite projectiology's *insufficient mileage*.

Science. The knowledge of the general history of science has reached a point where there is a clear awareness that the fundamental principles in acceptance today will often be seen as strange concepts of an immature erudition, tomorrow.

Utility. Therefore, the postulates listed below should be viewed within a context of heterocritique, with a willingness to abandon any or all of them when they are no longer of use.

Indications. As of this writing (2002), these affirmations seem to be supported by many existing indicators and seem to be useful guides for the research and study of projectiology, and correlated subjects.

Enunciation. According to parapsycho physiology, any consciousness that undergoes resoma in the intraphysical dimension can temporarily leave the human body (soma) and return to it without negative consequences for anyone. Projectiology openly endorses this enunciation through laboratorial and individual experiments.

Accumulation. The accumulation of experiments makes it impossible to confuse dreams and other altered states of consciousness with the lucid projection phenomenon.

Proof. This fact eliminates all doubt regarding the authenticity of lucid projection for the veteran projector with individual, unquestionable and definitive proof, because the phenomenon is self-persuasive, extinguishes personal doubts and establishes new perspectives in the projector-experimenter's existence.

Vehicles. There are irreconcilable differences between the nature of the psychosoma and the nature of the mentalsoma. Projections of the isolated consciousness, when produced in these vehicles of manifestation, are completely and unmistakably different.

Preponderances. The biological or physical body preponderantly dominates the intraphysical or human dimension; the psychosoma, the extraphysical tropospheric or paratropospheric dimension; the mentalsoma, the mentalsomatic dimension, evidently always sustaining the thosenizations of the consciousness in any condition or dimension.

Intentionality. This entire crescendo of actions obviously occurs under the indispensable command of the pointer of the consciousness or the qualification of the personality's essential intentionality when it manifests itself.

Soma. During peaks of perception in the ordinary, physical waking state, as the human body is so absolutely *real* for the intraphysical consciousness, the individual is not aware of the existence of the psychosoma.

Psychosoma. A phenomenon similar to that described above occurs when the consciousness in the psychosoma – which is also absolutely *real* for the intraphysical consciousness when projected in the pure extraphysical dimension – does not perceive the existence of the human body. The exception to this is when, on certain occasions, one sees one's human body before oneself.

Mentalsoma. Still another similar phenomenon occurs in reference to the *mentalsoma*, that is absolutely real for the intraphysical consciousness, when projected in the mentalsomatic dimension. However, here the consciousness is in a condition in which it does not perceive the existence of any body or vehicle of manifestation as we understand and sense them in the ordinary, physical waking state.

Motivation. Most human beings have still not experienced an impactful lucid projection because they were not sufficiently motivated toward this goal. In other words, the ordinary person has generally not yet had any conscious or unconscious motive to wish to "leave the human body."

Somnambulism. Chronic lack of motivation, the process of initiation of the conscious, voluntary and efficient action for consciousnesses in general to temporarily, but lucidly, leave the human body, unquestionably shows that almost all of humanity has been sleeping through life or, to use a more appropriate expression, has literally been *somnambulant for millennia*.

Thought. Outside the body, the consciousness goes wherever it thinks of going.

Thosene. The consciousness is what it thinks (or thosenizes).

Coadjutants. Lucid projection, an occurrence owing to the natural faculties of the intraphysical consciousness, is quite achievable without the helpers and without the self-aware parapsychism of the practitioner. Nevertheless, it becomes much easier, and offers much higher quality results, with these 2 coadjutants.

Action-reaction. The attempt to produce consciential projections with negative, anticosmoethical intentions, whatever they may be, results in the reversion of the sick results upon the projector's own consciousness.

Cosmoethics. Hence the indispensable nature of philosophical analysis – or of the influence and frank action of cosmoethics, and the philosophical bases of universalism – in the arena of manifestations and the world of projectiology research.

Nature. Within the next few decades, the phenomenon of human lucid projection, *no longer contaminated by magic*, will stop being considered a mystical, religious, bizarre or strange occurrence. It will then be addressed, accepted and studied in a natural and widespread manner, more and more scientifically, as the law of nature that it is. This, with neither obscurantism, nor involvement with surrealism, beliefs, delirium, disinformation, manipulation of existentially robotized intraphysical consciousnesses, or folkloric manifestations.

Bibliography: Andrade (27, p. 144), Muldoon (1105, p. 65).

35. PARADOXES OF PROJECTIOLOGY

Definitions. Paradox: the concept that is, or appears to be, contrary to common belief; the assemblage of words or contradictory concepts.

Synonymy: apparent contradiction; contradiction; countersense; oxymoron.

Categories. There are many paradoxes in the occurrences of projectiology. The following 16 categories can be highlighted according to the area of phenomena in which they appear or in regard to their specific nature:

1. **Assistential.** Unfortunately, human beings generally help more when they remain *nonlucid* while projected in the extraphysical dimension – even when helping in extraphysical assistance and operating as nonlucid extraphysical sensitives – than when entirely *lucid* regarding their liberated condition. This is due to the fear and other negative emotions exhibited by novices regarding consciential projection.

2. **Biological.** Impulsive *youths*, during their adolescence, present a great ease for projecting and recalling extraphysical facts in the manner of a natural physiological reaction of their intraphysical period or age group. Nevertheless, *senior citizens* or veterans of life or golden agers (old youths), 65 or older, have a more expanded serenity and experience that allows them to cope with the density and keep their balance regarding the results, objectives and evolutionary effects of the intraphysical consciousness' projective experiences.

3. **Consciential.** In fact, awareness is a continuous permanent state, because we are somehow *conscious* even when we think we are *unconscious* or asleep.

4. **Dualistic.** The intraphysical consciousness produces projections simultaneously using animism (intraconscientiality) and parapsychism; in an active and passive manner; with two lives, human and extraphysical; with two memories, human (biomemory) and integral (holomemory); submissive to human morals and cosmoethics; combating euthanasia, in the ordinary, physical waking state, following human codes and, as an aide to death, while projected in the extraphysical dimension, helping to deactivate the biological bodies of intraphysical consciousnesses or, in other words, helping consciousnesses to go through the transition of the first, biological or cellular desoma.

5. **Phenomenological.** In the phenomenon of consciential self-bilocation, intraphysical consciousnesses *actually go outside themselves* in a lucid projection and then contemplate and analyze their own inactive human bodies. Philosophically speaking, this act constitutes the first step toward the consciousness *going inside itself*.

6. **Philosophical.** Lucid projection demonstrates the existence of *excessively materialized* consciousnesses that are in a more comfortable condition now, while they are human beings, bound to the dense matter of the soma – the body that they worship and preserve with so much tenacity – as compared to the subsequent period, when they are extraphysical consciousnesses, free in the extraphysical dimension, albeit without the human body. This generates an *intuitive attachment* to

matter which – as incredible as it may seem – coexists and derives from a tranquil acceptance of the ego's survival of biological death. These facts transform and notably extend the currently used philosophical concepts of materialism and spiritualism because they reveal the regrettable ambivalence or a *spiritualistic-materialism*, the existence of which has always gone unnoticed in the subconscious of many individuals.

7. **Physiological.** When the projected consciousness endeavors to have a composed, well-formed psychosoma, it will have more possibilities for condensing a percentage of matter in this vehicle of manifestation or aggregate an increasingly greater amount of the holochakra. This will result in the consciousness remaining bound or restricted to the proximities of the terrestrial crust, without advancing to better districts, environments or communities of the extraphysical dimension.

8. **Mnemonic.** When the projected intraphysical consciousness becomes slightly adept at briefly utilizing the amplitude of reasoning of the integral memory (holomemory), it has difficulty in passing on these recollections to the partial memory of the ordinary, physical waking state (biomemory or cerebral memory) upon physically awakening. This same consciousness, while enjoying the benefits of the integral memory in the extraphysical dimension, finds it difficult, when there, to revalidate the concepts and appearances that it defends in regard to the issues and facts of intraphysical existence – due to the narrow vision of human preconceptions, repressions and conditionings. It is very difficult, in this case, to make one system of reasoning mesh with the other. Holomemory surpasses all conventional parameters of observation of the ordinary intraphysical consciousness belonging to the unthinking masses. Not all types of intelligence that predominate in the intraphysical consciousness' life permit an easier or smoother access to the inventory of recollections in the holomemory. This is a fact that still *requires in-depth research* or, in other words, a comparison of biomemory, holomemory and the category of intelligence predominantly used in the intraphysical consciousness' existence.

9. **Parapsychological.** Every intraphysical consciousness projects every night while sleeping, but remains nonlucid or semilucid outside the human body. Sporadically, upon achieving extraphysical self-awareness, the individual almost always suffers a trauma or *consciential shock* that makes the consciousness immediately return to the dense cellular body, thus losing the unique learning opportunity provided by the extraphysical experience.

10. **Psychological.** Lucid projection frees one from the repressions of the consciousness that, paradoxically, provides one with greater powers against negative, controlling emotionalism.

11. **Psychotherapeutic.** The best process for lending new meaning to the experiences of human life is to leave it through lucid projection. The best process for intraphysical consciousnesses to increase the ability to be in contact with themselves, others and events, is to get out from themselves through lucid projection.

12. **Chemistry.** After 40 years of age, one is forced to use medications that protect the cerebral cortex against arteriosclerosis and the problems of aging. These drugs are positive on one hand, as they avert intracranial pressure, stimulate the functioning of the brain and improve the cerebral memory or biomemory. On the other hand, they make the individual more awake and thus impede lucid projection, because they intensify and enhance the ordinary waking state in a person who is already predisposed to this due to crystallized habits and the need for fewer hours of sleep.

13. **Desomatic.** Lucid projection, or anticipated physical minideath (desomatics or thanatology), a *highly individual* experiment, leads to the definitive elimination of all types of personalism in the human projector's mind, through the ideas and sentiments that are amplified by *pure universalism*.

14. **Technician.** In order to improve the method for projecting, the projector should first saturate the mind, or *fill the mind* with the idea of lucid projection. Nevertheless, as soon as one perceives oneself to be projected, the individual should forget all human conditioning and preconceived ideas, keeping the *mind empty*, or open and receptive to any idea, event or new phenomenon that occurs extraphysically.

15. **Paraphysiological.** The intraphysical consciousness who is *physically* less anchored can achieve biological, *physical maturity* more quickly and can consequently advance even more quickly toward *extraphysical* maturity or holomaturity.

16. **Self-awareness.** Lucid projection, although a *natural occurrence* common to all humanity, presents the condition of advanced physical self-awareness as an occurrence that is unfortunately still *beyond the pattern* of the intraphysical consciousness' ordinary condition or, in other words, subordinated to the prison of the physical, terrestrial restriction imposed upon the extraphysical consciousness when operating a soma through resoma.

Resolution. Every paradox is waiting to be resolved.

Complexity. The paradoxes encountered in the occurrences of projectiology reaffirm the complexity and ample range of their manifestations in the areas of action of one's consciousness, and suggest innumerable research hypotheses.

Transcendent. Conscientiology and projectiology are sciences that are *more transcendent* or transpersonal in nature.

Demarcated. They are not so specific and demarcated regarding their manifestations and research in the intraphysical and extraphysical dimensions. This does not occur, for example, with physics, parapsysics, biology, parabiology, and many other sciences with radical *non-transcendent* counterparts that are far more contrary or antipodal when researched by humans or extraphysical consciousnesses.

Dilemma. The lack of understanding and application of this disparity between sciences is the fundamental cause for the existence of the two-centuries-old *mind-matter* dilemma and the traditional, non-participatory research which is unchanging and outdated on the part of the researchers working in the conventional sciences (*dermatologies of the consciousness*).

Consciousness. The material world does not have available resources that can provide equipment or instrumentation capable of directly studying the consciousness, which transcends consciential and immanent energies and, therefore, matter itself, in all of its most rudimentary or coarse manifestations, without the subtleties, *insubstantialities, rarefactions* and interdimensionalities of the consciousness of subhumans and humans.

Bibliography: Rogo (1446, p. 320).

36. PROJECTIVE LIMITATIONS

Definition. Projective limitations: factors that are disadvantageous, restricting the expansion of the objectives and practical applications of lucid consciential projection.

Synonymy: projective delimitations; projective disadvantages; projective improprieties; projective inconveniences.

Types. Besides the fact that lucid projection of the consciousness is, for a great number of researchers, by far the most transcendent, interesting and important phenomenon known to humanity, yielding many more definitive results for the individual and, obviously, presenting many more advantages than disadvantages, within the areas of psychology or parapsychology, 4 factors can be pointed out as being inconvenient, substantial limitations of projectiology: individualism; methodology; projective recesses; and the characteristics of the current growth of the human brain.

1. **Individualism.** The fact remains, which is incontrovertible up to the time of writing in 2002, that lucid projection research – as it is an exclusive and, above all, an inevitably individual occurrence, not directly affecting the multitudes, the unthinking masses (existential robotization) – has not been permitted to advance more rapidly, neither over the centuries of human history, nor (so far) in this technological era, because its research presents minimal psychological appeal to the human masses, who are absorbed in immediate material (earthly, hedonistic, physicalist, exclusively intraphysical) interests. This is characteristic of instinctive, animal, human life.

Proof. We cannot discard the fact that the ideal, basic proof of the existence of lucid projection is still something which will remain individual and nontransferable, achieved through the effort, training and improvement of the interested individual's personal performance.

Appeal. Lucid projection appeals to the individual, yet there is no great collective appeal. Lucid consciential projection is not the type of thing or activity that is, for example, able to: sell records, attract radio and television audiences, or increase tourism.

Success. The research findings do not appeal to a mass audience or attract the *populace* like the soccer player, the radical sport athlete on the edge of suicide, the sexy singer or musical pop star – all of whom are champions of human and transitory success.

Funds. It is common knowledge that all human-based research obviously demands financial resources besides the “people” factor. As lucid projection is not directly involved with the unthinking human populace, official funds for scientific research become scarce, except, unfortunately, for research related to ultra-secret bellicose objectives, or “psychotronic war.”

2. **Methodology.** There is always the limiting factor of the impracticality of making a single, practical, efficient, standardized and common lucid projection technique indiscriminately viable, easy and accessible to the majority of humans, who are at least thus far still somnambulant. This is due to the equally extremely individual nature of the lucid projection experience and to the variety of tendencies and characters of human consciousnesses.

3. **Recess.** Projective recess is a common fact that affects the intraphysical personality and creates practical disinterest toward the subject of consciential projection. It almost always occurs during one’s terrestrial period of greater human productivity. Therefore, the absolute and relative projective recess generated by diverse causes and its consequences, also certainly constitute a powerful limiting factor in the practical development of humanity’s lucid consciential projections.

4. **Brain.** Another factor that constitutes a considerable projective limitation is the exceptional, minority, countercurrent (against the flow) condition of expansion of the human brain, which is necessary for the development of the consciential projector’s consciousness. It seems to be more efficient when concentrating on the right cerebral hemisphere – thereby expanding one’s animic (intraconscentiality) and parapsychic capacities. However, on the contrary, it is currently observed that the average members of the planetary population predominantly concentrate on the development of the left cerebral hemisphere or, in other words, they are still caught up in the improvement of their command of language (laryngochakra) and rational operations.

Future. Despite the aforementioned limitations, the author remains optimistic and confident regarding the possible, plausible or probable future of projectiology.

Roots. A presumed process for definitively destroying and eliminating the science of projectiology will always be impracticable due to its basic phenomenological and physiological roots that are irrevocably lodged within the structure of the human body (soma).

Methods. The improvement of human lucid projections will be inevitable to the extent that projective methods are applied from this point forward.

Consensus. Mindful projective experiments with a desirable ethicality – performed by investigators who have a serious, vigilant, secure and deeply self-critiquing awareness – will inevitably occur. They will be impelled by the natural development of ideas, human interests and planetary issues. Hence, a consensus will arise that will establish productive routines regarding the phenomena that benefit everyone.

Replicability. On the other hand, we do not consider the difficulties involved in replicating all lucid projection experiences in an absolutely identical manner – stemming from undoubtedly individual factors – to be an insurmountable obstacle to the development of projectiology.

Logic. The imperative of the replicability of identical phenomena - applied in an *ad arbitrium* manner by researchers - which is presented as a basic, irrevocable and irreplaceable requirement of conventional scientific method, and of which we are constantly reminded, does not stand up to logical critique, as seen with astronomical phenomena, for example, which, although not being replicable, are not outlawed by science.

Astronomy. Astronomy also does not owe its prodigious development to the experimental manipulation of the celestial bodies.

Restraint. As a consequence of its current stage of consciencial evolution, or the freedom of the ego, humankind no longer possesses the natural instinctual restraint that inhibits other animals from killing members of their own species.

Respect. In intraphysical society, there is a much greater liberalism regarding customs and sexual permissiveness. On the other hand, there is a much deeper respect for the rights of subhuman consciousnesses, plants and nature (ecology).

Intelligence. These facts are proof that human intelligence, in general, on this planet has already at least overcome the consciencial primary nature of the rudimentary (so-called inferior) intelligence of subhuman animals. Strictly speaking, it is important to consider that subhuman beings already present a sketchy form of jealousy, envy, egocentrism and other emotional reactions similar to those of a child.

Mega-weak-traits. Nevertheless, in the current condition of the consciousness' evolutionary passage to another level or the *sublimation of the ego*, we cannot be boastful of terrestrial human intelligence, as seen by these 10 individual (psychopathies) and social (sociopathies) mega-weak-traits:

1. **Cruelty.** Calculated human cruelty.
2. **Anti-ecology.** Refined anti-ecological abuses.
3. **Genocide.** Crimes of genocide.
4. **Wars.** Continuous wars, armed conflicts, uprisings and revolutions.
5. **Lynchings.** Lynchings and collective suicides, under any pretext.
6. **Arsenals.** Nuclear arsenals and the rearming of nations.
7. **Mafias.** The organized crime of the multiform multinational mafias or the *societas sceleris*.
8. **Exterminators.** Aggression, kidnapping, assassination, death squads and gang raids.
9. **Terrorism.** *Faceless* international terrorism.
10. **Serial.** Mass slaughters and unspeakable crimes committed by the same individual, the so-called serial (serial killer, mass murderer) murderer (animal), who is intelligent, aware, calculating, cold, socially integrated, methodical, discreet and silent; and those who “shoot anything that moves.”

Solutions. The nature of these consciencial conflicts evidences that they will only be diminished or resolved when all violence is eliminated, by means of 4 measures that demand immense *political good will on the part of governments*, which still does not exist:

1. **Comprehension.** The deep comprehension of unconscious human passions (psychosoma or emotional body). Lucid projectability (LPB) is a light at the end of this tunnel.
2. **Altruism.** The ability to correctly satisfy the necessities that are more economic in nature (altruism), such that the *rich countries* (First World) stop exploiting the *countries of the dispossessed* (Third World). The hope lies in the strengthening of the United Nations (UN), in the still fetal globalization process and in the creation of a global government.
3. **Maxifraternity.** The establishment of better communication between potential adversaries (maxifraternity). An auspicious activity in this respect is the Internet.
4. **Universalism.** The improvement of the organization of governmental, national and international institutions (universalism), as well as consciencio-centric institutions; and changes in ideologies and values attributed to ephemeral things and life by humankind (extraphysical maturity or holomaturity). Included here are non-governmental organizations (NGOs), the International Institute of Projectiology and Conscientiology (IIPC), the Center for Higher Studies of the Consciousness (CHSC), the International Academy of Conscientiology (IAC), the International Association for Evolution of the Consciousness (Aracê) and the International Campus of Conscientiology (ICC).

Research. On library shelves we can find some books, even very attractive ones, that introduce areas of human research. The following are 8 examples of exotic or enigmatic titles: *Biosofia*, *Cosmonomia*, *Geopsíquica*, *Homaranismo*, *Metablética*, *Nomezofia*, *Psicomaiêutica* and *Teocracismo* (see Specific Bibliography).

Title words. You have probably never heard of some of these 8 title words, or seen them written in your preferred reading list or cited in the most popular dictionaries.

Marginality. The author thinks that “projectiology,” some decades from now, will not have the same obscure destiny as these respectable lines of thought or still peripheral concepts.

III - Phenomena of Projectiology

37. CLASSIFICATION OF PROJECTIVE PHENOMENA

Definition. Projective phenomenon: parapsychic occurrence specific to the scope of projectiology.

Synonymy: projectiological phenomenon; projective occurrence.

World. The world of projectiology research includes a domain of manifestations beginning with common facts or phenomena, namely those which almost all persons may have experienced and recalled at one time or another, such as semilucid projection in which the individual appears to be flying with some degree of lucidity. At the other end of the spectrum, some extreme cases can be included – which are as rare as they are spectacular – such as the phenomenon of physical bilocation, observed by numerous human witnesses.

Complex. In the phenomenological complex of projectiology, 54 correlated, connected or *sister* parapsychic phenomena are included here. They represent manifestations, consequences or correlations closely related to the act of the intraphysical consciousness projecting from the human body (soma). These phenomena go beyond essential consciencial projections, which are addressed in detail in other specialized chapters of this book, according to the sequential analysis of subjects.

Denominator. In the component chapters of this section, only the correlated phenomena were listed, independent of their causes, effects and operational aspects. They compose a *phenomenological complex*, or a block of phenomena with similar patterns, paradigms or manifestations. Their common denominator is the lucid projection of the intraphysical consciousness out of holosomatic coincidence with the human body.

Analysis. These phenomena simultaneously demand analytical study *per se* and, at the same time, analysis as a whole, in order to arrive at unified interpretations and global, clarifying, and correct views of the facts.

Causes. Many of these correlated phenomena can be provoked by causes other than the occurrences triggered by lucid projection of the intraphysical consciousness. For example, the more frequent poltergeist is not at all related to projectiology. The same is the case with spontaneous human combustion and other phenomena. The phenomena brought together are those which relate directly to projectiology.

Identification. It sometimes becomes very difficult to clearly identify or strictly classify the exact parapsychic phenomenon that we experience. For example: the expansion of the consciousness through projection in the mentalsoma, traveling clairvoyance and extraphysical vision are 3 very distinct occurrences in their manifestations. They can occur so simultaneously, mixed together with the interrelated facts, that the experimenter is not able to discern them from each other or to know at which point one phenomenon ended and another began.

Complexity. It is worth bearing in mind here that the consciousness is the most complex object in the universe.

Isolation. The degree to which a phenomenon is isolated determines the degree to which it can be acted upon in order to measure it, attempt to include it in a law or utilize its potentialities or force.

Fragmentation. The study of projective phenomena demonstrates that the *analytical decomposition of the human consciousness* – or the fragmentation of psychic and parapsychic activity – into different parts or into isolated, intellectual, affective and volitional functions, in an independent manner, will always be artificial. This is only done in response to the need for educational exposition and the facilitation of theoretical and practical research.

Thosenology. We should bear in mind that the thosene, or the complex base of manifestations of all consciousnesses is composed of 3 inseparable variables: idea or thought, emotion or sentiment and consciential energy or the act itself.

Practice. Due to the difficulty in identifying the phenomena in a detailed and accurate manner, the classification of projectiological phenomenology is the theory needed for precise research analysis. However, it is worth noting that, in practice, the consciousness presents itself as a totality, and all the spontaneous classified facts coexist in an interpenetrating manner, in a profound interaction, mutually influencing each other, connected to each other, establishing a relationship of cause and effect among themselves. They also alternate in their development, spontaneously overturning human selections, lists and schemes, as adequate and just as they may be or present themselves.

Classification. The phenomena related to projectiology were classified here according to the specific condition of the intraphysical consciousness – situated as the focus of analysis in a context, or the existing causal connection between all parapsychic processes – into *subjective* projective phenomena and *ambivalent* projective phenomena.

Concomitant. Besides these phenomena, there are those which are *concomitant* to lucid projection and are analyzed separately.

Orders. Deepening this superficial classification, which involves an initial educational approach, these projective phenomena can be divided still further into classes and orders, according to certain characteristics. The following 7, among others, serve as examples:

1. **Projectability.** Their parapsychic nature (projectiology, paraperceptiology).
2. **Intraphysicality.** Their physical nature (intraphysiology, somatics).
3. **Exteriority.** Their external and more exuberant manifestations.
4. **Intellectuality.** Their intellectual content or significance (mentalsoma).
5. **Personalities.** The condition of the personalities in which they are produced.
6. **Uses.** The uses of the occurrence for the main protagonist of the phenomenon.
7. **Will.** The dependence of the event upon the will of the consciousness in focus.

Suppositions. Given the phenomena that are provoked by the projected intraphysical consciousness and have thus far been verified, it must be supposed that various others, which are still unrecorded, may occur. For example: metaphony or the electronic voice phenomenon, communication executed by the projected intraphysical consciousness through apparatuses, recorders, telephones, television and others; direct writing performed by the projected intraphysical consciousness; direct painting, idem; direct drawing, idem; and others.

Perceptions. The classification of parapsychic phenomena and particularly projectiological phenomena serves to keep the various forms of extra-sensory perception, or intraconsciential and parapsychic phenomena in general, separate from each other, insofar as this is possible.

38. SUBJECTIVE PROJECTIVE PHENOMENA

Definition. Subjective projective phenomena: parapsychic occurrences restricted to the scope of projectiology that occur more within the consciousness and with the vehicles of manifestation of the projector partially or completely projected, thereby rendering the participation of the surrounding environment secondary.

Synonymy: internal projective phenomenon.

Psychosphere. There are 22 main interconnected phenomena, among others, which are essentially related to the psychosphere of the human projector:

1. Benign extraphysical projective catalepsy.
2. Benign physical projective catalepsy.
3. Consciential self-bilocation.

4. Cosmic consciousness (cosmoconsciousness).
5. Double projection.
6. External autoscopy.
7. Extraphysical clairvoyance.
8. Extraphysical double vision.
9. Extraphysical intuition.
10. Extraphysical precognition.
11. Extraphysical psychometry.
12. Extraphysical repercussions.
13. Extraphysical retrocognition.
14. Internal autoscopy.
15. Near-death experience (NDE): pre-final projection.
16. Near-death experience (NDE): resuscitative projection.
17. Physical repercussions.
18. Pre-projective, projective and post-projective double awareness.
19. Projective déjà vu.
20. Projective panoramic vision.
21. Self-telekinesis.
22. Waking disincidence.

Psychometry. In many of these phenomena, classified here as subjective projective phenomena, interrelations occur that are often directly related to the environment, as seen, for example, with the occurrences of extraphysical psychometry. Nevertheless, the roots and the realm of manifestation of these phenomena are mainly restricted within the consciousness. The environment therefore actually becomes secondary. This observation speaks equally in favor of the relativity and limitation of all phenomenological classification.

Analysis. Every important subjective projective phenomenon will be addressed in detail in its own chapter of this book, either in this or other sections, according to the sequential analysis of the topics.

39. CONSCIENTIAL SELF-BILOCATION

Definition. Consciential self-bilocation (OE: *self*, self; Latin, *bis*, two; and *locus*, place): the act of the intraphysical projector encountering and contemplating its own human body *face-to-face*, while its consciousness is outside it, headquartered in another vehicle of consciential manifestation.

Synonymy: autonomous abmaterialization; direct self-viewing; spontaneous self-visualization; epiprojection; breaking of the perception barrier; extraphysical self-contemplation; self- bicorporeity; projective self-confrontation; vision of one's own human body; vision of two bodies.

Self-bilocator. Consciential self-bilocation is the same phenomenon as bilocation. In this case, however, it is produced and perceived directly by the consciousness of the actual bilocator, or more precisely, the self-bilocator (see fig. 39, p. 1,121).

Perception. It is interesting to point out that many projected intraphysical consciousnesses do not immediately perceive that they are contemplating their own human body during the occurrence of consciential self-bilocation. Others are surprised to see themselves floating, suspended in the air, without falling to the floor.

Experiences. Although included in the first spontaneous occurrences that the projected intraphysical consciousness experiences, not all lucid projectors are able to have the following 6 experiences:

1. **Self-viewing.** See their own human body that has an empty brain, or is temporarily without the consciousness which, in this case, is located outside the two cerebral hemispheres.

2. **Self-embrace.** Perform a *self-embrace*, or enfold their own physical body with the extraphysical arms of the psychosoma (para-arms).

3. **Connection.** Identify the silver cord, namely the existence of the para-energetic connection between the two consciencial vehicles.

4. **Helper.** Extraphysically and consciously approach a helper.

5. **Self-awareness.** Produce a projection with continuous self-awareness, or one without any lapse in lucidity throughout the entire process.

6. **Dimension.** Visit the *native* extraphysical dimension, per se, which is devoid of all influence from human life, *below* the troposphere and *above* the earth's crust.

Proof. Consciencial self-bilocation, commonly occurring during near-death experiences, although presenting objective manifestations, constitutes a fascinating subjective phenomenon because it proves the reality of the psychosoma to the projector and, at a more advanced stage, evidences the existence of the mentalsoma.

Theta. Consciencial self-bilocation can thus evidence the survival of the consciousness after the biological death of the human body, or the so-called *theta* phenomenon.

Reactions. Six emotional, parapsychic, extraphysical, basic and opposing reactions can overwhelm the consciousness projected in the psychosoma (emotional body) upon suddenly coming across its own human body for the first time (being outside it):

1. **Desoma.** Fear of having unknowingly deactivated the soma and now observing its own cadaver, upon contemplating its own human body with its rigid members and pallid face, in the manner of a dead person.

2. **Compassion.** Sentiment of profound compassion for the organic form seen on that occasion, which is unquestionably disarmed and inactive.

3. **Gratitude.** An unexpected sentiment of gratitude for the human body, upon being aware that it represents a valuable instrument or vehicle of manifestation of its own consciousness.

4. **Narcissism.** Cultivation of unexpected narcissism (self-idolatry, self-fascination), sometimes not detected by the consciousness until that instance.

5. **Non-identification.** The opposite reaction, the absence of a sense of identifying (non-identification) with its own human body, which often appears to be dead, impersonal matter, or simply a strange, distant puppet.

6. **Comprehension.** An increased comprehension of human existence, of extraphysical life and the relationships between them.

Types. Consciencial self-bilocation presents 2 basic types, in regard to its physical aspect: *immobile* self-bilocation and *mobile* self-bilocation.

1. **Immobile.** Immobile self-bilocation occurs when the human body is inanimate, or inactive, almost always while resting, lying on a bed, during natural sleep.

Duration. Immobile self-bilocation is a common occurrence and of longer duration.

2. **Mobile.** In mobile self-bilocation, the human body continues moving, occurring more frequently while walking, with the projected consciousness observing from above (epiprojection) and from behind (retroprojection in regard to space).

Rarity. Spontaneous mobile consciencial self-bilocation is a rarer occurrence and one of brief duration.

Others. Besides the 2 abovementioned types, consciencial self-bilocation can be:

1. **Accompanied:** when the projected consciousness sees its own human body and that of its partner or evolutionary duo, at the same time.

2. **Successive:** when the projected consciousness sees its own human body, first during the takeoff of the psychosoma and then again, later, prior to interiorizing. This allows the individual to confirm the phenomenon, and the fact that the physical body has sometimes remained immobile in the same position the entire time.

Near-death. In near-death experiences, the consciousness in crisis may observe its human body moving, including undergoing intense convulsions, or being handled violently during the operations of clinical reanimation (resuscitation), with a complete absence of pain or discomfort, even when specialized doctors perform painful procedures without using anesthesia. On these occasions, the consciousness acts like a spectator, as though it were seated in a balcony of a theater, in a movie theater watching a film, or in the intimacy of the home watching a television program.

Modes. Two other modes of consensual bilocation deserve singling out:

1. **Monologue.** When the projected projector sees his/her own human body *occupied* by the helper and speaking through his/her vocal mechanism, in the case of psychophonic monologue.

2. **Psychophony.** When the projected projector witnesses the psychophonic communication of an extraphysical consciousness, such as an ill extraphysical consciousness speaking through the projector's own human body, in a parapsychic deintrusion session.

Metaphors. The following are some ideas, metaphors or images that consensual self-bilocation can suggest to those who experience it: an outline of the main parts of the dense body in relief, as though it were a real being, with its image reflected in a mirror or in water, reproduced in a photo, on a TV screen, as a sculpture, or projected on a movie screen.

Recognition. Through the experience of consensual self-bilocation, there is a definitive recognition of the soma by the consciousness, which is analogous to 8 different things, although having some similarities:

1. **Straightjacket.** The straightjacket of the intraphysical consciousness.
2. **Prison.** A prison of flesh and blood.
3. **Plant.** A living plant devoid of essence.
4. **Quasi-cadaver.** A *quasi-cadaver*.
5. **Bark.** The bark of a hollow tree.
6. **Apparatus.** An unplugged apparatus.
7. **Sosie.** The sosie (double) of an individual.
8. **Facsimile.** A duplicate (photocopy, xerox) or inert facsimile.

Relations. The following are occurrences which are directly related to the phenomenon of self-bilocation: extraphysical-physical self-touch, self-embrace, extraphysical self-examination or the accurate examination of the projector's own psychosoma.

Interiorization. All of these extraphysical acts may provoke abrupt interiorization of the consciousness which was projected in the psychosoma and involuntarily returned to the human body.

Mentalsoma. The most evolved stage of the self-bilocation phenomenon pertaining to the veteran lucid projector is the case in which the consciousness, projecting in the isolated mentalsoma, leaves the psychosoma *inside* the human body or, in other words, simultaneously reduces the restriction imposed by 2 bodies, the physical body and the psychosoma. This phenomenon occurs in cases of double consensual projection.

Double. If, on the one hand, the abovementioned double consensual projection does not allow procedures such as self-touch, self-embrace and extraphysical self-examination, on the other hand, it does allow the contemplation of the entire human body, without emotionalism, whether it has a dull aspect or is luminous or, in other words, with the energies of the holochakra or the psychosoma's own light.

40. PROJECTIVE AUTOSCOPY

Definition. Autoscopy (Greek: *autos*, oneself: *skopeni*, observe): the faculty and act of the individuals directly seeing or sensing themselves in front of themselves, while maintaining full waking consciousness, without the aid of any physical resource.

Synonymy: autoscopic experience; autoscopic metagnomy; autoscopic vision; viewing of oneself; cenestovisual kinesthesia; deuteroscopy; exteriorization of the kinesthetic sensation; *heautoscopy* hallucination; projective *heautoscopy* (Greek: *heautou*, of oneself + English: -scopy; *that one which sees him/herself*); self-apparition; self-gnosis; self-telediplosis; self-viewing; visualization of the image of the body.

Categories. Autoscopy can be generally classified into at least the following 11 categories:

1. Internal (studied below).
2. External (analyzed ahead).
3. Similar.
4. Different.
5. Specular (negative, or one related to mirrors).
6. Cenesthetic.
7. Recurrent.
8. Oneiric (related to dreams).
9. Partial (anatomically incomplete doubles).
10. Total (complete or apparently integral doubles).
11. Projective.

Sensations. Autoscopic sensations can be positive or negative, to various degrees and with different varieties. The phenomenon is one of the most obscure and controversial among all those grouped within the *phenomenological complex of projectiology*.

Cenesthetic. In cenesthetic autoscopy, the double is only sensed, without being seen by the consciousness.

Narcissism. Various psychoanalysts attribute autoscopic experiences to narcissism, self-idolatry or self-fascination. This simplistic hypothesis is completely ruled out by the projective heteroscopy phenomenon.

Nature. In a considerable number of cases that arise in a very transitory and accidental manner, the many occurrences of autoscopy cannot absolutely be qualified as pathological – whether they are internal or external – when someone visualizes his/her own image, which is exactly like him/herself, with identical clothes, the same hands and figure, or is faced with an *autoscopic phantasm* of him/herself.

Predispositions. The *twilight state of the consciousness*, whether deep self-concentration, daydream, sleep or general anesthesia, favors the appearance of the autoscopy phenomenon.

Attributes. The condition, moment, distance and aspect of the *autoscopic apparition* vary greatly.

Form. The form may have a smaller stature and be wearing different clothing at that moment.

Dialogue. In the majority of autoscopic occurrences, the apparition appears entirely mute, but it can happen that a dialogue and even a flagrant difference of opinion is established between the form and the *self* situated in the human body, perhaps due to autosuggestion.

Hypothesis. Quite often, it seems that a projection of the holochakra of the individual occurs, a likeness which is exteriorized without the consciousness, thereby creating the autoscopic phantasm, a second person, or *autoscopic double*.

Center. This apparition neither constitutes nor contains the center of the consciousness or the pointer of the consciousness.

Bibliography: Black (137, p. 15), Blackmore (139, p. 155), Bonin (168, p. 57), Bozzano (192, p. 154), Breecher (198, p. 28), Champlin (272, p. 182), D'arbó (365, p. 163), Dubugras (426, p. 369), Dumas (432, p. 9), Fodor (528, p. 25), Green (633, p. 212), Hemmert (713, p. 52), Kolosimo (858, p. 156), Larcher (887, p. 337), Lukianowicz (957, p. 199), Morel (1086, p. 37), Paim (1182, p. 52), Paula (1208, p. 57), Rank (1374, p. 73), Rogo (1444, p. 2), Sabom (1486, p. 235), Seabra (1534, p. 86), Shepard (1548, p. 83), Shirley (1553, p. 62), Sollier (1581, p. 3), Steiger (1601, p. 91), Stokes (1624, p. 23), Sudre (1630, p. 205), Tchou (1669, p. 279), Todd (1689, p. 47), Vieira (1762, p. 90).

41. INTERNAL AUTOSCOPYY

Definition. Internal autoscropy: the faculty and act in which individuals have an organic, internal vision of their own human bodies, inner organs and phenomena of vegetative life, either with the consciousness apparently inside the brain, or outside the physical body (soma).

Synonymy: alloscopy; autoscopic metagnomy; autoscopic unfolding; direct endoscopy; direct entoscopy; introvision; self-representation; self-vivisection; X-ray vision of oneself.

Inside. Internal autoscropy, when the center of the consciousness remains *inside* the human body, is obviously partial or, in other words, only one organic area is seen. A partial projection of the consciousness may or may not occur.

Outside. Internal autoscropy in which the *center of the consciousness* remains *outside* the human body, typically projective, can be partial or total, constituting an advanced phase of the phenomenon of conscial self-bilocation. In this condition, the consciousness simultaneously sees the physical body and the extraphysical body (psychosoma).

Observations. During autoscopic vision of the interior of the individual's own human body, projected lucid projectors observe at least 6 occurrences:

1. **Soma.** The body (soma), which is perfectly recognizable by its personal characteristics.
2. **Face.** The face.
3. **Nerves.** The bundles of veins and nerves, that vibrate like *luminous prickling*.
4. **Heart.** The heart beating.
5. **Blood.** The blood circulating, in a *vivid red flame*, coursing through the arteries.
6. **Armor.** The vascular networks and muscular structures or muscular mass, forming a unit, like a type of transparent crystal armor.

Diagnosis. In the majority of cases of internal autoscropy, it not only ceases to be pathological, but also becomes an extraordinary resource for projective self-diagnosis, especially in the phenomena of traveling clairvoyance performed for the sake of assistance to the person themselves. It should not be forgotten that it is difficult to establish a reasonably accurate diagnosis in certain obscure disturbances and processes.

Bibliography: Bonin (168, p. 57), Bozzano (184, p. 113), Coxhead (312, p. 128), D'arbó (365, p. 163), Depascale (392, p. 15), Fodor (528, p. 25), Gibier (587, p. 126), Gómez (613, p. 20), Greenhouse (636, p. 43), Kolosimo (858, p. 156), Larcher (887, p. 338), Martin (1002, p. 29), Morel (1086, p. 37), Paula (1208, p. 57), Richet (1398, p. 136), Seabra (1534, p. 98), Shepard (1548, p. 83), Sollier (1581, p. 45), Tondriau (1690, p. 198), Zaniah (1899, p. 60).

42. EXTERNAL AUTOSCOPYY

Definition. External autoscopy: the faculty and act of the individual seeing him/herself, while in the ordinary, physical waking state.

Synonymy: apparition to oneself; autophany; autoscopy of one's own double; autoscopic unfolding; *homologous projection*; homologous unfolding; phantasmic reflection; simulacrum-projection; sosie phenomenon; specular autoscopy.

Psychiatry. The external autoscopic phenomenon or insubstantial shadow of oneself, has been characterized for decades as being hallucination by many areas of medical research, especially the area of psychiatry founded on neurological bases, where 5 common terms are used, such as, "autoscopic hallucination," "autoscopy," "autoscopic double," "chimerical double" and "specular vision."

Etiology. In the etiology, or study of causes of pathological autoscopic hallucinations, some of the following 14 morbid organic conditions can be detected:

1. Acute labyrinthic vertigo.
2. Anxiety.
3. Chronic alcoholism.
4. Depressive states.
5. Epilepsy.
6. Fatigue.
7. Infectious, traumatic, vascular or neoplastic cerebral lesions, particularly in the temporo-parieto-occipital zones.
8. Influenza.
9. Intoxication by drugs.
10. Lethargic encephalitis.
11. Migraine.
12. Paralytic dementia.
13. Schizophrenia.
14. Toxic-febrile states.

Affinity. There is a greater affinity between pathological autoscopy, epilepsy and migraine (hemicrania).

Perceptions. In cases of pathological external autoscopy, individuals not only see the exact image of themselves as a *living replica* (visual perception) – whether solid, transparent, semitransparent or indistinct, like a mist, or similar to a gray gelatin – but can also *hear* their double with their mind (pseudo-auditive perception), perceive their movements (kinesthetic perception) and remain emotionally and intellectually aware of the existence of their double as an integral part of themselves (psycho-emotional perception).

History. Various writers, novelists, philosophers and poets have reported external autoscopic visions throughout human history, although some of the reported experiences are autobiographical, especially the following 14:

1. Hans Christian-Andersen (1805-1875), "Tales."
2. Aristotle (384-322 B.C.).
3. Gabrielle D'Annunzio (1863-1938), "Notturmo," poem.
4. Louis Charles Adélaïde Chamisso de Boncourt (1781-1838), "Peter Schlemihl."
5. Alphonse Daudet (1840-1897), works.
6. Fyodor Mikhailovich Dostoevsky (1821-1881), "The Double."
7. Johann Wolfgang von Goethe (1749-1832), works.
8. Ernst Theodor Amadeus Hoffman (1776-1822), "Tales."
9. Franz Kafka (1883-1924), "The Trial" (trans. Willa Muir & Edwin Muir; epil. Max Brod; 256 p.; 18 cm.; pocket; pb.; Penguin Books; Aylesbury; Great Britain; 1981).

10. Henry René Albert Guy de Maupassant (1850-1893), “Le Horla” (“O Horla e Outras Histórias”; trans. and pref. José Thomaz Brum; 104 p.; illus.; 21 cm x 13.5 cm; pb.; L & PM Publishers; Porto Alegre, RS, Brazil; 1986).

11. Louis Charles Alfred de Musset (1810-1857), “La Nuit de Décembre.”

12. Ferdinand Raimond, “Le Dissipateur.”

13. Johann Paul Friedrich Richter (1763-1825), “Hesperus.”

14. John Steinbeck (1902-1968), “Great Valley.”

Psychopaths. If we radically consider all external autoscopic phenomena to be pathological, then the above authors would doubtless have been psychopaths, which frankly sounds irrational or at least illogical and inadmissible.

Case study. From a psychiatric point of view, strange hallucinatory autoscopic occurrences arise, including the case of the patient who practiced mutual masturbation or, in other words, did so together at the same time with the figure of his projected double.

Permeability. There are similarities between the occurrences of phantom limbs and autoscopic doubles, according to observations of psychiatrists and neurologists. For example, the quality of permeability that permits the phantom limbs and the autoscopic double to *pass* through solid objects such as walls, beds and the patient’s human body.

Shadow. The fundamental difference between the autoscopic double and the classic apparition is that only the second casts a visible shadow, which is frequently observed by those who perceive the phenomenon.

Specular. In specular autoscopia, also called *negative* autoscopia, individuals see themselves before themselves to be absolutely identical and can observe his/her reproduction (simulacrum) breathe and live in detailed unison with themselves (which seems to be the holochakra, in this case).

Inside. Besides the occurrences of hallucinatory or pathological autoscopia, real autoscopia also exists. External projective autoscopia is considered here to be the condition in which the consciousness remains headquartered in the brain, namely *inside* the human body. When the consciousness sees its body while *outside* it, or inside the extraphysical body – the psychosoma – consensual self-bilocation occurs.

43. COMPARISONS BETWEEN EXTERNAL AUTOSCOPY AND LUCID PROJECTION

Differential. The basic differential factors between pure external autoscopia and lucid consensual projection outside the human body are very strong, defined and unmistakable, in regard to the following 5 approaches for studying both phenomena simultaneously:

1. **Position.** In most cases, external autoscopia occurs when the person’s human body is standing. In most cases, lucid projection occurs when the person’s inanimate human body is reclined (or lying down).

2. **Takeoff.** In external autoscopia, the consciousness stays *where it is* and does not have any sensation of leaving the physical body. In lucid consensual projection, the lucid takeoff is an unmistakable phenomenon and a generally unforgettable experience of leaving the physical body.

3. **Form.** The human, or humanoid, form seen by the consciousness itself during the external autoscopia phenomenon is generally incomplete. The form observed in lucid consensual projection is complete and the vision is clearer, whether perceived by the consciousness itself (consensual self-bilocation) or by others (physical bilocation).

4. **Vision.** External autoscapy consists of a consciousness, which is coincident, seeing a double of itself, which is found to be outside the human body. Lucid consciencial projection involves the sensation (lucid perception) of the consciousness being outside the human body, while discoincident, experiencing events of another type.

5. **Base.** In external autoscapy, the form which is seen (energetic body or holochakra) does not transport the consciousness (the consciencial center or the pointer of the consciousness), which is *inside* the two cerebral hemispheres (*full* brain). In lucid consciencial projections, the consciousness transports itself in other conditions, generally in the emotional body (psychosoma), while temporarily *outside* the cerebral hemispheres (*empty* brain).

44. PROJECTIVE CATALEPSY

Definition. Projective catalepsy (Greek: *katalepsis*, a seizing, grasping): a psychophysical state characterized by a rigidity of the members, insensitivity, slow respiration and a temporary incapacity of the lucid intraphysical consciousness to move the human body while consciously headquartered *inside it*, due to a dissociation between sensitivity and the motor capacities.

Synonymy: astral catalepsy; cataleptic consciousness; fourth state; generalized projective paralysis; physiological catalepsy; post-projective catalepsy; *pre-OBE* catalepsy; projective cataleptic paralysis; projective paralytic awakening; projective physical paralysis; projective tonic immobility; pseudo-awakening; waking paralysis; suspension of sensations and movements.

Weight. In the experience of projective catalepsy, intraphysical consciousnesses, from the beginning of the manifestation, feels that they are somehow *inside* the material mass of the human body. However, they are not able to move the human body, as though it were overcome by some physical weight which gives it the strange impression that the human body – or the set of vehicles of manifestations of the consciousness, the holosoma – weighs hundreds of pounds/kilos. This gives the sensation of being pressed against the bed, which prevents the consciousness from making any muscular movement, however slight.

Categories. There are two basic categories of projective catalepsy:

1. **Before.** Catalepsy related to departure or pre-projective catalepsy.
2. **After.** Catalepsy related to return or post-projective catalepsy.

Extraphysicality. Projective catalepsy related to departure occurs when the consciousness leaves the ordinary, physical waking state and endeavors to enter the extraphysical dimension (in this case, the energetic dimension or the paratropospheric dimension).

Interiorization. Projective catalepsy upon return occurs when the projected consciousness interiorizes into the human body and endeavors to physically awaken.

Post-projective. In catalepsy upon return, or post-projective catalepsy – which is far more interesting – the consciousness often returns in the psychosoma from a distance, *brimming* with the collected extraphysical sensations, with the *condenser-psychosoma* replenished by extraphysical or cosmic energy. This breaks the imperturbable granitic structure of the process of successive lives (existential series and multiexistential cycle), feeling as though the barriers between the dimensions of life have been destroyed, broadening the mental horizon to infinity, namely with an expansion of the consciousness and uninterrupted lucidity during the entire process. The extraphysical period is often not recalled, and the consciousness only awakens in the cataleptic state.

Benign. The extraphysical or physiological projective cataleptic state, which is invariably inoffensive or benign, namely of brief duration and devoid of damaging consequences, should not be confused with dramatic physical or pathological catalepsy, which is invariably malignant, being characterized by a truly morbid state arising in pre-moribund phases. This second condition can lead to the burial of the human body (soma) of an individual (intraphysical consciousness) who is believed to be clinically dead.

Psychopathology. From a psychopathological point of view, in the morbid state of catalepsy of the consciousness, called “simulation of death syndrome,” the person often feels unable to move and may even hear what is going on around his/her paralyzed human body.

Reproduction. This psychopathological state reproduces almost all of the characteristics of biological death (first desoma), especially these 3:

1. **Metabolism.** A reduction in the basal metabolic rate or the cooling of the human body.
2. **Fibrillation.** The heart beats slowing down to fibrillation or, in other words, practically imperceptible or in extreme bradycardia.
3. **Mydriasis.** Mydriasis or the total dilation of the pupils (an event which invariably occurs 2 to 3 minutes after physical death), although the blood is still *warm* or is heading towards complete cooling.

Duration. Also, according to psychopathology, the cataleptic state (awakening attack; awakening cataplexy; retarded psychomotor awakening; sleep paralysis) lasting more than 6 hours does not exist, because the patient thereupon enters into brain death and dies.

Return. The ill person generally returns to normal life spontaneously, when cardiotonics and oxygen are applied.

Burial. The chances that a person might undergo a necropsy (autopsy) or be accidentally buried are very remote nowadays, although they are always exploited by literature, being a theme of mystery films, part of the *folklore of death* and a recurrent theme in mysticism.

Necropsy. In accordance with the law, necropsy is only performed 6 hours after death. The body that arrives at competent medicolegal institutes is only taken to the freezer after completing the 6-hour wait, prior to a discerning examination, in order to avoid the risk of freezing someone who is still physically alive. For this reason, the risk of initiating a necropsy upon someone who is still alive and affected by the cataleptic state is, therefore, inexistent.

Barrier. Projective catalepsy occurs more frequently in the intraphysical projector’s first experiences, caused by a *barrier of fear* (projectiophobia) or a lack of preparation for lucidly projecting.

Recess. Projective catalepsy often impresses the suggestible, insecure, fearful consciousness, which does not know any projective techniques and becomes frightened. This can produce temporary blocks (projective recess), during a certain period, for new lucid departures in the psychosoma.

Bridge. In projective catalepsy, the intraphysical consciousness can still feel the small movements of the psychosoma inside the human body, with the level of awareness practically equal to that of the ordinary, physical waking state. This cataleptic state thus constitutes a true bridge between the two dimensions – the dense physical and the extraphysical – without any interference from other intraphysical or extraphysical intelligences, or even parapsychic connotations.

Sensations. The following 7, among others, are the more frequent general sensations that stem from or occur subsequent to the projective cataleptic state:

1. **Bed.** The psychosoma sinking into the bed.
2. **Psychosoma.** The psychosoma sliding to one side.
3. **Segments.** Segments of the psychosoma, such as the paralegs and para-arms, *undulating* to one side.
4. **Movement.** The sequential elevation, departure and reentry of the psychosoma (dynamic of discoincidence).
5. **Soma.** Perception of one’s human body (soma), as though it were a sealed box.
6. **Respiration.** An abnormal relationship of the intraphysical consciousness with the phenomenon of respiration.
7. **Satisfaction.** The extremely clear inner satisfaction of the intraphysical consciousness owing to the experience of having 2 organisms, in different dimensions of existence, with the unquestionable power (will, intentionality) of neutralizing or eliminating the omnipresent pseudotyranny of dense matter while still breathing on the planetary crust or in the troposphere.

Post-desomatic. Incidentally – according to observations made by lucid projectors in the extraphysical dimension, clairvoyant sensitives on deathbeds and psychophonic communications from extraphysical consciousnesses – the *post-desomatic* cataleptic condition occurs with certain persons for a period of time, as soon as they undergo deactivation of the human body (first desoma) while still on the deathbed, prior to their conscial awakening in the extraphysical dimension.

Desomatics. Under these circumstances, the consciousness feels its human body to be cold and is not able to move a single particle of matter, in the manner of pre-desomatic catalepsy.

Projectors. These lucid projectors – due to the type or nature of the conscial energies they possess – are called upon to assist in the removal of intraphysical consciousnesses, which have recently become extraphysical consciousnesses, from these *post-desomatic* cataleptic states.

Cause. It is believed that the real cause of projective catalepsy is the temporary impossibility of conscial communication between the mind of the psychosoma, in this case the mentalsoma, which is headquartered in the parabrains of the psychosoma, and the cortical motor areas of the dense, physical brain of the human body.

Holochakra. There may be an influence in the process of some still unclear alteration of the psychophysical, parabiological or energetic *insertions* of the silver cord (holochakra) in both vehicles of manifestation of the intraphysical consciousness: the psychosoma and the human body.

REM. A brief state of physical paralysis, or an incapacity to move, pertaining to projective catalepsy, commonly occurs for some seconds when the dreamer awakens during the phase of rapid synchronous eye movements or REM, before the human body's muscle tonus has had time to be restored.

Techniques. By following physiological techniques – without committing any physical or mental excess – there is no difficulty in breaking a moderate or intense projective cataleptic state. There are 2 simple processes for accomplishing this: either provoke physical awakening or induce *reprojection* of the consciousness in the psychosoma.

1. **Awakening.** In this process, which is more suitable for *pre-projective* catalepsy, your consciousness should endeavor – with ardent desire – to move the smallest part of the human body, whether it is an eyelid, a lip, the tongue, a finger, or even breathe more deeply and awaken normally in the ordinary, physical waking state.

2. **Reprojection.** In this process, which is more suitable for *post-projective* catalepsy, your consciousness should wish to leave the human body and project, or more appropriately, to *reproject* in the psychosoma, which is less difficult.

Second. In most cases, the cataleptic state does not occur after the second lucid projection.

Proof. As an animic (intraconsciality without extraphysical consciousnesses), xenophrenic, parapsychic, realistic and impressive phenomenon, projective catalepsy provides excellent proof of the existence of the extraphysical body or, in other words, the psychosoma, to the projector. As an unforgettable phenomenological impression, it is only surpassed by experiencing the lucid takeoff of the consciousness in the psychosoma.

Burial. *Projective* catalepsy should neither be considered to be maleficent, nor confused with *pathological* catalepsy, nor should the individual fear premature or involuntary burial as a consequence of this psychophysical condition. It is sufficient to reflect upon the fact that voluntary burial – a phenomenon common in the East for a certain time – was based precisely upon *provoked* projective catalepsy.

State. Cataleptic awareness is also called the *fourth state* by Eastern researchers, in relation to 3 other conscial states:

1. **Waking.** The ordinary, physical waking state.
2. **Dream.** The common symbolic dream.
3. **Sleep.** Natural sleep without dreams.

Bibliography: Andreas (36, p. 55), Bayless (98, p. 112), Crookall (343, p. 25), Digest (401, p. 350), El-Aowar (474, p. 100), Eliade (476, p. 65), Fodor (528, p. 42), Gaynor (577, p. 33), Gómez (613, p. 28), Greenhouse (636, p. 149), Kardec (824, p. 222), Krishna (867, p. 103), Monroe (1065, p. 247), Morel (1086, p. 47), Muldoon (1105, p. 11), Paula (1208, p. 69), Reis (1384, p. 86), Rogo (1444, p. 42), Salley (1496, p. 157), Shepard (1548, p. 151), Spence (1588, p. 95), Swedenborg (1635, p. 250), Tondriau (1690, p. 207), Vieira (1762, p. 160), Walker (1781, p. 69), Zaniah (1899, p. 106).

45. EXTRAPHYSICAL CLAIRVOYANCE

Definition. Extraphysical clairvoyance (Latin: *clarus*, clear; *videre*, to see): the perceptive faculty of the consciousness projected from the human body that allows it to acquire information, through the perception of images or scenes, about objects, psychic events, scenes and forms which are near or distant or occur in space, or even outside the intraphysical dimension.

Synonymy: astral clairvoyance; extraphysical double vision; extraphysical hylognosis; extraphysical paropsis; extraphysical second sight; extraphysical telecognition; extraphysical telopsis; extraphysical viewing; ultraviewing.

Attribute. The faculty of clairvoyance outside the human body is not dependent upon the intraphysical projector being an active clairvoyant in the ordinary, physical waking state and arises as a normal attribute of the freed consciousness, generally through the *para-eyes* of the psychosoma.

Psychospheres. One practical consequence of extraphysical clairvoyance is the projected projector seeing auras, parapsychic constellations or the psychospheres of intraphysical beings in general.

Bibliography: Blavatsky (153, p. 120), Cavendish (266, p. 64), Chaplin (273, p. 37), Day (376, p. 29), Digest (401, p. 350), Fodor (528, p. 45), Gaynor (577, p. 37), Greene (635, p. 89), Leadbeater (898, p. 1), Martin (1003, p. 35), Morel (1086, p. 51), Paula (1208, p. 71), Pensamento (1224, p. 29), Shepard (1548, p. 167), Spence (1588, p. 105), Tondriau (1690, p. 209), Vieira (1762, p. 44), Wedeck (1807, p. 85), Zaniah (1899, p. 112).

46. COSMOCONSCIOUSNESS

Definitions. Cosmoconsciousness: the inner condition or perception of the consciousness of the cosmos, life and the order of the universe; the indescribable intellectual, ethical exultation, when the consciousness feels the living presence of the universe and becomes one with it, in a single, indivisible unit.

Synonymy: a touch of the infinite; absolute moment; absolute Tao (Taoism); AH reaction (Arthur Koestler); *ante mortem* nirvana; ascendant self-transcendence; baptism of the spirit; climax experience; consensual big-bang; consciousness in the mentalsomatic dimension; cosmic awareness; cosmic consciousness; cosmic identification; cosmic mind; cosmic psyche; culminant experience; decerebrated consciousness; expanded consciousness; experience of atemporality; extraphysical maturity; extratemporal moment; fana or annihilation (Sufism); global consensual hyperacuity; holophotic mind; intercosmic consciousness; intimation of immortality; *kensho*; maximal extraphysical euphoria; mentalsomatic projection (projectiology); nirvana or extinction (Buddhism); objective consciousness; oceanic sentiment; plateau experience; projective superwaking; psychic turnaround; samadhi or conjunction (Yoga); samadhic consciousness; satori or illumination (Zen-Buddhism); self-absorption; sentiment of transformation; sleep without sleep; spiritual union; supercosmic consciousness; superlucid consciousness; supermind; supramental consciousness; total interfusion; transcendental unconscious; transconsciousness; transpersonal consciousness; *unio mystica* (Eastern mysticism); universal mind; *wu* (Chinese).

Cosmoconscientiology. The phenomenon of cosmoconsciousness, because of its transcendence and effects, required the creation of an area or specific subdiscipline within conscientiology: *cosmoconscientiology*.

Energy. The elevation of the state of consciousness requires intense consciential energy. High levels of intensity and frequency of energy (holochakrology) keep the levels of consciousness elevated. The phenomenon of cosmic consciousness or cosmoconsciousness is based upon these principles.

Communicology. There is interconsciential communication in the peculiar condition of cosmoconsciousness or, in other words: the use of conscientese. Most lines of human knowledge have still not detected, nor do they use, this transcendent mode of interconsciential communication belonging to the exceptional condition of cosmoconsciousness.

Mentalsomatics. In mentalsomatics, the state of cosmoconsciousness determines the more evolved condition of holosomatic homeostasis for the intraphysical consciousness.

Maturation. All the causes and conditions of the state of cosmoconsciousness are in the consciousness itself, awaiting maturation. This would be a type of *period of evolutionary incubation* or *period of a lack of holomaturity*.

Factors. Mental pacification and the liberation of *superconsciousness* act as predisposing factors, triggering projection in the mentalsoma and consequent cosmoconsciousness, thereby signifying 3 realities:

1. **Xenophrenia.** The xenophrenic state of a greater magnitude of paraperceptions.
2. **Experimentology.** The supreme peak of consciential experience at our evolutionary level (experimentology).
3. **Simultaneity.** The simultaneous contraction and expansion of the consciousness.

Explanation. The following are 6 bases provided for the comprehension and approximation of an explanation of the state of cosmoconsciousness:

1. **Dimension.** The existence of the mentalsomatic dimension.
2. **Mentalsoma.** The paraphysiology of the mentalsoma (mentalsomatics).
3. **Projections.** Lucid projections produced by way of the mentalsoma.
4. **Continuity.** Projections with continuous self-awareness.
5. **State.** The state of continuous self-awareness.
6. **Scale.** The scale of the state of continuous self-awareness (parahistory).

Indication. The understanding of these bases is the best indication or suggestion for the individual interested in endeavoring to achieve cosmoconsciousness.

Eclosion. The physical base for the eclosion of the phenomenon of cosmoconsciousness – a secondary component – can be any location (intraphysiology), because it manifests in the mentalsomatic dimension, in an atemporal manner, without forms (non-forms), without spaces or the physical universe (non-spaces) and without time, and can only be understood through extraphysical intuition or holomemory.

Powers. The consciential powers stemming from the mentalsoma that trigger the state of cosmoconsciousness manifest outside the physical head (encephalon) or, in other words, extrapolate the cerebral hemispheres even beyond the coronachakra. They extend, engross, penetrate, traverse, saturate, inspire, instill and diffuse life and lucidity, fertilizing all the energetic centers of the human individual – whether or not they are known by that individual – directly from the mentalsomatic dimension.

Levels. There is a temporary, gradual (by levels) state in the phenomenon of cosmoconsciousness which installs itself in two forms:

1. **Increasing.** In an increasing manner, gradually, little by little.
2. **Abrupt.** Abruptly in the manner of an agreeable, welcome surprise. This second condition is generally superior in its effects and quality to the first.

Duration. The duration of the state of cosmoconsciousness is always apparent because it is atemporal, according to our conventions or, in other words: it occurs beyond or independently of chronological time, in an intracosciential, inner or *internal manner*.

Physiology. Nevertheless, the time that the intraphysical consciousness spontaneously or thoughtfully dedicates to the phenomenon – which reflects upon the *exterior of his/her life*, in the physiology of his/her soma and, consequently, in the paraphysiology of his/her holosoma (holosomatics) – can be classified into 1 of 2 periods:

1. **Seconds.** An experience of seconds (").
2. **Minutes.** An experience of minutes ('). No longer than this.

Categories. The states of cosmoconsciousness can be classified into 3 basic categories with regard to the intensity or content of the recycling experience (intracosciential recycling):

1. **Approximative.** Approximative or incipient experiences of cosmoconsciousness.
2. **Average.** Experiences of average cosmoconsciousness, in regard to the density of the experience.
3. **Intense.** Intense or dense experiences of cosmoconsciousness are dependent upon the 3 categories of maturity of the intraphysical consciousness: biological, mental, and holomaturity (holomaturology).

Attainment. The condition of cosmoconsciousness can be attained in 2 manners:

1. **Spontaneous.** Spontaneous and independent of the will of the intraphysical consciousness.
2. **Provoked.** Provoked or intentional, as a consequence of effort and self-capacity.

Projectability. Lucid projection by way of the mentalsoma offers the best, most intense and enriching conditions for experiencing the provoked state of cosmoconsciousness. It depends greatly upon the level of projectiocritique of the intraphysical consciousness.

Intensity. The intensity of the experience of cosmic consciousness varies in the life of a single individual and between different individuals.

Single. A person may have only one culminant experience in his/her entire life.

Multiple. However, many individuals can experience an intense episode and other lesser experiences, which are still indescribable, extremely personal, nontransferable, unquestionable, immeasurable, cataclysmic and inalienable.

Stem. The condition of cosmoconsciousness obtained stemming from the projected state tends to be superior to cosmoconsciousness obtained from the ordinary, physical waking state, due to the direct experience through the mentalsoma, holomaturity and holomemory.

Impressions. In other words: the pure mentalsomatic dimension, reached indirectly from the intraphysical dimension is *less* impressive to the consciousness than reaching the mentalsomatic dimension directly from the extraphysical dimension, per se.

Difficulty. It is very difficult to characterize the experience of cosmoconsciousness within evolutiology and existential recyclology.

Exclusion. It is easier, through the process of elimination, to point out what cosmoconsciousness is not. It is not, at the very least, the following 15 conditions or occurrences:

1. It is not ecstasy pertaining to primary parapsychism or contemplation.
2. It is not hallucination of any type or nature.
3. It is not discrimination, segregation, factiousness or sectarianism.
4. It is not the partiality of myopic vision or narrow-mindedness.
5. It is not a gross, material or somatic activity.
6. It is not consciential passivity of any type.
7. It is not consciential confinement.
8. It is not simple intellectual exaltation of polymathy.
9. It is not a mere emotional exaltation of psychosomatics.
10. It is not a universal orgasm or holo-orgasm within sexosomatics.

11. It is not mysticism (intrapysical consciousnesses of existential robotization).
12. It is not psychologism (dermatologies of the consciousness, *epidermic* sciences).
13. It is not philosophism (cogitations of *theoreticians*).
14. It is not theologism (dogmas of theological empires).
15. It is not any conceptual limit.

Focus. In cosmoconsciousness, the focus of the consciousness (center or consciential pointer) or the point where the concentration of attention is maximum, is based in the unlimited reservoir of the entire universe, which becomes its field of manifestation. Therefore, 4 ordinary variables of our thosenization disappear:

1. **Consciousness.** The margin or periphery of the consciousness.
2. **Time.** The time factor (parachronology).
3. **Vehicle.** The vehicle of the consciousness (the zenith of holosomatics).
4. **Space.** Space, as we know it.

Paroxysms. Such a consciential expansion allows the individual to achieve, sometimes in seconds, an entire existence of understanding, *revelation*, *illumination* and *ascendant self-transcendence* due to healthy paroxysms of the holomemory, which are potentiated through great retrocognitions (mnemosomatics).

Certainty. The experience of intense cosmoconsciousness communicates unshakeable certainty, being incontestable and definitively self-persuasive for the individual.

Imitation. Nevertheless, a person can have a mere approximation, or an imitation of the state of cosmoconsciousness. In this case, he/she still doubts the legitimacy of the experience. It is as though he/she had had only a half-projection (hemiprojection) in the mentalsoma, a half-strength experience, a pale glimpse of a greater reality, a mere *introductory sample* of a great experience.

Maximum. Reaching the experience of intense cosmoconsciousness, whether in a gradual or spontaneous manner, represents the achievement of the maximum possible peak in production of lucid consciential projections. This can even signify an existential maxi-moratorium or an existential maxi-program (existential programology).

Repetitions. After this, there remains only its increasingly intense repetition, with regard to its increased level of quality.

Alienation. It is worth noting that intense consciential projections in the psychosoma can provoke the alienation of the intrapysical consciousness in regard to the physical world (intrapysicology and somatics). Experiences of cosmoconsciousness do not cause such alienation, but nevertheless lead the individual to inevitable intraconsciential recycling and existential recycling (existential recycology).

Objectives. The state of cosmoconsciousness allows the achievement of 3 transcendent consciential objectives in a natural manner as healthy consequences or aftereffects:

1. **Understanding.** An initial understanding of cosmoethics and evolutionary intelligence.
2. **Paraperceptiology.** The conscious use of intraconsciential and parapsychic powers.
3. **Genius.** The achievement of healthy genius or, in other words, one devoid of the unhealthy connotations of animal life in the manifestations of the intrapysical or extrapysical consciousness, amplifying the simultaneous use of more than 1 module of intelligence or multi-intelligences (3, 11 or even more).

Concepts. Cosmoconsciousness reveals the most transcendent types of concepts to the intrapysical consciousness. The following are 8 examples:

1. **Holomemory.** Easier access to the integral memory or holomemory (mnemosomatics).
2. **Omni-optics.** Omni-optics or the cosmovision of that which exists.
3. **Perspective.** The perspective of multifaceted research of the micro-universe of the consciousness and the universe or cosmos.
4. **Mega-experience.** Multimodal mega-experience in multiple dimensions.

5. **Holobiography.** Inborn (congenital or innate) wisdom characteristic of the multi-secular or multi-millenary holobiography of the intraphysical consciousness (healthy self-retrocognitions).

6. **Groupkarmality.** The collective sense in the individualized intraphysical consciousness or a maximal sense of groupality (groupkarmality).

7. **Holokarmology.** The individual's absolute indemnification or acquittal of his/her own groupkarmic interprisons through polykarmality (holokarmality), on the way toward self-awareness regarding the petifree state (petifreeology).

8. **Cosmoethic.** A broad ethic or a maximal or matured cosmoethics.

Incubation. Upon self-examination, after the intense experience of cosmoconsciousness, the individual will see that he/she first – consciously or unconsciously – underwent a type of preparatory process, a period of incubation or trial work phase for maturation of the phenomenon prior to his/her *intraconsciential implosion-explosion*.

Procedures. At least the following 8 evolved, libertarian procedures aid in the preparation for the experience of cosmoconsciousness:

1. **Imperturbability.** Imperturbability or personal balance.

2. **Derepression.** Self-aware derepression or sociocultural deconditioning.

3. **Depreconception.** *Depreconception* or neophilia as a good personal habit.

4. **Tachypsychism.** Self-aware tachypsychism or the lightning-fast elaboration of self-thosenes.

5. **Impersonalization.** Impersonalization in thosenization (which is not the same as *depersonalization* or *alienation*) or the *act of thinking more about others in a healthy manner*.

6. **Self-hypnosis.** Fully conscious or intentional self-hypnosis, aiming at self-knowledge and personal growth.

7. **Curricula.** The background of two categories of interactive extraphysical curricula:

A. **Multiexistential.** The intraphysical, multiexistential curriculum (resomas, existential seriation and existential completism).

B. **Multi-intermissive.** The extraphysical, *multi-intermissive* curriculum (intermissions and experiences of extraphysical euphoria).

8. **Minicog.** The work of interconsciential assistance as a minicog within a multidimensional, assistential maximechanism with the helpers. This is the most relevant and influential process for triggering the great experience of cosmoconsciousness.

Development. After the cosmoconsciousness experience has been achieved or experienced, there are two very distinct phases in its development: the induction phase and the command phase.

1. **Induction.** In the beginning, there is an increasing capacity for inducing the state of cosmoconsciousness in an extremely personal manner, so much so that only the consciousness knows that this type of induction works, at least for that individual.

2. **Command.** Later, the consciential force arises that is necessary for commanding the state of cosmoconsciousness in detail, including the frequency, intensity and *duration* of the experiences.

Inclusions. The following 14 variables, among others, included at the same time, can be encountered in the state of cosmoconsciousness (cosmic consciousness):

1. **Mind.** The mind.

2. **Thought.** The faculty of thought or the *tho* of thosenes.

3. **Psychism.** Psychism (brain).

4. **Consciousness.** The consciousness (per se).

5. **Parapsychism.** Parapsychism (parabrain, mentalsoma).

6. **Volition.** Volition or will, the greatest personal power of the consciousness.

7. **Self-awareness.** The combined process of thinking, feeling and all that makes up a state of consciousness.

8. **Thosenology.** The state of profound intertwining of thought or ideation and sentiment or emotionalism (mind-heart), where it becomes impracticable to separate them, as occurs with the indissociability of the 3 components of thosenization.

9. **Individualization.** Insulation (aloneness) or universal individualization wherein the consciousness has no relation with the social collective elements that constitute the ego.

10. **Self-identification.** Uniqueness or the act wherein the ego ceases to identify with external elements and returns to encounter its own individuality (reencounter with one's own identity or shadow).

11. **Rupturing.** The *paraperceptive* rupturing (breakthrough) of the psychic crust in which the intraphysical consciousness found itself enclosed, like being in a cocoon through the psychophysiological restriction imposed by resoma upon its holosoma of an extraphysical consciousness (2 vehicles), now with the holosoma of an intraphysical consciousness (4 vehicles).

12. **Self-perception.** Self-perception (self-knowing) or becoming aware of what you in fact *are*, in an instantaneous vision of the *self* in action (self-manifestation or self-thosenity).

13. **Self-awakening.** Self-awakening (awareness) or a greater lucidity of becoming aware of the self in all its extension, depth, complexity and other elements of a like nature.

14. **Hetero-identification.** Empathetically adjusted identification with the universe (oneness).

Conscientiogram. The understanding of cosmoconsciousness is extremely important in order to understand the conscientiogram (within conscientimetry) and conscientiology itself, even from an extraphysical point of view.

Avoidance. One problem encountered in the experience of all phenomena related to expansion of the consciousness, in the world of projectiological practices – which can only be solved by the individual through self-examination – is the judicious avoidance of the negative predominance of one consciential attribute, which is inadequate in that context, over another or others in the development of the experiences. Many errors result from this in interpretation of the experimentations.

Tendency. In principle, all consciential attributes do not always tend to expand together. When they do not, inefficient choices arise.

Choices. The following are examples of spurious choices of consciential attributes in projectiological occurrences, which are extremely relevant regarding the phenomenon of cosmoconsciousness:

1. **Fabulation.** Imagination can predominate over discernment. In this case, the consciousness loses a great part of its critical judgment. This is the erroneous valuing of fabulation over reality. It is very common in artists and poets.

2. **Emotionalism.** Emotionality (psychosomatics) can preponderate over rationality (mentalsomatics). Thus, the euphoric consciousness (intraphysical euphoria) aborts projective experiences in a frustrating manner. This is the erroneous valuing of emotionalism over maturity.

3. **Pastism.** Causal memory (holomemory) can preponderate over ever fugacious practicality (pragmatism, theorice, praxis) of the moment, leading the consciousness to marginalize its essential objectives. This is the erroneous valuing of the past over the present. It is very common in nostalgic and elderly persons.

4. **Effect-attribute.** Extraphysical attention can predominate over extraphysical self-awareness and the projected consciousness becomes caught in a secondary event, a rite of passage, losing sight of the essential objective. This is the erroneous valuing of a mere *effect-attribute* over the *cause-attribute*.

Continuous. It is necessary to avoid confusing the state of cosmoconsciousness or cosmic consciousness with the state of continuous self-awareness.

Note. It is also imperative to avoid confusing the authentic, healthy, pure experience of cosmoconsciousness with *pharmacological phantasmagoria*, or the unpredictable consequences of the action of dozens of neurochemical substances (neurotransmitters) that exist or are produced in the human brain or the organic systems – such as serotonin – and are sometimes misinterpreted in a sick manner.

Chemistry. Over the centuries, these facts have been generating mystical versions of reality, beatific visions and religious exaltations in the occurrences of the so-called *chemistry of mysticism*. This has occurred with anonymous or famous persons with various degrees of illness who were or were not aware of their infirmities, being diagnosed as having temporal lobe epilepsy, schizophrenia and other neuropsychic disturbances.

Increases. As the author has previously affirmed, there are 4 situations which have increased: human population; occupation of habitable spaces; atmospheric pollution; and obstinate economic competition between persons and institutions. So far, these have worsened the possibilities for the intraphysical consciousness to openly move toward the practice of the *omnilateral* mind, maxifraternity, universal citizenship, pure universalism, multidimensionality, cosmoethics and, lastly, like an evolutionary crowning, the personal condition of inner liberation, stemming from the phenomenon of cosmoconsciousness.

Reductions. The relationship of *reductions in human work* or intraphysical work with the experience of cosmoconsciousness can be illustrated with the following 3 connected facts, in chronological order:

1. **Technology.** Technology reduced *manual labor* or that relating to the psychomotricity of the soma.
2. **Informatics.** Informatics (infocommunicology) reduced *mental work* or the work of the neurons of the cerebral hemispheres (encephalic brain).
3. **Cosmoconsciousness.** Today, cosmoconsciousness reduces *paracerebral work* (the parabrain is an attribute of the psychosoma) pertaining to the multidimensionality of the intraphysical consciousness.

Groupality. One of the more obscure points within evolved groupality is precisely the study of the condition of cosmoconsciousness and conscientese, a challenge for all lucid projector-researchers, pre-*serenissimi*, consciential epicenters and petifree individuals.

Conscientiology. According to the subdisciplines or research areas of conscientiology, 4 evolved factors can predispose the experience of the cosmoconsciousness phenomenon:

1. **Existential maxi-program.** A recent, advanced, intermissive course dedicated to the upcoming execution of the existential maxi-program (intermissiology, existential programology).
2. **Macrosoma.** The use of a macrosoma (macrosomatics).
3. **Paragenetics.** Rich, powerful paragenetics, capable of overcoming the coercive forces of the genetics of the reborn extraphysical consciousness.
4. **Serenology.** The condition of serenism of the *Homo sapiens serenissimus*.

Cosmothosene. The cosmothosene is the thosene specific to conscientese, the state of cosmoconsciousness or the advanced form of communication of conscientese.

Era. The tendency of contemporary life, from now on, is to predispose a continually greater number of persons toward experiencing cosmoconsciousness, thus redefining and amplifying the *condition of conscientiality* of the planetary holothosene in this era of the consciousness.

47. PROJECTIVE DÉJÀ VU

Definition. Projective déjà vu: prior unconscious knowledge, or an impression of having seen or met a person, visited a certain place, or experienced a situation that the percipient has, in fact, never seen, been to, or experienced before in the ordinary, physical waking state, because it is an impression gathered by the projected consciousness during a lucid or semilucid consciential projection.

Synonymy: duplicative metagnomy; phenomenon of the already projectively seen; projective biperception; projective dejaism; projective paramnesia; projective promnesia; projective retro-glimpse; projective sentiment of already having seen; reverse projective memory.

Forms. The phenomena of déjà vu generally refer to things already seen, but are actually not restricted to visual perception.

Expressions. The following 11 expressions in the French language indicate real or imagined forms of reencounter with the past:

1. *Déjà aimé* = already loved.
2. *Déjà entendu* = already heard.
3. *Déjà éprouvé* = already experienced.
4. *Déjà-lû* = already read.
5. *Déjà pensé* = already thought.
6. *Déjà rencontré* = already met.
7. *Déjà-rêvé* = already dreamt.
8. *Déjà senti* = already felt.
9. *Déjà vécu* = already lived.
10. *Déjà visité* = already visited.
11. *Déjà vu* = already seen.

False. Alterations in memory such as paramnesia, mental fatigue and certain organic intoxications can create false *déjà vu*, false memory, false recognition, mental echo or pseudo-reminiscence. In this case, it is a pathological occurrence which should not be confused with the authentic impressions addressed here, stemming from consciential projections.

Psychopathology. Memory presents alterations in all psychopathy, mental or cerebral illnesses. This, in fact, in many cases, generates the illusion of the already-seen.

Categories. There are two basic categories of already-seen impressions, relative to consciential projections: physical projective déjà vu, in the human dimension; and extraphysical projective déjà vu, in the extraphysical dimension.

1. **Physical.** Common, physical projective déjà vu occurs in the ordinary, physical waking state when the consciousness pacifically, unquestionably recognizes the place, physical object, person or central point of recall which, in fact, was visited or seen by the individual during a lucid excursion outside the human body, in a consciential projection.

2. **Extraphysical.** The more complex, extraphysical déjà vu (extraphysically already dreamt or experienced) arises for the projected consciousness in any environment identified by its perceptions. This is so whether it is crustal or paratropospheric or even extraphysical per se, when recognizing the circumstances and the beings which were actually experienced or known in the past, in this or in another previous existence, or even in an extraphysical, interexistential interval, or intermissive period.

Evidence. Projective déjà vu, when occurring with a person who has still not experienced an impactful, recalled lucid projection, is evidence and proof, for that individual, of the existence of the spontaneous, lucid projection experience, which had not previously been recalled.

Triggering. In other words: when the projected consciousness remembers a fact that occurred during a prior lucid projection, which was not registered in its waking memory (biomemory), that recollection generates a delayed recall of other details of that lucid projection, which were forgotten or buried in the holomemory. In this case, one recollection *triggers* other recollections.

Cognitions. Within mnemosomatics and in regard to the mnemosoma, there are certain occurrences of projective déjà vu which are directly related to extraphysical retrocognitions and precognitions.

Opposition. The opposing phenomenon to déjà vu is *never-having-seen*, which is characteristically pathological.

Existential seriation. Aside from projective déjà vu, the other phenomenon of this type most frequently encountered by the intraphysical consciousness in the ordinary, physical waking state is *existential seriation déjà vu*, which is multiexistential and frequently multi-secular. In other words: the authentic, retrocognitive recollections of another previous life, already experienced by the consciousness in a retrosoma.

Psychology. The Freudian school of psychology, or psychoanalysis, generally considers déjà vu to be a defense mechanism invented by the subconscious in order to avoid the fear generated by certain critical situations. Obviously, when the situation is not critical and projective déjà vu occurs, this standpoint is meaningless.

48. NEAR-DEATH EXPERIENCE (NDE)

Definition. Near-death experience: a projection of the intraphysical consciousness which is involuntary or forced by critical human circumstances, common to terminally-ill patients, moribund patients and survivors of clinical death (first desoma).

Synonymy: experience of imminent death (EID); experience on the brink of death; first spontaneous extraphysical initiation; forced accidental projection; imminent death phenomenon; intimate encounter with death; NDE; near-death crisis; near-death phenomenon; *near-desoma* experience; near-fatal event; near-terminal event; second life experience.

Climate. The moment of biological death, cerebral death, clinical death, or the deactivation of the human body (desoma), has always offered a climate that is favorable toward the occurrence of phenomena considered to be parapsychic. The occurrence of lucid projections in this critical period is thus understandable.

Accidents. Various types of occurrences, near-terminal events or moments of extreme danger can trigger the near-death experience for diverse persons. The following 9 are some examples:

1. Children who are victims of near-drowning.
2. Near-drowned fishermen.
3. Near-electrocuted individuals.
4. Workers who survived construction site, mountain and railway accidents.
5. Drivers and passengers of car accidents.
6. Soldiers wounded on the battlefield.
7. Construction workers who fell from high construction sites.
8. Victims of building collapses and cave-ins.
9. Other victims of similar accidents.

Predispositions. Besides these accidents, certain medical circumstances also predispose provocation of the near-death experience, or the condition in which the person witnesses personal clinical reanimation (resuscitation) – as though being in the back of the surgical theater. The following 8 conditions are some dramatic examples:

1. **Illnesses.** Serious illnesses. A complicated childbirth.
2. **Comatose.** States of deep coma (comatose).
3. **Torture.** Tortured persons.

4. **Suicide.** Suicide attempts (*near-hangings*).
5. **Cardiopathy.** Heart attacks.
6. **Traumatisms.** Serious traumas.
7. **Allergies.** Paroxysmal allergic reactions.
8. **Disturbances.** Other serious diseases and acute disturbances of adults, children and adolescents.

Characteristics. Certain persons – or the *escapees of near-death* – who were rescued from near-fatal accidents at the last minute, notably in the medical field of *reanimation (resurrection) technology*, reveal a series of particularly characteristic elements of the near-death experience in general. The following 15, among others, are examples:

1. **Perceptions.** Sharpening of certain perceptions.
2. **Attention.** Altered attention.
3. **Tachypsychism.** Increase in the velocity of thoughts (tachypsychism or, in this case, *paratachypsychism*).
4. **Xenophrenia.** Altered mental state.
5. **Ineffability.** Uncontrollable ineffability.
6. **Time.** Altered perception of time and space.
7. **Self-control.** Loss of self-control.
8. **Psychosomatics.** Predominance of emotionalism in the manifestations of the intraphysical consciousness.
9. **Mnemosomatics.** Reliving of memories.
10. **Discoincidence.** Sensation of separation from the human body or the sense of detachment.
11. **Floating.** Sensation of floating.
12. **Desomatics.** Sensation of death (*desoma*).
13. **Reality.** Sensation of reality.
14. **Slowness.** Sensation and experience of slow motion.
15. **Identity.** Transcendence of personal identity.

Time. In subjective phenomena, the altered perception of time during the near-death experience can be singled out, wherein the sensation of an apparent reduction in the velocity of environmental or *external time* commonly arises for the accident victim – a sensation of *slow motion* – in contrast to the extraordinary increase in the velocity of *internal time*.

Projectiology. Lucid projection is a common experience among persons who undergo critical near-death events.

Medicine. According to recent medical research, age, sex, race, residential area, family size, level of education, civil status, occupation, social class, religious upbringing and religious affiliation have no influence upon whether or not a person experienced lucid projection during a medical near-death crisis.

Classification. Near-death crises were classified into 3 basic patterns, from a medical point of view, by the researcher Michael B. Sabom:

1. The autoscopic experience or the phenomenon of self-bilocation.
2. The transcendental experience in which the consciousness lucidly leaves the scenario of the medical resuscitation room or the scene of the accident.
3. The experience of both occurrences combined.

Units. Nowadays, after going through the emergency room, usually located on the ground floor of the hospital, and being classified as code blue or code 99 (in the United States of America, for example), patients with irreversible illnesses (a metastatic cancer, for example) are taken to the intensive care unit (ICU), in large hospitals, as long as it is a reversible complication and not the endpoint of their disease. Seriously-ill patients, with a chance of recovery, stay in a coronary unit.

Instrumentation. These units, which are superior to postoperative recovery rooms, according to the achievements of medical technology, have equipment for artificial respiration, mechanical respirators

(respiratory prosthesis), heart monitors, continuous ambulatory blood pressure monitoring (ABPM), among others. The intraaortic balloon pump and gamma camera can also be used in these units.

Categories. Among the conditions of terminal patients in general, two categories can be singled out which can influence the triggering of near-death experiences:

1. Cerebrovascular accident (CVA).
2. Multiple organ dysfunction syndrome (MODS), a cancer which has metastasized.

Atmosphere. Everything is currently being done in order to change the atmosphere (holothosene) of ICUs so they do not appear to be glass domes, painful doorways to the death of the physical body (desoma), inviolable recesses or torture chambers.

Light. Therefore, lights are not pointed into the patient's face and the ICUs are painted in subdued colors.

Hygiene. People are now allowed to enter with only an apron, protection on the feet and after having washed their hands.

Syndrome. All this aims to remove the tense atmosphere, the terrorizing chaos and the ICU Syndrome.

Statistics. Statistics show that, on average, 2 out of 10 patients admitted to an ICU die.

Resources. Besides other secondary resources, the following are 4 hospital resources which are capable of helping to improve the ill patient in an intensive care unit:

1. The electrocardiogram, which monitors the heartbeat in up to 12 derivations, when a complete EKG is needed on paper. For continuous monitoring, 3 or 4 derivations are generally used.
2. The cell-saver, that collects and filters blood which is lost during hemorrhaging and avoids the risks of blood transfusions. It is used to a great extent within the context of the surgical center.
3. The intravenous (IV) drip, that replaces the work of the nurse and controls the flow of drugs applied to the organism of the patient in exact doses.
4. The hemodynamic control which, connected through catheters to two arteries, monitors the blood pressure and shows the results on a screen (the Swan-Ganz, the echocardiograph and the invasive arterial pressure monitor may be included here).

Pharmacology. Medication therapy is one of the areas that developed recently. It is also one of the main aspects in the maintenance of human life, in which the following can be singled out:

1. Vasoactive amines: dopamine and dobutamine. These two drugs are currently (2002) essential in intensive therapy.
2. Other potent inotropic agents.
3. Thrombolytic agents (streptokinase, tissue plasminogen activator, urokinase) in the early therapy of acute myocardial infarction (AMI) as well as pulmonary embolism.

Nutrition. Another area that has acquired great relevance in intensive therapy is parenteral (and enteral) nutrition. There are medications for all types of ill persons (persons with COPD, diabetics, hypertensives, individuals suffering from malnutrition, newborns and many others) and for all types of pathologies. It is a highly specialized area that has been receiving a great amount of attention in all of the most renowned medical centers.

Apparatuses. The following are 11 apparatuses that are important in an ICU:

1. Continuous electrocardiograph monitor.
2. Digital oximeter: measures the oxygen saturation in the arterial blood (saturation of hemoglobin).
3. IV drips for the more accurate and adequate application of intravenous drugs.
4. Continuous arterial pressure monitor.
5. Mechanical respirator (sustains human life).
6. Swan-Ganz catheter.
7. External pacemaker (sustains human life).
8. Dialyzer (sustains human life).

9. Defibrillator for cardioversion in the reversal of cardiopulmonary arrest and some types of arrhythmia (it is ideally available in any part of the hospital, mainly in emergency and ICU).

10. Intra-gastric tonometer, for monitoring intramucous pH, in the early detection of low tissue blood flow conditions.

11. Pin for monitoring intracranial pressure.

Types. The near-death experience, certainly a special type of lucid projection, exhibits clearly recognizable patterns and can be classified into 2 basic types: those of terminal patients and those of revived patients.

1. **Terminal.** Terminal patients, who actually pass through desoma soon after experiencing a pre-final projection.

2. **Revived.** Revived patients or survivors of a near-death crisis who have undergone a resuscitative projection. In other words, they had the sensation of dying, but lived to tell their story. This even includes failed suicides, “losers” regarding the tremendous final act of madness that is suicide.

Multiple. Revived individuals can even have more than one (multiple) near-death experience.

Cord. It is interesting to point out that the silver cord, in certain cases of the near-death experience, is perceived to be exhausted, *slightly worn-out*, or to have a lower energetic potential.

Sensations. The near-death experience can be classified into two basic categories, according to the sensations that the intraphysical consciousness can have:

1. **Gratification.** Agreeable; of well-being or gratification.

2. **Nightmare.** As disagreeable as a nightmare.

Patterns. Just like spontaneous lucid projection, the near-death experience, although being of a highly subjective nature, presents a notable consistency in its patterns, varying slightly with regard to the following 5 aspects:

1. **Culture.** Culture or sociocultural background.

2. **Age.** Physical age, which ranges from infancy to *advanced age*, starting from 8 decades of human existence.

3. **Religion.** The religion of the individual.

4. **Cause.** The fundamental cause of the phenomenon.

5. **Diversity.** The diversity of occurrence from one intraphysical consciousness to another.

Explanations. Researchers generally endeavor to explain the nature and significance of the near-death experience in terms of the following 13 occurrences, among others:

1. Altered state of consciousness.

2. Autoscopical hallucination.

3. Conscious mental fabrication.

4. Depersonalization.

5. Dream.

6. Drug-induced hallucination or illusion.

7. Mystical influences.

8. Parapsychic holographic model.

9. Preexisting expectations.

10. Release of endorphins.

11. Semiconscious state.

12. Subconscious fabrication.

13. Temporal lobe crisis.

Hormones. One of the hypotheses raised in order to explain the appearance of near-death phenomena is based on the fear of death (thanatophobia), which would activate the production and secretion of hormones from the suprarenal glands, which would then, in turn, generate parapsychic effects similar to certain drugs like mescaline, LSD and others.

Facts. This hypothesis, however, is contested by the registered cases of individuals having more than one near-death experience at different times, when the intraphysical consciousness actually loses the fear of death (thanatophobia) in the first experience and, even so, continues to have a second, third or more experiences.

Children. The greatest evidence of the phenomenon of the near-death experience arises with dying children – that undergo near-drowning experiences, for example – who see or meet extraphysical consciousnesses which are deceased persons, namely someone who invariably preceded them in desoma or biological death, and whose reports follow the same general patterns as those of adults.

Intraphysical consciousnesses. Logically, if the reports of these experiences close to biological death or desoma were mere hallucinations, the children, at least in some of the cases registered by pediatricians, would have had hallucinations of a certain relative who was still alive and breathing among humans (intraphysical consciousnesses), which does not occur. Prototypical cases like these can be seen in the currently extensive specialized literature on the phenomenon.

Beliefs. It is worth emphasizing that the person's (adult, child) religious beliefs influence the interpretation of the near-death experience, but do not, however, alter the essence of the experience.

Phenomena. To the degree that the consciousness is able to get closer to the climax of the death of the human body (desoma), a greater number of phenomenological elements appear in near-death experiences. Statistically speaking, NDEs happen to more than 1,000 persons per year in the United States of America alone.

Farewell. The near-death experience should not be confused with the farewell projection or critical apparition, nor with the theory of successive lives or existential seriation.

Publications. For a more in-depth technical or historical study of the near-death experience, a detailed consultation of the following two specialized publications (which are no longer in circulation) is indispensable: *Anabiosis: The Journal for Near-Death Studies* (10 editions), and *Vital Signs* magazine (17 editions); as well as their two specialized replacement publications, *Journal of Near-Death Studies* and *Revitalized Signs*, all edited in the United States of America. The *Journal* is currently edited in *New York, NY*. It is currently at Volume 16, Number 4, Summer 1998.

Adverb. It is worth clarifying that the adverb *near* is used in this book to signify *almost or on the edge of*, and constitutes an ample variety of expressions in the context of correlated phenomena, as with the following 21 examples:

1. Near-death crisis.
2. Near-death critical event.
3. Near-death egress.
4. Near-death experience.
5. Near-death phenomenon.
6. Near-death resuscitative experience.
7. Near-death.
8. Near-drowned.
9. Near-drowning event.
10. Near-drowning experience.
11. Near-drowning victim.
12. Near-electrocuted.
13. Near-fatal accident.
14. Near-fatal event.
15. Near-hanged.
16. Near-mortal critical event.
17. Near-mortal event.
18. Near-rebirth.
19. Near-sleep.
20. Near-terminal death experience.
21. Near-terminal event.

Projectiological Bibliography: Andrade (29, p. 83), Badham (67, p. 71), Banerjee (74, p. 40), Baumann (93, p. 65), Bender (113, p. 170), Bennett (118, p. 3), Blackmore (139, p. 133), Bozzano (188, p. 48), Caversan (267, p. 9), Champlin (272, p. 218), Chauvin (275, p. 105), Conti (296, p. 124), Currie (354, p. 113), Ebon (453, p. 24), Eysenck (493, p. 155), Fardwel (494, p. 15), Gabbard (564, p. 374), Gallup Jr. (566, p. 36), Gauld (576, p. 221), Gildea (591, p. 43), Giovetti (593, p. 145), Goldberg (606, p. 174), Grattan-Guinness (626, p. 109), Grof (647, p. 9), Grosso (654, p. 37), Harlow (681, p. 112), Heim (702, p. 337), Hemmert (712, p. 181), Hodson (729, p. 138), Holzer (750, p. 13), Ingber (788, p. 16), Knight (851, p. 397), Levine (921, p. 272), Lundahl (959, p. 1, p. 97), Meek (1030, p. 55), Moody Jr. (1077, p. 10; 1078, p. 33), Noyes Jr. (1141, p. 19), Osis (1163, p. 38), Parrish-Harra (1202, p. 75), Perkins (1236, p. 5), Perry (1238, p. 100), Plato (1261, p. 488), Prieur (1289, p. 122), Rawlings (1375, p. 61), Ring (1405, p. 5; 1406, p. 1), Rogo (1445, p. 60), Sabom (1486, p. 12; 1487, p. 1071; 1488, p. 29), Smith (1574, p. 114), Steiger (1601, p. 42), Stevenson (1621, p. 265), Vieira (1762, p. 175), Wheeler (1826, p. 8), White (1832, p. 20), Wilkerson (1848, p. 39), Wilson (1852, p. 15).

Specific Bibliography:

1. **Basford, Terry K.;** *Near-death Experiences: An Annotated Bibliography*; X + 182 pp.; 710 bibliographic entries; ono.; 21.5 x 14 cm; hb.; New York, NY; Garland Publishing; 1990; pp. I-X, 1-182.

49. PRE-FINAL PROJECTION

Definition. Pre-final projection: involuntary or forced experience of the consciousness outside the human body, common in terminal patients.

Synonymy: anticipated detachment; *ântuma projection*; deathbed visions; next to the last projection of the intraphysical consciousness; pre-agonizing experience; pre-final projection; visit of projective health; terminal near-death experience.

Terminal. The terminal near-death experience, a characteristic type of lucid projection, occurs shortly before the transition of biological death with moribund, incurable or terminal patients.

Pattern. Classic cases of lucid projection experienced by terminal patients more or less follow a sequential pattern of events, similar to the following 13, that commonly occur in the final phase of human life:

1. The incurable patient has a presentiment that he/she is on the threshold of desoma.
2. The patient bids farewell to family and friends.
3. The patient stretches the legs out on the bed.
4. The patient crosses the hands over the chest in a traditional position.
5. The patient goes into deep unconsciousness.
6. The doctor responsible is present.
7. The patient has no pulse or perceptible heart beat for hours.
8. At this point, the church bells declare the patient dead.
9. However, the inert body occasionally takes weak, almost imperceptible breaths.
10. The doctor pricks the muscles with a pin, with no response.
11. Soon afterwards, however, the patient awakens, entirely lucid for the last time.
12. Surprised and dazzled, the patient reports the experiences outside the human body.
13. The patient subsequently undergoes desoma, truly happy.

Phenomena. Pre-final projections often exhibit intriguing phenomenological aspects that invalidate all of the merely psychological interpretations for the entire set of projectiological occurrences.

Deceased. The above-cited cases include human beings (adults as well as children), who report seeing, meeting and mentally understanding the consciousnesses of 2 or more deceased relatives, brothers, friends and others. There are persons, in cases of near-death experience, who come across cherished pets that have died.

Encounter. The following serves as an example: if the consciousness of the agonizing person (adult or child) encounters extraphysical consciousnesses, deceased friends, one of which had died only 2 days before, given that the agonizing person was unaware of the deactivation of this friend's physical body, the occurrence completely annuls the psychological hypothesis of information being accumulated in the mind of the agonizing person.

Bibliography: Bozzano (189, p. 83), Champlin (272, p. 212), Currie (354, p. 113), Ebon (453, p. 37), Fiore (518, p. 202), Greenhouse (636, p. 147), Grosso (654, p. 38), Ingber (788, p. 20), Malz (992, p. 81), Rogo (1445, p. 65), Tyrrell (1717, p. 165).

50. RESUSCITATIVE PROJECTION

Definition. Resuscitative projection: the involuntary experience of the consciousness outside the human body, common with survivors of clinical death, non-terminal patients, or those technically considered to be dead (*desoma*), also called revived, resuscitated, recuperated or reanimated individuals, who are almost always victims of diverse types of accidents.

Synonymy: aborted death; apparent death; cardiopulmonary reanimation (resurrection); clinical resuscitation; death with return; provisory death; pseudodeath; *pseudodesoma*; resuscitative near-death experience; return from clinical death.

Accidents. Persons who have experienced cardiac arrest, drowning, freezing, hemorrhaging, or were shot, suffered car accidents and other incidents – whose heart stopped beating, lungs stopped breathing, arterial pressure became undetectable, pupils dilated and body temperature dropped drastically – have often been brought back from the brink of *desoma* with modern medicine's sophisticated reanimation (resuscitation) techniques.

Descriptions. After the abovementioned tragic episodes, many “ex-dead” describe fabulous experiences during their temporary journey in the *kingdom of death* through lucid projection, where they encounter *deceased* relatives and friends, as well as *extraphysical assistants* or *beings of light*.

Spontaneous. Spontaneous resuscitative projections have been registered for dozens of centuries, as seen in the previously cited episode (prototypical case) of Er, son of Armenius of Pamphylia, reported by Plato (400 B.C.; “The Republic,” Book 10).

Evidence. The resuscitative projection proves the falsity of the popular saying, “no one returns to tell us what exists after death.”

Types. Resuscitated patients may have gone through a *blank consciential period* or had extremely vivid experiences. Some of those who had been considered technically dead and were later resuscitated *more than once* report both types of experience. No one knows why these variations occur.

Pattern. The following are 22 examples of the characteristic sensations that constitute the pattern-sequence of near-death experiences or revivals from apparent death:

1. **Ineffability.** A difficulty in putting all the aspects of the experience into words.
2. **Floating.** A sensation of floating in mid-air in the environment, or in the hospital room, near the ceiling.
3. **Awareness.** Awareness of the conversations and actions of those present around the human body, in a situation wherein the individual is deeply unconscious upon hearing that he/she is dead.
4. **Incommunicability.** Seeing relatives crying and trying to speak to them, without anyone hearing the words.
5. **Permeability.** An attempt to touch people without success.
6. **Translocation.** The sensation of traveling at high speeds.

7. **Tunnel.** The sensation of rapidly traveling in the dark along the interior of a long tunnel, abyss, hole, cavern, cylinder, funnel, well, or deep valley.

8. **Buzzing.** Auditory sensations of strange and often disagreeable noises such as buzzing, whistling and tinkling. Nevertheless, the sensation of hearing an agreeable melody can occur.

9. **Calm.** A strong sensation of tranquility, peace and quietude.

10. **Solitude.** A sensation of profound solitude.

11. **Psychosoma.** The surprising sensation of possessing another body, beyond the human body, often a type of cloud.

12. **Encounters.** Encounters with extraphysical consciousnesses or intelligent extraphysical beings.

13. **Parapsychotics.** Seeing extraphysical consciousnesses who are disturbed by post-desomatic parapsychosis, being stuck to some object, person or habit and in conflict or tormented.

14. **Messenger.** The apparition of a being composed of blinding light, that is radiating intense happiness and love, generally taken to be a guide or messenger.

15. **Review.** Telepathic dialogue with the messenger, without words or accusations, relative to past actions during human existence and the consequences thereof, reviewed from infancy, like a film or a mirror, like a self-judgment.

16. **Mental.** There are those who relate brief glimpses of the mentalsomatic dimension of existence, as though they were a center of consciousness suspended in a void, where all knowledge seems to coexist with an apparent state of extremely ineffable timelessness and spacelessness.

17. **Colonies.** Some describe luminous, extraphysical communities similar to so-called *heaven*, in accordance with biblical, religious or unusual mystical notions that they know.

18. **Border.** The individual is faced with something symbolic described as a barrier, fence, entrance, border, limit, demarcation line, gray cloud, door, gate, or river. If this *point of no return* or *point of conversion* were crossed, it would signify no return to the human body and the acceptance of biological death or desoma. This episode represents a decisive process.

19. **Moratorium.** Some believe that the messenger promotes some pardoning or salvation from biological death solely for the purpose of rescuing some loved one who is still alive on earth, or in favor of an existential moratorium for the individual him/herself.

20. **Interiorization.** The interiorization of the consciousness is often felt to be a great disappointment, especially for those who undergo resuscitation after clinical death.

21. **Effects.** The effects subsequent to the near-death experience are invariably positive. The following 5 variables serve as examples:

A. **Self-confidence.** Elimination of the fear of death (thanatophobia).

B. **Megafraternity.** Acquisition of a greater humanitarian sense.

C. **Paraperceptiology.** Development of parapsychic faculties.

D. **Goals.** The individual's deep determination toward high objectives (goals).

E. **Serenity.** A reduction in anxiety when faced with the difficulties of human life.

22. **Discussion.** Generally, individuals, encountering a lack of comprehension on the part of others with respect to consciencial experiences, soon learn not to discuss the subject of extraphysical experiences openly in order to get along better with other intraphysical consciousnesses for the remainder of their terrestrial existence or intraphysical survival.

Bibliography: Baker (69, p. 14), Bedford (103, p. 190), Blackmore (139, p. 142), Champlin (272, p. 231), Crookall (343, p. 19), Currie (354, p. 137), Eysenck (493, p. 160), Flammarion (522, p. 107), Grosso (654, p. 38), Hampton (676, p. 6), Malz (992, p. 81), Moody Jr. (1078, p. 33), Plato (1261, p. 487), Ritchie (1407, p. 104), Sabom (1486, p. 91), Steiger (1601, p. 31), Wallis (1791, p. 20), Wilkerson (1848, p. 55).

51. EXTRAPHYSICAL INTUITION

Definitions. Extraphysical intuition (Latin: *in, in; tueri*, to look at, view): the phenomenon of instantaneous perception and clear inner knowledge through the apprehension and abrupt entrance into the consciousness of thoughts or ideas, truth or fact, when projected from the human body, without the intervention of any rational process; the capacity for separately considering certain concepts and conditions that normally intervene in our habitual thought processes.

Synonymy: abrupt extraphysical comprehension; apotheosis of intelligence; direct extraphysical understanding; extraphysical insight; extraphysical inspiration; extraphysical intellectual instinct; extraphysical introvision; extraphysical knowledge without reasoning; extraphysical notice; extraphysical premonitory conviction; extraphysical sixth sense; first guide of the projected consciousness; inherent extraphysical knowledge; inner extraphysical voice; inner extraphysical warning; instantaneous extraphysical foresight; interdimensional reason; preconscious.

Hypothesis. Intuition can play an indispensable role in the elaboration of hypotheses. In this case, however, it is absolutely necessary to put these hypotheses to the test.

Illusions. Intuition should not be accepted only on its own merit, without verification, because this opens the door to all types of illusions and superstitions.

Science. Science rejects intuition per se as sufficient proof of its own relative truth.

Proof. For science, that which is intuitively grasped needs to be subsequently proven through observation, experimentation and reasoning, and accepted only after being put through the sieve of these convergent proofs and the universality of the *intercorroborative* testimony.

Factors. In our evolutionary development we are faced with 3 factors of *relative protection*, in ascending order:

1. Instinct (subhuman animal).
2. Reason (human being).
3. Intuition (*serenissimus*, holomemory, holobiography, retrocognitions).

Occurrences. Static intuition is often taken to be the cause of the following 13 occurrences, for example:

1. Conscial confinement.
2. Creative illness.
3. Creative trance.
4. *Divine emanation*.
5. Epileptic state.
6. Flash of genius.
7. Inspirational crisis.
8. Inventive eclosion.
9. Mild furor.
10. Oneiric influence.
11. Psychic automatism.
12. State of madness.
13. Sublime improvisation.

Consequences. Intuition can consequently lead to various conditions, such as the following 9:

1. Catharsis, purging or purification.
2. Conscial outflow.
3. *Creative gestation*.
4. Expansion of the consciousness.
5. Insight.
6. Intrapysical euphoria.
7. Mental purification.

8. Psychic relief.
9. Ventilation of the ego.

Similarities. Nevertheless, intuition in ordinary, everyday life continues to be the fundamental source of all knowledge.

Flash. Intuition, in general, does not always arise in a blinding flash.

Signals. In the process of intuition, preliminary indicators or precursory signals often occur that finally lead to it. The following 4 are examples:

1. **Idea.** The vague idea hidden in the back of the consciousness.
2. **Vision.** The vague glimpsing of things in the periphery of our field of vision.
3. **Hypomnesia.** The irritation experienced when having difficulty in remembering someone's name (hypomnesia).
4. **Clarification.** The anticipation of clarification.

Complexity. Intuition is generally a sentiment of what is unjust or wrong and manifests simply, although being a complex phenomenon.

Categories. Extraphysical intuition can be classified into 4 basic categories, according to its conditioning or causes: recollective, premonitory, psychometric and inspiratory.

1. **Recollective:** when stemming from a recollection or retrocognition, subordinate to the past-time-factor (mentalsoma): the voice of knowledge accumulated during past existences (self-intuition of paragenetics and holobiography).

2. **Premonitory:** when restricted to the perceptions of the consciousness projected within the immediate-future-time-factor (mentalsoma): the voice of cosmic consciousness.

3. **Psychometric:** when limited to the perceptions of the consciousness projected within the form-space-factor, in a crustal or paratropospheric environment (psychosoma): the voice of the extraphysical environment.

4. **Inspiratory:** when constituting a suggestion coming from an invisible, intangible extraphysical consciousness (extraphysical parapsychism): the voice of another consciousness (hetero-intuition, a phenomenon very close to telepathy).

Depth. Extraphysical intuition is the same intuition that is characteristic of the intraphysical consciousness' ordinary, physical waking state. The only difference is its greater depth of supranormal information gathered through the subconscious which, in this case, accesses all previous existences and intermissive periods, bringing it inside that selfsame consciousness when it finds itself projected from the human body (access to the holomemory).

Enrichment. Extraphysical intuition is also the same *reasoning* that is common to ordinary life, except it is enriched in an *interdimensional* manner.

Intrathosenes. The general mechanism of intuition seems to bear some relation to the phenomenon of hearing *mental words*, or intrathosenes. This relationship merits more research within thosenology.

Calm. The mechanism of the subjective experience of extraphysical intuition demands a certain state of consensual calm in order to function better.

Obstacles. The following are 8 obstacles or factors, among others, that make the acquisition of extraphysical intuitions more difficult:

1. The projected consciousness which is very agitated by its own experience.
2. Short attention span.
3. Distractibility.
4. Happiness or extraphysical euphoria.
5. Fear (phobias).
6. Sadness, grief or lamentation.
7. An anxious temperament.
8. Extraphysical trauma.

Neutrality. The facts suggest that the best condition for accessing intuition is the inner unemotional, unaffectionate state of consciential neutrality (serenity, tranquility).

Awareness. Extraphysical intuition simplifies experiences for the projected consciousness in a positive way, giving it the incontestable awareness of certain facts when it urgently needs to know them, sometimes arising providentially in a dramatic, very special and unique extraphysical circumstance.

Evolution. In principle, the novice lucid projector does not perceive the existence of extraphysical intuition. The individual simply uses it without perceiving the existence of this consciential faculty.

Confidence. With the spontaneous repetition of intuitive-projective experiences and the evolutionary development of the lucid projector, the projected consciousness acquires confidence with regard to its intuition and begins to apply it normally, with ease, as though it were a new tool acquired in its extraphysical activities.

Door. The inner certainty offered by the flashes of extraphysical intuition, for example, with respect to a detail regarding a fact, the mental identification of an extraphysical consciousness, clarification on a certain existential circumstance and other occurrences, arises immediately. It does not always represent the direct or indirect inspiration of a helper, because it constitutes the consciousness' natural perception, which is incomprehensible when living in the ordinary, physical waking state.

Realities. In general, intuition unquestionably constitutes at least the following 4 realities:

1. **Logic.** Leapfrogging steps of logic.
2. **Reason.** Anticipation regarding the processes of reason.
3. **Thought.** Shortcut in the natural or physiological elaboration of thought.
4. **Proofs.** Prior revelation regarding much sought-after and discussed scientific proofs.

Research. The author leaves the following research hypothesis: If intriguing intuition, as a subjective experience, is more evolved than reason and if reason is an attribute of the consciousness in the mentalsoma, might not intuition emanate from “something” of the consciousness which is beyond or more evolved than the mentalsoma, a condition characteristic of free consciousness (FC) which we still do not understand?

Acquisition. Extraphysical intuition plays an important and often decisive role in the acquisition of *original ideas* through lucid consciential projection.

Bibliography: Blavatsky (153, p. 284), Bonin (168, p. 252), Chaplin (273, p. 89), Day (376, p. 65), Fodor (528, p. 185), Gaynor (577, p. 87), Greene (635, p. 89), Morel (1086, p. 98), Pensamento (1224, p. 57), Shepard (1548, p. 469), Vieira (1762, p. 66), Wang (1794, p. 17), Zaniah (1899, p. 245).

52. EXTRAPHYSICAL PRECOGNITION

Definition. Extraphysical precognition (Latin: *prae*, pre; *cognoscere*, to know): the perceptive faculty whereby the consciousness, fully projected outside the human body, comes to know indeterminate upcoming facts, including objects, scenes and distant forms in the future.

Synonymy: anticipated projective memory; extraphysical clairvoyance in the future; extraphysical future memory; extraphysical paragnosis; extraphysical pre-esthesia; extraphysical pregnosis; extraphysical premonition; extraphysical prenotation; extraphysical prescience; extraphysical prognosis; extraphysical promnesia; extraphysical prophetic metagnomy; extraphysical radar; intuitional accessing of the future; projective forecast; projective precognition; projective proscopy; prophetic astral projection.

Categories. Precognitions can be placed into 4 basic categories:

1. **Realistic.** Ordinary, spontaneous and realistic precognition.
2. **Intuitive.** Unrealistic and intuitive precognition.
3. **Laboratorial.** Precognition provoked in the laboratory.
4. **Extraphysical.** Spontaneous extraphysical precognition that comprises precognitive lucid projection. It is far more common than imagined.

Self-precognition. Extraphysical precognition, when related to the projector him/herself, is the extraphysical self-precognition of death (*desoma*), generally through illness or accident.

Retrocognition. There are instances of extraphysical retrocognition in which the projected intraphysical consciousness becomes aware of past facts, prior to the present human existence, identifies former personalities who are currently intraphysical. This enables projective forecasts of events in the near future.

Mixed. This last occurrence should be classified as a special type of extraphysical precognition or as a complex, retrocognitive-precognitive, mixed, effect or consequence phenomenon.

Percipient. It is common for the agent of the phenomenon – the projected projector – to analyze its own occurrences of extraphysical precognition.

Apparition. Nevertheless, there are many cases of projective precognition that occur directly with the percipient of the lucid projection of another – a case of *inter vivos* consensual apparition.

Unconsciousness. In these cases, the projector – whether projected, or even in the ordinary, physical waking state, after the consensual projection – is not aware of the precognitive facts that refer to him/her and which he/she transmitted, becoming aware of this only after they are ratified over time (see *Bozzano*, Ernesto).

Bibliography: Blasco (151, p. 133), Bonin (168, p. 408), Boswell (174, p. 78), Bozzano (188, p. 87), Cavendish (266, p. 205), Chaplin (273, p. 125), Cheetham (276, p. 149), Cornillier (304, p. 85), Denis (390, p. 85), Digest (401, p. 374), Fodor (528, p. 295), Gaynor (577, p. 144), Grattan-Guinness (626, p. 144), Greenhouse (639, p. 58), Harrison (685, p. 103), Holzer (751, p. 108), Marin (996, p. 118), Martin (1003, p. 97), Monroe (1065, p. 152), Morel (1086, p. 144), Norvell (1137, p. 217), Paula (1208, p. 75), Schiff (1515, p. 117), Shepard (1548, p. 727), Still (1622, p. 255), Tondriau (1690, p. 273), Vieira (1762, p. 90), Wang (1794, p. 219), Wedeck (1807, p. 288), Zaniah (1899, p. 364).

53. EXTRAPHYSICAL PSYCHOMETRY

Definition. Extraphysical psychometry (Greek: *psykhé*, soul; *metron*, measurement): knowledge acquired by the projected human consciousness regarding the present and past, as well as details about personalities, by way of direct extraphysical contact with the double of these physical objects (catalysts) that pertain to the epoch or epochs regarding which the individual wishes to know.

Synonymy: astral psychometry; astral *telefrontisia*; extraphysical iconognosis; extraphysical psicognition; extraphysical psychoscopy; extraphysical retrocognitive telesthesia; extraphysical telegnomy; indirect extraphysical lucidity; paratelegnomy; projective psychometry.

Potentialiation. Lucid projection potentiates the psychometric capacity of the intraphysical sensitive. This suggests that there is a strange relationship between the essential nature of the phenomenon and the *mentalsoma*, outside time and space.

Technique. The technique of extraphysical psychometry follows the same criteria as the well-known practices of common psychometry in the ordinary waking state, except that it utilizes the spontaneous amplification of the perceptions of the projected human consciousness in order to feel, perceive and see the *essence of things*, achieve *universal knowledge* directly in the *cosmic memory*, *book of life*, *akashic* records or *akashic* registers, in the so-called *reflexive ether* of the universe.

Uses. Extraphysical psychometry, although difficult in practice, is used in the tracing of missing persons and criminals who are sought by the intraphysical authorities.

Bibliography: Boswell (174, p. 166), Carton (252, p. 225), Cavendish (266, p. 168), Chaplin (273, p. 127), Day (376, p. 105), Digest (401, p. 331), Fodor (528, p. 317), Gaynor (577, p. 148), Johnson (807, p. 175), Lee (908, p. 165), Martin (1003, p. 102), Morel (1086, p. 149), Paula (1208, p. 89), Pensamento (1224, p. 81), Perkins (1236, p. 44), Sculthorp (1531, p. 108), Shepard (1548, p. 754), Spence (1588, p. 333), Toben (1688, p. 79), Tondriau (1690, p. 270), Vieira (1762, p. 159), Wedeck (1807, p. 293).

54. EXTRAPHYSICAL RETROCOGNITION

Definition. Extraphysical retrocognition (Latin: *retro*, behind; *cognoscere*, to know): perceptive faculty whereby the intraphysical consciousness, fully projected from the human body, becomes aware of facts, scenes, forms, objects, successes and experiences pertaining to the distant past.

Synonymy: extraphysical clairvoyance in the past; extraphysical consciential intimation in the past; extraphysical post-cognition; extraphysical remote memory; extraphysical retromonition; extraphysical retroscopy; mnemonic retrocession; multi-existential retrocognition; pre-natal regressive projection; projective multidimensional memory; projective retrocognition; regression of extracerebral memory; retrocognitive projection; superlucid dream.

Events. Retrocognition experienced by the projected consciousness can refer to events from the individual's current existence or other previous intraphysical lives, which may be known or entirely unknown. This always occurs through perceptive resources that go beyond the possibilities of ordinary, physical memory, cerebral memory or biomemory, and rational inference based on known facts.

Projection. Extraphysical retrocognition – acting in a direction inverse to extraphysical precognition in chronological time – permits the occurrence of retrocognitive lucid projection.

Hypotheses. The following are 5 work hypotheses pertinent to the subject:

1. **Work.** How does the process of retrocognitive lucid projection actually work?
2. **Cause.** What is the *raison d'être* of retrocognitive lucid projection?
3. **Time.** In this case, does time operate in an inverse manner?
4. **Holomemory.** Could extraphysical retrocognition be a consciential journey using the integral consciousness or is it exclusively an intraconsciential journey within the holomemory?
5. **Mentalsoma.** Does the retrocognitive process only manifest and develop within the mentalsoma, in the mentalsomatic dimension?

Pseudo-intrusion. The phenomenon of extraphysical retrocognition, in certain cases, can generate pseudo-intrusion, in this case self-intrusion, as though the recollection of a prior intraphysical existence were a separate, intrusive entity associated with the underlying mental disturbance of the individual, which does not cease to be a typical parapsychosis.

Categories. Considering another aspect of the phenomenon, retrocognitive experiences can be placed into two categories: those that are personal and those pertaining to others.

1. **Personal.** Personal retrocognitive experiences are those that refer to the past – and *less* complex – experiences of the consciousness itself.

2. **Others.** Retrocognitive experiences of others are those that refer to past – and *more* complex – experiences of other individuals. They generally occur in circumstances in which the intraphysical projector is serving as a sensitive in the human dimension and learns of the experiences of someone who already passed through desoma by using sympathetic assimilation, extraphysical psychophony and projective recollection.

Politics. These retrocognitive experiences of others occur frequently in extraphysical deintrusive assistential services provided to former members of rival political groups.

Bibliography: Cannon (240, p. 40), Castaneda (256, p. 17), Cavendish (266, p. 211), Chaplin (273, p. 131), D'arbó (365, p. 152), Digest (401, p. 375), Edwards (465, p. 99), Fodor (528, p. 328), Gaynor (577, p. 155), Morel (1086, p. 156), Müller (1107, p. 253), Paula (1208, p. 109), Shepard (1548, p. 776), Steiger (1601, p. 147), Tondriau (1690, p. 273), Tourinho (1692, p. 47), Vieira (1762, p. 159), Wang (1794, p. 217), Zaniah (1899, p. 387).

55. PROJECTIVE PANORAMIC VISION

Definition. Projective panoramic vision: spontaneous, *en bloc*, simultaneous, retrospective vision of human facts and psychological conditions experienced by the projected intraphysical consciousness, through the superactivity of the evocative memory.

Synonymy: cinematographic recollection; consciential self-examination; consciential self-judgment; ecmnesia; *en bloc* evocations; epilog of biological death; existential examination; existential review; introspective visual review; kaleidoscopic vision of existence; life retrospective; life review; mnemonic cinematographic film; mnemonic mirror; panoramic memory; panoramic projective review; panoramic reconstitution of life; panoramic remembrance; pictographic recollections; recapitulation of life; recapitulation of remembrances; reexperiencing of memories; synthesis of recollections; synthetic memory; synthetic reminiscence of existence; total retrospective review.

Characteristics. The phenomenon of panoramic vision presents 10 basic characteristics:

1. **Instantaneity.** The scenes of panoramic vision develop in sudden succession, surprising the individual, like an orderly whirlwind of facts around the person.

2. **Simultaneity.** Many facts can be exhibited simultaneously in panoramic vision, with lifelike images occurring at the same time and in the same plane.

3. **Ordering.** The scenes of panoramic vision can also proceed in an orderly, regular manner, whether in inverse order to that in which the facts were experienced (retrograde order), or in a direct manner, in the exact chronological succession in which the facts were produced.

4. **Intensity.** The number of recollections in panoramic vision vary from individual to individual, presenting two degrees of intensity:

A. **Integral.** The integral recollections provide the entire panorama of existence which have occurred up to that moment, from trivial facts to those that are most important.

B. **Partial.** The partial recollections are restricted to a specific part of human existence.

5. **Images.** The images of panoramic vision are pictographic, being figurative frames from daily life with an uncommonly lifelike nature, as well as having spectacular sound, color, movement and emotion that unfolds before the consciousness.

6. **Clarity.** The scenes are extremely clear, showing all the smallest intrinsic and collateral details of the occurrences of panoramic vision, even including situations that had been forgotten and are therefore unexpected. Scenes can either have an incredible vivacity or be projected in only two dimensions.

7. **Sensations.** The sensations experienced during panoramic vision are profound, whether they are of satisfaction and relief, or remorse. The sentiments between good and bad are very well defined. The phenomenon allows the consciousness to analyze in detail its own sensations in the progression of its personal history. The critical moments and common facts, the positive and negative occurrences – the actions regarding which the consciousness felt gratified as well as the attitudes it was ashamed to remember on that occasion – are gathered impartially, all at once, into a whole, through panels. On rare occasions, the sequence of memories can unfurl without emotional involvement, in an impersonal manner.

8. **Duration.** In panoramic vision, the thousands of scenes involved in a perfect integral recapitulation of the recollections of episodes of human existence last for some seconds or can extend up to a maximum of almost one hour. There is no sensation of the passage of minutes. Often, 6 decades pass in tenths of a second, in a complete consciential self-judgment.

9. **Significance.** The experience of panoramic vision can be interpreted as an educational effort, stemming from the more evolved consciential dimensions, with the aim of helping the intraphysical consciousness to understand the significance of human life.

10. **Summary.** The recollections of panoramic vision can be of an entire period of consciential life or may only arise as a “summary.” In this case, only the more relevant or decisive recollections appear.

Conditions. Hypermnnesia or mnemonic exaltation generally occurs more frequently during at least the following 18 conditions or stages, or with persons in critical circumstances:

1. Physical illness.
2. High fever.
3. Religious exaltation.
4. Ecstasy (beatitude).
5. Elevated emotional condition.
6. *Pre-mortem* delirium or the crisis which precedes dying.
7. Hysteria.
8. Senility (Alzheimer's disease).
9. Epilepsy.
10. Other xenophrenic states or altered states of consciousness.
11. Persons who experience life-threatening situations or the imminence of the human body's death.
12. Asphyxiation by submersion.
13. Explosion on a battlefield.
14. Surgical operation.
15. Falls from treetops.
16. Falls experienced by mountain climbers.
17. Near-strangled individuals.
18. Wounded soldiers.

Forced. All the above-cited facts predispose the forced, abrupt projection of the consciousness. That is why it is connected to occurrences of panoramic vision.

Expressions. Many scholars endeavor to identify panoramic vision in general with expressions such as: “*akashic* register,” “annals of the past,” “astral clichés,” “astral images,” “astral light,” “brain of nature,” “ether-reflector,” “indelible images,” “memory of God,” “memory of nature,” “memory of the world,” “soul of the world,” “soul of things,” and others.

Mechanisms. These expressions endeavor to say much in regard to the causes, sources and resources of the phenomenon. However, they actually clarify nothing. The mechanisms of memory remain extremely obscure.

Children. It is interesting to note that, in near-death experiences, children do not experience the panoramic review of their lives, which are obviously of short duration. This fact is an exception in relation to adults, who have greater, more traumatic and extensive experiences to recall when undergoing the near-death experience. The facts show that the same occurs with the experience of projective panoramic vision.

Accidents. Panoramic vision especially occurs in impactful circumstances aside from hypermnnesia, super-recall or the simple exaltation of memory, when the consciousness experiences the near-death phenomenon. It can also occur spontaneously, during abrupt lucid projections, in cases of physical accident.

Memory. In panoramic vision, introspective (*inside* the consciousness, outside time and space) projection occurs in the mnemonic center or integral memory bank of the personality. This happens without external interference from occurrences that refer to the person's existence, as though it were an immense computer that reviews its own biography – in an instant, as though on film – with all the programmed data.

Scenes. The scenes seem to pass before the *mind's eye*, intraconscientially.

Continuous. Panoramic vision clearly demonstrates that, when necessary, the *integral* memory (holomemory) of the consciousness shows itself to be *continuous* memory or one without hiatus, perfect, indelible and susceptible of emerging in all of its plenitude in critical moments of the intraphysical being's (intraphysical consciousness) life.

Causes. Panoramic vision is explained as being an effect which is consequent to the superexcitation of the mnemonic faculties, produced by the crisis of dying, in the disconnection of the cerebral hemispheres and the integral memory (holomemory) of the consciousness, that occurs in the beginning of the dis coincidence of its vehicles of manifestation, in this case, the soma and psychosoma.

Helper. However, it sometimes seems that panoramic vision is also triggered intentionally by the direct interference of an extraphysical helper upon the projected or semiprojected consciousness.

Objectives. Many people characterize the phenomenon of panoramic vision as being a moral test or an examination of the individual's conscience.

Relief. It is curious to note, in this sense, that in certain cases of panoramic vision the individual notices that the sequence of the scenes occurs in a selective manner, or *in relief*, emphasizing the reason for the vision, namely the analytical objective with regard to the personality and his/her true emotions felt at the precise moment at which the facts occur.

Photos. It is as if the consciousness were examining a vast collection of photos of familiar persons, with the figures appearing flat and two-dimensional, with the exception of one, precisely his/her personality, that is in focus, appearing more clearly, accentuated, emphasized, in relief, as though it were under the *spotlight* the entire time.

Intention. This would seem to indicate the underlying intention of consciential self-examination somehow acting upon the causes of panoramic mnemonic phenomena.

Extraphysical consciousnesses. Through parapsychic, psychophonic and psychographic communications, extraphysical consciousnesses generally affirm that they experience panoramic vision immediately after the first death and before the *restorative sleep*, characteristic of that intraphysical consciousness which has just returned to the status of an extraphysical consciousness in the extraphysical dimension.

Haptics. In analogy with the existing scientific aspects of physics – such as acoustics, optics and olfactology – *haptics*, the science of touch, was created.

Classification. Panoramic vision can be classified into two categories, according to the division of the general perceptions of human personalities, visual (optics) and auditory-mental (acoustics and haptics):

1. **Frequent.** The most frequent or common occurrence is panoramic vision per se, when the consciousness focuses its perceptions only through the *visual aspect*.

2. **Infrequent.** Less frequent is the recapitulation of recollections when the perceptions of the consciousness are predominately characterized by the *auditive-mental aspect*.

56. AMBIFACETED PROJECTIVE PHENOMENA

Definition. Ambifaceted projective phenomena: parapsychic occurrences restricted to the scope of projectiology that occur within the consciousness of the projector – who may or may not be projected – but which, however, have important consequences outside this same consciousness or its consciential micro-universe.

Synonymy: external projective phenomenon; trans-sensory phenomenon.

Intraphysical. The following 32 connected, main or ambifaceted parapsychic phenomena, among others, occur with the human consciousness – which may or may not be projected – and with the participation of the intraphysical consciousness, whether in the ordinary, physical waking state or projected in an extraphysical environment:

1. Apparition of the projected projector to intraphysical beings.
2. Cardiac and umbilical self-desoma.
3. Creation of morphothosenes (thought-forms).
4. Exteriorization of motricity.

5. Exteriorization of sensitivity.
6. Extraphysical elongation.
7. Extraphysical energetic transmissions (exteriorizations) made by the projected projector, including *exteriorization-by-three* or *triple energization*.
8. Extraphysical projective psychophony.
9. Extraphysical self-transfiguration.
10. Extraphysical telekinesis.
11. Extraphysical telepathy.
12. False arrival.
13. Farewell projection.
14. Human parateleportation.
15. Human projective psychophony.
16. Physical bilocation of the person of the projector, seen by others
17. Physical multilocation.
18. Possessive projection.
19. Projection of the subhuman animal's double, detected by an intraphysical consciousness.
20. Projective ectoplasmy.
21. Projective heteroscopy.
22. Projective parapyrogenesis.
23. Projective pneumatophony.
24. Projective poltergeist.
25. Projective psychography.
26. Projective raps.
27. Self-psychophony.
28. Semimaterialization.
29. Sonorous projection.
30. State of suspended animation.
31. Traveling clairvoyance.
32. Zoanthropy.

Analysis. All important ambifaceted projective phenomena will be addressed in detail in a specific chapter in this book, either in this or in other sections, according to the sequential analysis of the subjects.

Complexity. In cases of parapsychic phenomena with an extraphysical agent that may be an intraphysical *consciousness*, an extraphysical consciousness, or a recent-extraphysical consciousness – which can be referred to as an *intraphysical-extraphysical consciousness* – human detection can be performed by one or more intraphysical percipients at the same time.

Confirmation. In this last hypothesis of collective perception, the phenomenon receives more ample confirmation, the revalidation of the facts, making the occurrences more complex and the analyses and interpretations more difficult.

57. SELF-PSYCHOPHONY

Definition. Self-psychophony (OE: *self*, self; Greek: *psyche*, soul; *phone*, sound): the faculty whereby the consciousness speaks through the speech mechanisms of the human body while remaining partially projected outside it.

Synonymy: animic psychophony; *inter vivos* psychophony; intraconsciential psychophony; personification; self-incorporation.

Nature. Self-psychophony, or intraconsciential psychophony, constitutes an altered state of consciousness, an animic phenomenon, as opposed to classic parapsychic psychophony, or the incorporation of an extraphysical consciousness. It works like a consciential semi-detachment or a partial discoincidence of the vehicles of manifestation of the consciousness.

Categories. The phenomenon of self-psychophony can occur in a completely unconscious manner and can be classified into two basic categories: simultaneous self-psychophony and retrocognitive self-psychophony.

1. **Simultaneous.** In simultaneous self-psychophony – also called clairvoyant autoscapy, personification, or the well-known, controversial *phenomenon of animism* – the consciousness enters into an altered state and talks about contemporary facts.

2. **Retrocognitive.** In retrocognitive self-psychophony, the consciousness refers to facts from previous existences, unaware of the fact, as it occurs in parapsychic sessions when the consciousness of the sensitive – in this case an animist – mnemonically exteriorizes itself to one of its previous lives, reporting about what it knew or what it experienced on that occasion.

Regression. A correlated or similar phenomenon that can be brought to mind here is memory regression.

Clairvoyance. Simultaneous self-psychophony is common during traveling clairvoyance, where the sensitive feels his/her own consciousness to be partially projected from the human body, seeing scenes or witnessing events, transmitting descriptions and reports through his/her psychophysiological mechanism of speech (laryngochakra).

Monologue. Self-psychophony is a phenomenon that is similar to, albeit significantly different from, psychophonic monologue, wherein the sensitive's consciousness leaves the state of coincidence of the consensual vehicles of manifestation, although remaining in the proximity, speaking between worlds with an extraphysical consciousness who speaks through the vocal apparatus (laryngochakra) of his/her human body.

Bibliography: Mitchell (1058, p. 44), Rogo (1446, p. 155).

58. PHYSICAL BILOCATION

Definitions. Physical bilocation (Latin: *bis*, two; *locus*, place): the simultaneous presence of the personality of an individual in 2 locations; the act of someone being and acting in 2 distinct locations through parapsychic means; the faculty whereby the same consciousness appears in more than 1 body (vehicle of manifestation) seemingly at the same time.

Synonymy: *anguttara nikaya* (Tibet); apparition of the living to the living; apparition of the projectionist; appearance outside the body; autonomous abmaterialization; bicorporality; bicorporeity; bilocation of the living; bilocal apparition; bilocal excursion; bilocal journey; bi-presence; double location; double presence; double solid body; holosomatic mitosis; incipient bilocation; *inter vivos* solid apparition; *larvata*; materialization of a living person without a sensitive; materialization of the adept; materialization of the projected intraphysical consciousness; materialization-projection; materialized apparition; materialized unfolding; natural materialization; non-human kind; objective bilocation; objective unfolding; phantasm state; phenomenon of double persons; phenomenon of duplication; physical bilocation; reciprocal hallucination; self-ectoplasm; self-materialization; self-telediplosia; simultaneous bilocation; solid psychosoma; spectacular consensual projection.

Mechanisms. In most cases, physical bilocation is an involuntary, animic (of the intraphysical consciousness) projection in which the soma, that is inactive or absolutely static and immobile – similar to the death of the human body (*desoma*) – and in the empty brain condition, due to the temporary absence of the consciousness, remains in one place (the improvised physical base). Thus the consciousness, moved for whatever extreme psychological reasons, presents itself in the psychosoma, which is visible (stimulating the visual perceptions of other intraphysical consciousnesses) or even tangible (stimulating the tactile perceptions of the fingers of other intraphysical consciousnesses) in another nearby or distant location.

Distinction. There are those who make a theoretical distinction between 2 phenomena:

1. Bilocation, which refers to 2 *places*.
2. Bicorporeity, relative to 2 *bodies*.

Similarities. In practice, however, the 2 phenomena are similar or identical in their origin, evolution and objective, possibly occurring in at least 4 specific conditions of the intraphysical consciousness:

1. **Trance.** With the person in a parapsychic trance.
2. **Somnolence.** In the state of somnolence.
3. **Sleep.** During natural sleep.
4. **Projection.** In an altered state of consciousness, projected with full lucidity.

Distance. The phenomenon of physical bilocation can occur near to or distant from the human body. In fact, the bilocation of the actual human body does not occur. It is, rather, the projection of the intraphysical consciousness when outside the body.

Objectivity. Physical bilocation can be further classified into two basic categories with regard to its objectivity:

1. **Objective.** Objective bilocation, when the presence of the bilocator is made ostensive and practically physical, being perceived by more than 1 percipient or witness.
2. **Subjective.** Subjective bilocation, when the form of the individual appears with all of its lifelike attributes to a sensitive, or a clairvoyant sensitive, who is distant from where the bilocator's human body is located at that moment, having been left in a condition of relative inactivity (vulnerable, inanimate, torpid, vegetative).

Types. The phenomenon of physical bilocation can be produced in 3 different ways:

1. Unconscious.
2. Conscious.
3. Experimental or false bilocation. This mode of the phenomenon was produced by French researchers and was called *false bilocation* by some scholars.

Factors. In the causes of the phenomena of physical bilocation, 1 of 2 basic triggering factors can be detected, which should be researched with regard to their motivations, per se:

1. **Escape.** Escape from a difficult human situation, thereby serving as a maneuver for physical survival on the part of the bilocating social being (intraphysical consciousness). It is, therefore, a process of *intraconscial* origin.
2. **Help.** Help for a person with whom the bilocator is almost always affectionately connected and truly wishes to provide service or assistance. It is therefore a process of *extraconscial* origin.

Hallucination. Those who have not had a more profound lucid projection experience tend to interpret physical bilocation as being implausible, a mere reciprocal hallucination between the agent and the percipient or percipients. The author judges this hypothesis to be simplistic and inconsistent, when faced with the facts and the wealth of existing historical reports on the topic.

Mixed. The phenomenon should be called *physical* bilocation in order to distinguish it from *mixed* bilocation in two dimensions or, in other words, the simultaneous presence of the individual's human form, the human body in the empty brain condition in the intraphysical dimension, and its humanoid form, with the mentalsoma and the consciousness in the extraphysical dimension per se, during the occurrences of lucid projection, although manifesting itself visibly and tangibly to human beings.

Tangibility. Physical bilocation is the same phenomenon as apparition of an intraphysical projector to intraphysical consciousnesses, but more tangible, seen, or physically perceived by a greater number of persons due to its quality of visibility.

Apparition. In fact, the apparition of a projected projector is always a bilocation, although, in this situation, the apparition (psychosoma) and the human body of the projector are observed separately at the same time.

Space. It is important to classify the phenomenon of physical bilocation into two basic categories, with regard to space:

1. **Soma.** In bilocation considered to be *subjective*, the projected projector, or agent, appears at a distance from the human body (soma) to a percipient (the subjectivity of this being that the projector does not see his/her distant soma).

2. **Place.** In bilocation considered to be *objective*, the projected projector manifests his/her presence (*copy*) in a place different from that which his/her human body (*original*) occupies, the presence of which is confirmed or detected by one or more other persons who are different from those who see the projector's immobile human body.

Fear. Fear can sometimes dominate the novice projector, as well as the intraphysical witness who sees him/her projected. The cause for this seems to be in the unusual aspect of the occurrence for both parties, although each one acts in his/her own, specific or different situation.

Density. In the phenomenon of physical bilocation, the anthropomorphic figure of the bilocator can be of 2 distinct types in regard to its density:

1. Vaporous.
2. Dense.

Brink. Bilocation occurs more frequently in the moments before death, or the brink of biological death or desoma, prior to the deactivation of the consciousness' human body.

Clairvoyance. Certain cases of pure clairvoyance, on the part of an intraphysical percipient who registers the apparition of someone, can be confused with the phenomenon of physical bilocation, although being a very different fact. In this eventuality, the condensation or semimaterialization of the projector's psychosoma does not occur. What does occur is only the more pronounced parapsychic perception of the profound acuity of the paraperceptiology of the *spectator-percipient-sensitive-clairvoyant*, or even an interconsciential phenomenon of *paraclairvoyance*.

Sharpness. The visual images or humanoid, human and extraphysical forms of the apparitions and of the bilocator's manifest themselves in different degrees of sharpness on the part of the percipient or clairvoyant.

Duration. The phenomenon can have many degrees of duration, lasting from tenths of a second to several hours for the percipient.

Simulacrum. The isolated projection of the holochakra represents a phantasmagoric bilocation, or a mere simulacrum. That is to say, a projection of this vehicle occurs without the dislocation of the seat of the consciousness, which remains in the psychosoma and the human body, like an energetic image projected *from* and *by* the person. It can be seen, but does not have its own personality, nor is it the center of the consciousness (pointer of the consciousness).

Case study. Everything points to the fact that certain cases of autoscapy, false arrival and 2 classic examples of physical bilocation – that of Antonio de Pádua (1195-1231), and Emília Sagée (1845) – are of the nature of simulacra. There was no retrieval of information, awareness of the individual and, particularly in the case of the 2 last examples above, the fact did not serve any purpose lucidly elaborated by the will of the responsible parties.

Effects. In most physical bilocation phenomena, the appearance of the bilocator's psychosoma is observed by a person or a group and successively by various persons, and even by subhuman animals, especially dogs and cats (pets), without provoking tangible, physical effects or, in other words, without leaving traces.

Reminders. There are, however, rare and remarkable incidents in which some type of evidence, trace, human sign, animate or inanimate semipermanent measurable marks, and physical traces resulting from patent physical or telekinetic contacts are left, thereby providing proof of the presence of the bilocator at that location.

Objects. Certain occurrences of physical bilocation constitute indisputable proof of the relationship between the projector bilocators and physical objects during the moments of their parapsychic trances. These fall into two categories:

1. **Carry.** The projected projector can transport physical objects – personal *baggage* – along on the *extraphysical trip* and leave it at the location visited, where he/she was seen to be physically bilocated.

2. **Bring.** The projected projector can bring back objects – parapsychic *souvenirs* – which were obtained at the distant place visited.

Non-human kind. The intraphysical projector, projected in the solid psychosoma, in the phenomenon of tangible or physical bilocation, is a true non-human kind, a being that was not biologically generated, or a *para-android*. In these cases, in a paraphysical creation, the humanoid being is generated through means other than natural conception, gestation, genetics and human, physical, biological or animal birth.

Paragenetics. The non-human kind proceeds or stems directly from the paragenetics of the consciousness.

Communications. In parapsychic (mediumistic or channeled) communications or, more precisely, animic (intraphysical consciousness) *inter vivos* communications, the communicant-projector, or pseudo-dead is producing – whether through psychophony or psychography, in a location different from its physical base – the phenomenon of physical bilocation, without, however, the tangible condensation of the form of the psychosoma occurring.

Frequency. *Inter vivos* parapsychic communications occur more frequently than *inter vivos* animic communications. In these cases, the pure animic process is very rare.

Guide. Some help is always provided, notably by the sensitive's extraphysical mentor (blind guide or helper).

Thread. The *thread of light* – or, better yet, the silver cord – generally constitutes the only perceptible difference between the apparition characteristic of the intraphysical bilocator and the apparition of the extraphysical consciousness.

Appearance. Nevertheless, some percipients and clairvoyants even add – as a differential characteristic between one apparition and another – the lifeless, dead (visual, physiognomy), statue-like or mannequin-like appearance of certain apparitions of intraphysical beings (intraphysical consciousnesses).

Motivations. The following are 6 of the more frequent deep concerns or strong motivations, among others, for the intraphysical consciousness to spontaneously produce ostensive, physical bilocation, or that which is perceived by other intraphysical beings:

1. Extraphysical assistance (helper, evolutiologist).
2. Intense affection, including that of an evolutionary duo.
3. Religious devotion (belief, faith, fanaticism, sectarianism).
4. Professional service.
5. Urgent human business (intraphysical problems).
6. Strictly political reasons.

Devitalization. The phenomena of bilocation in general, and all those which are based upon the temporary transference of the seat of the consciousness out from the human body – including altered states of the intraphysical consciousness – occur in multiple gradations during the reduction of the individual's vitality, in at least some of the following 8 conditions:

1. Natural sleep (sleeper).
2. Sleep produced by anesthetics (patient).
3. Hypnotic, somnambulistic phase (*sujet*).
4. Lipothymia (fainting, becoming weak, everything goes dark, loss of the senses).
5. State of coma (comatose).
6. Crisis of convalescence (convalescent).
7. Nervous fatigue (overwork, pathological stress).
8. Demoralization (depression).

Explanation. Currently, the most plausible explanation for the phenomenon of human bilocation is to interpret it as being an occurrence in which the vehicles of manifestation of the bilocator-projector are simultaneously both partially objective and partially immaterial.

Stage. This means that physical bilocation constitutes an advanced stage of ordinary human lucid projection.

Hagiography. Hagiographers, including Augustine of Tagaste, Africa, who wrote *The City of God*, refer to bilocators and their bilocations in their writings.

Historians. The Latin historians Cornelius Tacitus (55-120), author of the *Annals*; and Gaius Suetonius Tranquillus (70-122), responsible for the work *Lives of the Caesars*, also spoke about aspects of projectiology phenomena.

Projector-bilocators. Occurrences with various projector-bilocators (as well as some *trilocators*) have been registered in the world's chronicles, most notably the following 20:

1. Alphonse-Marie de Liguori (1696-1787).
2. Angelo de Acri (epoch: 1739).
3. Antonio de Pádua (1195-1231).
4. Apollonius of Tyana (98 A.D.).
5. Caterina dei Ricci (1522-1590).
6. Clement I (first century).
7. Dadaji.
8. Emília Sagée (1845).
9. Eurípedes Barsanulfo (1880-1918), Sacramento, MG, Brazil, Spiritist.
10. Francesco Forgione, or Pio de Petralcina (1887-1968).
11. Francisco Xavier (1571).
12. Giuseppe Desa, of Cupertino (1603-1663).
13. José de Anchieta (1534-1597), São Paulo, Brazil, Catholic.
14. Liduvina de Flandres (1400).
15. Maria de Agreda (1602-1665).
16. Martin de Porres (1579-1639).
17. Natuzza Evolo, Paravati, Calabrian, Italian, Catholic.
18. Sathya Sai Baba, India.
19. Severo de Ravenna.
20. Teresa Higginson (1844).

Induction. Thus far, the phenomenon of physical bilocation cannot be artificially induced with relative ease, as is being done with ordinary human lucid projection.

Mega-strong-traits. The person who is predisposed toward or is a natural candidate for the production of physical bilocation – particularly when enjoying a positive peak in the scale of his/her biological clock or parapsychophysiological biorhythm – is the intraphysical consciousness who presents 1 or all of the following 3 mega-strong-traits:

1. **Imagination.** Ample powers of imagination.
2. **Attention.** A certain capacity for maintaining divided attention, or doing something while thinking about something else (cerebral versatility, intellectual polyvalence).
3. **Holochakra.** An advanced capacity for voluntarily exteriorizing consciential energy.

Television. The following is 1 practical example of the abovementioned division of attention: watching and intelligently following 3 different television channels or programs at the same time – either by using the remote control or 3 operating television sets – demonstrates an expressive level of division of attention which is sufficient to predispose the consciousness of the television viewer to produce the phenomenon of physical bilocation.

Assisted. It should be kept in mind that just as assisted lucid projection exists, so does assisted physical bilocation exist or, in other words, that which is sponsored by helpers, and which perhaps predominates among all the categories of these phenomena.

Recall. In most instances, the phenomenon of physical bilocation only became known to the bilocator after the occurrence, subsequent to his/her presence being confirmed by percipients in another

location distant from his/her physical base. This shows the absence of recall of the extraphysical events by the bilocators in general, as happens with almost all of humanity, every night upon sleeping.

Desoma. As previously mentioned, many cases of physical bilocation occur moments before death, from the death bed (desoma).

Triangulation. Only very rarely does physical bilocation permit one to *connect extremes*, integrate the processed information, polarize the reports and triangulate converging testimonies or, in other words, obtain confirmatory evidence between at least the following 3 individuals, or those persons who play different roles in the occurrences:

1. **Witness.** The observer-witness who sees the inactive human body of the bilocator in the physical base.

2. **Percipient.** The occasional percipient who simultaneously witnesses the tangibility of the same bilocator's psychosoma at another location.

3. **Bilocator.** The bilocator per se, who gives a detailed report of the event when in the ordinary, physical waking state, immediately after the occurrence.

Evolution. The facts show that repeated human parateleportation constitutes the most evolved stage of physical bilocation. There thus occurs a clear ascending progression in the development of the 3 interrelated phenomena, in the following 3 distinct steps:

1. **LP.** First, human lucid projection (LP).
2. **Bilocation.** Second, physical bilocation.
3. **Parateleportation.** Third, human parateleportation.

Complex. This gradation speaks in favor of the existence of the phenomenological complex of projectiology and the theory of irruption of the psychosoma in the soma.

Evidence. Among the experimental evidence that has been presented at different points in time, in order to directly demonstrate the reality of the phenomenon of physical bilocation, the following 4 can be singled out as the most relevant:

1. **Psychosoma.** Photographs of the materialized psychosoma of the projected intraphysical consciousness, together with his/her human body. These are called *photos of doubles*. This is currently an extremely controversial fact, with the improvement of the art and science of photography.

2. **Emanations.** Photographs of nebulous, dense, colored emanations, at the deathbed.

3. **Exteriorization.** Hypnotically-induced projection of the consciousness, wherein the projector's human body is wrapped in a paper covered with a fluorescent substance. This provokes fluorescence upon the exit of the psychosoma, or the phenomenon of the exteriorization of sensitivity.

4. **Telekinesis.** Physical effects provoked by the consciousness while projected in the psychosoma and witnessed by intraphysical beings in the waking state, or projective telekinesis with a projective origin.

Extraphysical. Physical bilocation should not be confused with extraphysical bilocation, or double projection.

Evolo. Among the most well known currently living bilocator-projectors, the Italian, Calabrian, illiterate, mystical Catholic woman, Natuzza Evolo can be singled out. She was born in 1924 in the city of Paravati, where she was still residing (1990) with her husband and 5 children.

Talents. Among her most noteworthy animic-parapsychic talents, the capacities of seeing extraphysical consciousnesses and diagnosing illnesses can also be included.

Stigmatization. She is a stigmatic. Her wounds, in the form of a cross, have occasionally appeared on her wrists and feet, since the age of 10. Her stigma also include the bizarre phenomena of *hemography*.

Testimonies. The projective powers of Natuzza Evolo have been researched since 1974 by Prof. Valerio Marinelli, an engineer at the University of Calabria, who has collected and documented 52 different cases of lucid projection and physical bilocation produced by Natuzza, with the testimonies of still-living persons. A portion of the investigations was published in 1979, in a restricted circulation edition of the publication *A Study of the Bilocational Phenomenon of Natuzza Evolo* (see bibliography below).

Statistics. Natuzza Evolo was clearly seen by human witnesses in 18 cases of physical bilocation. In 8 cases, there were apparitions of extraphysical consciousnesses accompanying the bilocator, in a visually perceivable manner or in an invisible manner. On another 6 occasions, the voice of the bilocator was heard, but her apparition was not seen.

Activities. In 13 cases, during the phenomenon of physical bilocation, this bilocator conducted incontestable physical activities, such as the following 5:

1. **Speech.** Speaking, evidencing her own voice for the witness or percipient.
2. **Watch.** Making a desk clock work.
3. **Door.** Loudly slamming a door.
4. **Vase.** Moving a vase with flowers.
5. **Hair.** Pulling the hair of one witness' head.

Stains. In 9 cases, her bilocal apparitions left bloodstained fingerprints, similar to those of her hemographs, and some with religious designs, in the locations of the physical bilocations.

Indications. These incontrovertible indications of Natuzza Evolo's physical presence at the bilocation scene eliminated the outworn hypothesis of individual or collective *hallucination* to explain the bilocal phenomena.

Proof. Fingerprints made with the person's own blood certainly provide definitive proof of the presence of a bilocated projector.

Known. In this case, the occurrence becomes even more expressive, because Ms. Evolo is sometimes accompanied by an extraphysical consciousness who the witness had known for a long time, when still an intraphysical consciousness, sometimes being identified as the witness' own father, another relative or another personality.

Information. This bilocator has the habit of giving information about her bilocal visit *before* being informed about the experience by the witness (chronology).

Will. According to Natuzza Evolo's registered declarations, her bilocations have never occurred through her own will.

Extraphysical consciousnesses. According to her testimony, one or more extraphysical consciousnesses present themselves and accompany her to where her presence is needed. There, she has full awareness of the location visited and of the existence, at that moment, of her inactive human body that has been left in her house in Paravati. She remains only some seconds or a few minutes, returning to the physical base, while always maintaining consciential lucidity regarding the main events of the phenomena.

Details. Natuzza Evolo explains that her bilocations can occur at night, when sleeping, as well as when she is awake. In this situation, she suddenly feels herself to be in a new environment, as though she had been *teleported* there and then immediately becomes aware that she has been bilocated.

Instantaneity. The translocation is instantaneous, regardless of the distance.

Incidence. According to Ms. Evolo, the bilocations can occur many times a day and she can visit various locations and different persons in succession.

Assistential. It should be pointed out that these physical bilocations that are assisted by helpers and are assistential, in favor of others, and even have mystical connotations, serve to demonstrate that mysticism, asceticism, the life of a hermit and a celibate life are totally dispensable for the development of animism and parapsychism, since this bilocator is married, a housewife and the mother of 5 children. The same occurs in countless cases of penta (daily, personal energetic task) practitioners.

Trilocation. Natuzza's extraphysical companion or helper often tells her where she is bilocated. At other times, she has the impression of being in 3 places at the same time or, in other words: the phenomenon of *physical trilocation* occurs, which has also been reported by other projectors. It seems to be produced by the action of the vehicles of manifestation of the intraphysical consciousness due to the instantaneity of the occurrences.

Consciousness. In these cases, the seat of the consciousness is singular, however the facts occur with extreme rapidity, giving the impression of being in 3 or more places at the same time. The seat of the consciousness separates, but in a lightning fast manner. The mentalsoma, for example, generally acts independently from chronological time, as we conventionally understand it in this intraphysical dimension, in the ordinary, physical waking state.

Uselessness. The phenomenon of physical bilocation alone annuls and makes hundreds of materialistic themes and disciplines at universities throughout the planet ineffective by proving their uselessness and the waste of time they represent.

59. COMPARISONS BETWEEN LUCID PROJECTION AND PHYSICAL BILOCATION

Comparisons. Despite the fact that both lucid projection and physical bilocation are phenomena involving exteriorization of the human consciousness, that temporarily leaves its *coarse* seat in the brain – the facts still suggesting that the second phenomenon is the continuation, or more evolved stage, of the first – it is worthwhile pointing out 7 superficially established aspects in a differential comparison between the two:

1. **Takeoff.** In lucid projection, the consciousness generally clearly perceives the sensations of the takeoff of the psychosoma. In physical bilocation, the consciousness generally does not experience the act of leaving the human body.

2. **Psychosoma.** In lucid projection, the consciousness can, in certain cases, leave the human body and not feel itself to be *inside* any vehicle of the consciousness, when manifesting in the mentalsoma. In physical bilocation, the consciousness always has the sensation of having 1 body, in this case the psychosoma, which is clearly similar to the human body.

3. **Translocation.** In lucid projection, the consciousness generally has the unquestionable sensation of leaving the human body and only then leaves the physical base. In physical bilocation, the consciousness generally only perceives that it has already translocated to its destination in some instantaneous manner.

4. **Telekinesis.** In lucid projection, the consciousness generally does not interact well with the new environment or communicate well with the human beings that it encounters. In physical bilocation, the consciousness interacts with the new environment and executes physical acts or, in other words: produces telekinesis phenomena, communicates with occasional human witnesses and, less frequently, can even bring back some evidence of having been in the other intraphysical environment.

5. **Duration.** Lucid projection generally tends to be of brief duration. It would seem that physical bilocation tends to last a little longer. This comparison still requires more research in order to arrive at a more reliable conclusion.

6. **Witnesses.** In instances of lucid projection, the percipient of *inter vivos* apparitions of the projector generally seems to see a partially immaterial figure before him/her. In instances of physical bilocation, the percipient of the *inter vivos* apparition of the bilocator generally has the impression of actually interacting and communicating with a real, living person like any other.

7. **Complexity.** The projector can commonly produce the phenomenon of lucid projection at will. The bilocator is not always able to produce physical bilocation, or a visible, tangible *inter vivos* apparition at will. This demonstrates that the phenomenon is doubtlessly more complex compared to the phenomenon of simple lucid projection.

Double. Perhaps 1 of the rarest phenomena of projectiology is *bi-bilocation*, double bilocation, wherein 2 bilocators are projected with lucidity at the same time, in unmistakable conditions of tangibility. Up until now, only a very few incidents of this type have been reported.

Vampirism. Many cases of ill bilocators, or even inexperienced projectors, can be classified as being authentic instances of vampirism. Well known facts exist through the folkloric reports of the citizens of many countries.

Zoanthropic. There are also cases of self-transfigurations of the psychosoma, resulting from physical, zoanthropic bilocations, or certain phenomena of zoanthropy, in which the bilocator presents him/herself in the psychosoma that is changed into the form of the subhuman animal regarding which he/she continues to be influenced by suggestion. This fact doubtlessly constitutes a manifestation restricted to the parapsychopathology of the psychosoma.

60. TRAVELING CLAIRVOYANCE

Definition. Traveling clairvoyance: simultaneous partial projection of the visual paraperceptions of the consciousness, at a distance from the human body, along with the “live” oral description and report on extraphysical events glimpsed by the projector, including the psychosphere of extraphysical consciousnesses (traveling consciousness) (see fig. 60, p. 1,122).

Synonymy: ambulant clairvoyance; clairvoyance in space; clairvoyant travel; distant traveling clairvoyance; distant vision; fifty-fifty projection; hypnotic mental projection; independent clairvoyance; indirect vision; *inter vivos* clairvoyance; itinerant clairvoyance; itinerant spirit; long-distance clairvoyance; long-distance vision; micro PK; mind travel or MT; mobile clairvoyance; projection without recall II; remote observation; remote perception; remote precognitive perception; remote sensitivity; remote viewing or RV; remote vision; telepathic travel; teleperception; traveling clairvoyance or TC; *traveling consciousness*; traveling metagnosis; traveling telecognition; traveling telopsis; visual metagnomy.

Categories. Traveling clairvoyance, or tracing executed by the semi-awake consciousness, beyond the barriers of space and the existential dimensions, can be interpreted according to 3 perspectives or classified into 3 basic categories:

1. **Spontaneous.** Spontaneous, normal, common clairvoyance, without trance.
2. **Self-induced.** Self-induced traveling clairvoyance, per se.
3. **Hetero-induced.** Traveling clairvoyance hypnotically induced by another.

Ideoplasty. Aside from these 3 perspectives, clairvoyance can be assisted by a helper, with or without ideoplastic projection.

Perceptions. The perceptions of the traveling clairvoyant can be classified into two basic categories:

1. **Physical.** Traveling clairvoyance in which the sensitive perceives hidden physical objects, remote physical environments or living beings (humans, subhumans) at a distance.
2. **Extraphysical.** Traveling clairvoyance in which the sensitive perceives immaterial forms, environments, extraphysical consciousnesses and extraterrestrials at a distance.

Remote. Remote viewing (scanning) is a mode of traveling clairvoyance wherein the clairvoyant describes a remote location, indicated only by the geographical coordinates of latitude and longitude. The execution of remote viewing demands full attention and deep concentration on the part of the clairvoyant.

Noise. In specific cases of remote viewing, or probing using geographical coordinates, a type of “mental noise” arises, owing to memory and imagination, which interferes in the acquisition of information by the clairvoyant who, probably due to this, has difficulty in detecting names, numbers, letters and other analytical material.

Manifestations. The following are two phenomenological manifestations that are equivalent in terms of psychological or mental reactions and parapsychic or extraconscious reactions of the intraphysical consciousness:

1. **Dream.** The *lucid dream* constitutes the initial, psychological manifestation of the *lucid projection*, this being a parapsychic phenomenon.
2. **Viewing.** *Remote viewing* is the initial, psychological manifestation of *traveling clairvoyance*, this also being a parapsychic phenomenon.

Magnetism. Some sensitives affirm that common clairvoyance increases when they sit with their back toward the North Terrestrial Pole, when they are in the Northern Hemisphere; and with their back toward the South Terrestrial Pole, when they are in the Southern Hemisphere. Nevertheless, the role that magnetism plays in the majority of the functions of the human body and in parapsychic faculties is still not clear. These affirmations still require further research regarding the facts.

Physiology. The action of the mechanism of speech in traveling clairvoyance is of extreme importance, illustrating the probable function of the silver cord (holochakra) seen during lucid projections, which may also exercise functions in different types of parapsychic phenomena.

Confirmation. In certain cases, traveling clairvoyance can be simultaneously confirmed during the unfolding of the phenomenon, through local or long-distance telephone calls made by the researcher, who places the mouthpiece to the mouth of the projector in trance and he/she directly reports what he/she sees in the location, visited by his/her projected consciousness, to the person who is beside his/her human body and to the other person, who listens to the phone at a distance.

Participation. In traveling clairvoyance hypnotically induced by another, the hypnotist can unconsciously or telepathically influence the descriptions and subjects related by the projector. In this case, the researcher-hypnotist also becomes a participant, besides being the recorder of the facts and a guide for the projector. This should be avoided, taking adequate precautions and employing special safeguards against this participation through the conduct and words used by the hypnotist.

Staccato. While in trance, the traveling clairvoyant often responds to direct questions in a staccato manner – reminiscent of the difficulty involved in obtaining information from ill persons, in certain circumstances – there being long pauses in their descriptions, thus making the use of a telephone somewhat inadequate.

Exocclairvoyance. Celebrated experiments were realized in 1973, in the United States of America, with the sensitives Ingo Swann (1933-) and Harold Sherman, using traveling clairvoyance to explore the planets Jupiter and Mercury, through exocclairvoyance, prior to space probes being sent there.

Agreement. The observations of the clairvoyants generally tallied with the findings made by astronomical instruments.

61. LUCID PROJECTION AND TRAVELING CLAIRVOYANCE

Complex. Strictly speaking, projection of the consciousness from the human body constitutes a phenomenological complex that – (1) besides the projection in the integral psychosoma, or with the humanoid form completely constituted; (2) in the partial psychosoma, or with an imperfect humanoid form; (3) in the psychosoma with and without the holochakra; and (4) in the mentalsoma – encompasses various lesser phenomena, including the following 5:

1. **Apparition.** The apparition of the projected projector to intraphysical consciousnesses.
2. **Bilocation.** The physical bilocation of the person of the projector
3. **Telekinesis.** The production of projective telekinesis.
4. **Typtology.** The manifestation of the consciousness of the projector by way of the phenomena of typtology.
5. **Poltergeist.** The participation of the consciousness of the projector in instances of poltergeist.

Miniprojections. Aside from the cited phenomena, traveling clairvoyance merits singling out as it can be considered to be a lesser projection, or a set of miniprojections, wherein there is a predominance of manifestations of the extraphysical visual perceptions of the consciousness, which does not leave the human body for extended periods and can continue to communicate through speech, in a type of self-psychophony.

Alternations. All experiences of lucid projection can be mixed together with different successive or alternate states of consciousness. In this way, for example, the projector can experience the phenomenon of traveling clairvoyance and, soon thereafter, produce the integral projection of the consciousness in the psychosoma, and vice versa.

Nuances. The following 3 distinct phenomena are aspects or nuances of the same phenomenon of lucid projection of short duration, whether spontaneous or provoked at will, or even through hypnotic induction:

1. Traveling clairvoyance.
2. Remote viewing.
3. Mind traveling.

Results. Traveling clairvoyance receives more attention from observers as it produces immediate, practical results. This is generally because the consciousness, in these cases, performs extraphysical actions in the crustal, paratropospheric dimension that relate to the human or diuturnal physical life of the participants.

Daydream. Remote viewing can be interpreted as a daydream with some flashes of awareness or clairvoyance at a distance. This can serve as a visualization technique which is useful for inducing a major lucid projection in the psychosoma.

Repetition. Self-discernment between one state and another can only be achieved with patient, exhaustive repetition of the experiences by the projector.

Mentalsoma. Certain occurrences of traveling clairvoyance seem to suggest that the majority of these facts are often partial projections of only the mentalsoma of the projector.

Reincorporation. In certain instances of traveling clairvoyance, the consciousness of the projector can transform its extraphysical manifestation, through the force of the will, into a full projection. This is followed by the instantaneous extraphysical reincorporation of the psychosoma, which projects, without needing to return to the human body to effect this maneuver.

Humanoid. One hypothesis suggests that the extraphysical reincorporation of the psychosoma must be due to the resources of the golden cord, which are still very unclear to us. The phenomenon is an impressive one, as though the projected consciousness, feeling itself to be without any body whatsoever, suddenly gained a complete humanoid body, in order for it to manifest in perfect consonance with the extraphysical environment.

Bibliography: Fodor (529, p. 173), Rogo (1444, p. 122), Steiger (1601, p. 131), Turvey (1707, p. 159).

62. COMPARISONS BETWEEN TRAVELING CLAIRVOYANCE AND LUCID PROJECTION

Differential. By using the system of comparison and contrast, the following are 9 differential factors that allow a distinction between traveling clairvoyance and the full projection of the consciousness from the human body in the psychosoma:

1. **Takeoff.** In traveling clairvoyance, the consciousness does not experience the takeoff of the entire psychosoma. In projection with continuous self-awareness, the process of lucid takeoff is impressive and unique.

2. **Speech.** In traveling clairvoyance, the consciousness of the individual in trance can see at a distance and simultaneously report what is being seen, speaking through the vocal mechanism of the human body. In full, lucid projection, the consciousness remains absent from the inactive human body, with only vegetative life, and is not able to act upon the soma, which remains in the *empty brain* condition, sometimes in a coma-like state.

3. **Permanence.** In traveling clairvoyance, the individual, although seeing at a distance, is fully aware that he/she is still in the human body. In a full projection, the consciousness is completely aware of the fact that it is manifesting in the psychosoma and not in the human body.

4. **Paraperceptions.** In traveling clairvoyance, the consciousness sees, although it does not *touch* the things that it sees. In full projection, the consciousness sees firsthand and achieves the paraperception of touch.

5. **Participation.** In traveling clairvoyance, the consciousness is a simple spectator of events at a distance. In full projection, the consciousness recognizes that it is a protagonist or a participant of extraphysical events.

6. **Translocation.** In traveling clairvoyance, the paraperceptions of the consciousness are always tropospheric or crustal and superficial. In a full projection, the consciousness experiences more vivid sensations, including the unquestionable dislocation through space to the target-place, sometimes to extraphysical districts per se, with *departure-return-new-departure-return* being determined by the consciousness itself.

7. **Cord.** In traveling clairvoyance, the consciousness does not see the energetic formations that surround the human body. In full projection, the consciousness can perform a detailed analysis of its own silver cord.

8. **Bilocation.** In traveling clairvoyance, the consciousness sees scenarios at a distance. In full projection, the consciousness can ostensibly manifest in the psychosoma, producing the phenomena of apparition to intraphysical consciousnesses and the physical bilocation of the personality itself.

9. **Preview.** Traveling clairvoyance frequently operates like a previous projection of a well-defined projection of the full consciousness, clearly demonstrating that, through clairvoyance, the consciousness *comes to see* where it will go and then it goes there through projection, leaving the human body behind.

Communication. The greatest evidence that the phenomenon of traveling clairvoyance will inevitably always be inferior or insufficient, compared to lucid, consciential projection, per se, is the fact that the consciousness of the clairvoyant continues to communicate through the speech mechanism of the human body.

Restriction. This demonstrates that, in this manner, the consciousness is not able to completely free itself from the 2 cerebral hemispheres or, more appropriately, from the inferior condition of physical restriction, thus not being able to achieve a higher level of expansion of the consciousness.

Holochakra. Certain clairvoyant sensitives, upon analyzing a traveling clairvoyant in trance, affirm that the greater part of the clairvoyant's human aura goes together with the vehicle of manifestation (psychosoma) of his/her consciousness which projects. This demonstrates that a good portion of the holochakra goes together with the consciousness.

Psychosoma. If the holochakra goes, it is because the psychosoma also goes along with it, because the holochakra alone does not transport the consciousness, which is headquartered in the mentalsoma.

Very rapid. It can be concluded, at this point, that many cases of traveling clairvoyance are nothing more than an intensive series of full – however extremely rapid – lucid projections. In this case, the consciousness projects fully, together with the holochakra, the psychosoma and the mentalsoma, and returns to report what is seen through the speech mechanism of the human body, many times in succession, in an intensive manner.

Bibliography: Crookall (343, p. 41), Fodor (529, p. 173).

63. PROJECTIVE ECTOPLASMY

Definition. Ectoplasmy: the temporary appearance of more or less organized substances with various degrees of solidity, having characteristics of physical objects and/or human forms – lips, faces, eyes, heads, complete configurations, clothing, personal objects – composed of an unknown agent, using the exteriorization of ectoplasm.

Synonymy: ectometaplasmy; ectoplasmic concretion; ectoplasty; ectoplasmy; entoplasmy; etherialization; experimental materialization; hylopasty; hyloplasm; *inter vivos* ectoplasmy; *inter vivos* materialization; *laboratorial apparition*; mechanical projection; metamorphogeny; metideogeny; metideoplasmy; objective thought-form; phantasmogenesis; psychoplasmy; semoplasmy; stereobioenergetic effects; tangible morphothosene; teleplasm; teleplasty.

Signals. The following two occurrences clarify each other:

1. **Intraphysical consciousness.** Physical torpidity is the first personal sign of the dis coincidence of the vehicles of manifestation of the intraphysical consciousness.

2. **Soma.** Dis coincidence is the first sign of the beginning of the process of dematerialization of the human body or soma.

Chronology. Thus, the chronological order of the phenomena of disincidence of the vehicles of manifestation of the intraphysical consciousness and the process of dematerialization of the soma, can be understood through 5 steps:

1. **Torpidity.** Physical torpidity: the first sign or loss of organic sensations.
2. **Disincidence.** Disincidence of the vehicles of manifestation of the intraphysical consciousness (rudimentary consciential projection).
3. **Dematerialization.** Dematerialization of part or segments of the soma.
4. **Rematerialization.** Rematerialization of the parts of the soma which were dematerialized.
5. **Sensitivity.** Organic sensitivity: the final sign or the regaining of organic senses.

Complex. Strictly speaking, ectoplasmy seems to comprise a phenomenological complex that is structured by way of 3 other very characteristic phenomena, which arise in the following chronological order:

1. First, the dematerialization of the sensitive (and intraphysical assistants).
2. Second, the materialization of temporary forms.
3. Third, the rematerialization of the ectoplasmic sensitive and assistants who, even so, still almost always end up losing some amount of body weight.

Interdependence. The facts suggest that any materialization results from a partial or total dematerialization, as though one phenomenon always depended upon another in order to occur.

Agent. Ectoplasm is always the psychophysical agent of ectoplasmy.

Physics. The materialization, dematerialization and rematerialization of atomic elements are already known to professionals of nuclear physics in the familiar environment of their laboratories, but this has still not been happening in the daily reality of ordinary human existence.

Similarities. Ectoplasmy, which is, in theory, the greatest parapsychic phenomenon (macro-PK), presents some similarities to lucid projection, which is, in theory, the greatest intraconsciential phenomenon of the intraphysical consciousness (animism). This is because it generally seems to be a projection of vital, mechanical, luminous energy.

Coexistence. Nevertheless, ectoplasmy and lucid projection always coexist.

Laboratorial. In certain cases, it is supposed that ectoplasmy represents nothing more than the exact, tangible projection of the vehicles of manifestation of the consciousness of the ectoplasmic sensitive. This constitutes the experimental, laboratorial apparition to intraphysicals of part or all of the human body, of the holochakra (including the silver cord) and even the psychosoma. In these cases, the sensitive's double serves as a mold for the creation of other materialized forms (phantasmogenesis). In this situation there is an irruption of the psychosoma through the soma.

Decomposition. Ectoplasm is a plastic, physical and extraphysical essence, that easily decomposes and appears in unstable forms as tenuous vapors, sticks, spirals, wires, cords, webs, rigid or semi-rigid rays, sometimes moving sinuously like reptiles and other times as though it were a living, intelligent being, vibrating, stretching or shrinking.

Condensation. This essence, ectoplasm, can constitute the condensation of the form of an entire or partial human body, in a phenomenon of partial materialization, sometimes with the anatomical decentralization and even the partial or total dematerialization of the human body of the ectoplasmic sensitive.

Conditions. The following are 3 basically different conditions:

1. The state of materialization of the intraphysical consciousness' own life.
2. The phenomenon of dematerialization of the human body.
3. The phenomenon of rematerialization.

Projection. All generally partial dematerialization with rematerialization of the human body, is also, in some way, a projection of the intraphysical consciousness.

Multidimensionality. If dematerialization occurs, matter goes or is generally temporarily projected to another dimension.

Takeoff. Dematerialization is the phenomenon correspondent to the takeoff of the psychosoma or the departure of the consciousness from the state of coincidence of the consciential vehicles.

Interiorization. Rematerialization, which is generally abrupt, is the phenomenon corresponding to the sudden interiorization of the projected consciousness.

Angles. Evidently, 3 consciential states represent the same condition, approached from different angles:

1. **Waking.** The ordinary, physical waking state of the consciousness manifesting in the human body.
2. **Holosoma.** The state of coincidence of the vehicles of consciential manifestation (holosomatic state).
3. **Existence.** The ordinary state of physical materialization of human existence.

Assisted. Among the phenomena of dematerialization, materialization and rematerialization registered in parapsychic and conscientiological case studies since the nineteenth century, it is inferred that dematerialization is one of the most advanced and complete projections of the intraphysical consciousness, assisted by the helpers – of the ectoplasmic sensitive, in this case – that can be produced on earth.

Reaggregation. This is because, in certain instances, the complete disappearance, without a trace, or disaggregation of the organic matter of the human body of the sensitive (who is confined in a booth and securely tied) and even the inorganic matter of the clothing, accessories and surrounding objects, can be complete for the duration of the phenomenon of materialization or ectoplasmy. This lasts until the immediate recomposition, reaggregation or rematerialization, with subsequent disappearance of the form or forms that had previously been temporarily materialized.

Multiple. The instances of physical multilocation, or the bilocation of more than one double of the projector – various projections of morphothosenes (thought-forms) of humanoid configuration at the same time – indicate that, in certain cases, different extraphysical consciousnesses can simultaneously become tangible during ectoplasmy sessions (in this case: triplasia, pentaplasia), each one using a projected double or facsimile of the ectoplasmic sensitive.

Phenomena. In order to avoid misunderstandings, it should be stressed that, within the framework of projectiology, two categories of well-defined phenomena occur relative to human materializations, in terms of their natures: animic materialization and parapsychic materialization.

1. **Animic** or intraconsciential materialization, only of the intraphysical consciousness. Psychophysical materialization of the living person *without a sensitive*, or the phenomenon of physical bilocation. The materialization of the bilocator's psychosoma occurs in this case. This is a fact that rarely occurs.

2. **Parapsychic** materialization or that of the intraphysical consciousness with some extraphysical consciousness. Psychophysical materialization of the living person *with a sensitive* or, in other words, the physical manifestation of the communicant-projector, who is projected and tangible due to ectoplasm coming from other sources: the ectoplasmic sensitive, the assistants who operate as secondary sensitives, besides other diverse ectoplasmic resources. This is a fact that occurs even more rarely.

Projected. It should be kept in mind that the even more authentic phenomenon of projective ectoplasmy of the projected intraphysical consciousness occurs when the ectoplasmic-sensitive-projector – while projected – provides energy, or ectoplasm, directly to another intraphysical consciousness (also projected) or an extraphysical consciousness in order for it to materialize (or semi-materialize) itself and be seen by other intraphysical beings (intraphysical consciousnesses and subhuman animals) which are breathing in the ordinary, physical waking state.

Lucidity. In a good number of instances, the projected projector that exteriorizes energy, in the above-mentioned cases, does not lose extraphysical lucidity.

Energy. The energy furnished by the projected projector generally couples – potentiates or is potentiated – with the energy, or ectoplasm, of the intraphysical consciousness or intraphysical consciousnesses who witnesses the materialization of the being, which is the object of the phenomenon.

Hypotheses. The author puts forward the following 3 work hypotheses, which are extremely pertinent with regard to projective ectoplasmy:

1. **Unconsciousness.** Can the intraphysical consciousness of the bilocator unconsciously use his/her own ectoplasm without the direct cooperation of extraphysical consciousnesses?
2. **Inclusions.** In the phenomenon of physical, tangible bilocation, might there also be an imperceptible – or more precisely, unconscious – inclusion of the ectoplasmic elements of other intraphysical beings besides the bilocator’s own human body?
3. **Origin.** Finally, where does the ectoplasm with which the bilocator materialized come from?

64. SEMIMATERIALIZATION

Definition. Semimaterialization: miniscule, brief materialization produced with the participation of the lucid, spectating intraphysical projector.

Synonymy: clairvoyant-materialization; collateral materialization; economical materialization; intramaterialization; vision-materialization.

Connection. Lucid projection permits the confluence of diverse phenomena, such as the connection of the clairvoyance of an intraphysical consciousness, operating as a clairvoyant-ectoplasmic *semi-sensitive*, with a *semi-materialized* extraphysical consciousness, through the process that encompasses 8 points:

1. **Partial.** On the physical side, the partial projection of the consciousness allows the projector the possibility of having a miniscule clairvoyance and simultaneously provides exteriorized energy, which is compound in this case, until it forms or condenses ectoplasm (*minimaterialization*).
2. **Miniscule.** On the extraphysical side, the helpers manipulate the ectoplasm, producing a perfect, lifelike, brief, miniscule materialization that only demands an indispensable minimum of energy or, in other words, a very small amount of exteriorized ectoplasm.
3. **Encounter.** The clairvoyance of the projected projector with full awareness, and remaining contiguous to the human body, converges and encounters the semimaterialization – in this case, a familiar extraphysical consciousness – with which the projector maintains a profound empathy, or *rapport*, in order to facilitate the execution of the process.
4. **Sphere.** The phenomena always develop inside the extraphysical sphere of energy that surrounds the human body of the intraphysical consciousness (extraphysical psychosphere or holothosene), with a profound interdependence between the 2 main responsible parties, the projector and the extraphysical consciousness.
5. **Interaction.** An effective interaction occurs between two different dimensions – the physical and extraphysical paratropospheric or crustal dimension – at a *halfway point*, or in the three-and-a-half dimension (an energetic floodgate), the *energetic dimension*, each one contributing a minimum of its possibilities and efforts, for the maximum, common objective.

6. **Conjugation.** The results of these 2 conjugated efforts, which occur simultaneously and in the same space-time continuum, are the individual materialization of an extraphysical consciousness as well as the individual, conscious vision of the intraphysical projector. This vision is extraordinarily lifelike, clear, detailed and a transmitter of ideas, or better still, enables consensual conversation that is unquestionable for the projector.

7. **Practice.** This fact permits the practice of the improvement of energetic or ectoplasmic manipulation on the part of the extraphysical consciousnesses involved in the process.

8. **Economical.** This materialized-vision, or clairvoyant-materialization, represents a genuine animic-parapsychic, or parapsychic-animic, manifestation which is extremely economical because it utilizes only one intraphysical consciousness, does not expend excessive energy, time or effort in either dimension and does not interfere in the interdimensional activities in progress, such as extraphysical assistential tasks.

Personal. These observations are the result of repeated personal experiments performed by the author (parapsychic researcher-participant), registered over time in special laboratories. In Rio de Janeiro, RJ, Brazil alone, approximately 300 experiments with consensual energies were performed over a 6-year period in the 1980s.

Bibliography: Vieira (1762, p. 44).

65. STATE OF SUSPENDED ANIMATION

Definition. Suspended animation: the state in which the intraphysical consciousness has temporarily suspended the essential vital functions of its cellular body, subsequently returning to its normal physiological conditions, in certain cases without provoking any damage to its health, the cells having survived in a metabolism of human hibernation.

Synonymy: ambiosis; animated suspension; apparent death; biopausy; biostasis; burial of a living person; cataplexy; consensual burial; hypobiosis; induced human hibernation; intentional burial; intentional inhumation; non-fatal sleep; prolonged burial; prolonged sleep; semimortal state; state of suspended life; stenobiosis; suspended death; thanatoidia; *vaju-stambha*; voluntary catalepsy; voluntary cataleptic state; voluntary inhumation.

Hibernation. The condition of animal hibernation (Latin: *hiber*, winter), or prolonged hibernal sleep, is a semi-state between natural sleep and biological death. In other words, it is the most extreme form of non-fatal sleep, which occurs with various animals, called hibernators, such as: insectivores; hirundinidae; squirrel; hamster or cricetidae; marmotae; bat; some birds and other subhuman animals.

Regulation. Hibernal animals continue regulating their temperatures; they readjust their thermostats to lower levels. The temperature is frequently lowered to the level of the ambient air, if it is above thirty-two degrees Fahrenheit (zero degrees Celsius). The pulse slows. Even aging apparently stops. The following is an example: the American squirrel, in its social interrelationships, has a pulse of between 200 and 400 beats per minute; when hibernating, this falls to between 7 and 10 beats per minute.

Animals. The state of suspended animation, or this condition of prolonged hibernation, even including apparently cadaveric rigidity, being coma-like in some cases, is a common physiological occurrence with the above-mentioned hibernating – so-called *subhuman* – animals living in regions that freeze for a number of months during winter.

Exception. This is why it is perfectly natural that the human being – the so-called *superior animal* – can also, exceptionally, as exception-behavior, realize that which those inferior animals perform normally, as pattern-behavior.

Trigger. It is for this reason that scientific searches were initiated, in the twentieth century, seeking out the trigger (detonator, triggering factor) that induces hibernation, or the elixir of suspended animation.

The objective was its rational application in human beings, in the sense of taking them to states of extreme *metabolic depression*, which will greatly favor the following 7 intraphysical procedures, among others:

1. Combating of the aging process (senescence, senility, old age, gerontology).
2. Interplanetary flights by astronauts. (*Omni*; New York, NY; magazine; monthly; illus.; vol. 6; no. 6; March, 1984; p. 70).
3. Personal weight control.
4. Surgery in general.
5. Surgical anesthesia.
6. The treatment of insomnia, viral infections, neoplasias and even radiation sickness.
7. The use of anorexics.

Lungfish. The Australian lungfish may be the oldest life form on the face of the earth. When the waters recede, it buries itself in the mud, leaving only a small air hole. It remains there, hibernating, without the ingestion of any food or water for *up to 5 years* until the waters return. It then emerges, unharmed, and resumes intraphysical life.

Ancurina. Upon studying the incredible ability of these fish to live on the threshold of life, without apparently aging or requiring nutrition, researchers see that the same state is possible in human beings. The key substance for this is a protein in the brain, a peptide that carries chemical information, called *ancurina*.

Training. In the East, and even today in the West, yogis and fakirs are frequently trained to control the autonomic nervous system, the part of the human nervous system which is normally not under willful control, and which regulates the activities of the heart, body temperature, blood pressure, pupillary dilation and respiration.

Silence. Electrocardiograms and electroencephalograms have already been taken of yogis when in conditions analogous to inhumation. These experiments evidenced the intense physiological action provoked by the yogic technique, proving that the person can achieve a profound circulatory reduction at will, as well as the electrical silence where the provisory suspension of the organic functions occurs. They can thereby achieve a considerable reduction, or an electroencephalogram that is practically null, plane, or *isoelectric*, showing an absence of any electrical activity – the condition of a cadaver.

Projection. The state of suspended animation can, exceptionally, enable lucid projection with a relative recall of extraphysical events. This is because the consciousness of the individual remains awake in certain cases, continually showing the potential and enormous resistance that the human body, the human mind or the determination of the disciplined will are capable of, within a balanced intentionality.

Categories. The state of suspended animation of the human being can be classified into 9 distinct, basic categories: voluntary burial; premature burial and the timely saving of the victim; mystical resurrection; reanimation of drowning victims; surgery performed with hypothermia and medical reheating; the modeling of hypobiosis; zombification with the consequent reanimation of voodoo; poisoning; and deep parapsychic trance.

1. **Burial.** Voluntary burial is the act whereby the fakir, the yogi, the fasting individual, the meditator, the monk, while controlling the autonomic nervous system, allows him/herself to be buried directly in the soil, or in a tomb, enclosed in a sack, small container or locked box with an air cubage that is totally insufficient to assure their survival. They are isolated from all sources of vitality for a period of time, being under the direct control of observers.

Technique. The following is the basic yoga technique for *voluntary inhumation* or suspended animation, in this case, voluntary burial, which was used a great deal in India, Iran and other places:

1. The yogi sits on a soft bed made of furs and combed cotton in a quasi-subterranean cubicle.
2. The yogi turns his face to the East.
3. He crosses his legs in the lotus position.

4. He fixes his gaze on the base of his nose.
5. He *inverts his tongue, having reversed the lingual frenum*, to the back of the throat, in the pharynx, closing the opening of the glottis.
6. He closes the eyelids.
7. He benumbs the members and enters into a deep trance.

Disciples. Next, the yogi's disciples rub his lips, close his eyes and ears with pieces of linen, covered in wax, in order to protect him from insects, the effects of the atmosphere on the organic tissues, as well as to protect him against the germs of decomposition.

Shroud. Finally, wrapping him in a linen shroud, they tie the 4 ends over his head.

Inhumation. The observers and local authorities who are present imprint a seal on the knot of the shroud. The body of the yogi is buried, alive, in a small wooden casket – a human hibernaculum – hermetically sealed and signed with a seal and signatures.

Cubicle. The yogi, buried in the walled grave, a 3-foot (1-meter) deep cubicle, with a door that is closed, sealed and completely walled in with clay.

Soil. In certain cases, the tomb is covered with a large quantity of carefully compressed soil.

Barley. Barley is planted in the ground and a guard of 4 sentinels remains on duty. They relieve each other every two hours and secure the area day and night, preventing strangers from entering.

Security. According to the yogis, the small reserve of air that remains inside the box where the practitioner is voluntarily buried serves as a safety measure, designed to allow him to take only a few breaths in order to return to the previous state in case an accident forces him out of his yogic trance, or samadhi, thereby placing him in danger.

Self-regulation. The dynamic of the phenomenon of voluntary burial is precisely in the self-regulation of the organism, which is executed by the meditator through deep meditation, creating a state of hibernation, *self-lethargy* and voluntary catalepsy, with the abolition of all intentional and unintentional movement, and the partial suppression of human life, including respiration.

Soma. The human body or soma is thus maintained with its vital processes and functions at an absolutely minimal functional level. The practitioner emerges from this state rested and happy, without any traces of lasting negative or ill physical or psychological effects.

Exhumation. The inhumed practitioner – who lived through this period while subjected to a suppression of oxygen – is reanimated (resurrected) in the *ritual of reviviscence*, sometimes after a period of 6 weeks. This occurs at the “exhumation,” or the breaking of the seals, with the added presence of a medical authority.

Statue. The practitioner appears to be a wax statue or a semi-cadaver, a body that is cold and apparently lifeless, but mysteriously preserved from decomposition.

Cranium. According to reports of these occurrences, the only area which is less cold is the cranium.

Theories. The most ingenious and ingenuous theories have been put forward to explain the phenomenon of voluntary burial, including the porousness of the soil that covers the interred practitioner and the use of miracle drugs on his part.

Demonstration. It is common knowledge, however, that all theories should be exhaustively questioned until they are able to be demonstrated. In this case, the demonstration has never occurred.

Duels. Some decades ago, “fakir duels” were performed between different nationalities, in Europe, in order to see who could exhibit greater prowess of voluntary burial for a longer time.

Prohibition. In 1955, the authorities in India prohibited the practice of voluntary burial, due to the high number of fatal victims of this type of fakir practice, persons insufficiently trained to conduct such a transcendent feat through the state of *samadhi*, equivalent to *satori* and the state of cosmic consciousness or cosmoconsciousness.

2. **Premature.** The difference between biological death (desoma) and parapsychic trance is still not entirely understood by the majority of humanity. Intentional burial – a public demonstration of determination and courage – should not be confused with the obscure and lamentable phenomena

of premature, unintentional burial, or the apparent death of persons who are alive but ill and in a rigid, cold, cataleptic state, without a heartbeat (a pathological condition), and who were disinterred, or removed from the coffin, and saved from asphyxia.

Necropsies. Many autopsies or necropsies have been mistakenly performed on living persons. In one case, the physician, who certified someone's death, had to pay for the burial expenses and an indemnification to the saved "living-dead" victim.

Case study. The following are 5 famous cases of persons who were buried alive, but lived past it nonetheless. They are listed along with the year of their premature burial:

1. Marjorie Elphinstone (seventeenth century).
2. Margaret Halvron (1610).
3. Victorine Lefourcade (1810).
4. Max Hoffman (1865).
5. Delphine de St. Paul (1876).

Taphephobia. There is currently no great cause for nurturing taphephobia, or the obsessive fear of being buried alive.

Incidence. Nowadays, so-called *apparent death* and undue burial are only possible in certain exceptional cases.

Vietnam. Upon transportation of the bodies of American soldiers buried in Vietnam to the United States of America, their coffins were opened, as a matter of policy. Dislocations and alterations – such as gnawed fists, bodies overturned in the casket, fractured kneecaps, changed fingers and broken nails – were verified in 4% of the cadavers.

Accidents. However, most of the cadavers that were found in a different position inside the coffin were due to accidents which had occurred during their removal, or in the transport of the body from one place to another.

Contractions. Cadavers can sometimes make violent (posthumous) movements due to muscular contractions.

Rigidity. Cadaveric rigidity (*rigor mortis*) appears 3 to 5 hours after biological death or desoma, lasts from 12 to 24 hours and subsequently disappears.

Narrative. Apparent death is also a real fact of suspended animation, being an event that has been greatly exploited in literature since the nineteenth century. In literary narratives, the person who is being carried gets out of the coffin, surprising all those present, and returns to his/her house on foot, almost always alone.

Bioelectrometer. The *bioelectrometer* is currently used. It is a sensitive instrument used specifically to detect the death of the human body and avoid burial of living persons.

Detectovida. Some time ago, in São Paulo, SP, Brazil, an apparatus called the *detectovida* (life detector) was used in order to avoid the burial of persons who are still breathing.

3. **Resurrection.** Intentional burial and premature burial explain the mechanics of the phenomena of resurrection, or the resuscitation of persons who are apparently dead, as in the cases of Lazarus (John 11:14) and the daughter of Jairus (Luke 8:55), according to reports in the New Testament.

4. **Drowning.** There are registered cases of respiratory arrest and suspended animation in the drowning of persons in water colder than 68 degrees Fahrenheit (20 degrees Celsius or centigrade), in which they survived prolonged immersion – often an entire hour underwater – and subsequent reanimation, without irreversible cerebral lesions or other sequels.

Reflex. The suspended animation of those who drown in cold waters is explained by the *diving reflex* or, in other words, the reflex presented by certain *aquatic mammals* who breathe using lungs, besides humans, e.g.: whales and dolphins, that permits an immediate reduction in heart rate, provoking peripheral arterial vasoconstriction, or a reduction in the caliber of the arteries.

Deviation. When this occurs, in the vessels of the members and in all organs, which are not essential for survival, the blood is deviated from the extremities and the viscera that are not of immediate vital interest, such as the liver, spleen and intestines, in favor of the heart and brain.

Water. The diving reflex in humans – children or adults – is triggered when cold or freezing water suddenly covers the forehead and nose, deviating oxygenated blood from the members to the heart and brain through nervous signals.

Transfusion. This permits the heart to guarantee a weak, but constant, cerebral blood transfusion, while the coldness of the water reduces the vital oxygen requirements of the tissues. This mechanism is especially powerful in children.

Coma. In certain occurrences of this type, the drowning victim is retrieved frozen, with at least 4 negative *vital signs*:

1. **Heart.** The heart not beating.
2. **Respiration.** An absence of respiratory frequency.
3. **Temperature.** The temperature of the human body lower than 77 degrees Fahrenheit (25 degrees Celsius or centigrade).
4. **Pressure.** An abrupt drop in arterial pressure.

Other. Aside from these, 2 other *somatic signs* are visible to the naked eye: gray skin and fixed, dilated pupils.

Respirator. In these conditions, the patient is reheated, placed on artificial respiration equipment (mechanical respirator) and induced into a state of *barbiturate coma*, while given high doses of phenobarbital for a period of days (*Jornal do Brasil*; Rio de Janeiro; daily; year XCIII; N. 292; 27, January, 1984; p. 9; *Newsweek*; New York, NY; magazine; weekly; illus.; vol. CIII; N. 6; February 6, 1984; p. 47).

5. **Hypothermia.** The state of suspended animation and the phenomenon of voluntary burial should not surprise medical scholars, bearing in mind the existence of hypothermic surgery, *cerebral cryosurgery*, or artificial hibernation that were created based on the experience of saving those who drowned in cold waters, frozen lakes and snow avalanches (accidental hypothermia).

Surgery. In fact, the uncommon technique of suspended animation is being used with positive results in children and adults with uncomfortable and difficult surgical problems, the solution of which are impracticable using conventional means, due to: small organs; low body weight; intervention close to the heart, in open-heart surgery; and large volumes of blood.

Submersion. The phenomenon known as *submersion hypothermia* is the most important defense against brain damage. It works in the following manner: the extreme cold of the surrounding water, which is breathed into the lungs, cools the human body, lowering the metabolic levels, thereby reducing the need for oxygen in the brain.

Complements. The above-cited medical precautions – immediate heart massage, gradual increase in body temperature and induced coma state, which are also performed to protect the brain – are indispensable complements when ministering to certain drowning victims.

Reheating. In cases of surgery with induced hypothermia, or prolonged hypothermia, the patient – cooled to between 59 and 66.2 degrees Fahrenheit (15 and 19 degrees Celsius or centigrade), for example – has the blood circulation completely interrupted during the 30 or 45 minutes of the operation, given that the blood is reheated soon afterwards, reinitiating the heartbeat (*O Globo*; Rio de Janeiro; newspaper; daily; year 59; N. 18,240; 13, October, 1983; p. 12).

Stop. The human organism (soma) can conserve its integrity even after the stopping of the blood circulation (deliberately interrupted), and the heartbeats for 65 minutes (*Jornal do Brasil*; Rio de Janeiro; newspaper, daily; year 97; N. 42; May 20, 1987; p. 13).

Physiology. In light of the above considerations, it can be rationally concluded that the state of suspended animation is, above all, integrated with human physiology, or the body's natural defense mechanisms (immunity, immunology).

6. **Hypobiosis.** Russian scientists have created a method that provokes the state of hibernation in humans, called *hypobiosis modeling*.

Resistance. This process decelerates the development of illnesses and increases the organism's resistance. It is used successfully with infarct patients and in cases in which it is impossible to provide rapid, simultaneous assistance to many persons.

Thermo-regulation. This method limits or annuls the organism's thermo-regulation processes, giving it qualities of cold-blooded bodies without disturbing physiological functions.

Injection. In order to achieve the state of hypobiosis, it is necessary to apply an injection – at the specialist's discretion – to the patient.

Metabolism. Scientists have been able to achieve temperatures close to 32 degrees Fahrenheit (0 degrees Celsius), with a 90% reduction in metabolism.

Brain. In certain cases, the patient's heart stops beating; the blood is removed and substituted by a nutritive solution; the electroencephalogram shows no activity (*VEJA*; São Paulo, SP; magazine; weekly; year 21; N. 43; October 26, 1988; 2 illus.; p. 81).

7. **Zombification.** Certain scientists, anthropologists, psychiatrists and ethnobotanists are also not surprised by the state of suspended animation, or the phenomenon of voluntary burial, due to the occurrence of the legendary voodoo phenomenon of zombiism or zombification, in Haiti and in other areas of the Caribbean.

Bocor. On these occasions, the fearful *bocor* – the voodoo priest, a professional warlock, in this case – with the complicity of the individual's relatives, poisons the victim with a potion, a “zombi powder,” containing toxins that induce a state of coma, which is similar to the death of the physical body. This powder is composed of 3 ingredients extracted from different sources:

1. **Plants.** Plants which are skin irritants.
2. **Frog.** Frogs or *Bufo marinus* (bufotenine), the *cururu* or *bonga* frog.
3. **Tetrodotoxin.** Inflatable fish (prolonged psychotic state), which contains the neurological poison tetrodotoxin, an anesthetic 160,000 times more potent than cocaine.

Ritual. Less than 8 hours after the burial of the person who has been officially declared *dead* or, in other words, in a state of suspended animation from induced intoxication, or a lethargic state indistinguishable from clinical death, the bocor and his followers perform a voodoo ritual in the cemetery, the *cult of the dead*, or the ceremony of resurrection.

Reanimation. There they dig up the soil, exhume and reanimate the pseudodead with a paste – the “zombi cucumber” – applied to the skin, containing sweet potato and the hallucinogenic plant *datura stramonium*.

Intoxication. The resuscitated, zombi, or “walking dead,” being a female or male victim, having lost all control, sense of time, space and memory, not exactly aware of his/her situation, is kept in a state of permanent intoxication and is taken to work as a slave in the rural zones of Haiti.

Human vegetable. Zombis, bodies devoid of character and will, are recognized by their existence as a vegetable, their deeply distracted manner, pale face and blank, dead, almost glassy eyes (Bernardo, Stephanie; “Zombis”; *Science Digest*; New York, NY; magazine; monthly; illus.; vol. 92.; N. 2; February, 1984; p. 87, 88).

Retardation. Many of these unfortunate personalities, upon being resuscitated from zombification, are mentally disturbed and become victims of alcoholism, epilepsy, insanity or mental retardation.

Farce. There are, however, registered cases of some zombified persons who were able to survive and recount the tragic farce of the zombification process, being recognized by dozens of persons upon their reappearance, with relative lucidity, one to two decades after the occurrence, as with the well-known case of Clairvius Narcisse (*Time*; New York, NY; magazine; weekly; illus.; vol. 122; N. 17; October 17, 1983; p. 48); Francina Illeus (1976); Natagette Joseph (1966).

Ex-zombi. The *zombi savane* is the ex-zombi, the person who underwent burial, became a *zombi cadaver* and later returned to the living state.

Narcisse. According to the findings of the controversial ethnobotanist Wade Davis, the human body of Clairvius Narcisse – declared as being truly dead in the Albert Schweitzer Hospital in Deschapelles, in the Artibonite Valley, in Haiti – was placed in a freezer for 20 hours, and only then was removed for burial.

8. **Poisoning.** There are subtropical fish, such as *Diodon hystrix* or *fou-fou*, and the *Spherooides testudineus*, *crapaud de mer*, globefish or puffer, that possess the potent neurotoxin tetrodotoxin in the skin, liver, ovaries and intestines.

Paralysis. Tetrodotoxin induces a state of deep paralysis (state of suspended animation), marked by complete immobility, during which the boundary between human life and physical, biological or brain death is not absolutely defined, even for experienced physicians. The poison generally does not place the intraphysical consciousness in a state of suspended animation; the individual most likely passes through desoma due to respiratory paralysis.

Undefined. This undefined situation can lead to an individual being buried alive (premature burial).

Accidents. As a consequence of the above, accidental poisoning from the ingestion of puffer, and the subsequent states of suspended animation, occur in various places.

Japan. Notably in Japan, 4 species of puffer, all of the genus *Fugu*, are sold as a delicacy (gastronomy) by over 1,800 fishmongers in Tokyo alone.

Customers. There, not only the refined customers, but also many restaurant chefs become victim of their own cooking, or of accidental poisoning from puffer.

Heat. Heat (or, more precisely, the action of frying, grilling, baking or cooking) does not denature the tetrodotoxins.

Suicide. Without a doubt, the act of eating puffer or, in other words, practicing *Russian roulette with fish*, shows an undisguisable suicidal tendency (self-murder or senselessness).

Literature. Tetrodotoxin, inducing a state of suspended animation, has been exploited in literature.

Bond. In his spy novels, the British author Ian Fleming has his spymaster James Bond, succumb to the power of tetrodotoxin in the last scene of *From Russia, With Love*, and has him reappear, having come back to life, only in the second chapter of the next novel, *Doctor No*.

9. **Trance.** The deep trance sensitive can become extremely cold and can appear to be dead while in trance.

Psychosoma. In this case, projection of the consciousness in the psychosoma, laden with the holochakra, occurs and installs the parapsychic state of suspended animation. This can often last for two hours.

Paraphysiology. This parapsychic condition should be interpreted as being paraphysiological rather than pathological.

Astronautics. It is hoped that the state of suspended animation during voluntarily-induced hibernation by the fakir, for example, in the phenomenon of intentional burial, also favors the feasibility of future long-distance, long-term space flights by astronauts.

1. **Fleming**, Ian; *Doctor No*; 232 pp.; 20 chaps.; 17.5 x 10.5 cm; pocket; pb.; 4th reprint; New York, NY; Berkley Books; December, 1983; p. 15.

2. **Fleming**, Ian; *From Russia, With Love*; 248 pp.; 28 chaps.; 17.5 x 10.5 cm; pocket; pb.; 6th reprint; New York, NY; Berkley Books; March, 1984; p. 246.

66. EXTERIORIZATION OF MOTRICITY

Definition. Exteriorization of motricity: action of the motor force of the individual, who is projected in a parapsychic manner from the periphery (sensitivity) of the human body or soma, whether under the lucid impulsion of the will, in an unconscious manner, or provoked by another consciousness (extraphysical consciousness).

Synonymy: peripheral energy; repercussion of motricity.

Sketch. The exteriorization of motricity constitutes, to a certain extent, a glimpse of that which is fully produced during the phenomenon of projection of the human consciousness (intrapysical consciousness) in the psychosoma.

Projection. The exteriorization of motricity is a type of projection of the motor force of the vehicles of manifestation commanded by the consciousness. It is directly related to 3 phenomena:

1. The exteriorization of energies.
2. The vibrational state (VS).
3. Projective raps.

Telekinesis. The exteriorization of motricity produced through ectoplasm is one of the existing explanations for the phenomenon of telekinesis.

Instruments. Various instruments have been invented, planned and built in this last century of parapsychic experimentation, in order to measure the intensity of the exteriorizable motor force of the human being. The following 14 are examples:

1. **Biometer**, of Louis Lucas.
2. **Cylinders**, of J. Thoré.
3. **Dynamoscope**, of Collongues.
4. **Fluid motors**, of G. de Tromelin.
5. **Galvanometer**, of Puyfontani.
6. **Magnetometer**, of Fortin.
7. **Magnetoscope**, of Rutter.
8. **Pendulum**, of Briche.
9. **Psychometer**, of Góes, in Brazil.
10. **Sensitivometer**, of Gaston Durville.
11. **Spiricom**, of George W. Meek.
12. **Spiritoscope**, of Robert Hare (1781-1858).
13. **Sthenometer**, of Paul Joire.
14. **Volometer**, of Sydney Alrutz.

Consensus. Nevertheless, none of these, or even other apparatuses of energetic integration and interconscial communication between the conscial dimensions, have been able to achieve a universal consensus regarding their efficacy or efficiency in order for them to come to be used on a daily basis and be recommended here, by the author, as a reliable instrument.

Hope. It is always hoped that some instrument of this nature will arise for common use. Future generations will see.

Potentialiation. Interplanetary communication will be a fact in the future world state, on this planet. This occurrence will be able to potentiate the knowledge of humankind regarding this subject.

Bibliography: Andrade (29, p. 124), Blackmore (139, p. 215), Blunsdon (157, p. 143), Boirac (164, p. 278), Carrington (245, p. 246), Chaplin (273, p. 64), Delanne (381, p. 15), Dubor (421, p. 235), Dupouy (434, p. 127), Durville (436, p. 281), Fodor (528, p. 133), Frichet (557, p. 242), Lévrier (922, p. 21), Maxwell (1017, p. 301), Paula (1208, p. 138), Riland (1403, p. 96), Rochas (1428, p. 347), Schutel (1525, p. 21), Shepard (1548, p. 316).

67. EXTERIORIZATION OF SENSITIVITY

Definition. Exteriorization of sensitivity: parapsychic transport of the individual's sensory functions outside the periphery of his/her human body or soma.

Synonymy: ectesthesia; exteriorization of the *sensorium*; parapsychic sensitivity; perispiritual irradiation; repercussion of sensitivity.

Projection. The exteriorization of sensitivity is a type of projection – almost always through hypnotic resources – of the sensations that reach the intraphysical consciousness, thus triggering a dislocation of the holochakra and/or the psychosoma.

Layers. According to Eugene August Albert De Rochas D'Aiglun (1837-1914), parapsychic sensitivity begins to exteriorize itself at the edges of an energetic layer which is parallel to the human body and situated approximately 1 3/8" (35 mm) from the skin. The second sensitive layer exteriorizes itself from 2 3/8" to 2 3/4" (6 or 7 cm) beyond the first.

Reunification. In this phenomenon, the projection of the holochakra and/or psychosoma occurs with the appearance of parapsychic sensitivity in the layers next to the skin, until the (almost always humanoid) form is composed by the union of two nebulous columns – a blue one on the right and a red one on the left – wherein only a temporary separation appears, followed by the reunification (reaggregation) of the polarization of the holochakra and/or psychosoma.

Charges. The phenomenon of exteriorization of sensitivity shows that the psychosoma – or, more specifically, the holochakra, the so-called *body of energy*, or body of vitality – presents negative and positive charges that interact among themselves (polarization).

Question. What is the precise relationship that this has with the *nadis*, energetic points and meridians of acupuncture and do-in (acupressure)?

Senses. The facts show that, through the functions of the holochakra and the psychosoma, there is an effective relationship between the phenomenon of exteriorization of sensitivity and the phenomena of transposition of the senses or dermo-optic vision.

Bibliography: Blackmore (139, p. 183), Blunsdon (157, p. 144), Boirac (164, p. 271), Bozzano (184, p. 156), Carrington (245, p. 246), Chaplin (273, p. 64), Crookall (333, p. 61), Delanne (382, p. 160), Depascale (392, p. 39), Dubor (421, p. 215), Dupouy (434, p. 79), Durville (436, p. 272), Erny (483, p. 78), Flammarion (524, p. 63), Fodor (528, p. 133), Frichet (557, p. 142), Geley (583, p. 76), Larcher (887, p. 338), Lévrier (922, p. 54), Maxwell (1017, p. 301), Morel (1086, p. 75), Paula (1208, p. 138), Riland (1403, p. 96), Rochas (1429, p. 47), Roure (1479, p. 111), Schutel (1525, p. 21), Shepard (1548, p. 317), Targ (1651, p. 78), Tondriau (1690, p. 227), Wauthy (1803, p. 93).

68. FALSE ARRIVAL

Definition. False arrival: prior announcement of the physical arrival of the projector to a residence, effected by the anticipated presence of his/her consciousness – projected in the psychosoma – in unaccustomed physical manifestations perceived by intraphysical beings (intraphysical consciousnesses).

Synonymy: notice of approximation; parapsychic announcement; phenomenon of arrival; *vardager* (Spain); *vardögr* (Swedish term used to signify the perception of approximation of a person before he/she is seen or heard).

Mechanisms. In the phenomenon of false arrival, the projected projector sometimes acts as the emissary of his/her own pending arrival, which is often awaited, acting in an unconscious manner, subsequently ignoring the fact of having been to that place.

Morphothosenes. His/her behavior during the occurrence seems mechanical, like a *somnambulant ghost*, or a projection of morphothosenes or thought-forms.

Factors. The following 6 predisposing factors seem to influence the triggering of *vardager* and even the most minor varieties of this type of phenomena:

1. **Population.** A sparse local human population.
2. **Isolation.** The physical isolation of intraphysical beings (intraphysical consciousnesses).
3. **Solitude.** The psychological condition of existential solitude of individuals.
4. **Altitude.** The high altitude of a location.
5. **Climate.** The lack of sun during many months of the year in a human environment.
6. **Hereditariness.** Some hereditary quality of the persons involved in the phenomenon.

Interpersonal. There must also be other interpersonal or assistential factors that have an exceptional influence, such as: cooperation, material help or support.

Psychosoma. According to previous observations, the psychosoma or emotional parabody plays an important role in the phenomenon of false arrival, as there is a predominance of certain emotional reasons in its causes, such as: kinship, friendship, solitude, physical isolation, a sad environment (holothosene, materthosene), self-absorption, longing and others of a like nature.

Regions. The *vardager* – the messenger phenomenon – occurs in 8 specific regions:

1. Nordic villages in general.
2. Northern Europe.
3. Norway.
4. Sweden.
5. Denmark.
6. Scotland.
7. Basque Country.
8. Galicia, in Northern Spain.

Subhumans. However, *vardager* has been observed among primitive people and subhuman animals.

Universality. The phenomenon of false arrival is more universal than might be imagined, because it arises in areas other than those just cited, albeit more rarely.

Case study. A good example of this is the case that occurred in Birmingham, England in 1833, reported in 1890 by Alexander Nikolayevich Aksakof: 1832-1903 (Aksakof, 9, p. 560).

Effects. Among the physical effects produced by the projected consciousness in *vardager*, and detected by those present, the sounds of 5 human actions can be singled out:

1. **Steps.** Hearing steps on the floor, stairs or hallway.
2. **Doors.** The noise of opening doors.
3. **Coat.** The act of taking off a coat (jacket).
4. **Luggage.** The placement of luggage in its usual place.
5. **Umbrella.** The act of placing an umbrella in the umbrella stand.

Daily. In specific areas where the phenomenon habitually occurs, false arrival is an almost daily phenomenon. In some cases, it operates with such precise timing that the housewife waits for this announcement in order to heat the food.

Announcements. We should not fail to establish the correlation between the phenomenon of false arrival and the *approach announcement* or, in other words, the inexplicable ideas of an imminent encounter with someone, which can occur through an auditory perception, whether during a dream or during the ordinary, physical waking state.

Bibliography: Aksakof (09, p. 560), Andreas (36, p. 48), Battersby (92, p. 95), Black (137, p. 20), Blackmore (139, p. 11), Bonin (168, p. 513), Digest (400, p. 175), Fodor (528, p. 246), Garrett (571, p. 51), Gauld (575, p. 163), Greenhouse (636, p. 175), Haynes (696, p. 263), Heine (706, p. 183), Holroyd (736, p. 108), Jaffé (798, p. 155), Knight (851, p. 94), Leaf (905, p. 91), Muntañola (1108, p. 83), RPA (1481, p. 21), Smith (1572, p. 90), Steiger (1601, p. 94), Vieira (1762, p. 15), Wereide (1822, p. 3).

69. PROJECTIVE HETEROSCOPY

Definition. Heteroscopy: the faculty and act whereby the projected consciousness sees the interior of the human body, organs and phenomena of the vegetative life of other persons or animals.

Synonymy: heterognosia; heteropsy; heteroscopic metagnomy; heteroscopic vision; metasomoscopia; *inter vivos* clairvoyance; xenoscopy; X-ray vision of another.

Extension. Heteroscopy can be of two categories, in terms of extent:

1. Partial or segmented.
2. Total or complete.

Quality. Heteroscopy can be of two categories, in terms of the quality of the consensual principle:

1. Human or pertaining to the intraphysical consciousness.
2. Subhuman or animal.

Organ. The more common phenomenon is when the consciousness sees the organ, organs, or the limited area of the human body or soma of another person that is affected by some disturbance.

Diagnosis. In most cases, heteroscopy is not pathological, becoming an extraordinary resource of projective diagnosis, especially in the phenomena of traveling clairvoyance provoked in order to provide assistance.

Evidence. Heteroscopy annuls the hypothesis of psychoanalysts who attribute the cause of autoscopy to narcissism or self-fascination.

Narcissism. If there are persons who also see the structure of the human body of others, or even the physical body of animals in general, then the 3 phenomena demonstrate affinity, do not have only one cause and are not derived only from the emotionalisms of the consciousness. In summary: narcissism cannot rationally be the main cause of heteroscopy.

Bibliography: Bonin (168, p. 227), D'arbó (365, p. 164), Kolosimo (858, p. 157), Tondriau (1690, p. 198).

70. PHYSICAL MULTILOCATION

Definition. Physical multilocation: the apparently simultaneous presence of a person in 3 or more different places through parapsychic means.

Synonymy: multiple physical locations; phenomenon of ubiquitousness; phenomenon of ubiquity; physical trilocation.

Multiplication. In fact, it can be admitted, as a working hypothesis, that the phenomenon of multiplication of the forms of consensual manifestation does not refer to or should not be restricted to only 3 locations, since it sometimes occurs in various locations at the same time.

Transferences. The consciousness cannot be divided into two, three or many parts, as it is concluded by observations of the phenomena of double awareness. This is because a single consciousness is not able to manifest itself actively and consciously in 2 or more different locations at the same time.

Seat. The consensual seat always remains in only 1 place, despite transferring itself from 1 vehicle or location to another with the instantaneity of thought.

Forms. The phenomenon of physical multilocation seems to be due to the attribute of the multiplicity by way of which the consciousness almost always unconsciously projects its morphothosenes (thought-forms), aided by the energetic resources of the holochakra, having the appearance of the shape of its human body.

Note. The phenomenon of *physical multilocation*, which can also be called *physical trilocation*, should not be confused with the phenomenon of *physical-extraphysical trilocation*, or with double projection, or with the attribute of multiplicity of the psychosoma, which permits physical multilocation. These are 2 phenomena and 1 attribute that are completely different from each other.

Bibliography: Crouzet (344, p. 539), Delanne (382, p. 175), Muntañola (1108, p. 92), Owen (1177, p. 255), Sculthorp (1531, p. 135), Yogananda (1894, p. 289).

71. PROJECTIVE PARAPYROGENESIS

Definition. Projective parapyrogenesis: combustion in the intraphysical dimension caused by the consciencial energies of the projected human projector.

Synonymy: *inter vivos* parapyrogenesis; projective parapsychic combustion; projective pyroparaphoresis.

Poltergeist. In the phenomenon of parapyrogenesis – which is frequent in cases of poltergeist – sudden combustion occurs in environments and even with objects, such as clothes kept in a hermetically sealed trunk.

Types. Projective parapyrogenesis, like projective typtology, is a rare phenomenon. The projector's consciousness hardly ever precisely recalls the act performed in the extraphysical dimension with effects in the physical dimension, it thus being an unconscious phenomenon.

Incendiary. The projected projector responsible for projective parapyrogenesis is an unconscious incendiary, but is nevertheless not a pyromaniac.

Bibliografía: D'arbó (365, p. 229).

72. PROJECTIVE PNEUMATOPHONY

Definition. Projective pneumatophony: the type of physical phenomenon of a direct voice that is directly sponsored by a projected intraphysical consciousness.

Synonymy: communication by independent projective voice; direct projective voice; *inter vivos* pneumatophony; projective autophony; projective mistepphony.

Theory. According to the most widely accepted theory, the phenomenon of direct voice, through physical effect sensitives (ectoplast), derives from 1 artificial larynx, which is constructed by a communicant intelligence.

Box. This *voice box* works like a material megaphone.

Semimaterialization. In this case, the phenomenon of semimaterialization occurs.

Sonorous. The phenomenon of projective direct voice is a type of sonorous projection.

Bibliography: ADGMT (03, p. 289), Cavendish (266, p. 73), Chaplin (273, p. 48), Fodor (528, p. 92), Gaynor (577, p. 49), Greenhouse (636, p. 139), Martin (1003, p. 43), Morel (1086, p. 180), Paula (1208, 171), Zaniah (1899, p. 483).

73. PROJECTIVE POLTERGEIST

Definition. Poltergeist (German: *poltern*, noisy; *geist*, ghost, little devil): intelligent phenomena, noises, diverse physical alterations or disturbances that are normally inexplicable.

Synonymy: haunting of the living; infestation; *inter vivos* poltergeist; metakinetics; metapathogeny; metapsychorrhagia; parapsychic riot; phenomenon of haunting; projective poltergeist; *rabbat*; RSPK (Recurring spontaneous psychokinesis); spontaneous recurrent psychokinesis; *televasia*; thorybism; thorybus.

Phenomenology. The following are 13 basic phenomena, among others, which compose the phenomenological complex of **poltergeist** occurrences:

1. **Transport.** The spectacular transporting of objects.
2. **Lithotelergy.** Flying rocks (lithotelergy).
3. **Violence.** Actions that are sometimes violent.
4. **Apport.** Abnormal movement of heavy furniture (*apport*).
5. **Falling.** Falling plates, silverware, cups and other fragile objects.
6. **Cracking.** Surprising cracking noises.
7. **Currents.** Air currents.
8. **Doors.** Slamming doors.
9. **Marks.** Marks, scratches, drawings and writing on walls and floors (*interdimensional thosenic signatures*).
10. **Parapyrogenesis.** Spontaneous parapsychic combustion (parapyrogenesis).
11. **Odors.** Diverse odors.
12. **Apparitions.** Apparitions of ghosts.
13. **Hauntings.** Hauntings or the occurrences in places said to be *haunted*.

Epicenter. Poltergeist occurrences are generally attributed to extraphysical consciousnesses in the proximity of a focal person of the phenomena, who is the source of energy responsible for the mechanics involved in the movement of objects (psychokinesis). This person is almost always a child or adolescent who, in this case, is called a *phenomenological epicenter*.

Categories. There are 3 categories of distinct occurrences in so-called poltergeist phenomena: poltergeists per se; the phenomena of haunting; and projective poltergeists.

1. **Poltergeists.** Poltergeists manifest themselves in 3 ways:
 - A. A benevolent manner.
 - B. A prankish manner (immaturity of extraphysical consciousnesses).
 - C. A destructive or malevolent manner (anticosmoethical).
2. **Locations.** Certain researchers separate the poltergeist – manifestations that change locations, accompanying the phenomenological epicenter – from haunting, which are manifestations connected to a specific location, whether a house, castle, cemetery, building, farm, hospital, church, palace, prison, barracks, or country house, and which occur independent from the existence of an epicenter. In this case, there is a drop in ambient temperature and photographable ghosts sometimes arise.
3. **Projective.** Aside from customary poltergeist events, with their abovementioned causes, it is necessary to add the sporadic cases of haunting, especially manifestations that demonstrate an intelligent presence and are produced by a projected intraphysical consciousness that is either aware or unaware of its extraphysical actions. These phenomena can occur with or without the interference of extraphysical consciousnesses, whether the manifestations be extraphysical telekinesis, physical bilocation, raps or other similar occurrences.

Practices. The epicenter should not be considered an absolute rule for the occurrence of poltergeist. Depending upon its modalities, it can be produced by a projected intraphysical consciousness or by one or more extraphysical consciousnesses. It is also thought that poltergeist is induced from a distance through empirical magical practices, such as those occurring in Brazil with *quimbanda*.

Recurrence. When repeated hauntings are produced by the intraphysical projector, it is due to recurring projections – either lucid or nonlucid – in which case the individual's subconscious will be acting.

Planetary. It should be pointed out here that consciential energy and the widespread occurrences of poltergeist suggest the theory of planetary or cosmic poltergeist in order to explain a considerable number of the apparitions that are typical of UFOlogy.

Bibliography: Aksakof (09, p. 540), Amadou (21, p. 67), Andrade (27, p. 190), Bayless (95, p. 102), Bonin (168, p. 402), Boswell (174, p. 133), Bozzano (194, p. 118), Carrington (251, p. 231), Carton (252, p. 224), Cavendish (266, p. 196), Chaplin (273, p. 122), Chauvin (275, p. 154), Currie (354, p. 106), D'arbó (365, p. 175), Day (376, p. 102), Delanne (385, p. 216), Digest (401, p. 374), Eysenck (493, p. 101), Fodor (528, p. 291), Foin (532, p. 88), Frazer (549, p. 264), Gaynor (577, p. 141), Grant-Veillard (623, p. 110), Grattan-Guinness (626, p. 123), Greenhouse (636, p. 58), Holms (735, p. 238), Holzer (743, p. 196), Kardec (825, p. 166), Lee (908, p. 162), Martin (1003, p. 94), Morel (1086, p. 143), Paula (1208, p. 69), Pratt (1285, p. 118), Randall (1369, p. 51), Rogo (1453, p. 241), RPA (1481, p. 104), Salomon (1497, p. 119), Shepard (1548, p. 718), Spence (1588, p. 325), Steiger (1601, p. 97), Still (1622, p. 165), Sudre (1630, p. 359), Tinoco (1685, p. 34), Tondriau (1690, p. 267), Walker (1781, p. 17), Watson (1800, p. 138), Wedeck (1807, p. 285), Wilson (1855, p. 196), Wolman (1863, p. 382), Zaniah (1899, p. 362).

74. FAREWELL CONSCIENTIAL PROJECTION

Definition. Farewell consciential projection: the extraphysical goodbye visit of the consciousness of the moribund individual, or the dying intraphysical personality, to someone (whether a relative, friend or acquaintance), at the critical moment of the transition of biological death, in the deactivation of his/her physical body, or in his/her *first posthumous minute*.

Synonymy: consciential anti-twilight; consciential farewell apparition; critical apparition; critical projection; *inter vivos* farewell apparition; projection of the first desoma.

Sensations. In the farewell consciential projection, a common and universal occurrence, the agent, or the visitant-projector, can be seen, heard, or merely have its extraphysical presence sensed by another, the visited-percipient social being, which may be an adult, child or subhuman animal, especially a dog.

Motivation. The main motivation that promotes the farewell lucid projection resides in affection, whether it is a bond of kinship, romance or deep friendship.

Suicide. There are registered cases of farewell consciential projections produced by suicides, which proves the existence, as incredible as it may seem, of *suicide-projectors* or, in other words, those who produce final projection through suicide.

Survival. In most cases, the farewell consciential projection constitutes irrefutable individual proof for the percipient of survival of the consciousness after the death of the human body.

Objective. Besides being a final goodbye, this proof of survival often seems to represent the greater objective of the phenomenon, which may be produced with or without the aid of helpers.

Romanticism. Looked at in another way, in many instances, the farewell consciential projection is a final projection that is enriched with the charm of leave-taking by someone who is loved, or a case of romantic biological death.

Categories. There are two modes or categories of final projection (projection without interiorization, projection without return), according to the qualification of the *consciousness-agent*:

1. Lucid.
2. Nonlucid.

Desomatics. The farewell lucid projection only happens because the consciousness is concluding the trance (shock) experience of the first desoma (deactivation of the human body), but has still not gone through the second desoma, the deactivation of the holochakra.

Holochakrality. In this second condition, it becomes far more difficult for the consciousness to manifest to human beings, because its decreased density, or the different degree of the frequency of its energies, distances it from human reality and the possibility of direct intervention in the intraphysical, human or dense dimension.

Pattern. The typical farewell consciential projection generally follows a pattern-sequence of 4 manifestations:

1. **Surprise.** The percipient prepares to go to bed or to go out, whereupon the image or figure of the visitant, a loved one, suddenly and unexpectedly appears before him/her.

2. **Goodbye.** The apparition, clearly identified by the visited-percipient, not only presents a perfect figure, but also the clothing and even the objects of personal use (hat, necklace, glasses, pipe, watch, ring), sometimes smiles and waves goodbye or demonstrates affection.

3. **Disappearance.** After a brief period of time, the apparition silently disappears from the sight of the perceptive intraphysical consciousness.

4. **Confirmation.** Soon after the critical apparition, the percipient receives notice that the visitant's personality has just departed human life at a distant location, and at the exact date and moment of the phenomenon's occurrence, due to the matching time (simulcognition, synchronicity).

Evidence. The simultaneousness nature of the apparition and biological death, as well as the visited person's unawareness of the friend's passing away, serve to rationally remove the hypothesis of visual hallucination and provide significant evidence for the authenticity of this type of consensual projection.

Cord. The silver cord is doubtless a key factor in the phenomenon of the farewell consensual projection.

Rupture. A great number of occurrences happen when the silver cord is rupturing, or immediately after its rupture and the consequent liberation of the psychosoma.

Psychosoma. Thus, in certain cases, the farewell consensual projection constitutes an extreme projection of the psychosoma, practically without the silver cord, being the final act of leave-taking by the intraphysical consciousness, or the *recent-extraphysical-consciousness*, that intraphysical consciousness which has just returned to its condition as an extraphysical consciousness in the intermissive period.

Indirect. Indirect (ricochet) farewell consensual projections also occur in which the intraphysical percipient – the target-being of the projector – is not able to perceive the extraphysical presence and manifestations of the agent undergoing desoma, which are providentially performed by another person who is physically close and parapsychically more sensitive, and who may never have met the agent undergoing desoma in intraphysical life.

Case study. Thus, for example, upon passing through desoma, the brother visits his sister, who does not detect his presence, but the event is perceived in detail by the sensitive babysitter, who is beside her on that occasion, taking care of her child, the nephew of the individual who underwent desoma.

Aspects. The facts show 2 relevant aspects regarding farewell consensual projections:

1. **Frequency.** The farewell consensual projections involving indirect percipients suggest that a far greater number of these phenomena occur than the amount actually registered because the percipients are not able to confirm the presence of the agents that are undergoing desoma.

2. **Reduction.** The evolution and intensification of modern human means of communication, in this era of acceleration of human history, have contributed to a considerable reduction in the motivation that led intraphysical consciousnesses in the process of desoma to seek their loved ones and bid them farewell. Mobile phones, international and long-distance phone calls, faxes, rapid means of transportation, including air transportation, radio transmissions, Internet, e-mail, as well as print and televised media, have reduced the distance between intraphysical beings, since they can always be together when necessary or when they wish.

Animals. The farewell projection also occurs with extraphysical animals, especially pet dogs.

Barks. In these cases, the dog announces its own desoma with persistent loud extraphysical barks, which end up being perceived and waking up the deeply sleeping owner who gets up and finds the animal's physical body already cooling or even cold in another area of the house, far from the owner's bedroom.

Joining. Various categories of lucid projection can present themselves joined into a single one. The following 3 occurrences serve as examples:

1. **Farewell.** A farewell consensual projection occurs.
2. **Final.** This farewell projection is also an intraphysical consciousness' final consensual projection.
3. **Sonorous.** This final projection can develop into a sonorous consensual projection.

75. PROJECTIVE PSYCHOPHONY

Definitions. Projective psychophony (Greek: *psykhé*, soul; *phonos*, sound): the act whereby a projected intraphysical consciousness (the communicant) speaks, while incorporated, through the human body and vocal mechanism of another intraphysical consciousness (the sensitive) whose vehicles of manifestation are coincident; communication of an extraphysical consciousness through the psychosoma of the intraphysical consciousness which is projected to denser extraphysical dimensions.

Synonymy: normal projective possession; projective incorporation.

Categories. Thus, by definition, there are two categories of projective psychophony: human projective psychophony and extraphysical projective psychophony.

1. **Human.** In human projective psychophony, the phenomenon occurs through two intraphysical consciousnesses – the projected incorporator and the other normal intraphysical consciousness – according to the above definition.

2. **Extraphysical.** In extraphysical projective psychophony, the phenomenon occurs through an intraphysical consciousness, or a projected-intraphysical-projector, a sensitive, and an extraphysical consciousness, the communicant.

Personality. In *common human incorporation*, the sensations are very well-defined for the sensitive, as though someone had put their own body onto the sensitive, in the same way that someone usually puts on clothing.

Sense. In this case, the clear, incontrovertible sense of being another person, or personality, arises within oneself.

Sensations. The human psychophonic sensitive (*channel*), when incorporated, actually feels the sensations of his/her own body as if they were another person's. The following 9 variables are examples:

1. The condition of an aged, weak person.
2. A young woman who is healthy and full of life.
3. A lady with a high-pitched voice and arthritic joints.
4. The melancholy and hopelessness (extraphysical melancholy) of a suicide.
5. The broken leg of an accident victim who underwent desoma.
6. Whether a person is heavy or thin, tall or short, man or woman, adult or child.
7. The way that consciousness used to walk when in the condition of a person in intraphysical life.
8. The manner of speech characteristic in timbre and tonality to the former human personality.
9. The memory of another intelligence that possesses him/her temporarily but completely.

Psychosoma. In *extraphysical projective incorporation*, the same situation occurs, with the same, albeit more refined, sensations. What changes is the vehicle of manifestation, now no longer the human body, but the psychosoma and all of its energetic appendices in operation, such as the holochakra, the chakras and the silver cord.

Bibliography: Currie (354, p. 107), Gooch (617, p. 6), Morel (1086, p. 148), Paula (1208, p. 82), Turvey (1707, p. 177), Vieira (1762, p. 80), Zaniah (1899, p. 369).

76. HUMAN PROJECTIVE PSYCHOPHONY

Definition. Human projective psychophony: that phenomenon in which the projected-projector intraphysical consciousness manifests as a communicant, speaking through the vocal mechanism of the human body of an intraphysical sensitive.

Synonymy: human projective incorporation; *inter vivos* psychophony.

Circles. In the nineteenth century, animic-parapsychic study circles were organized in two distant cities wherein the persons would simultaneously meet and communicate between themselves through the sensitives of the circles, through the phenomenon of human projective psychophony.

Telepathy. The events occurred in such a manner as to definitively exclude the possibility of telepathic interference or the direct interference of other animic or intraconsciential phenomena.

Locations. The most well-known circles at that time were those in Boston and New York, in the United States of America.

Movement. The projected intraphysical consciousness can manifest through psychophony while its human body is being carried by a vehicle in motion or, in other words, in a mobile physical base, at the same instant of communication.

Aksakof. In 1890, Alexander Nikolayevich Aksakof (1832-1903), gave a detailed report of one of these cases that occurred in 1882.

Categories. The categories of manifestants – intraphysical consciousnesses – who communicate through a psychophonic sensitive, can be quite diverse. The following are 7 examples:

1. A healthy person.
2. An ill person.
3. A psychopath (mentally insane).
4. A person who is aware of his/her experience after the fact.
5. A person who is unaware of the fact, after its occurrence.
6. Another sensitive.
7. An assassination victim (simultaneously).

Personism. *Personism* is the manifestation of the animist's intraphysical consciousness through the vocal mechanism of his/her own human body, situating and characterizing the entirety of his/her personality in another of his/her previous existences (generally the one immediately prior to the present one) to which he/she temporarily mnemonically regressed (intrusive personality).

Psychopathology. Many instances of *personism* are restricted to the parapatology of the mentalsoma and can even manifest as undeniable paraclinical profiles of multi-existential self-intrusion.

Interference. It is evident that the reference made here to human projective psychophony is based on the indispensable premise of the anticipated exclusion of any possible interference and confusion with instances of voluntary or involuntary *personism* – or that which is consciously or unconsciously generated (mystification, fraud, simulation) – from the phenomenon being studied.

Bibliography: Aksakof (09, p. 534), Currie (354, p. 108), Turvey (1707, p. 178).

77. EXTRAPHYSICAL PROJECTIVE PSYCHOPHONY

Definition. Extraphysical projective psychophony: the phenomenon in which the projected-projector intraphysical consciousness makes itself passive as a sensitive to another consciousness (extraphysical consciousness) – that is generally presumed to be more evolved – which manifests through the projector's psychosoma in the paratropospheric extraphysical dimension.

Synonymy: extraphysical projective incorporation.

Uses. Extraphysical projective psychophony permits intermediation between consciousnesses that are situated in very different extraphysical dimensions.

Extraphysical consciousness. Through the projector, the extraphysical communicant consciousness does not need to densify its psychosoma in the less evolved, denser dimension and performs this densification in a gradual manner, using the projected intraphysical sensitive for this purpose.

Energy. The intraphysical sensitive projector, when projected – as it carries a greater intensity of human, consciential energy – is better suited to extraphysical psychophony in environments or communities that are near the terrestrial crust, even more than the extraphysical consciousnesses that inhabit this location during their intermissive period.

Looseness. The facts demonstrate that human parapsychic manifestations occur through the looseness of the holochakra or, in other words, are based upon the principle of dis coincidence of the vehicles of manifestation of the intraphysical sensitive.

Discoincidence. It is presumed that the same principle of the condition of dis coincidence is also in effect for diverse extraphysical parapsychic manifestations.

Dimensions. Just as with intraphysical sensitives, these dis coincidences must also occur in analogous manifestations in the extraphysical dimension, either with the projected intraphysical sensitive or the extraphysical sensitive consciousness at the moment of parapsychic manifestation through the extraphysical-communicant from the more evolved extraphysical environment.

Mentalsoma. In this last case, the parapsychic manifestation – occurring without an intraphysical consciousness – seems to happen based on the same principle of dis coincidence, but in this instance with the *looseness of the mentalsoma* of the extraphysical-sensitive-consciousness in relation to the extraphysical head (parahead) of its psychosoma. This is because, in such a situation, it has neither a holochakra nor a human body.

Bibliography: Vieira (1762, p. 81).

78. PROJECTIVE PSYCHOGRAPHY

Definition. Projective psychography: a type of parapsychic writing in which the consciousness of the projected intraphysical communicant – at a distance from its human body – writes through the sensitive psychographer.

Synonymy: *inter vivos* psychography; projective automatic writing; projective automatography; projective transcriber parapsychism; psychographic projection; psychography between living persons.

Mentalsomas. Projective psychography sponsored by the consciousness of the intraphysical projector through the human sensitive generally occurs by way of projection of the consciousness in the psychosoma, although the connection of the energetic, consciential, parapsychic wave or mental wave is effected through the mentalsomas of both.

Categories. Projective psychography can be classified into two basic categories:

1. **Direct.** In direct, manual and involuntary projective psychography, the projected human consciousness takes direct control of the motor force writing mechanism, namely the vehicles of manifestation of the intraphysical mechanical sensitive, especially the human body, the nervous system, an arm, a hand and, besides this, the pencil that is held by the sensitive's fingers, being a less difficult and more practical process for the interdimensional transmission of thought through writing.

2. **Indirect.** In indirect, projective psychography, the projected human consciousness can use the most difficult, inconvenient and always rarest resources of the primitive mechanical means of interdimensional transmission of thought through writing, namely through a device such as the funnel or planchette used by the sensitive, almost always with the help of a human assistant who is not a developed sensitive.

Rarity. *Inter vivos* psychography has always been and continues to be rare in any of its categories, manifestations and types of psychographer sensitives. Nevertheless, the phenomenon logically does occur.

Phenomenology. The following 4 phenomena, which involve the human personality, are interconnected or intimately connected to psychography:

1. Intuition.
2. Hypnosis.
3. Telepathy.
4. Clairvoyance (less frequent).

Bibliography: ADGMT (03, p. 245), Bardon (80, p. 384), Chaplin (273, p. 127), Fodor (528, p. 317), Gaynor (577, p. 147), Kardec (825, p. 191), Martin (1003, p. 102), Morel (1086, p. 149), Paula (1208, p. 83), Shepard (1548, p. 753), Zaniah (1899, p. 369).

79. PROJECTIVE RAPS

Definition. Projective raps: knocking noises or percussive sounds of varying intensity – in this case without a visible, known or normal cause – that are produced by a projected intraphysical consciousness.

Synonymy: animic crepitations; *inter vivos* raps; knocks; projective banging; projective percussive sounds; projective rapology; projective typtology; rappings by the projector; raps; scrapes; sonorous knocks; typtological noises; typtological sounds.

Categories. The phenomena of knocks and percussive sounds of extraphysical origin can be classified into 4 categories: parapsychic, animic, internal and typtological.

1. **Parapsychic.** Cracking noises, physical knocks or raps that are provoked by an extraphysical consciousness, and are usually somewhat familiar.

2. **Animic.** Sporadic cases of dull, weak, light, clear and distinct, or even resounding banging noises that are heard by intraphysical beings and are either consciously or unconsciously produced by the projected intraphysical consciousness, with or without interference on the part of extraphysical consciousnesses. They are typical occurrences of exteriorization of motricity.

3. **Internal.** These are banging noises of an extraphysical origin, produced inside the actual wood of a piece of furniture, or material of the room of a house, without any type of external movement (*endokinesis*).

4. **Typtological.** This is the application of the method of communication, or language – through bangs and knocks which, by agreement, can be separately associated with different letters of the alphabet – which is called typtology (Greek: *typtô*, strike; *logos*, study), or grammatology.

Telekinesis. Strictly speaking, projective raps generally constitute sonorous manifestations of extraphysical telekinesis.

Energies. The production of raps of any type requires the intense application of consensual energies, or more precisely, of ectoplasmy.

Bibliography: ADGMT (03, p. 252), Ambelain (23, p. 73), Bardon (80, p. 325), Chaplin (273, p. 129), Crouzet (344, p. 340), D'arbó (365, p. 270), Digest (399, p. 275), Durville (436, p. 302), Fodor (528, p. 321), Morel (1086, p. 154), Muldoon (1105, p. 275), Myers (1114, p. 454), Paula (1208, p. 103), Pearsall (1215, p. 195), RPA (1481, p. 173), Schatz (1514, p. 199), Shepard (1548, p. 766), Spence (1588, p. 335), Wedeck (1807, p. 300), Zaniah (1899, p. 379).

80. EXTRAPHYSICAL TELEKINESIS

Definition. Extraphysical telekinesis (Greek: *tele*, at a distance; *kinesis*, action, movement): physical action at a distance – such as the movement of physical objects – provoked directly by the intraphysical consciousness which is projected from the human body, especially using the energies of the holochakra and the components of the psychosoma for this purpose (see fig. 80, page 1,123).

Synonymy: extraphysical PK; extraphysical psychokinesis; extraphysical telekinesis; extraphysical telekinesis; *inter vivos* telekinesis; projective parapsychokinesis; projective PK; projective psychokinesis; projective telekinesis.

Psychokinesis. The term *psychokinesis* defines the type of movement, or action, provoked by the consciousness, or the interaction of persons with objects in the environment.

Movement. The term *telekinesis*, on the other hand, defines movement, or action, at a distance from the consciousness – intraphysical, in this case – without the use of any resource of conventional physical manifestation. These terms are indiscriminately used here as though they were synonyms.

Effects. Among the effects generated by the energies of the intraphysical consciousness projected from the human body (projective PK), the following 10 can be listed:

1. **Metaphanism.** Annihilative effects (disappearance of objects; metaphanism).
2. **Biology.** Biological effects (e.g., exteriorization of therapeutic consciential energies).
3. **Combustion.** Combustive effects (the reduction of objects to ashes).
4. **Electromagnetism.** Electromagnetic effects (action upon electrical circuits).
5. **Electrochemistry.** Electrochemical effects (action upon batteries).
6. **Structure.** Structural effects (action upon the physical-chemical properties of objects).
7. **Photogenic.** Photogenic effects (generation of light).
8. **Mechanics.** Mechanical effects (alteration of the kinetic state of objects).
9. **Chemistry.** Chemical nuclear effects (action upon the nature of the chemical elements of objects or the transmutation of objects).
10. **Acoustics.** Sonorous effects (generation of sounds; projective raps; sonorous projection).

Aspects. With the accumulation of experiences, plus the fruitless attempts and the very low rate of success, the lucid projector detects 5 important aspects in the phenomenon of telekinesis provoked by the projected intraphysical consciousness:

1. **Energy.** The extraphysical execution of the movement of any physical object, as insignificant as its weight and volume might be, requires an enormous expenditure of consciential energy.
2. **Charging.** Some objects, especially those of personal use, remain charged with energy and appear luminous to the perceptions of the projected intraphysical consciousness. This charged energy can negatively (against) or positively (in favor) influence telekinetic movement.
3. **Consciousness.** Extraphysical telekinesis, generally born of will, as incredible as it may seem, can be triggered in an unconscious manner by the projected intraphysical consciousness in certain circumstances, even with the assistance of a helper, which is also unperceived by the projector.
4. **Carrying.** In many cases, the physical object only moves when acted upon not only by the will, but also when carried by the extraphysical hands (parahands) of the intraphysical consciousness in the psychosoma, which is in a condition of greater density, thereby taking it from one place to another and even being able to use lucid volitation for this purpose.
5. **Damage.** An extraphysical trauma endured by the projected intraphysical consciousness, at the exact moment that the object is being moved from one place to another, can have an influence upon this action. Depending upon the nature of its structure and the conditions, this can cause its fall and consequent damage.

Case Study. The author extraphysically saw a glass picture frame break on the floor during one of his attempts at extraphysical telekinesis. The object's owner, who was parapsychically insensitive to the extraphysical presence, later attributed the domestic occurrence to a breeze that did not exist in that location.

Reality. The projected intraphysical consciousness often appears to be a type of *living virtual reality*.

Clocks. There are registered cases of clocks that stop and pictures and hanging frames that fall from the wall which are coincident with the farewell consensual projection.

Telekinetic. The intraphysical consciousness capable of producing extraphysical telekinesis, whether spontaneous or voluntary, receives the name of *telekinetic projector*.

Bibliography: Aksakof (09, p. 558), Ambelain (23, p. 73), Bozzano (189, p. 147), Cavendish (266, p. 248), Chaplin (273, p. 157), Crookall (343, p. 93), Day (376, p. 131), Delanne (382, p. 414), Digest (401, p. 380), Durville (436, p. 281), Fodor (528, p. 376), Fortune (540, p. 49), Gaynor (577, p. 183), Grattan-Guinness (626, p. 160), Hemmert (712, p. 40), Machado (968, p. 39), Martin (1003, p. 122), Morel (1086, p. 171), Northage (1135, p. 49), Paula (1208, p. 127), Randall (1369, p. 17), Shepard (1548, p. 912), Spence (1588, p. 404), Vieira (1762, p. 131), Walker (1781, p. 73), Wedeck (1807, p. 345), Zaniah (1899, p. 447).

81. EXTRAPHYSICAL TELEPATHY

Definition. Extraphysical telepathy: the transmission and reception of thought through the process of direct information from the intraphysical consciousness which is projected in the extraphysical dimension to another intraphysical consciousness that is in the ordinary, physical waking state, or to another projected intraphysical consciousness, or even to an extraphysical consciousness.

Synonymy: consensual telephony; direct extraphysical information; extraphysical cryptesthesia; extraphysical diapsiquia; extraphysical mind reading; extraphysical tele-hypnosis; extraphysical telementation; extraphysical thought transmission; *inter vivos* telepathy; mental telegraphy; parabiological radio; paratelepathy; projection or reception of thoughts (*telethosenes*); spiritual telegraphy; subjective transference of bio-information; super-sensory thought transference; telegnosis; transmental dialog.

Interpretations. Being a form of paraperception or consensual projection, telepathy is also interpreted under 4 aspects:

1. **Telesthesia:** sentiment at a distance.
2. **Cryptesthesia:** hidden sentiment.
3. **Clairsentience:** mind reading.
4. **Thought transference:** unmodifiable by either distance or time.

Synchronicity. Comparative tests using the electroencephalogram in the United States of America and the former Soviet Union suggested perfect synchronicity in the alpha rhythms or relative brain waves of the encephalograms of the emitter and the receiver during telepathic transmissions, when in the ordinary, physical waking state.

Action. The projected intraphysical consciousness almost always spontaneously acts doubly, as a transmitter-agent and as a receiver-percipient of thoughts, whether near to or distant from the other intraphysical consciousness or an extraphysical consciousness.

Looking. In this case, the communication of thoughts is apparently performed by one consciousness looking at the face or *paraface* of the other.

Projections. The great occurrences of advanced telepathy are only executed through the projection of the consciousness outside the human body, even when it is only partial, by means of a partial or even semilucid projection, going beyond the limits of the physical restriction imposed by the cerebral hemispheres.

Telepath. The projected intraphysical consciousness that is able to activate the mental communicatory process of extraphysical telepathy receives the name of *telepath projector*.

Animals. Besides men, women and children, the intraphysical consciousness projected from the human body can induce thoughts in other beings, thoughts that result in actions, especially over diverse subhuman animals, such as cats with which they have some affinity.

Self-awareness. When they are sufficiently aware of their extraphysical condition, intraphysical consciousnesses generally use their extraphysical telepathic processes freely.

Oligophrenia. Extraphysical oligophrenic beings (post-desomatic parapsychotics) are not able to use their telepathic faculty due to their consciencial deficiencies.

Acceptance. Currently, telepathy is a parapsychic (or psychic) phenomenon that is generally accepted in the more advanced areas of conventional science. It is the first type of *consciencial projection* that is universally admitted without greater restrictions or heated debate. The projection of consciencial energies came to be more broadly accepted at the end of the twentieth century.

Bibliography: ADGMT (03, p. 226), Baker (69, p. 30), Blasco (151, p. 165), Blavatsky (153, p. 781), Boswell (174, p. 190), Bozzano (186, p. 166), Cavendish (266, p. 248), Chaplin (273, p. 157), Crookall (343, p. 22), Day (376, p. 132), Digest (401, p. 380), Fodor (528, p. 376), Garrett (574, p. 115), Gaynor (577, p. 183), Greene (635, p. 91), Greyson (643, p. 184), Holzer (751, p. 108), Martin (1003, p. 122), Morel (1086, p. 170), Paula (1208, p. 131), Podmore (1266, p. 204), Russell (1482, p. 60), Shepard (1548, p. 912), Spence (1588, p. 404), Still (1622, p. 232), Swedenborg (1635, p. 256), Toben (1688, p. 78), Tondriau (1690, p. 282), Vieira (1762, p. 125), Walker (1782, p. 406), Warcollier (1796, p. 96), Wedeck (1807, p. 345), Zaniah (1899, p. 446).

82. HUMAN PARATELEPORTATION

Definitions. Human parateleportation (Greek: *para*, outside; *tele*, distant, remote; Latin: *portare*, to carry): the phenomenon composed of dematerialization, levitation, apport and rematerialization, in which the intraphysical consciousness suddenly disappears and reappears in another location; the act or process of transporting objects, human beings or subhuman animals through space, without any mechanical means.

Synonymy: extra-human teleportation; intraphysical-extraphysical commute; intraphysical-extraphysical transport; magical metastasis; movable parapsychism; parapsychic commute; parapsychic teleportation; parapsychic transportation; self-parateleportation; teledynamic dislocation; telekinesis of the human being.

Process. In parateleportation – one of the most universal and shocking or impactful parapsychic phenomena – the dissolution or *dematerialization* and subsequent reconstitution or *rematerialization* of the object occurs, which is called *apport*.

Person. When this occurs with living beings, the person (intraphysical consciousness) dissolves into nothing, or vanishes into thin air, only to later reappear outside that environment, at another location.

Characteristics. The following 24 more common factors should be gathered from among the characteristics of human parateleportation:

1. **Inevitability.** The phenomenon of parateleportation is unexpected, unwanted by the parateleported individual, and inevitable.

2. **Surprise.** The parateleported individual disappears from view without warning or a sign of farewell to those present.

3. **Intraphysical consciousness.** The parateleported being can be an adult or child, of any social group or belief, whether an ordinary citizen, a sensitive, a so-called “civilized” individual, or an indigenous person; or an animal: an ox, cow or horse.

4. **Clouds.** The disappearance or reappearance of the parateleported person can occur through a luminous cloud.

5. **Sound.** The phenomenon of parateleportation can occur in silence or with some noise.

6. **Number.** The phenomenon of parateleportation generally involves only one person, but can involve various, one at a time, this being a very rare occurrence.

7. **Amnesia.** Self-awareness disappears with and at the moment of the parateleported individual's disappearance. The state of amnesia continues until that consciousness reappears at a distant location.

8. **Self-lucidity.** Self-lucidity during the course of the phenomenon of parateleportation is the exception.

9. **Sensations.** The parateleported individual can first feel as though his/her legs have disappeared, thereby giving the sensation of extreme lightness of the entire human body, followed by temporary unconsciousness.

10. **Points.** There are two points that occur as a rule, during the phenomenon of human parateleportation: the departure and the arrival.

11. **Reappearance.** The reappearance of the parateleported person in any other place is instantaneous.

12. **Destination.** The destination of the parateleported individual arises at random, without the person's choice or decision.

13. **Direction.** There is almost always only a departure, but the departure and rapid *return* of the individual, in diverse directions, has also occurred.

14. **Shock.** The phenomenon of parateleportation does not cause any damage to the parateleported individual's human body, but produces temporary effects of (psychic) shock.

15. **Space.** Human teleportation is limited to space and is not related to chronological time.

16. **Time.** It seems that no parateleported individual returns to the past, surpasses his/her own memories or disappears into the future.

17. **Duration.** The duration between the disappearance and the reappearance of the parateleported individual ranges from brief moments, to short periods of time and even to hours.

18. **Distance.** The distance involved in the phenomenon of parateleportation varies, from one room to the next, from one country to another and from one continent to another.

19. **Location.** There are often difficulties involved in locating the parateleported individual.

20. **Temperature.** The process of disappearance-dissolution and reemergence-reconstitution of the human body of the parateleported individual requires high temperatures.

21. **Objectives.** The phenomenon of human parateleportation is used for objectives which are unknown and inexplicable.

22. **Hypotheses.** Among the hypotheses that have been put forward to explain human parateleportation, some think it is a means used by nature to distribute things over the face of this planet.

23. **Elimination.** Others think it could be a natural resource of instantaneous protective elimination.

24. **Extraphysical consciousnesses.** The phenomenon of parateleporation may also be provoked by the direct action of extraphysical consciousnesses, thus resulting in *assisted parateleportation*.

Reactions. Human parateleportation has caused many attendants of parapsychic sessions held by sensitives of various types of phenomenological manifestations to become amazed, lower their heads, completely disturbed and confused, or suddenly leave the scene, sometimes scared and stunned.

Parapathology. There have been complicated occurrences of parateleported persons, within the world of parapathology, such as the following 3:

1. **Saboteur.** Parateleportation to military areas forbidden to outsiders, leading the parateleported individual to be taken for a saboteur.

2. **Thief.** Parateleportation inside residences and stores at improper times, when they are closed to the public, which causes the parateleported individual to be taken for a thief.

3. **Poltergeist.** Other occurrences reveal the aspect of *intrusion-related parateleportation*, which are linked to poltergeist activity in certain cases.

Descriptions. In classic descriptions of human parateleportation “whirlwind” is used to refer to “being carried by the wind,” “aerial journey,” “flying brothers,” “unexpected disappearances and reappearances.”

Conditions. The parateleported individual sometimes disappears from within a dark room with closed doors and windows and reappears in another room, at a distant location in the same condition, but turned around or facing in the opposite direction.

Bible. The Bible is a fertile field for human parateleportation research. The following 5 such topics:

1. **Elijah.** Elijah raised up in a chariot of fire (2 Kings 2:1).
2. **Ezekiel.** Ezekiel lifted up into the sky (Ezekiel 11: 1).
3. **Nebuchadnezzar.** The episode of men in the furnace of Nebuchadnezzar (604-566 B.C.), (Daniel 3: 20-27).
4. **Philip.** Philip transported from Gaza to Azotus, located more than 30 miles (50 kilometers) away (Acts 8: 39, 40).
5. **Pedro.** The freeing of Pedro from a hermetically sealed, heavily guarded prison (Acts 12: 7-11).

Recent. In the twentieth century, different types of cases of human parateleportation are known, such as the following 4:

1. **Shamans.** The human parateleportation of shamans.
2. **Ectoplasmic.** Ectoplasmic persons or sensitives in ectoplasmic sessions.
3. **Scotto.** The celebrated parapsychic physical effects session of Marquis Carlo Centurione Scotto, held on July 29, 1928, in the castle of Millesimo, in the province of Savona, Italy.
4. **Mirabelli.** The still highly controversial phenomenon of Carmilo Mirabelli (1889-1951), one of the greatest physical effect sensitives of all time, who was parateleported, almost instantaneously, from Estação da Luz, in the city of São Paulo, Brazil, to the city of São Vicente, Brazil, located approximately 56 miles (90 kilometers) away.

Self-parateleportation. The day will come when terrestrial sensitives will practice self-parateleportation or, in other words, the phenomenon will be induced at will, just as many persons are already able to perform self-levitation at will while in the ordinary, physical waking state.

Research. A question for the research of human parateleportation is appropriate here: How many parateleported persons are not included in missing person reports?

Complement. In certain cases, it is presumed that parateleportation actually *complements* the phenomenon of physical bilocation. Instead of the psychosoma returning *en bloc* to the human body through the retraction of the silver cord, the opposite occurs, namely the psychosoma attracting the cells of the human body toward itself, *en bloc*, by way of the same silver cord.

Magnitude. This phenomenon evidences the extraordinary magnitude of the action of the psychosoma as a biological organizing agent or model of the human body (irruption of the psychosoma in the soma).

Transport. In advanced cases of conjunction of the phenomena of poltergeist, intrusiveness, projection of the consciousness and physical bilocation, the bilocation of the person, who is generally mystical, is transformed into a full parateleportation, or projective transportation (OBE transportation).

Decomposition. In these more complex cases, the human body of the bilocator atomically decomposes in the physical base, recomposing itself at another location.

Case study. An example of parateleportation as a consequence of the phenomena of poltergeist or perhaps even intrusiveness, is the case of the young Tyrolese woman, Angelica Darocca, a rigorous ascetic, who *sweated (exuded) blood*, presented stigmata on various areas of the human

body and frequently disappeared from her cell, only to reappear inside it later. She was seen in neighboring or distant cities during these disappearances.

Witnesses. The phenomenon of human parateleportation has not given rise to witnesses of transportational movement, per se.

Prapil. The name *prapil* is given to the faculty that the raja yogi acquires of moving in the emotional parabody (psychosoma) from one place to another, as distant as it may be.

Disappearances. Human parateleportation corresponds exactly, by analogy, to the phenomenon of the sudden extraphysical disappearance of extraphysical consciousnesses, as well as projected intraphysical consciousnesses, that manifest in the psychosoma and are commonly observed by other intraphysical consciousnesses that are also projected.

Self-permeability. Human parateleportation temporarily provides the intraphysical consciousness, when dis coincident in its vehicles, with the quality of extraphysical self-permeability, or the act of passing through dense, physical objects – such as walls, doors and closed windows – and even the possibility of volitation, in certain cases.

83. PHENOMENA CONCOMITANT WITH LUCID PROJECTION

Definition. Concomitant phenomenon: that phenomenon which does or does not occur within the space-time continuum, but simultaneously with the occurrence of the lucid projection experience, in a spontaneous and unexpected manner.

Synonymy: by-product of lucid projection; collateral phenomenon; confluent phenomenon; epiphenomenon; intercurrent phenomenon; peripheral effect; peripheral phenomenon; reflex phenomenon; residual phenomenon; surprise-phenomenon.

Complex. Besides the fact of situating the consciousness outside the human body, the lucid projection experience invariably causes certain consequent concomitant parapsychic phenomena (surprise-phenomena) as collateral results of the experience.

Phenomenology. This serves to affirm the character and nature of the phenomenological complex of projectiology.

Sciences. Peripheral phenomena also occur in the fields of medicine and psychotherapy.

Causes. The following 4, among others, have an influence as generative factors of peripheral parapsychic phenomena in general:

1. **Resistance.** The individual's psychological resistances when participating in experiments.
2. **Categories.** It is important to clarify that there are two categories of psychological resistance: healthy, or the self-defense of survival, and pathological, such as those who experience mood swings related to medication being taken.
3. **Anxieties.** Anxieties and the inner defensive reactions of this same individual.
4. **Meteorology.** The meteorological aspects at that time of the experiment. Does atmospheric pressure have an influence in this case?

Laboratory. It is interesting to point out that the incidence of concomitant phenomena affects not only spontaneous and provoked individual lucid projections, but also projective experiments performed in the laboratory. There are already various cases of this nature which have been registered.

Classification. The concomitant phenomena that are more common to lucid projection can be classified into two basic categories: primary and secondary.

1. **Primary.** The following 5 are the most notable *greater* primary phenomena which are concomitant to lucid projection:

- A. Double awareness.
- B. Precognition.
- C. Retrocognition.
- D. Extraphysical psychometry.
- E. Benign catalepsy.

2. **Secondary.** The following 8 are the most notable *lesser* secondary phenomena which are concomitant to lucid projection

- A. Vibrational state.
- B. Transitional state.
- C. Extraphysical evocation.
- D. Current of extraphysical force.
- E. Extraphysical energetic shower.
- F. Extraphysical trauma.
- G. Psychophysical repercussion.
- H. Condition of waking dis coincidence.

Bibliography: Ebon (453, p. 76), Fiore (517, p. 167), Greenhouse (636, p. 299), Morris (1092, p. 53), Osis (1159, p. 16), Steiger (1601, p. 226).

84. PRELIMINARY PHENOMENA

Definition. Preliminary phenomena: that *lesser occurrence* that *precedes*, prepares, and indicates a *greater occurrence* and, although showing similarities and correlations between the nature of their manifestations, also presents certain pronounced differences between both manifestations, whether qualitative and/or quantitative in nature.

Synonymy: antecedent phenomenon; miniature phenomenon; *miniphenomenon*; preambular phenomenon; precursor phenomenon; trailer phenomenon.

Previsions. The preliminary phenomenon demonstrates the nature, quality or category of the *whole*, in regard to the main phenomenon. It also permits the making of forecasts and prognostications, extremely accurate approximations or coinciding probabilities regarding the next level of evolution of the facts, projects and techniques in diverse areas of the interests and research of humankind.

Categories. The following are 7 categories of preliminary phenomena:

- 1. **Physics:** the representative fragment of the product.
- 2. **Engineering:** the showroom.
- 3. **Industry:** the small free sample.
- 4. **Biology:** the incubation period (biological or pathological privation).
- 5. **Psychology:** the laboratory of transformations (experimentation).
- 6. **Sports:** the preliminary game.
- 7. **Art:** the general rehearsal of a large-scale performance.

Precedence. In the existing phenomenological complex within the scope of consciology research, the well-defined phenomenon of *greater effects*, in the scale of the development of the events, is always preceded by an also very well-defined phenomenon of *lesser effects*. These are indicative of an inferior category or, in other words, are of reduced importance relative to the expression of the results of the main phenomenon. This finally forms a natural series of interlinked facts (cascade effect, domino effect, halo effect) that can also manifest in a process of constant relay.

Standard. There is no doubt regarding the 3 standard aspects of the abovementioned phenomena of the consciousness:

1. **Sequence.** There is an ordered sequence between those phenomena with *lesser* effects and those phenomena with *greater* effects.

2. **Implication.** A relationship of implication between both phenomena stands out, allowing the first phenomenon to forecast what is to follow.

3. **Expression.** The qualitatively greater expression of the second phenomenon (*maxiphenomenon*) over the first (*miniphenomenon*) becomes evident to the consciousness.

Projectiology. It is possible to affirm, without fear of contradiction, that the world of conscientiology research, particularly in its subdiscipline of projectiology, does not deviate from these *rules of precedence* regarding the xenophrenic states and basic projectiological phenomena. Let us consider 10 examples:

1. **Daydreams.** In a determinate line of ascending manifestations, it is observed with mathematical clarity, for example, that a daydream can precede a hypnagogic state (hypnagogy) in the mentalsomatic world of all intraphysical consciousnesses.

2. **Dream.** A common dream, or the exteriorization of repressed mental contents or *oneiric excretions*, can precede a lucid dream, even for those persons with no evident parapsychic tendencies.

3. **Semilucid.** A lucid dream, or semilucid projection can, in turn, like a specific factor, precede a great lucid consciential projection (OBE).

4. **Previews.** Occasional human lucid projections (previews of desoma, temporary minideaths) obviously precede the final projection, or desoma, for all human lucid projectors. They comprise a series of desomas which are as real as natural desoma or biological death of the human body (deactivation of the soma).

5. **Near-death.** The near-death experience (NDE) evidently always precedes desoma for all those who have had this experience.

6. **Bilocation.** Physical bilocation (bicorporeity) can precede the phenomenon of human parateleportation, this second phenomenon thereby constituting a spontaneous complement to the first phenomenon.

7. **Remote.** In another line of ascending parapsychic manifestations, remote viewing (RV) precedes traveling clairvoyance (TC).

8. **Miniprojection.** Traveling clairvoyance, or consciential miniprojection, in turn, precedes the great lucid projection, even in the manner of a prior projection, in certain cases.

9. **Exteriorization.** The exteriorization of consciential energies, whether executed spontaneously or deliberately, precedes extraphysical telekinesis.

10. **Facial.** Facial clairvoyance can precede the act of installing the phenomenon of materialization (ectoplasmy) per se, and so on.

Gradual. Without a doubt, preliminary phenomena constitute the greatest evidence of the law of the gradual, step by step development of animic-parapsychic sensitivities.

Generation. Animic (intraconsiential) development, namely direct, firsthand experience of the consciousness – much less, parapsychic development, namely intermediary, second hand, experience of the consciousness of any type – is not obtained *suddenly*, through spontaneous generation.

Repetition. The achievement of greater sensitivity becomes virtually unsustainable without the continued repetition of the lesser sensitivities, on the part of the consciousness that is self-organized, rigidly disciplined and persistent in the control of the manifestations of its consciential vehicles.

Evaluation. Being self-aware of this mechanism of animic-parapsychic development, any intraphysical consciousness interested in conscientiology can evaluate his/her own parapsychic development in any line of consciential manifestation in which he/she wishes to evolve.

Usefulness. The basic usefulness of the preliminary phenomenon is to offer the interested individual the ideal formula for evaluation – the unit of measurement of his/her own consciential performance – even when he/she feels at a complete loss to give meaning to the events and his/her parapsychic, energetic, intraconsiential or multidimensional experiences.

Stagnation. Any person with evident parapsychism who has been repeating the same procedures and obtaining the same parapsychic results for a decade, always in the same manner, without any innovation or addition to the phenomenological dynamic of his/her manifestations and without any greater or more expressive conquest, clearly remains stopped in time, stagnated in his/her inner improvement.

Inflexibility. He/she may even be performing very well at that level, animated by the most noble concerns and intentions, and may feel self-realized with this, living like a person who is not very willing to admit to having made the slightest errors. He/she is nevertheless complacent, at a standstill in regard to his/her true self-knowledge, showing little mental flexibility in the search for his/her greatest performance in the execution of the existential program.

Step. Each preliminary phenomenon, although not being a summary or synthesis, indicates the next step to which the intraphysical consciousness, if he/she is willing and capable of experimentally producing some lucid consciential projection, should be attentive in order to maintain his/her personal progress in gear.

Direction. The preliminary phenomenon clearly and rationally indicates the direction in which the intraphysical consciousness should concentrate his/her efforts as an animic and parapsychic, energeticist projector, outlining the next, immediate achievement before him/her that is closer at hand.

Evolution. For the individual who keeps his/her feet firmly planted in intraphysical reality but has nevertheless neglected the abovementioned areas of study and is still a victim of the “I will leave it until tomorrow” syndrome, it is important to remember that consciential development in any evolutionary field, besides being infinite, is inevitable. This is because it is truly the essence of the march of evolution of the consciential principle (ego), through that notion which is conventionally referred to as *eternity*.

IV – Altered States of Consciousness

85. XENOPHRENIA

Definition. Xenophobia (Greek: *xenos*, strange; *phren*, mind): the state of the human consciousness, outside the normal pattern of ordinary, physical waking state, induced by physical, physiological, psychological, pharmacological or parapsychic agents.

Synonymy: altered state of consciousness; alternative perceptions; changes in consciential states; dislocation of consciential perceptions; modified state of consciousness; non-ordinary state of consciousness; xenophrenic state.

Alterations. First and foremost, it is necessary to rationally characterize the circumstantial, *intra-subjective* altered state of consciousness pertaining to the ego itself. Examples include: daydreams, hypnagogy, sleep, somnambulism, ordinary dreams, nightmares, hallucinations and many others.

Distinctions. In this way, it becomes possible to establish the substantially distinctive characteristics of the state of consciential manifestation per se which – although not ceasing to be an altered state of consciousness – presents itself as being far more objective, a condition that is evolutionarily broader and less ephemeral for the ego and with respect to which there are so far only 3 known very distinct states: the intraphysical, extraphysical and projected states.

Manifestations. The expression *projected state* summarizes, in the essence of its meanings (umbrella term), all types of specific projections of the consciousness and the entire specific field of research of the science of projectiology.

Appearance. Many altered states of consciousness, if not all of them, can arise in any of the 3 states of manifestation of the consciousness.

Medicine. From a medical point of view, an altered state of consciousness leads patients to report some of the following 10 experiences:

1. Alterations in concentration, attention, memory or critical judgment.
2. Distortions in perception.
3. Disturbances regarding the sense of chronological time.
4. Emotional extremes oscillating between jubilant ecstasy and deep fears (some type of phobia).
5. Fear of losing touch with reality.
6. Hyper-suggestibility.
7. Ineffability.
8. Sensation of separation between the mind and the human body.
9. Sense of profound truth and discernment.
10. Sense of renewed hope.

Actuation. Altered states of consciousness permit the appearance of almost all parapsychic phenomena and act intensely in at least the following 3 occurrences:

1. In scientific intuition.
2. In poetic inspiration.
3. In mystical-religious ecstasy.

Predominance. In general, the different consciential states appear due to the operational predominance of a specific attribute of the consciousness over the other attributes.

Rapidity. The act whereby the consciousness passes from one state to another, with the predominance of one of its attributes, occurs with ease and in an extremely rapid manner, or instantaneously, according to our sense of chronological time.

Analyses. For this reason, the following 8 observations, among others, can be itemized in an initial analysis:

1. **Will.** In the physical and extraphysical states in which the consciousness is awake and lucid, the will predominates over the other consciential attributes.

2. **Reason.** In the act of critical judgment, reason subjugates imagination.

3. **Imagination.** In the hypnagogic state (altered state of consciousness), imagination and will replace reason.

4. **Memory.** In the phenomenon of retrocognition, the depth of the most remote memory, or integral memory (holomemory), replaces the will.

5. **Unconscious.** In the natural, ordinary dream state (altered state of consciousness), the unconscious – the so greatly unknown *dead file of the consciousness* – replaces the will.

6. **Precognition.** In the phenomenon of precognition, parapsychism (animism or extrasensory perception) replaces the waking memory or that of the ordinary, physical waking state.

7. **Animism.** In the phenomena of animism in general, the will of the consciousness predominates over the influence of the will of external intelligences or consciousnesses.

8. **Parapsychism.** In the manifestations of parapsychism, the sensitive's consciousness makes itself passive to the will of another (an extraphysical consciousness or a projected intraphysical consciousness) which takes the place of the sensitive's will. This even occurs with the help of another extraphysical consciousness, in this case, the sensitive's helper or even blind guide.

Units. Many altered states of consciousness can be considered to be isolated units of associated mental events.

Types. Diverse altered states of consciousness can be confused with lucid projection, such as the following 18:

1. Catalepsy.
2. Continuity and/or discontinuity of awareness.
3. Daydream or guided waking dream.
4. Double awareness.
5. Extraphysical somnambulism.
6. Hallucination.
7. Hypnagogy or semi-awake state.
8. Hypnopompy.
9. Hypnotic trance.
10. Lucid dream or semilucid projection (SLP).
11. Meditation.
12. Nightmare.
13. Ordinary dream.
14. Parapsychic trance.
15. Psychedelic experience.
16. Self-hypnosis or autosuggestion.
17. Self-intrusion or obsession (self-corruption).
18. Triple awareness.

Understanding. To understand xenophrenic states is to understand lucid projection of the consciousness.

Criterion. The intraphysical projector has to seek out a personal criterion for distinguishing heteropsychic stimuli, or those coming from external worlds (the physical and extraphysical, in general), from self-psychic stimuli, or those of an internal origin. The projector also needs to avoid possible confusion between that which the consciousness actually perceives and that which is no more than its creations, such as: hallucinations, daydreams, morphothosenes (thought-forms), nightmares or dreams.

Awareness. Objectifying awareness regarding the above-mentioned criterion, this section addresses the xenophrenic states, making extensive comparisons, parallels, and lists of the differential characteristics between them. This is done in order to provide distinguishing elements to the experimenter who wishes to obtain personal proof of the reality regarding the qualities of the lucid projective consciential experience.

Separation. The separate study of these consciencial states is extremely positive.

States. The more we deepen our individual analytical approach toward each consciencial state, the less difficult the comprehension of their complexities will be. This is also the case regarding forced consciencial projection, spontaneous lucid consciencial projection, the natural sleep state, the condition of extracorporeal sleep, ordinary dreams, lucid dreams per se, extracorporeal dreams, and other phenomena.

Sleep. Undoubtedly, although the consciousness may be one and the same, the condition of sleep, in the state of consciousness according to the vehicles of manifestation, is not the same as the condition of extracorporeal sleep, since the consciencial circumstances are different.

Dreams. The same occurs with the condition of ordinary dreams and the condition of extracorporeal dreams, and even with forced lucid consciencial projections and spontaneous lucid consciencial projections.

Bibliography: Brown (211, p. 200), Davies (370, p. 28), Garfield (569, p. 114), Grattan-Guinness (626, p. 326), Greenhouse (636, p. 45), Ludwig (956, p. 225), Roll (1466, p. 231), Sabom (1486, p. 239), Steiger (1601, p. 56), Tart (1653, p. 1), Walker (1781, p. 79), White (1829, p. 23).

86. CLASSIFICATION OF XENOPHRENIC STATES

Projection. Lucid projection, along with its entire phenomenological complex, constitutes one of the altered states of the human consciousness.

Phenomena. The phenomena of projection can be classified into 3 basic categories according to phenomenological phases, or the chronological stages of the experiments: physical waking state phenomena, transitional phenomena and extraphysical waking state phenomena.

1. **Physical.** The physical waking phenomena according to consciencial states: ordinary, physical waking state, daydream and the transform state.

2. **Transitional.** The transitional phenomena: pre-takeoff, hypnagogic state, sleep and takeoff of the psychosoma.

3. **Extraphysical.** The extraphysical waking state phenomena: oneiric state, nightmare state and extraphysical awakening.

Divisions. The researcher Susan J. Blackmore affirms that natural divisions exist between the different states of consciousness, an observation that the author fully agrees with. Some states of consciousness are close to each other and some are more distant. Some of the limits between these states are easy to cross and others are far more difficult.

Dream. Lucid dream is very close to lucid projection, whereas ordinary dream is far removed.

Nightmare. The nightmare state is situated between these 2 types of dream.

Self-awareness. The condition of the consciousness in the ordinary, physical waking state of the intraphysical consciousness is quite similar to the condition of the intraphysical consciousness when fully projected outside the human body.

Projectability. Lucid projection can be reached with some difficulty from the ordinary, physical waking state, but can be achieved more easily from the hypnagogic state and easier still from a lucid dream.

Relationship. We can classify the xenophrenic states, which are directly related to lucid projection, into 10 basic consciencial states in the following order of occurrence: daydream, hypnagogy, transform state, sleep, somnambulism, dream, lucid dream or semilucid projection, nightmare, interconsciencial intrusion and hallucination. The following chapters address the relationships of these xenophrenic states with the phenomenon of lucid consciencial projection.

Bibliography: Blackmore (147, p. 2).

87. MECHANISMS OF LUCID PROJECTION

Vibration. Briefly, it can be affirmed that projection of the consciousness from the human body is produced by the increase in the vibrations of the vehicles of manifestation of the consciousness, including here the human body itself, as well as the mentalsoma.

Analogies. To show this occurrence we can use crude comparisons or admittedly rough analogies.

Bus. A comparison: when the vibrational frequency of a bus motor reaches a certain pitch, one of the windows in the bus can begin to vibrate together with the motor. What has occurred is that the motor reached the natural vibrational frequency of that window as a whole and the window entered into resonance with the motor.

Body. Each body as a whole has a natural vibrational frequency. Every time that another body reaches this frequency, it makes the first one enter into resonance with the second or, in other words, absorb the other's energy with great intensity.

Transmitter. In the case under analysis, the air (or the sound) is the intermediary transmitter for conducting this energy, as is the forced vibration of the bus itself, in part.

Resonance. If the phenomenon of resonance continues at a high intensity, and if the resonant frequency is identical and not only close, the window will crack or, if it is not securely restrained, will separate from the bus.

Glass. Another comparison: the opera singer breaks a glass when reaching a certain note, or sonorous frequency, that is identical to the natural frequency of the glass as a whole.

Acoustics. In this case, the glass enters into resonance with the note, beginning to rock when the frequency comes close. If the note has a great intensity (or potency) and the singer is persistent, the glass will break into small pieces.

Air. The intermediate transmitter of energy in this case is the air, through the phenomenon of sound, which carries vibratory acoustic energy.

Psychosoma. Each vehicle of manifestation of the consciousness has a natural vibrational frequency. The psychosoma, which is *inside* the human body, having increased its vibrational frequency (extraphysical vibrations) and, probably having reached its natural vibrational frequency, frees itself from the vibrations of the dense organism, thus giving rise to the projection of the consciousness in the psychosoma.

Mentalsoma. The mentalsoma, in turn, having increased its vibrational frequency (mental vibrations), frees itself from the psychosoma, thus giving rise to the projection of the consciousness in the isolated mentalsoma. The psychosoma is considered here to be acting together with the energies of the holochakra, with anywhere from the highest to the lowest extraphysical density of the psychosoma's composition.

Frequency. The psychosoma has a natural vibratory frequency that is higher than that of the human body and lower than that of the mentalsoma. In other words, the psychosoma's resonance energy is higher than that of the human body and lower than that of the mentalsoma.

Phenomena. This fact clarifies innumerable phenomena, including the mechanism of the vibrational state (VS), the mechanism of extraphysical translocation, the influence of a low heart rate in consensual projection, and others.

Structure. The subtler structure of the psychosoma escapes from the dense structure of the human body. The same occurs with the mentalsoma in relation to the psychosoma.

Comparisons. The comparisons made can be specified even further, characterizing the bus as though it were the human body and the window as though it were, for example, an extraphysical arm that projects alone, or the partial projection of a para-arm. The motor of the bus, in this case, would be the mentalsoma or, more precisely, the consciousness.

Summary. In summary, the act of one vehicle of manifestation leaving another, be it the psychosoma or the mentalsoma, depends only upon its achieving the natural vibrational frequency of each one of them through (by some mechanism) the transmission of the resonance energy to these bodies.

Discoincidence. The mechanism of discoincidence of the vehicles of manifestation of the consciousness is therefore based on the phenomenon of resonance.

Universality. One of the definitive pieces of evidence regarding the natural, parapsychical and energetic aspect of lucid projection phenomena that speaks in favor of the increase in the natural vibrational frequency of the consciousness' vehicles of manifestation is the fact that it occurs in disparate cultures, epochs, races, locations and environments, through diverse but fundamentally similar processes, or with a reasonable level of functional interaction.

Verification. The above-cited universality can be verified through various analytical and critical research results, testimonies and autobiographical analyses, such as those occurring between intraphysical consciousnesses, as well as those from extraphysical consciousnesses:

1. Germans (Engel; Fischer; Lischka. See the International Bibliography).
2. Brazilians (Pereira; Prado; Vieira).
3. Danes (Vett).
4. Spaniards (Anglada).
5. French (Durville; Lefebure; Lancelin; "Yram").
6. English (Brennan; Brittain; Crookall; Fox; Gerhardie; Green; Sculthorp; Turvey).
7. Irish (Garrett).
8. North Americans (Greene; Monroe; Muldoon; Swann; Tanous).
9. Indigenous Hawaiians (Long).
10. Mexican Indians (Castaneda).
11. Extraphysical consciousnesses (Maes; Xavier; and many others).

Bibliography: Anglada (39, p. 25), Brennan (200, p. 71), Brittain (206, p. 45), Castaneda (258, p. 20), Crookall (330, p. 1), Durville (436, p. 1), Engel (480, p. 1), Fischer (519, p. 19), Fox (544, p. 32), Garrett (574, p. 67), Gerhardie (584, p. 1), Green (632, p. 1), Greene (635, p. 1), Lancelin (879, p. 309), Lefebure (909, p. 65), Lischka (937, p. 91), Long (946, p. 33), Maes (984, p. 85), Monroe (1065, p. 1), Muldoon (1105, p. 1), Pereira (1230, p. 16), Prado (1284, p. 1), Sculthorp (1531, p. 17), Swann (1632, p. 65), Tanous (1647, p. 113), Turvey (1707, p. 111), Vett (1738, p. 379), Vieira (1762, p. 7), Xavier (1881, p. 97), Yram (1897, p. 1).

88. LUCID PROJECTION AND DAYDREAMS

Definition. Daydream: fantastical story line created by the imagination during the ordinary, physical waking state of the human consciousness or intraphysical consciousness.

Synonymy: associative flow; daydreaming; directed waking dream; diurnal dream; dream realization; flight of fancy; gilded dream; lazy dream; mental digression; mental wandering; mentambulism; oneirism; open-eyed dream; secret fantasy.

Fantasy. Fantasy is a by-product of subjective reality. It is composed of thoughts originating entirely from the consciousness.

Denominations. Fantasy is called by many names, such as the following 6:

1. Castles in the air.
2. Daydreams.
3. Fairy tales.
4. Imaginary events.
5. Imaginary fiction.
6. Science fiction.

Usefulness. Fantasies are useful and important and even essential in practical life.

Creativity. Every creative idea began as a fantasy.

Psychosoma. Literature, drama, music, the fashion and culinary industries, love and sex, and many other things derived from the consciousness based on the *emotional* parable (psychosoma), somehow exist due to fantasy.

Science. Without fantasy, science – derived from the consciousness and stemming from the *mentalsoma*, the parable of discernment – would be a mere collection of data, without any ability to formulate connections, interactions and relationships between them.

Theory. Theory – a precursor of all experimentation – is a fantasy until it is proved or confirmed through repeated verification.

Subjects. In this book, there are texts on subjects based entirely on fantasy, such as the following 2 examples:

1. Questionnaire for *serenissimus*.
2. The Ideal Projector.

Uncertainty. Even under the best circumstances there is some uncertainty in determining what is fantasy and what is reality. One of the objectives of science is to reduce this uncertainty to the minimum.

Distinctions. Upon gaining more experience, especially through consciential projections in series, the projector rationalizes and clearly defines the differential characteristics of 5 categories of oneiric experiences for himself:

1. **Projection.** Lucid projection and the common dream of flying and falling.
2. **Physiology.** The dream with an organic origin or originating in the physiology of the soma.
3. **Autobiography.** The *historical* dream or one that focuses on a passage from the individual's personal history, or autobiography.
4. **Nightmare.** The nightmare or the dream with a predominance of a distressing factor.
5. **Waking.** The daydream or *oneiric* fantasy generated while still in the ordinary, physical waking state, where special physiological symptoms do not arise.

Analysis. In some *consciential circumstances* the experienced projector is able to perfectly distinguish personal daydreams (the free association of ideas with the tendency to *magnify* and *justify* them) from lucid projections and even that he/she is experiencing a dream or nightmare based on *the themes of his/her projections*.

Minimization. The analytical criterion of the consciousness becomes so pronounced that these altered states of consciousness – ordinary dream, physiological dream, personal history or autobiographical dream, projective dream, nightmare, daydream, and even oneiric projection, lucid projection and semilucid projection – are so well-defined that they end up being minimized and each one put in its proper place, often at the same instant at which they occur, thus diminishing their importance or partially eliminating them.

Protest. Daydreams above all constitute protests against reality. They do not have the need for logical reflection and lack direction and purpose.

Preparation. Daydreams have been employed as an efficient technique for the intraphysical consciousness to feel inner peace, inner quietude, profound well-being and conciliate natural sleep. This technique is used when confronted with acute crises and the extreme pressures of daily life in human experience, when the individual's mind is very agitated by supposed problems that cannot be resolved. In addition, and more importantly, this technique helps the consciousness to prepare to lucidly project, in certain cases.

Technique. The technique of the ascensional daydream, guided daydream or gilded dream, consists of a great concentration of positive thoughts in which the intraphysical consciousness imagines, in great detail, everything that will make him/her the happiest person in the world at that moment.

Details. In this creation or mental reconstitution of the “apparently impossible,” the will, the imagination and one’s fantastical creations come together and introduce, in the most minute detail, everything that composes an ideal world for the individual, or at least the following 7 experiential variables:

1. **Location.** The most marvelous location possible.
2. **Weather.** The most exceptional weather conditions.
3. **Company.** The most desirable company.
4. **Clothes.** The most brilliant outfit or the most sumptuous clothing.
5. **Dishes.** Those culinary dishes that are preferred and considered a must.
6. **Impressions.** Those most dreamt-of pleasurable personal impressions or sensations.
7. **Atmosphere.** The materialization of a scenario and an atmosphere with all the illusions that are most craved in human life, in conditions capable of making you completely and definitively happy.

Predominance. Upon reaching the level at which the consciousness predominates over matter, one’s mental focus or concentration reaches such an intense, profound level that it becomes real, thus making the consciousness truly happy, distant from inner problems and diuturnal pressures. This will bring psychic and muscular self-relaxation, absolute self-confidence, and the sleep that is sought, all in a natural manner, without the use of any stupeficient and without an excessive waste of time, consciential energies and money.

Bibliography: Lefebure (913, p. 175), MacLaine (980, p. 245), Rogo (1444, p. 123), Steiger (1601, p. 217), Vieira (1762, p. 123).

89. COMPARISONS BETWEEN DAYDREAMS AND LUCID PROJECTIONS

Differential. The differential characteristics between daydreams and lucid projections are well defined and unmistakable with regard to 4 angles of approach:

1. **Coincidence.** When in the condition of the daydream, the intraphysical consciousness is aware of being *inside* or coincident with the human body, in the ordinary, physical waking state. When in the condition of the lucid consciential projection, the intraphysical consciousness knows and feels that it is *outside* the human body or dis coincident, and is even able to see the dense body in front of it (self-bilocation phenomenon).
2. **Forms.** In daydreams, less dense substratums arise that are of a physical origin and are tangible or palpable, such as a succession of mental images. In the lucid projection that occurs in physical districts and even in certain extraphysical crustal or tropospheric environments, there is an incontrovertible concretization of much denser physical and extraphysical forms, thought-forms or morphothosenes.
3. **Nature.** The daydream is a consciential condition that is far more oneiric than projective. The consciousness itself distinguishes the major lucid consciential projection in all of its aspects, from the consciential states of dream, nightmare and daydream.
4. **Clairvoyance.** The manifestations of the daydream are similar in part to those of traveling clairvoyance, although the latter presents clearer story lines and goes beyond the inconsequential simple mental elaboration of the human consciousness.

Ascensional. It is curious that the condition of the daydream (as well as the ordinary dream) shows itself to be so different from the condition of consciential projection that it also ends up constituting a process whereby the consciousness can project itself from the human body, called *ascensional daydream* or *guided daydream*. This technique is based on the act wherein the intraphysical consciousness, while in the ordinary, physical waking state, imagines leaving the human body and rising up through space, with the help of rhythmic respiration, after *preparation* through the daydream.

Bibliography: Lefebure (909, p. 176), Vieira (1762, p. 123).

90. LUCID PROJECTION AND SLEEP

Definition. Natural sleep: the state of rest in humans and higher animals that is especially characterized by the normal and periodic suppression of perceptive activity, voluntary motor force and daily social interrelationships, through the relaxation of the senses and muscles, reduction in the heart and respiratory rates, as well as oneiric activity, during which the organism recuperates from fatigue.

Synonymy: daily projection; half-life; Morpheus; nap; normal sleep; ordinary sleep; spontaneous sleep; state of those who sleep.

Organizer. Sleep is the most powerful organizer of the physical body's physiology and the individual's human life. No one escapes this imperative.

Necessity. It is easier to go without food, water and company than without sleep. Sleep is a natural necessity, but it is also a cultural fact and a rite.

Minideath. The state of natural sleep, without consciencial projection, is the first and true *minideath*.

Sleepers. Some individuals sleep normally, while others sleep badly. Approximately 15% of the earth's population, when sleeping, has more or less serious difficulties in endeavoring to obtain *sufficient daily* (or nightly) *sleep*.

Phases. Sleep goes through various phases that are divided into ordered cycles of complex activity throughout the night.

Interleukin. A discovery made about sleep reveals that the "S factor," part of a group of chemical elements, can provoke sleep, regulate temperature and stimulate the organism's immunological system. In the final part of the sleep process, a substance called interleukin-1 is liberated, which provokes sleep and stimulates the immunological system.

Immunology. Sleep allows the immunological system to recuperate from environmental challenges faced during the ordinary, physical waking state of the individual in activity.

Movements. While sleeping, an adult makes about 40 to 70 more pronounced movements, including turns and jerks, uses 160 liters of oxygen, and exhales 130 liters of carbonic anhydride each night.

Variations. These variations impede the accumulation of blood in the inert body, maintain a constant exchange of oxygen and carbon dioxide, and maintain the muscular tonus.

Vegetative. The so-called *correlative* organic functions that operate without the action of the will, operating in an involuntary or automatic manner, such as reflexive acts (e.g., respiration, heart rate, gastrointestinal mobility and perspiration) or vegetative life, are regulated by the vegetative or autonomic nervous system. It is mainly composed of 2 nervous systems having opposing functions that balance each other: the sympathetic and parasympathetic (vagus) nervous systems.

Sympathetic. The predominance of the sympathetic nervous system maintains the consciousness in the ordinary, physical waking state.

Vagus. The predominance of the vagus nerves allows the state of natural sleep.

Latency. The latency of sleep, or the period between turning off the light and the act of sleeping, is less than 15 minutes under normal conditions. On average, it is between 6 and 8 minutes.

Pre-sleep. The pre-sleep state, called *stage 0*, occurs when one starts to fall asleep.

Belief. Since the times of the ancient Greeks, it was always believed that Hypnos, the god of sleep, was the younger brother of Thanatos, the god of death, but this supposition or belief is relative.

Similarity. Sleep is only similar to biological death because it separates the vehicles of manifestation of the consciousness and carries the latter to the extraphysical dimension, thus realizing a daily, natural, physiological, inoffensive and generally nonlucid projection.

Coma. Sleep is neither a passive phenomenon, nor is it the younger brother of the light coma state (neurology).

Manifestations. An infinite number of activities or manifestations occur during sleep.

Thalamus. The thalamus – both the diencephalon (neurons, neurology) and the *energetically shielded chamber* (bedroom, sexosomatics) – play an active role in the control of sleep and wakefulness.

Laboratories. In sleep laboratories, scientists study this altered state of consciousness, sleep, with volunteers daubed with contact gel, and small electrodes connected to the face and scalp.

Polyhypnograph. The electrodes send messages to a polyhypnograph, a recording device that transcribes the sleeping person's brain waves, heart beats, eyes movements and muscular activity onto moving continuous sheets of chart paper using ink pens that oscillate.

Types. There are 2 basic types of sleep that alternate: slow sleep and rapid sleep.

1. **Slow.** Slow, inactive or calm sleep, a period of bodily relaxation, is classified as non-REM or NREM (non-rapid eye movement) sleep, and is composed of 4 progressively deeper stages.

1. Light (5-7 cycles per second, theta waves).
2. Confirmed (4-5 cycles per second, theta waves).
3. Deep (2-4 cycles per second, delta waves).
4. Very deep (0.5-2 cycles per second, delta waves).

Electroencephalograph. The electroencephalograph (EEG) registers the phases of rest with characteristic brain waves.

Temperature. During slow sleep, the heart rate drops, respiration slows and body temperature reaches its lowest point.

2. **Rapid.** Rapid or active sleep is characterized by EEG tracings that are distinct from those of the slow period, presenting total muscular atonia, rapid synchronistic movements of the eyeballs under the closed eyelids, and intense brain activity, as evidenced by strong variations in metabolic activity, a suppression of muscular activity and vivid dreams.

REM. This type receives the name of REM sleep (rapid eye movement sleep).

Dreams. In the phase of sleep in which the eyeballs present rapid, synchronistic, involuntary eye movements (REM) under the closed eyelids, there is an increase in brain activity, heart rate, respiratory frequency, hormonal secretion and the appearance of different patterns of brain waves and dreams.

Register. The polyhypnograph registers the sleeping person's brain waves, pulse and respiration, more pronounced body movements, and involuntary, rapid, synchronistic bi-ocular movements. These are measured by way of electrodes attached to the skin above and below or on each side of one eye, detecting the difference in the potential (voltage) through the eyeball in-between the cornea and retina.

Duration. Each individual *eye* movement lasts a fraction of a second, but 1 period of eye movements frequently lasts, with interruptions, about 50 minutes.

Direction. The quantity and direction of eye movements corresponds, in certain cases, to that which the dreamer is looking at or following with the eyes.

Neurophysiology. As we have seen, a complex neurophysiological activity of the human organism occurs during sleep. The body only apparently remains immobile, as small spasms or contractions occur in the leg muscles, jolts take place in the toes and fingers, and grimaces are caused by facial muscles.

Beginning. Regarding the soma, per se, dreams frequently begin soon after a series of *corporal* movements (cerebellum, psychomotricity) have ceased.

Men. Occasionally, during sleep, penile erection occurs in men, regardless of the sleeper's physical age or level of sexual satisfaction (androsomatics).

Women. With women, the cyclical awakening of the clitoris or the periodic lubrication of the vagina occurs, manifestations which are independent of the sleeper's physical age or level of sexual satisfaction (gynosomatics).

Blood. These occurrences are not related to dream content, as they are a result of the organism's blood flow in the genital area.

Paradoxical. In the REM phase of sleep, muscular paralysis also occurs, which causes this phase of sleep to be termed *paradoxical*. Although the brain is very active, the muscles of the torso and body members essentially become paralyzed, as if to protect the sleeper, or dreamer, from the possibility of physically reacting to that which is being dreamt about.

Habitat. Sleep is the dream's natural *habitat* although it is not the same *habitat* for lucid consensual projection.

Continuous. The evidence for this fact becomes highlighted in the experience of projection with continuous self-awareness, wherein there is no intermingling of other altered states of consciousness, whether daydream, sleep, nightmare, hypnagogy or hypnopompy.

Manipulation. At least some types of projection involve a conscious state characterized by the conscious manipulation of REM sleep, which occurs periodically, 4 to 5 times every night.

Recuperation. Delta sleep, which is the deepest phase of sleep, seems to be connected to the individual's *physical* recuperation, while REM sleep is linked to *psychological* recuperation.

Spasms. When one produces the full projection of the consciousness in the psychosoma or mentalsoma, leaving the human body in the empty brain condition, complete immobility is established. In this state, even small spasms do not occur with so much frequency because the organic reflexes almost completely annul themselves in the organism that remains inanimate and only with vegetative life.

Chronopsychophysiology. Modern chronobiology (sleep chronopsychophysiology) laboratories research the automatic manner in which the human body's chronometric, chronobiological or circadian rhythm governs the sleeping-waking cycle, mainly objectifying the application of sleep hygiene and chronotherapy in the treatment of insomnia. This research is performed through polysomnography – the continuous, simultaneous registering (polysomnogram) of diverse physiological variables, mainly brain activity, eye movements and muscular activity during sleep.

Functions. The following are 5 essential functions of sleep:

1. **Detoxification.** Eliminates the human body's cellular intoxication.
2. **Changes.** Triggers physical, chemical, hormonal and muscular changes.
3. **Protection.** Maintains the human being safe from damage.
4. **Energy.** Renews the vitality of the energy of the holochakra (energetic parabody) and psychosoma (emotional parabody).
5. **Perceptions.** Frees the perceptions of the consciousness through the disincidence of its vehicles of manifestation.

Quality. The quality of sleep is more important than its quantity.

Projector. The *extraphysical consciousness* (extraphysical being) in the condition wherein its vehicles of manifestation (2 vehicles: psychosoma and mentalsoma) are coincident, and the *projected intraphysical consciousness* (4 vehicles) when disincident, can experience different categories of sleep.

Soma. In certain cases, the physical body (soma) sleeps (vegetates) without the consciousness, and the projected consciousness simultaneously sleeps close to or distant from the physical body.

Extraphysical consciousnesses. The sleep of the projector during consensual detachment, when at a distance where the silver cord (energetic connections) is stretched beyond the proximities of the human body, or when the projector remains within the minimal circumference of the silver cord's distension is, in most cases, assisted by some extraphysical consciousness, including helpers.

Self-telekinesis. The involuntary, unconscious and almost imperceptible physical movements of the sleeper while in the sleep state, generally constitute reflexive reactions to identical undulations and oscillations of the semi-exteriorized or fully exteriorized psychosoma which is, however, in an unstable condition, close to the human body. These can be considered occurrences of *mild mini-self-telekinesis*.

Reflexes. The facts show that, in some cases, reflexes (repercussions) can occur in 2 directions: from the extraphysical vehicle (psychosoma) to the physical vehicle (soma) and from the physical vehicle to the extraphysical vehicle.

Consecutive. Major changes in the position of the sleeper's human body, e.g., from one side to the other during sleep, correspond, in some cases, *but not in all cases*, to reflexive reactions to small, consecutive and sometimes semilucid exteriorizations-interiorizations of the consciousness in the psychosoma.

Causes. The human being or intraphysical consciousness can sleep or, in other words, can substitute the alpha rhythm of the EEG for a slower rhythm, e.g., delta waves, due to various causes, notably the following 9:

1. **Physiology.** Natural, spontaneous, physiological sleep.
2. **Autosuggestion.** Sleep provoked by autosuggestion.
3. **Accident.** Sleep provoked by an accident.
4. **Anesthesia.** Sleep provoked by anesthesia.
5. **Pharmacology.** Sleep provoked by light or heavy, licit or illicit drugs.
6. **Hibernation.** Hibernation sleep provoked by a reduction in temperature (hypothermia).
7. **Hypnosis.** Hypnotic sleep provoked by a hypnotist.
8. **Helper.** Hypnotic sleep provoked by a healthy extraphysical consciousness (preamble to an assisted projection).
9. **Intruder.** Hypnotic sleep provoked by an ill extraphysical consciousness (interconsciential intrusion).

Projectability. From any of these 9 types of sleep, the sleeper's consciousness can enter into a projective state or, in other words, can initiate a nonlucid, semilucid or lucid consciential projection.

91. EVOLUTIONARY VACUUM THEORY

Definition. Evolutionary vacuum: daily period in which the human bodies of men, women and children are biologically renovated through natural sleep, when the intraphysical consciousness also sleeps without having lucid extraphysical experiences.

Synonymy: consciential evolutionary loss; daily consciential hibernation; evolutionary breach; evolutionary gap; evolutionary hiatus; evolutionary void; interval of *dead* life; lacuna of self-awareness; period of consciential inattentiveness; *semilife*; vacuum of consciential lucidity.

Sleep. As an altered state of consciousness, sleep constitutes one of the most nullifying and apparently useless conditions that the intraphysical consciousness is known to go through. For example: parapsychic phenomena that occur with the ego can occur while the human body is sleeping, because the soma is not the consciousness. They are distinct realities.

Asleep. Nevertheless, with the exception of fantasized dreams, lucid dreams and intuitions, the majority of people probably do not experience even 10% of their animic, parapsychic and lucid projective potential that remains dormant and nullify themselves together with the human body, during the daily period of natural sleep.

Career. *Evolutionary careers* differ from consciousness to consciousness.

Hiatuses. Nevertheless, the *evolutionary hiatuses* generated by the biological renewal of the soma are, in fact, inevitable for all intraphysical consciousnesses.

Shortening. It is up to the interested party to shorten or prolong the duration of personal consciential and evolutionary loss according to his/her number of hours of natural sleep.

Losses. Among the consciential losses generated by daily periods of sleep, we can point out the use of the personality's fundamental faculties, such as the following 8:

1. Alertness.
2. Superior reflexive awareness.
3. Consciential self-concentration.
4. Attention.
5. Rationality.
6. Critical judgment (self-critique and hetero-critique).
7. Use of imagery.
8. Memory.

Analysis. The condition of daily existential and *intrusive* periods analyzed here, can always be interpreted as a type of vacuum, in the manner of the following 11:

1. Daily consciential vacuum.
2. Vacuum of unperceived uselessness.
3. Vacuum of attentiveness (or inattentiveness).
4. Vacuum of perception (or paraperception).
5. Vacuum of self-awareness (or unconsciousness).
6. Vacuum of routine waste.
7. Vacuum of experience (or inexperience).
8. Vacuum of relative consciential hibernation.
9. Vacuum of definitive personal loss.
10. Evolutionary vacuum.
11. Physiological (or paraphysiological) vacuum.

Ambivalence. As can be observed in the preceding enumeration, some characteristics of the evolutionary vacuum's daily existential periods are *paradoxical*, apparently *contradictory* or blatantly *ambivalent*.

Vacillation. The facts are similar to the case of a vacillating person who arrives at the bus station in Rio de Janeiro (Brazil) and does not know where to go: whether to go to the outskirts of the city, to go ahead without an address, to wander at random (nonlucid projection), to go to Porto Alegre, a city in the South of Brazil (lucid projection at a distance) or to return home (interiorization into the soma).

Melatonin. According to human physiology, the pineal gland liberates melatonin, which is thus far considered to be the most potent factor for inducing natural or human sleep (together with vasopressin and oxytocin, both secreted by the hypophysis).

Activity. Up until now, nothing definitively proves that the intraphysical consciousness needs 5 conditions:

1. **Sleep.** To sleep (the soma needs to rest its cells or interneurons).
2. **Inertia.** Phases of immobility, inertia or accentuated inactivity.
3. **Deperception.** Periodic suppression of self-acuity or perceptive activity.
4. **Hibernation.** Personal hibernation, in the manner of many subhuman animals.
5. **Vacuity.** A daily consciential vacuity.

Mutability. What is observed is that the energetic body of the consciousness, e.g., the human aura, does not stop, presenting extreme mutability in its manifestations and endless pulsations. The same occurs with the consciousness per se, which is always active.

Life. Life is activity, pulsation or movement.

Duration. The *average* period (number of hours) of natural sleep, in which delta sleep is included, or that sleep which is capable of providing some degree of minidis coincidence for the normal person, is 8 hours within the 24-hour day/night cycle. Thus, the duration of the daily evolutionary

vacuum for the average intraphysical consciousness is probably 1/3 of the individual's existence, on average taking advantage of 16 hours, or 2/3 of the condition of the useful waking state.

Waste. Strictly speaking, if we hypothetically consider the daily periods of the intraphysical consciousness' evolutionary vacuum as being useless, we will then have pinpointed the ego's greatest wastefulness in intraphysical life, namely the loss of 1/3 of its personal opportunities for experience, development and personal reeducation.

Recuperation. The recuperation of the daily periods of evolutionary vacuum allows the experiential utilization of up to 1/3 of the evolutionary potentialities that are dormant and not utilized by the intraphysical consciousness. Even when it is still not possible to totally achieve this ceiling, any percentage of recuperation of this evolutionary opportunity, which has thus far been constantly and systematically lost, will represent a significant dynamization of consciencial growth.

Nonlucid. The evolutionary vacuum of human sleep is partially filled by all persons, in the majority of their sleep periods, by instinctive or nonlucid projections. These experiences are generated within the physical base, close to but *outside* the soma. These experiences reach 100% of terrestrial humanity during ordinary sleep.

Para-instinct. In this case, the ego para-instinctively sinks into a state of *extracorporeal sleep*. This means that intraphysical consciousnesses depart from the state of coincidence of the holosoma, in the psychosoma, but do not achieve the lucidity needed to experience and remember extraphysical facts.

Percentage. According to international statistics, of all (100%) the components of humanity, who experience nonlucid projections, 9.8% experience lucid dreams or semilucid projections, and only 1.2 % produce lucid projections. This leaves a total of 89% of the population, from all areas, who project exclusively in a nonlucid manner, without any extraphysical experience and, consequently, without any projective recall.

Self-awareness. Extraphysical self-awareness is the irreplaceable causal agent for the greater fulfillment of daily periods of the evolutionary vacuum of human sleep. This is achieved by regaining lucidity immediately after the intraphysical consciousness' vehicles of manifestation discoincide into another consciencial dimension.

Permanent. Extraphysical self-awareness is also the first step toward achieving permanent multidimensional self-awareness, one of the basic goals of projectiology that can be reached by the motivated practitioner through the individual's own will.

Projectiology. In practice, experimental projectiology (experimentology) offers the technical means whereby the interested intraphysical consciousness gradually diminishes personal daily periods of evolutionary vacuum, through two conditions:

1. **Projection.** It firstly supplies techniques for the practitioner to replace an apparently useless altered state of consciousness – sleep – with another far more enriching altered state of consciousness, which is the lucid consciencial projection. This is one personal projectiological utility. The soma remains partially inert during sleep. The consciousness, during the same period, awakens and has transcendental experiences.

2. **Continuous.** Later on, at an advanced stage, it indicates methods for the intraphysical consciousness to gradually promote, reach and live in the state of continuous self-awareness, or intraphysical existence with an uninterrupted waking state.

Others. The intraphysical consciousness experiences brief or prolonged physiological or pathological occurrences, less frequently, that are similar to the vacuum of natural sleep, such as the following 6:

1. Epileptic absence (*petit mal*).
2. Syncope (fainting).
3. Cranial trauma (brain concussion).
4. Encephalic lesion.
5. State of light coma (comatose). Coma 1 or light coma, relative to coma 2 (coma per se), coma 3 (deep), and coma 4 (brain death).
6. Post-desomatic sleep or restorative sleep of the consciousness that resumes being an extraphysical consciousness.

Contents. Periods of evolutionary consciential vacuum do occur in some of these conditions. However, they present greater content, well-defined causal or triggering factors and, as they are occasional conditions, they do not get to the point of being so *intrusive* and far-reaching in the consciousness' evolutionary ascensional progress.

Elimination. It is reasonable to suppose that all intraphysical consciousnesses on this planet will one day eliminate their daily periods of evolutionary vacuum, achieving the condition of absolute serenity of the ego, with integral lucidity or lucidity with no interruption in continuity, and without stagnant periods with regard to the retention of the causal memory (integral memory, holomemory).

92. LUCID PROJECTION AND SOMNAMBULISM

Definition. Somnambulism (Latin: *somnus*, sleep; *ambulare*, walk): the xenophrenic state of sleep or semi-awake trance that occurs in a spontaneous or artificially induced manner, in which the subconscious faculties take the place of normal awareness and direct the human body to perform physical actions, whether they are common, erratic (sleep walking), talking in one's sleep (somniloquy), or highly intellectual (problem solving).

Synonymy: ambulatory activity; noctambulation; semi-awake trance; sleepwalking; walking while sleeping.

Incidence. Spontaneous somnambulism is frequent in children from 3 to 10 years of age – notably in boys – during the state of deep natural sleep, in the first third of the night. It is a disturbance in REM sleep (during the dream period). It mostly affects people above middle age (90% are men).

Criminology. During certain somnambulistic disturbances, the person can even commit crimes without remembering what occurred. Night terror has some similarity with somnambulism.

Motricity. As a generally benign disturbance, somnambulism occurs in the first of the 6 nocturnal portions of sleep, as it shifts from a deeper to a lighter sleep: the motor functions awaken, while the consciousness continues to sleep. In other words, the somnambulant moves but is not aware of what is happening.

Arrhythmia. Psychopathologically speaking, somnambulism is considered to be provoked by a generally hereditary cerebral arrhythmia.

Duration. The spontaneous somnambulistic state can last from 30 seconds to 30 minutes, during which the somnambulist, in the manner of an automaton, maintains open eyelids and an expressionless face.

Eyelids. Nevertheless, the somnambulist can also walk with eyelids closed and with a perfect sense of direction.

Amnesia. As a general rule, the somnambulist's consciousness, upon waking up, does not recall anything from the natural trance of the somnambulistic crisis. In this case, therefore, amnesia or hypomnesia occurs.

Types. In hypnology, somnambulism is generally classified into 4 types – when the phenomenon is addressed in view of the intraphysical or human dimension:

1. Natural.
2. Symptomatic.
3. Artificial.
4. Ecstatic.

Electro-hypnogram. The electro-hypnogram is the electroencephalogram that is characteristic of sleep.

Somnosis. Somnosis is somnambulism provoked during hypnotic sleep.

Vigilambulism. Vigilambulism or, in other words, unconscious automatism occurring during the ordinary, physical waking state and manifesting itself through more or less coordinated acts – such

as standing up, walking and executing simple tasks, shouting, kicking about, calling someone – represents a “second state” that does not leave any recall whatsoever and is mostly observed in children, adolescents, hysterical persons and in certain epileptics.

Degrees. There are various degrees or intensities of the somnambulistic state.

Sleep. The somnambulistic state differs from the state of natural sleep by the muscular tension that remains equal to that of the physical condition of the human body when it is in the ordinary, physical waking state.

Catalepsy. Catalepsy is a deep stage of somnambulism that does not present memory in certain occurrences of hypnosis.

Extraphysical. In the same way that extraphysical catalepsy exists, *extraphysical somnambulism* (somnambulism of the double) also occurs. This constitutes a nonlucid consciential projection.

Projective. Besides the types already referred to, *projective somnambulism* also exists.

Inoffensive. After having a considerable number of projective experiences, the veteran consciential projector can begin to discover him/herself experiencing periods of somnambulism of a characteristically projective origin. Although they are light and inoffensive, they generate extremely real – and sometimes disturbing – facts that are clearly evidenced by the circumstances.

Intercurrences. Due to projective somnambulism, 4 interurrences or natural effects of the phenomenon can arise:

1. **Identification.** The consciential projector only identifies the fact of acting in a somnambulistic manner after some time – almost always hours – after the occurrence. This can evidently be intriguing and even disturbing in the first occurrences.

2. **Prolonged.** In this case, the somnambulism evidences a prolonged consciential projection, generally of 3 hours or longer; although it lacks complete physical recall or, in other words, has only extraphysical memory (holomemory).

3. **Showers.** Post-projective energetic showers clearly reveal the occurrence of consciential projection in the previous period. They nevertheless do not have an emergence of an integral recall of the extraphysical experiences, which is generally impracticable with consciential projections that last more than one hour.

4. **Facts.** The following are 4 absolutely unrecalled physical facts which reveal to the intraphysical consciousness that they were executed in a projective somnambulistic state:

A. **Soma.** Unrecalled change of the physical position of the human body (soma) that is inanimate on the bed.

B. **Cover.** The placement or removal of a cover from the inanimate human body without recollection of the occurrence. This is a fact common to all persons, even without the occurrence of a consciential projection.

C. **Conditioner.** Turning off the air-conditioning (air-conditioner) after the environment becomes adequately cool, also without recollection of the fact.

D. **Window.** Closing or opening the projector’s bedroom window or door according to the convenience of temperature, air currents and other factors, without emergence of the recollection of the fact.

Observation. It is important for us to understand that there is one type of somnambulism that is initiated with the consciousness’ vehicles of manifestation still in coincidence, and another one in which the intraphysical consciousness is already somehow discoincident (or semidiscoincident).

Predisposition. Other factors can obviously predispose the occurrence of the veteran consciential projector’s somnambulism, aside from prolonged consciential projection, especially the following 4:

1. **Exhaustion.** Physical exhaustion prior to the experiment.

2. **Circumstances.** Specific existential circumstances.

3. **Medication.** Use of medication that favors sleep.

4. **Phenomenology.** Category of the prolonged consciential projection (assisted, assistential, or that of another nature).

Criminology. The state of somnambulism, when malign, can even lead the intraphysical consciousness to commit acts of madness, as with the case that occurred on May, 1987 in Canada, where a man of 23 years of age killed his mother-in-law and violently attacked his father-in-law. This person was absolved by the court because it was shown that he was a somnambulist since childhood and had committed the crime while asleep (*O Globo*; newspaper; daily; section: *O Mundo*; 1 illus.; Rio de Janeiro, RJ, Brazil; August 12, 1992; p. 20).

Parapathology. There are cases of young somnambulists who throw themselves from an open window on a high floor of an apartment building and accidentally commit suicide. Cases of highly developed and constant somnambulism demand more accurate observations regarding malignant aspects for the person and his/her relatives. Malign somnambulism in an intraphysical consciousness with extraphysical intrusion is that which requires more attention and caution.

93. LUCID PROJECTION AND DREAMS

Definition. Natural sleep: intermediate consciential state between the ordinary, physical waking state and natural sleep, characterized by a set of ideas or a sequence of images that are more or less coherent and present themselves to the consciousness.

Synonymy: common dream; dream of the observer; nocturnal daydream; normal psychosis; oneiric state; ordinary dream; physiological dream; symbol creation state.

Research. Researchers have clearly shown that during 8 hours of sleep all adults usually dream repeatedly during 4 or 5 periods of 30 minutes each. Individuals seem to fundamentally differ with regard to the clarity with which they recall their dreams.

Hypomnesia. If you think you rarely or never dream, it is because you do not recall (hypomnesia) your dreams and not because you are not having oneiric experiences, which are practically inevitable every night. Fetuses and babies also dream.

Dream. Current sleep research shows that, under normal conditions, every person dreams every night, generally at 90 minute intervals after falling sleep.

Phases. The first dream of the night lasts about 10 minutes, and the following phases gradually increase to a final dream of between 30 and 45 minutes, which is frequently recalled.

Percentage. The natural facts of life cause the human being to dream sometimes for 25% of the time asleep, or 4 to 5 times during an average 8 hours of sleep per night, thus yielding a total dream time of about one-and-a-half hours.

Totals. Thus, each person has a total of more than 1,000 dreams per year, or spends more than 4 entire years of personal human existence *dreaming*.

Center. Researchers are currently endeavoring to open a new area of dream research for the pinpointing and identification of the so-called “dream center” in the human brain, by studying explosion victims who are injured on battlefields.

Fragment. These persons cease dreaming when a small bomb fragment becomes lodged in the brain exactly at the point where the “center of sleep” is thought to be located, apparently destroying it.

Effects. At least 11 effects occur due to sleep and dreams:

1. An excess of incorrect interpretations of extraphysical events.
2. Creations of the imagination.
3. Extraphysical hallucinations.
4. Inconsequential nightmares.

5. Intercurrent dreams.
6. Mental masks.
7. Odd associations with extraphysical realities.
8. Physiological and organic reflexes.
9. Psychological molds.
10. Release of daily tensions.
11. Unfitting supplementary data.

Bad. Two thirds of the dreams of healthy people are *bad* or unpleasant dreams.

Blindness. Persons who are blind from birth have auditory dreams.

Loss. Persons who become blind at some point during their life gradually lose their visual dreams.

Sounds. Ambient sounds, such as a telephone or an alarm clock ringing can sometimes become part of a dream.

Categories. There are many categories of dreams, according to the types of manifestations that occupy the intraphysical consciousness' mind. The following is a list of 16 examples:

1. Bad dream.
2. Bizarre dream.
3. Creative dream.
4. Dramatic dream.
5. Dream of survival.
6. Exciting dream.
7. Gratifying dream.
8. High dream.
9. Incomprehensible dream.
10. Invented dream.
11. Monotonous dream.
12. Mutual dream.
13. Nocturnal dream.
14. Recurring dream.
15. Vivid dream.
16. Warning dream.

Mimic. The dreamer typically remains immobile for the duration of the dream, but may make some slight movements, or certain special mimicking gestures with the hands, feet and face.

Theories. Many theories are proposed, however there is so far no consensus regarding the true cause of the altered state of consciousness that we call *dream*.

Nets. The most recent theory claims that dreams undo undesirable neural nets, thus avoiding an overloading that reduces the efficiency of the brain – in the manner of a data processing machine – during the period in which this organ has its main functions deactivated.

By-product. Dreams may merely be a psychological follow-up – a type of by-product – of a specific rhythmic operation of the nervous system.

Symbols. Dream symbols are generated in an attempt to compensate for an insufficiency in the physical memory bank (biomemory), that encounters neither parallels nor similes in its programming for that which the consciousness perceives in the extraphysical dimension.

Discoincidence. When sleeping, every human being or intraphysical consciousness departs from the state of coincidence of the consciousness' vehicles of manifestation either lucidly, semilucidly or nonlucidly.

Rational. Upon accumulating lucid consciential projection experiences, it is observed that the tendency is to make dreams more rational and apparently less incoherent, thus permitting the consciousness' critical judgment to allow it to *discover that it is dreaming*. This minimizes the dream's oneiric disturbances and even partially nullifies the dream, little by little, the consciousness thus leaving the human body in an ordinary lucid consciential projection.

Comparison. Many lucid projectors compare lucid consensual projection to a color photograph and the ordinary dream to a black and white photo. This actually does little to characterize the reality of these 2 altered states of consciousness.

Product. If, on the one hand, there are projective techniques that are based on dreams, the facts, on the other hand, indicate that at least 1 ordinary dream each night is the product of or the *effect* of a lucid projection, instead of being the generator or the direct *cause* of a consensual projection.

Fall. According to the opinion of many lucid projectors, dreams of falling (lucid proto-projections) are related, in a considerable number of cases, to the phenomenon of physical repercussion.

Complexity. Lucid consensual projections, as evolved as the human projector may be, do not exclude the natural unconscious elaboration of morphothosenes, ordinary dreams, nightmares, daydreams, hypnagogic states, hypnopompic states, nonlucid projections, semilucid projections and other altered states of the consciousness, whose intra-subjective life does not stop, thus always being extremely complex.

Relationship. Unconsciously generated morphothosenes and ordinary dreams are intimately related to each other, to the force of the ego's imagination, as well as those images experienced or even those which are recorded without the individual realizing it in the most recent hours of the intraphysical consciousness' experiences. They are stored in the personal consensual data bank, namely the very recent facts of the morphothosene (thought-form) generator, the dreamer and the imaginer who, in the final analysis, are one and the same person. These facts become important elements for the projector who wishes to precisely analyze and distinguish personal projective experiences from those products generated by his/her elaboration of thoughts, whether they are morphothosenes or ordinary dreams.

94. ONEIRIC IMAGES

Definition. Oneiric image: the image born in a dream, inside the consciousness, whether it is imaginative, hallucinatory, nightmarish, one's own thought-form or morphothosene, the morphothosene of another intelligence, or a distorted perception of extraphysical reality.

Synonymy: dream image; hallucinatory image; phantom image.

Dreams. According to the biological, practical or utilitarian interpretation of psychopathology, there is no other sector of human experience that is more irrational and devoid of logic than dreams.

Contents. Psychoanalysis, on the other hand, which is diametrically opposed to the psychopathological interpretation, considers dreams to be always endowed with *meaning*, presenting contents that are subject to interpretation within a psychological framework.

Logic. The term "logic" can be taken to signify *sense* which, in everyday language, is understood within the perspective of a subject and not objects.

Decoding. In this way, a fact may not possess "logic" for one person, if this individual does not understand it, but does possess "logic" for another person, if that individual was able to decode it.

Object. The object, in and of itself, would be neither logical nor illogical. This is what common sense does, and it only has validity from the subject's point of view.

Principles. The term "logic" can still be taken in a rigorous sense, and in this meaning it will imply, upon being used, that 3 principles are not isolated, namely:

1. **Identity.** The principle of identity.
2. **Noncontradiction.** The principle of noncontradiction.

3. **Third.** Except for intuitionist mathematicians, the principle of the “excluded third.” In this sense, then, nothing in the world would be illogical, only sentences (linguistics, the plane is semantic) could violate these principles. Based on this, dreams, as phenomena, would not be *illogical*, as they would not contradict any of these 3 principles.

Products. Oneiric images – individual psychic products that constitute the content of dreams, oneiric deliria and twilight states – represent visual or fantastic images which, due to the obfuscated condition of the ordinary waking state, are considered to correspond to real objects.

Characteristics. As well, according to psychopathology, the following 7 can be singled out from among the phenomenal characteristics of oneiric images: vivacity, mobility, atemporality, aspatiality, intimacy, irrationality and experientiality.

1. **Vivacity.** Despite the lack of sensorial clarity, the oneiric image is vivid and endowed with extreme plasticity.

2. **Mobility.** All oneiric images are essentially unstable and movable, and are therefore not fixed, or are ceaselessly moving.

3. **Atemporality.** The oneiric image manifests itself independent of the time factor.

4. **Aspatiality.** The oneiric image manifests itself independent of the space factor.

5. **Intimacy.** The oneiric image is projected in internal space, in the intimacy of the consciousness, momentarily considered as objective space.

6. **Irrationality.** The oneiric image is fundamentally illogical or irrational in its appearances (see the topic “Dreams,” above).

7. **Experientiality.** All oneiric images derive from some specific experience of the consciousness.

Stimuli. Certain factors, such as the following 11, can serve as triggering stimuli for the composition of sequences in oneiric situations, whether of ordinary dreams or nightmares:

1. Anger (in this case: rage, antipathy).
2. Anxiety.
3. Cold.
4. Fear.
5. Fever.
6. Indigestion.
7. Intense light shone on the sleeper’s closed eye lids.
8. Menstrual cramps.
9. Noises.
10. Pre-menstrual tension (PMT).
11. Vesical repletion.

Causes. The causes of oneiric images are highly varied. Among them, the following 10 can be listed:

1. Cortical excitation of oneiric imagination.
2. Discontinuity in the degree of extraphysical awareness.
3. Fright.
4. Incorrect rationalization of facts that actually occurred during authentic projections.
5. Occasional nightmare.
6. Physical or extraphysical trauma while the human body is inactive.
7. Sheer hallucination due to foods or medication.
8. Unconscious creation of thought-forms or morphothosenes.
9. Unconscious reception of the morphothosenes of others.
10. Vegetative or neuromuscular reflexes of the organs.

Effects. Countless effects arise from oneiric images, although the essential ones presented here are those related to lucid projection, most notably the following 3:

1. **Perceptions.** Interference in the correct perception of extraphysical events.
2. **Evaluation.** Confusion in the evaluation of extraphysical experiences.
3. **Recall.** Distortion of recollection of the extraphysical period, creating embellishment in the fragmentary recall.

Alert. In light of the facts presented, the projector should always be alert in the sense of maintaining extraphysical lucidity, clarity in the quality of parapsychic perceptions and the possibility of outside consensual interference in the experiments, always removing all doubts in interpretation, incoherence and extravagance, which should be attributed to oneiric images.

Agents. The voluntary intensification of lucid projections in series permits the intraphysical consciousness to perfectly distinguish ordinary dreams in a specific manner, in order to subordinate them to being agents for lucid consensual projection, whether their origin is essentially organic, hypertensive, arteriosclerotic, thermic, or others.

Arteriosclerotic. Recurrent arteriosclerotic dreams are those that indicate the crystallization of the memory in a determinate existential period, generally at least 2 to 3 decades in the past.

Traumas. Arteriosclerotic dreams make the imagination and memory return to the same nucleus of preoccupations or traumas that afflicted the individual in adolescence or infancy, for example, and can be transformed into an effective lucid consensual projection through abrupt extraphysical self-awareness.

95. COMPARISONS BETWEEN DREAMS AND LUCID PROJECTIONS

Differential. The basic differential characteristics of natural, common dreams and the lucid projection of the consciousness from the human body are very distinct and can generally be classified into two categories:

1. Subjective or individual.
2. Objective or public.

Comparisons. The following are 33 didactic comparisons between natural dreams and lucid consensual projections:

1. **Beginning.** In a dream, the intraphysical consciousness does not start dreaming while in the ordinary, physical waking state. In lucid projection, there are episodes wherein the condition of continuous self-awareness is effectively maintained from the waking state or, in other words, before, during and after the projective experiment, without lapse or interruption in consensual lucidity.

2. **Vibrational.** In a dream no condition arises that can be interpreted as being the intense vibrational state, a singular, unique phenomenon that frequently occurs before and after a lucid projection, in a manner that is unmistakable to the projector.

3. **Sounds.** In a dream, the strange intracranial sounds do not occur which are characteristic of the consensual interiorization stage and, less frequently, of the takeoff stage, when the consciousness projects in the psychosoma.

4. **Takeoff.** In dreams there are no consensual impressions of the exit from the human organism. In projection, lucid takeoff in the projective experience of continuous self-awareness is fascinating and unique.

5. **Awareness.** In dreams, due to their inoperative nature, the intraphysical consciousness may not always determine the oneiric images at will, but acts like a spectator or semi-spectator of a show that unfolds before it, over which it has no control as, in fact, we do not dream, *we are dreamt*, *we suffer* the dream, we are objects of the dream. The projected consciousness generally directs the

extraphysical acts and has decision-making capacity equal to that which occurs in the ordinary, physical waking state, because we are the agents of extraphysical events in which we are integrated, speaking, acting, and actually moving.

6. **Activity.** In dreams mental activity is habitual. In lucid projection the consciousness' inner activity transcends the ordinary, physical waking state in richness.

7. **Reason.** In dreams, full reasoning capacity does not occur with ease. In lucid projection, reasoning faculties remain the same in the 2 states, the physical waking state and the extraphysical waking state. They also often transcend the bounds of the ordinary, physical waking state.

8. **Judgment.** In dreams there is neither time nor a clear, immediate awareness of experiences; critical judgment is absent and the most absurd occurrences and situations are readily accepted, because the consciousness is not sufficiently alert to awaken the sense of attention. In lucid projection, critical judgment is always present and the projector is unquestionably certain that his/her human body is distant from the consciousness or, in other words, the consciousness is outside the human body.

9. **Autosuggestion.** In dreams, autosuggestion does not influence the coordination of images. In lucid projection, will or thought determine acts and extraphysical events.

10. **Waking.** In dreams, the dreamer neither recalls nor is aware of the ordinary, physical waking state. In lucid projections, the projector maintains all memories of the waking state.

11. **State.** The dream, as an altered state of consciousness, does not present the magnitude of lucid experience that lucid projection provides in a *sui generis* manner: the degree of self-awareness; the sensation of freedom; the feeling of well-being; the mental lucidity; the expansion of a notion of power; permeability relative to structures and physical bodies; volitation; extraphysical euphoria.

12. **Quality.** In a dream, images more frequently appear distorted, unreal and full of fantasies arising from the creations of the intraphysical consciousness. In lucid projection, the consciousness sees images and experiences events that do not become deformed, are real, occur in a defined environment that is independent of its personal creativity and do not require interpretation.

13. **Intensity.** In dreams, the images of the experiences are less intense than those of the ordinary, physical waking state. In lucid projection, the objective images may attain the greatest degree of intensity of all consensual states.

14. **Images.** Dreams, although having weaker images, allow a stronger and easier recall because they almost always occur when the vehicles of consensual manifestation are nearly coincident or totally coincident, or at least when the consciousness is in the proximity of the human body. Lucid projections, while having stronger images, almost always afford weaker, evanescent, and fleeting memories, as they occur without the direct influence of the brain, the physical organ of the human body, but of the parabrain instead, the extraphysical organ of the psychosoma.

15. **Predetermination.** In a dream, it would be useless to attempt to plan the execution of a specific action, while in the oneiric state, in a specific place chosen before sleeping. Lucid projection makes it possible for you to carry out a resolution, made before sleeping, to direct yourself to a specific location during the experience and realize the willfully planned extraphysical action.

16. **Translocation.** A dream allows deliberate extraphysical travel, but of a relative, illusory, internal, imaginary nature that is merely thought by the consciousness. Lucid projection facilitates the willful execution of extraphysical translocation in a *departure-return-new-departure*, in the same itinerary, giving the projector direct, irrefutable experience of extraphysical situations commanded by the will.

17. **Body.** In a dream, the dreamer, given that he/she dreams inside him/herself (brain), does not have the direct, objective view of his/her own human body when outside it, as with consensual self-bilocation, a characteristic and singular fact that lucid projection provides in an impressive manner, including tactile sensation, self-embrace and the proof – which is definitive for the lucid projector – of the existence of the parabrain or psychosoma.

18. **Reflexes.** During a dream, sensory stimuli produce fantasies. In lucid projection, during the absence of the consciousness from the human body, small external touches made upon the inactive human body provoke the return of the psychosoma with the unmistakable sensation of traction of the silver cord, the admonitory discomfort, intracranial sounds and other phenomena peculiar to extraphysical repercussions.

19. **Interiorization.** Those occurrences characteristic of the mechanism of lucid projection, such as the lucid interiorization of the consciousness while in the psychosoma, are not experiences that can be associated or confused with dreams.

20. **Duration.** It is very difficult to prolong a dream. During a lucid projection, the consciousness determines whether it is going to end or continue the extraphysical period and, through perseverant training, the veteran projector can voluntarily make the experience last for an hour or more.

21. **Recall.** In a dream, the dreamer (*oneironaut*) most often does not recall the images in a correct and logical sequence. The lucid projector (*projectionaut*) can recall the complete, coherent events of the projection in full detail. The projector sometimes does not even need to recall the facts, because it does not lose awareness at any time during the experience.

22. **Accomplishments.** Lucid projectors are able to see and participate in *real* events, as well as describe actual places visited by the consciousness during the extraphysical period. These accomplishments surpass the normal possibilities of dreams with regard to the frequency, validity and intensity of the consciencial experiences.

23. **Continuance.** In a continuance-dream, occurring after an intermission of awakening or sleeping, the images continue in the same apparently incoherent and illogical manner as before. In a continuance-projection, the sequential images of the episodes are coherent and well interlinked, whether according to the theme, the scenario-locations and the character-consciousnesses of the lucid projection, in the first as much as in the second occurrence. The second projective experience undeniably confirms the events and experiences of the first for the lucid projector.

24. **Recurring.** In *recurring* dreams, *there is a reprise of the same* personalities, scenarios and dream story lines that involve 1 constant theme. In recurring projections, there is no repetition of identical patterns of extraphysical occurrences, but similar events that can be grouped, inserted or classified into similar categories.

25. **Energies.** In a dream, the following do not occur: exteriorization of energies, energetic shower, *physical* and psychic phenomena which are ostensive and peculiar to the complex of manifestations of lucid projection, whether occurring before, during, or even after the episodes.

26. **Psychosoma.** There is no similarity between the extremely individual characteristics of the vehicle of manifestation, the psychosoma, which are sensed and observed by the consciousness of the projected projector, and the altered states of consciousness that pertain to the natural dream.

27. **Self-knowledge.** The veteran projector distinguishes perfectly between lucid projections and dreams in a convincing, unquestionable and definitive manner for him/herself.

28. **Ostensive.** The ostensive, public manifestations of lucid projection – such as influence over persons, appearance of the projected projector to intraphysical beings and others – transcend the parameters of the manifestations of dreams.

29. **Encounters.** Lucid encounters between the consciousness of the projected projector and intraphysical beings or extraphysical consciousnesses definitively surpass the restricted limitations of dreams.

30. **Waking.** In dreams, there are no witnesses to oneiric events. In many cases of lucid projection, intraphysical beings who are in the waking state and are present give matching testimonies regarding the occurrences that were triggered or witnessed by the projected projector, as they see it *inter vivos* apparition, or witness the phenomenon of its physical bilocation.

31. **Frequency.** Dreams are more frequent and, furthermore, are better recalled than lucid projections.

32. **Extraphysical.** Some projected-intraphysical-witness-projectors are present and directly participate in the same extraphysical events with other consciousnesses. This does not occur in shared dreams.

33. **Laboratorial.** Laboratory experiments demonstrate, in practice, with the use of special equipment and monitoring, that the reality of lucid projection is an altered state of consciousness very different from the dream state. For example, electro-oculogram readings indicate that rapid bi-ocular movements diminish or stop completely during the period in which the consciousness is projected and indicate a sharp increase in these same rapid eye movements during ordinary dream or while in the oneiric state.

Approaches. The approach, focus and the consensual treatment of a subject are very different between an ordinary dreamer and a lucid projector when they are active. The following are 2 examples:

1. **Fantasy.** The conditioned mind of a young female television viewer has a colorful dream in which she is involved in a fanciful story about an impressive actor in her favorite soap opera.

2. **Reality.** The consciousness of the same young female television viewer projects itself, consciously invading, in a direct and real way, the privacy of the actor-target, who plays the particular soap opera character.

Primitive. It is worth noting that the cultures of primitive societies usually make a symbolic distinction between natural dreams and lucid projections, referring to different trips of the *soul* to *realms* that are also different.

Projectiogenic. It is interesting to note that dreams – just as with daydreams – are so different from lucid projection that they also come to be used as a process whereby the consciousness projects itself from the human body, so-called projectiogenic dreams.

Bibliography: Andreas (36, p. 55), Baumann (93, p. 37), Brown (211, p. 214), Champlin (272, p. 205), Crookall (343, p. 42), Currie (354, p. 78), Farrar (496, p. 198), Fischer (519, p. 171), Frost (560, p. 37), Greenhouse (636, p. 42), Holzer (747, p. 124), Lefebure (909, p. 46), Monroe (1065, p. 179), Monteith (1072, p. 47), Rampa (1352, p. 71), Reis (1384, p. 55), Salley (1496, p. 162), Stevens (1615, p. 232), Stokes (1625, p. 22), Vieira (1766, p. 5), Yram (1897, p. 112).

96. ORDINARY DREAMS ABOUT LUCID PROJECTION

Saturation. After repeated projective experiences and the veteran projector's consequent mental saturation with the subject of lucid projection, typical ordinary dreams with specific themes on lucid projection spontaneously and inevitably arise as an inoffensive, secondary side effect of this saturation.

Identification. Ordinary dreams about lucid projection are easy to identify and distinguish due to their extremely personal characteristics, when compared with semilucid projections, precognitive dreams and premonitory dreams.

Inexperience. In certain cases, ordinary dreams that are centered on projective themes can even happen to the intraphysical consciousness who has never experienced an entirely lucid major projection (which is recalled in this human life).

Experience. Nevertheless, it is very common for this to happen to the veteran projector who has had a considerable number of experiences outside the human body and who has a consciousness that is psychologically predisposed to oneiric story lines about lucid projections.

Characters. Among the more striking characteristics of dreams with lucid projection as their theme, the following 6 can be singled out:

1. **Awareness.** Absence of awareness and critical judgment characteristic of the dreamer and not of the projected projector, who enjoys extraphysical lucidity. For example: the projector's consciousness, when dreaming, does not perceive that it has already projected many other times and wants to project as if it were the first time.

2. **Time.** Discrepancies regarding chronological time and weather conditions characteristic of the dream scenario. For example: the projector – a dreamer in this case – feels him/herself to be flying over the street of his/her physical base, illuminated by the summer sun, at a time when it is actually night and is even raining.

3. **Clothing.** There is an evident discrepancy regarding the clothes being used. For example: the projector – a dreamer in this case – experiences being dressed in a suit and tie, and is concerned with the cleanliness of the shoes, looking for some polish to put on them before meeting some projected friends. Obviously, no projector will ever need to polish shoes while projected.

4. **Vehicle.** Discrepancy regarding the vehicle of manifestation. For example: the projector – a dreamer in this case – unexpectedly thinks of projecting directly with his/her own dense human body, which is impracticable and incoherent in that instance.

5. **Attitudes.** Discrepancy regarding attitudes. For example: the projector – a dreamer in this case – feverishly looks for, and cannot find, 1 technical book on lucid projection that he/she wishes to study, in an atmosphere typical of nightmarish anguish.

6. **Energies.** Absence of the post-projective shower of energies. For example: the projector – a dreamer in this case – physically awakens and does not enjoy any of the well-being characteristic of the post-projective period of an authentic major projection.

Erection. One of the most common dreams in which the consciousness of the veteran projector identifies that it is dreaming, occurs *after* a prolonged assistential projection that was distant from the physical base, when the consciousness interiorizes and encounters the physical penis in erection (androsomatics).

Parapenis. This physiological erection that began during the temporary absence of the consciousness from the human body did not previously extraphysically have a repercussion in its psychosoma or, in other words, in its *parapenis*, nor even in its *mentalsoma*. It thus did not get to the point of provoking the para-erection of the extraphysical penis.

Interiorization. In this case, the erotic dream, when it occurs, almost always begins immediately when the projected consciousness interiorizes. The consciousness might not let itself become involved by the dream, and may even physically awaken soon thereafter.

Opportunity. In a single night, a person can experience an expressive lucid projection and, soon thereafter, dream about the same projection. This is the best opportunity for making a detailed study of the differences between these manifestations and the phenomenological parameters between one experience and the other.

Inductions. The projector may either intentionally produce a lucid projection or induce a dream about that selfsame projection soon thereafter.

Bibliography: Shay (1546, p. 91).

97. SEMILUCID PROJECTION

Definition. Semilucid projection: a dream that the intraphysical consciousness experiences for a period of time in which he/she enters into a state wherein he/she knows he/she is dreaming but is unable to obtain a greater degree of uninterrupted lucidity during the entire period and does not even become aware that he/she will soon physically awaken.

Synonymy: conscial subprojection; conscious dream; discontinuous projection; dream of knowledge; high dream; *lucid dream*; mixed dream; participatory dream; pre-lucid dream; pre-projective dream; semi-dream state; semilucid projection; semi-oneiric projection; semi-projective dream; state of fluctuating consciousness; translucid dream; true dream; twilight conscial projection; veridical dream.

Complexity. Semilucid projection is classified as being intermediary between the 3 basic categories of consensual projections, in regard to the degree of lucidity:

1. Nonlucid projection.
2. Semilucid projection.
3. Lucid projection.

Similarities. Semilucid projection has similarities and direct relationships with at least the following 5 intraconsensual occurrences:

1. **Daydream.** Daydream or the waking dream.
2. **Hypnagogy.** The hypnagogic state.
3. **Pharmacology.** Psychedelic states (pharmacological, or chemical).
4. **Hypnosis.** Hypnotic hallucinations.
5. **Imagetic.** The types of imagetic (image) creation.

Sleep. It is currently accepted that sleep is a far more complex phenomenon than was previously thought. It is even possible to be simultaneously awake and asleep, because the condition of the *ordinary, physical waking state* and the altered condition of the *dream* are not mutually exclusive consensual states.

Intensity. At our current evolutionary level, no intraphysical consciousness only sleeps, only dreams or projects all the time when he/she leaves the ordinary, physical waking state.

Discontinuity. All persons, including the most advanced consensual projectors, ordinarily have a period of discontinuous sleep. In other words, upon going to bed at night they sleep, dream, have a nightmare, project, dream again, wake up, sleep, dream, and project again, and so on, until waking up in the morning and getting out of bed.

Mixture. This fact predisposes the appearance of mixed consensual projections, evidencing some degree of lucidity while simultaneously being interwoven with oneiric images.

Interaction. As a general rule regarding terrestrial humanity, consciousnesses project themselves at night while sleeping. However, neither they nor their vehicles of manifestation – in this case, especially the psychosoma – get to the point of interacting with the extraphysical environment where they temporarily go. They most often remain within the extraphysical sphere of energy (psychosphere, holothosene, materthosene).

Nightmare. Semilucid consensual projection in the psychosoma generates a nightmarish consensual projection due to uncontrolled extraphysical emotion.

Circuit. The influence of the silver cord's two-way energy flow, in the human body-psychosoma circuit, is decisive in the production of semilucid consensual projection.

Ballast. The greater the percentage of semimaterial energetic constituent components – ballast – of the energetic body or holochakra that enter into the structure of the projected psychosoma through the silver cord, thus increasing its density, the greater will be the clouding or obnubilation of the consciousness' lucidity during the projection.

Rarefaction. The psychosoma, when much more rarefied (less dense or *lighter*), facilitates the maintenance of the projected consciousness' lucidity.

Factors. Any consensual projection in which there is an interference of oneiric factors, profound distortions of images, absurd, incoherent and incongruent scenes, whether at the beginning, middle or end of the extraphysical period experienced by the consciousness, constitutes a semilucid projection.

Predisposition. Semilucid projection acts as a predisposing factor, launching pad, or halfway point for the lucid dreamer's consciousness to reach a full-scale lucid projection.

Proximity. Semilucid projection is closer to certain altered states of consciousness, such as: somnambulism, dreams and nightmares of all types and manifestations.

Rule. The following is a fundamental principle or rule: semilucid projection occurs with all people, *without exception*, even when they do not perceive the extent and nature of this typical consensual phenomenon.

Types. The following are 4 types of oneiric experiences that may, in many cases, but *not in all* cases, be semilucid projections:

1. **Flight.** An agreeable dream of unimpeded flight, with a clear view of landscapes.
2. **Fall.** A dream of an abrupt fall with immediate physical awakening, whereupon physical repercussions also occur.
3. **Sliding.** A dream of sliding along on your bare feet.
4. **Clothing.** A dream of being dressed in pajamas, in a manner that is inappropriate for the environment or scenario of the oneiric experience.

Veridical. Certain so-called veridical dreams – presumably *supranormal* dreams that in some ways correspond to facts or events beyond the dreamer’s normal knowledge or sensory range – also constitute semilucid projections.

Joint. Joint semilucid projections can occur. These are more evolved phenomena than mutual dreams and less evolved phenomena than full, joint lucid projections.

Archiprojections. Lucid dream - an inferior, primary version of lucid projection - which only lasts for a few minutes, typically occurring at 5 o'clock in the morning, in which the dreamer develops a certain degree of lucidity while dreaming, recognizes the dream, which is almost always more colorful than an ordinary dream, perceives that he/she is dreaming with no need to wake up, as well as a great number of dreams of floating, flying and falling, can be interpreted as semilucid projections and, moreover, in some cases, are initial or incipient projections (protoprojections or archiprojections).

Distinction. However, distinguishing between a lucid dream and a full lucid projection becomes difficult, as it depends on the practice of the self-critiquing and discerning projector, a characteristic that is only achieved by those who have already experienced a series of lucid projections and possess personal elements needed for making comparisons.

REM. All lucid dreams occur during the period called REM dreaming.

Understanding. Thus, we can conclude that, strictly speaking, only an understanding of lucid projections allows the practitioner to understand semilucid projections or lucid dreams.

Statistics. According to the statistical surveys performed to date, only 5% to 10% of the population has lucid dreams with some regularity.

Separation. There is currently a tendency among researchers to separate the following 3 events:

1. **Semilucidity.** Lucid dream or semilucid projection.
2. **Oneirism.** Natural dreams.
3. **Self-awareness.** Lucid projection.

Publication. In the United States of America, an institute has been founded that is dedicated to the research of lucid dreams: The Lucidity Institute (home page on the Internet).

Analyses. The more we anatomize the consensual states in order to establish more circumstantiated analyses, without losing the panoramic vision of the phenomena, the better it will be for research of the consciousness, which is the most complex reality in the cosmos.

Metachoric. Lucid dreams are also being studied together with full lucid projections (extracorporeal experiences) and *false awakenings*. This research is studying processes called *metachoric experiences* or, in other words, those in chorus with the 3 abovementioned consensual experiences.

Technique. The most efficacious technique for inducing lucid projection through ordinary lucid dream that is currently employed and recommended by international research symposiums on ordinary dreams and lucid dreaming, is for the individual to ask him/herself, as many times as possible, in all environments and circumstances, day after day, during at least one month, the following simple

but pondered question: *Am I awake or am I sleeping?* This method really works, and the lucid dream ends up leading the consciousness to a full lucid projection.

Entrance. Sleep researchers accept that, with correct, adequate mental training, it is possible not only to have an objective, clear vision of our own dreams but *also to enter them* and alter them, just as the director of a play or a theatrical author reworks the plot of a piece on-the-spot directly on the stage (in the scene).

Mnemosomatics. The autosuggestion technique used to induce a lucid dream is the mnemonic induction of lucid dreams (MILD) technique, which is based on the following affirmation being made to oneself when going to sleep: “The next time I am dreaming, I want to remember that I am dreaming.” One then visualizes oneself to be simultaneously sleeping in the bed and dreaming, and being very much aware of where he/she is.

Inducer. In light of the facts, lucid dream can be utilized as an inducer of lucid projection, in the same manner as the more common projectogenic dream.

Recollection. Due to the discontinuity of extraphysical lucidity, the recollection of experiences during a semilucid projection frequently becomes repressed, altered or more difficult.

Oneiric. In the *oneiric projection* – a characteristic type of semilucid projection – the projector only has discontinuous awareness during the experiences. Instances of authentic exteriorization occur, mixed with oneiric episodes, which can be interspersed with brief phases of normal sleep. This should not be confused with projective dreams.

Consequences. Nonlucid projection, or projection in the extraphysical dimension without self-awareness, can occur *with* or *without* visually perceiving events.

Unconsciousness. In this case, the projector can see extraphysical events and even act upon physical objects. He/she does not, however, perceive that he/she is projected on that occasion, being able to recall the scenes of the facts after physical awakening.

Evidence. This is the condition of extraphysical somnambulism, of certain apparitions of the intraphysical projector and even cases of physical bilocation, or even projective poltergeist and projective haunting.

Conclusions. These pieces of evidence lead to 4 conclusions about our consciencial conditions:

1. **Awareness.** Awareness, merely as a state of lucidity, is *independent* from the process of projection in general.
2. **Biomemory.** The memory (biomemory) that is present in the neurons (of the cerebral hemispheres) is *independent* from the intraphysical consciousness’ process of lucid and nonlucid projection.
3. **Dream.** The phenomenological complex of projection or, more precisely, the altered state of the consciousness that is semilucidly projected, has superficial similarities, but is essentially very *different* from the oneiric state because, in this case, it is a lucid dream.
4. **Somnambulism.** The phenomenological complex of semilucid projection has superficial similarities, but is essentially very *different* from the somnambulant state.

Locations. In theory, the researcher could endeavor to characterize and distinguish the lucid dream state from the semilucid consciencial projection according the consciencial location or seat where the intraphysical consciousness’ experience unfolds, in 2 manners with regard to the parabrains:

1. **Inside.** The lucid dream, in this case, would unfold in the parabrains of the psychosoma, but *inside* the human body, in the intimacy of the encephalon, or the 2 cerebral hemispheres.
2. **Outside.** The semilucid projection would always manifest in the parabrains of the psychosoma, though when it is *outside* the brain or the human body.

Extracorporeal. This distinction, although simplistic, becomes problematic when the projected intraphysical consciousness (headquartered in the parabrains of the psychosoma) sometimes experiences *extracorporeal sleep* and experiences an *extracorporeal dream* that should logically, in this case, be classified as a lucid dream, because this same consciousness sensorially detects nothing regarding the extraphysical dimension in this instance.

Classification. Hence, lucid dreams are included and classified here as semilucid projections, besides any other considerations, in light of the real difficulty in rigorously separating the real manifestations of these altered states of consciousness which occur, interlace and alternate with surprising rapidity. The consciousness does not stop.

Categories. It is worth registering here the 3 categories in which the lucid dream can develop, in regard to certain, essentially diverse consciential conditions:

1. **Brain.** The lucid dream unfolds inside the human brain, when the consciousness' vehicles of manifestation are coincident, and therefore without any consciential projection.

ISBE. This simply oneiric experience is the ISBE (inside-the-body experience, or experience inside the human body or soma) or the dream that develops inside the human body. Do not confuse this with the intracorporeal experience or the ordinary, physical waking state.

2. **Unconscious.** The lucid dream only unfolds inside the parabrains of the projected psychosoma in a nonlucid consciential projection.

Oobe. This experience is the Oobe (out-of-the-body experience or experience outside the human body), although it is not experienced with lucidity (nonlucid projection).

3. **Semilucid.** The lucid dream unfolds inside the parabrains of the projected psychosoma in a semilucid consciential projection, namely when the consciousness partially detects, with its perceptions, the extraphysical dimension, where it is manifesting on that occasion.

Lucidity. This experience is the Oobe (out-of-the-body experience) with a certain degree of lucidity (semilucid projection).

Research. Statistical public opinion research conducted with students revealed a far higher incidence of the lucid dream phenomenon, or semilucid consciential projection, with significantly higher percentages, in relation to lucid consciential projection, per se (approximately 10:1).

Perceptual. Within the scope of semilucid projections, it would also be more rational to include specific consciential projections of one isolated perception (perceptual projection) of the consciousness, without resulting in full dis coincidence of its vehicles of manifestation.

Clairvoyance. For example, visual perception, peculiar to clairvoyance, is in certain cases a projection of the sense of *vision* outside the human body, without the dislocation of the entire *center of the consciousness* and its essential components or other basic attributes outside its physical seat, the brain. The same may occur with the *auditive, tactile*, and other sensory perceptions.

Relationships. This phenomenon has a direct relationship with certain occurrences of telekinesis, *traveling* clairvoyance, exteriorization of motricity and sensitivity.

Intraphysical consciousnesses. Perceptual projections are common with persons or intraphysical consciousnesses who are on drugs, ill, novice clairvoyants, aura readers and other personalities.

Subtleties. The projected consciousness' contradictory attitudes during semilucid projections are sometimes extremely subtle because its emotions suffocate rationality.

Case Study. For example: in order to counteract the retraction of the silver cord – which is dragging the psychosoma back into the human body – the anxious consciousness, already projected outside the building where it resides, tries, as a last resort, to grab and hold onto the cement ledge at the base of the closed bedroom window (of the bedroom where the soma rests) with the parahrands. This ledge is situated 6'6" (2 meters) from the bed, but is within the radius of the all-powerful action of the silver cord, which is 13' (4 meters) on average.

Phenomena. In this maneuver, its parahrands first went through the curtains and the windowpane (the attribute of self-permeability of the psychosoma), in order to immediately attach themselves to the window sill (phenomenon of extraphysical telekinesis).

Procedures. Conclusion: the projected consciousness attempts to employ – in an obviously futile manner – two procedures that are antagonistic, or which cannot coexist almost simultaneously:

1. **Dematerialization.** The dematerialization or permeability of the parahands.
2. **Materialization.** The materialization or impermeability of the same parahands.

Cord. In this case, the evident and most common phenomenon occurs, namely the impermeability of the parahands in the two procedures, and the silver cord wins the contest.

98. LUCID PROJECTION AND NIGHTMARES

Definition. Nightmare: the afflictive dream the effects of which are agitation, anguish and oppression during its development.

Synonymy: bad dream; *cauchemar*; demonic dream; nightmarish dream; nightmarish hallucination; sleep terror disorder.

Victim. In nightmares, what occurs is a periodic detonation of neural activity, reflecting material in which the individual is more a victim (direct experiencer) than an actor (feigned protagonist).

Infancy. Nightmares are generally associated with basic fears in our infancy and recreate a time in our current physical life in which we are completely defenseless.

Insecurity. Nightmares occur in adult life when a person feels insecure and recalls these initial fears, insecurities and disagreeable expectations.

Mood. Sleepers who have nightmares during the night, even when they do not remember them, generally wake up in a bad mood.

Spontaneous. Children's spontaneous nightmares always appear after deep sleep, notably at the beginning of the night. Awakened due to intense anguish, or panicky fear (oneirophobia), the child screams loudly and is sometimes difficult to calm.

Pathology. Sleep terror disorder is not an expression of dreams, but represents a pathological awakening that frequently occurs in children between 4 and 7, or between 10 and 13 years of physical age.

Avoidance. Some persons suffer periods of prolonged and frequent nightmares (recurrence), in accordance with certain occurrences in life.

Prophylaxis. There are 3 attitudes that help the individual to avoid all types of traumatic nightmares:

1. **Cause.** Discover what it is that causes the person to feel afraid or have that type of phobia.
2. **Thoughts.** Maintain pleasant thoughts before sleeping.
3. **Relaxation.** Maintain a state of inner relaxation.

Incidence. Many nightmares, whether they are of origins which are chemical-physiological (medications, food), pathological (specific illness, trauma, accident), environmental (excessive heat) or others, can arise exaggerating or intensifying the story line of a distressful situation previously experienced, even if many decades ago, either in one's childhood or adolescence.

Recurrence. Nightmares tend to repeat themselves, with small variations on the same basic familiar story line, and as a function of the repetition of the cause that generated them.

Categories. Nightmarish hallucinations, or "night demons," vary according to the dreamer's psychic state and organic state, and can be divided into 3 groups or categories:

1. **Personages.** According to the (exotic) personages that are involved.
2. **Animals.** According to the (monstrous) animals in their story lines.
3. **Situations.** According to the (tragic) situations that they comprise.

Forms. Nightmares also manifest in two forms:

1. **Possession.** Passive, in which the dreamer-possessed individual submits him/herself to nightmarish anguish without reaction.
2. **Reaction.** Active, in which the dreamer reacts to the nightmare's hallucinatory conditions.

Characters. The adult's nightmare in its various forms, whether digestive, hypertensive, or of another nature, constitutes a manifestation of the altered state of consciousness called *dream*. The characteristics that differentiate it from lucid projection are obvious.

Recall. There are two conditions of recall in this context:

1. **Fright.** People generally recall *nightmares* because they are frightened by them.
2. **Vagueness.** In many cases, *lucid projections* are not recalled because they hold no significance for the intraphysical consciousness, other than being mild or agreeable, not frightening experiences. They are often vague and lack sufficient emotional significance to provoke recall.

Start. The intraphysical consciousness can project from the human body starting out from a nightmare, or from an *anxiety attack* experienced in a dream, as well as from experiencing a characteristically nightmarish semilucid projection.

Lucidity. As a rule, when the consciousness achieves some degree of lucidity during a nightmare, negative dream, or terrorizing dream – the lucid nightmare – the nightmare disappears completely.

States. This last condition can develop into 1 of 3 consensual states:

1. **Dream.** The nightmare disappears and the consciousness continues to uninterruptedly experience a natural dream that is inoffensive or even agreeable, from an emotional point of view.
2. **Projection.** The nightmare disappears and the consciousness subsequently has a lucid projection.
3. **Awakening.** The nightmare disappears and the consciousness physically awakens, recalling multiple different consensual events.

Volitation. One of the more common processes for eliminating a nightmare stems from the ability of the consciousness to volitate extraphysically.

Scenario. Upon feeling anguished, in extremely frightening circumstances, the consciousness *leaves the nightmarish scenario* volitating.

Psychosoma. This fact suggests that the psychosoma's advanced consensual attributes do not permit the consciousness to have intense projective nightmares, because these attributes – developed to a degree beyond the human body's restrictions – break the conditioning of organic limitations and naturally undo the nightmarish anguish.

Sensations. We can arrive at two conclusions regarding the intraphysical consciousness' sensations from the material presented thus far:

1. **Oneiric.** The common *natural dream* constitutes a consensual experience that is *stronger* than a nightmare, in respect to its sensations, although this does not seem to be the case at first sight, because it imposes itself upon the consciousness (*dream versus nightmare*).
2. **Projective.** Similarly, *lucid projection* is a *stronger* experience than natural dream and nightmare from the standpoint of the consciousness' experiences when in these altered states (*lucid projection versus dream and nightmare*).

Parapathology. The intraphysical consciousness' intrusion-related situations, as well as the incubus and succubus processes (sexosomatics), can trigger terrifying nightmares.

Bibliography: Fodor (529, p. 185), Frost (560, p. 49), Rampa (1352, p. 71), Vieira (1762, p. 49), Walker (1781, p. 100).

99. COMPARISONS BETWEEN NIGHTMARES AND EXTRAPHYSICAL INTRUSION

Differential. The basic differential characteristics between nightmares and extraphysical interconscial intrusions are very important for the intraphysical projector's understanding of conscial states. They are well defined, as can be seen in these 10 topics:

1. **Evidence.** The nightmare constitutes a manifestation that is specifically internal, psychic or self-psychic, related to the intraphysical consciousness itself.

Nightmare. Influence exerted over others through the thoughts and emotions of extraphysical intruders (intruders, as well as their satellites) can even occur through nightmarish manifestation by way of external interference that is effected upon the individual's oneiric images, whether that person is a child, youth, or adult.

Paraperceptions. Nevertheless, these interferences sometimes become evident to the intraphysical consciousness. They are extraphysically *parasensed*, *paraseen* and *paratouched* as originating *from outside* oneself (heteropsychic), namely stemming from another or other consciousnesses.

2. **States.** A nightmare is a characteristic manifestation that occurs in the oneiric state or during the intraphysical consciousness' ordinary dreams, being almost always benign.

Malign. Intrusion-related influence is a profuse manifestation, arising in many cases as a living nightmare, or occurring in the ordinary, physical waking state like a negative daydream imposed upon the intraphysical consciousness, with clearly noxious or malign aspects.

3. **Continuity.** Nightmares, which are ephemeral manifestations, generally completely extinguish at the moment the consciousness physically awakens.

Continuation. Intrusion-related influence, a less transitory manifestation, does not always end upon physical awakening. It demonstrates a logical continuation and continuity into other conditions or altered states of consciousness. Negative *mental wedges* or *xenothosenes* – sick ones, in this case – also occur (thosenology).

4. **Images.** The nightmare is characterized by an absence of logic in its nightmarish images.

Logic. Intrusion-related influence demonstrates reasonably plausible connotations in its negative images, that are induced or forged in the intraphysical consciousness' mind.

5. **Positions.** In a nightmare, the characters do not have well-defined roles.

Roles. In extraphysical interconscial intrusion, the roles performed by the extraphysical consciousness (the *tormentor*) and the intraphysical consciousness (the *victim*) are clearly defined.

6. **Emotionality.** In a nightmare, ephemeral emotionality arises from the human being's own sentiments and sensations.

Superimposition. Intrusion-related influence provokes insinuating, strange, and even exotic superimposed emotionality in the individual who is suffering intrusion.

7. **Memory.** A nightmare does not provoke considerable alterations in the normal flow of the dreamer's mnemonic engrams upon awakening.

Intrusion. Intrusion-related influence causes an invasion or intrusion of traumatizing phantom-recollections into the victim's memory that correspond to events that were not experienced in the current existence and therefore do not have a corresponding place in the biomemory of the current existence.

Para-amnesia. These recollections compose the para-amnesia that can sometimes even refer to experiences from previous lives together with the victimizer or the intrusive company.

8. **Age.** Nightmares occur more frequently in children. Intrusion-related influence occurs more frequently with adults.

9. **Incidence.** From the perspective of the incidence of the various conditions analyzed here, we cannot say that an *intrusion-related nightmare* exists.

Recurrence. The most that can happen is that the individual has a recurring nightmare, or one that repeats due to certain predisposing physiological or psychic conditions.

Intrusion. On the other hand, nightmarish, uncomfortable and insidious intrusion does occur, and has unmistakable characteristics, in the manner of a mega-weak-trait.

10. **Parapsychopathology.** As can be seen, ordinary nightmares, which we can call *natural* or physiological nightmares, are overall very different in their manifestations from *artificial* (parapsychopathological) nightmares, which are created from the existence and action of a consciousness that intrudes upon the intraphysical consciousness' psychic (intraconsciential) and parapsychic (intra and extraconsciential) life.

Bibliography: Vieira (1762, p. 49).

100. LUCID PROJECTION AND HALLUCINATION

Definitions. Hallucination (Latin: *hallucinari*, to mistake): the apparent perception of an external object that is not present at the moment; a mental error in sensory perception not based on an objective reality; an experience with the characteristics of sensory perception, but with no evident sensory stimulation.

Synonymy: derangement; fantasy; ideophane; illusion; mirage; perception without an object; wrong perception.

Similarities. There undoubtedly exist similarities between hallucination and certain ordinary states of consciousness, especially natural *sleep*, the ordinary *dream*, and the physiological *nightmare*.

Defense. All these states constitute the human body's (soma) own and peculiar defense mechanisms against that which is unbearable (something) to the consciousness (self-lucidity).

Aspects. Some researchers consider 2 apparently logical aspects:

1. **Awake.** Hallucinations could be the consciousness' dreams in the ordinary, physical waking state.
2. **Sleep.** Dreams could be hallucinations experienced by the sleeping person (sleep).

Psychopathology. Within psychopathology, hallucinatory states arise more easily in those consciential conditions that are intermediary between the ordinary, physical waking state and the natural sleep state.

Disturbances. These conditions present themselves in almost all mental disturbances, notably in the following 5, among others:

1. Bipolar disorder (manic-depressive psychosis).
2. Epilepsy.
3. Exotoxic psychoses.
4. Feverish delirium.
5. Schizophrenia.

Clairvoyance. On the other hand, visual hallucinations are extremely similar in their manifestations to the animic-parapsychic phenomenon of *facial clairvoyance*, especially due to the following 4 characteristics:

1. **Eyes.** As they occur with the eyes open.
2. **Gaze.** Maintenance of a fixed gaze in a specific direction.
3. **Fixation.** The special characteristic attitude of expectation, or fixation.
4. **Indifference.** Indifference to normal visual stimuli.

Energy. Bioenergy is a powerful anti-nightmare factor. If you are aware of your consciential energies and are able to enter into the vibrational state whenever you wish in any critical or traumatic

circumstance while in the ordinary, physical waking state, and if the vibrational state is already a permanent conscial habit of self-defense, the most intelligent thing to do is to continue to produce the same condition when experiencing the altered state of a nightmare.

Will. The energies triggered by the will undo the nightmare images upon rationalizing the oneiric scenes.

Phenomenon. All phenomena, and therefore, all altered states of consciousness require energy.

Thosenization. It is a matter of thosenization, with the *ene* component.

Realities. However, the consciousness, or the will itself, is simultaneously 4 realities:

1. More than energy.
2. More than the brain.
3. More than the neurons.
4. More than the soma's *cellular flimflam*.

Causes. Generally speaking, besides mental disorders, hunger, thirst, fear, guilt, loneliness and extreme physical sensory deprivation or emotional deprivation can cause hallucinations that are simple or complex phenomena and vary in type and manner, such as the following 19, among others:

1. Abstract hallucinations.
2. Antagonistic hallucinations.
3. Associated hallucinations.
4. Auditory hallucinations.
5. Cenesthetic hallucinations.
6. Endoscopic hallucinations.
7. Extrascenic hallucinations.
8. Gigantic or Gulliverian hallucinations.
9. Gustatory hallucinations.
10. Kinesthetic hallucinations.
11. Negative hallucinations.
12. Neurological hallucinations.
13. Normopsychic hallucinations.
14. Olfactory hallucinations.
15. Perceptive hallucinations.
16. Psychomotor hallucinations.
17. Small or Lilliputian hallucinations.
18. Tactile hallucinations.
19. Visual hallucinations.

Similarities. The greatest similarities between hallucinations and lucid projections are in regard to the following 3 factors:

1. **Alterations.** Both are altered states of consciousness.
2. **Mechanisms.** Both act as conscial self-defense mechanisms.
3. **Deprivation.** Both can be triggered by sensory deprivation.

Explanation. Hallucination is generally proposed as the psychological occurrence that explains lucid projection. This explanation is obviously given by those who have never experienced conscial projections and are unaware of the extent of manifestations that arise in the much broader conscial universe of projectiology.

Multi-sensory. Lucid projection, using hallucination as an explanatory hypothesis, would be an illusory, imaginary perception that utilizes all the senses as a mechanism, or at least vision, audition and taction.

Collective. In order to explain certain projections of the consciousness, the hallucination theory would have to be a collective or a group one, because it would simultaneously occur with the projector, the assistant or assistants, and witness-observers, in the case of joint or shared apparitions. Each

individual's perceptions would react simultaneously and with several of their senses in hallucinatory states. This is difficult to understand in light of logic and reason. This hypothesis is more absurd (nonsense) than hallucination itself.

Facts. There are 2 essential facts that, for the projector, eliminate the hallucination hypothesis as being explanatory of lucid projection:

1. **Induction.** The individual can experimentally induce the lucid projection, and the projector is very clear that the experiences are not mere autosuggestions.
2. **Self-bilocation.** During the self-bilocation phenomenon, the consciousness sees itself outside the human body and contemplates it in relief with full lucidity as the real being that it is.

Cases. In cases of lucid projection, it can be seen that the accounts are far too numerous and unanimous to be considered mere hallucinations, as they come from all countries, and are related by non-pathological people who receive all types of cultural influence and describe the occurrences as having the same phenomena-related patterns. It is highly improbable that so many apparently psychologically healthy persons are suffering hallucinations.

Physiology. In this case, the best, more rational and logical hypothesis that matches up with the general facts is to consider consciencial projection to be a natural, physiological and universal phenomenon that is equal to other *parapsychic* (intraconsciencial and parapsychic) phenomena.

Veridical. It is worth noting that there are those who defend the existence of the so-called *veridical hallucination*, corresponding to an event or circumstance that is unknown to the percipient, which, in this case, distorts the meaning of the term *hallucination*.

Bibliography: Blackmore (139, p. 81), Champlin (272, p. 205), Currie (354, p. 159), Fortune (540, p. 76), Gooch (617, p. 72), Gurney (666, p. 457), Kardec (825, p. 140), Lippman (934, p. 345), Marinuzzi (998, p. 112), Paim (1182, p. 45), Rogo (1436, p. 178), Souza (1584, p. 8), Todd (1689, p. 53), Walker (1781, p. 85), Wolman (1863, p. 926).

101. COMPARISONS BETWEEN HALLUCINATION AND LUCID PROJECTION

Differential. The basic differential characteristics between hallucination and projection of the consciousness outside the human body, like those that refer to ordinary dreams, are quite striking and can generally be classified into two categories:

1. **Individual.** Subjective or individual.
2. **Public.** Objective or public.

Subjective. We will now consider at least 14 of these differential characteristics between hallucination and projection of the consciousness, the first 8 being subjective ones:

1. **Predetermination.** It is useless to attempt to execute a specific action in a predetermined location while hallucinating. With projection, this becomes possible, and with assured results, starting from the resolution taken before sleeping to direct oneself to a certain location during the projection and, when there, to realize the extraphysical action that was planned.

2. **Takeoff.** The experience of lucid takeoff, namely the impressions of the departure from the human body, cannot be associated with hallucinations.

3. **Psychosoma.** The extremely individual characteristics of the psychosoma and its manifestations, that are felt and observed by the projected projector, convince it of extraphysical realities, which are far removed from any mistaken perceptions or hallucinations.

4. **Realities.** Hallucinations do not present the resources necessary to provide exact information regarding *real* events experienced and the *real* places described by the projector.

5. **Translocation.** Deliberate extraphysical transit is not possible through hallucination by the consciousness. Projection facilitates the willful execution of extraphysical *departure-return-new-departure*

translocation, in the same itinerary or trajectory, giving the projector the direct, irrefutable experience of extraphysical situations commanded by its own will.

6. **Interiorization.** The experience of lucid interiorization while in the psychosoma is also very different from hallucination.

7. **Energies.** In hallucination there is no exteriorization of energies and the ostensive energetic shower, which are *physical* and psychic phenomena peculiar to the complex of projective manifestations, whether occurring before, during, or even after the projective episodes.

8. **Self-knowledge.** The projector perfectly distinguishes lucid consciential projections from any erroneous perceptions or hallucinations through the self-persuasion that is peculiar to the projective phenomenon.

Objectives. We will now look at 6 objective differential characteristics between hallucination and projection of the consciousness:

9. **Influence.** The influence exercised by the projected projector over other persons, including the apparitions to intraphysical consciousnesses, is not even remotely similar to erroneous perceptions or hallucinations.

10. **Encounters.** Logically speaking, hallucinations do not permit encounters with extraphysical consciousnesses or intraphysical consciousnesses, as occurs with lucid projections.

11. **Waking.** Hallucinations do not permit occurrences similar to those of intraphysical beings who are in the waking state, are present, and give matching testimonies regarding the events seen by the projector, as they see its apparition in the psychosoma, or the phenomenon of physical bilocation.

12. **Extraphysical.** Some projected-intraphysical-witness-projectors observe and directly participate in the same extraphysical events with other companions. This does not occur in hallucinations.

13. **Laboratorial.** Laboratory experiments demonstrate, in practice, with the use of special equipment and monitoring, the reality that the lucid projection is an altered state of consciousness quite different from hallucinations.

14. **Philosophical.** The powerful effects of lucid projection upon the philosophical perspectives of the experimenter, such as loss of fear of physical death (thanatophobia), existential recycling and others, constitute evidence against the affirmation that projections are mere hallucinations or fantasies, from which such profound or lasting effects would never be expected.

Drugs. Nonetheless, some apparent forms of hallucinatory experience, such as those induced by light or heavy, licit or illicit drugs, have been known to cause effects, which are not so profound, upon the individual's subsequent existence. Paradoxically, however, many of these effects can actually constitute drug-induced projections (pharmacology).

Improbabilities. Lucid projections have been spontaneously experienced by persons who did not accept (conviction) the existence of the phenomenon until it happened to them (experience).

Questions. From the preceding considerations, it is possible to pose two pertinent questions:

1. **Informed.** Why do those persons who are aware of projections, but nonetheless do not accept projectiological phenomena, have hallucinations of projections?

2. **Uninformed.** Why do persons who never heard of lucid projection have hallucinations of projections? Strictly speaking, these hallucinations logically would either be very improbable or even impossible to occur.

Conclusion. The above arguments lead us to the evident and logical conclusion that hallucinations, regardless of their type, do not satisfactorily explain lucid projections.

V – Vehicles of Manifestation of the Consciousness

102. EGO

Definitions. Ego: the substratum of the individualized consciential principle; the primordial and irreducible state of consciousness, the basis of all states of consciousness.

Synonymy: *anandamayakosha*; androgynous being; *atman*; causal body; cause of psychic life; central self; controller; driver of the soma; eternal identity; eternal integral consciousness; greater self; individuality; intelligent principle; *jiva*; microworld; *pneuma*; principle of identity; psyche; *purusha*; real self; self; *sema*; soul; spirit; spiritual principle; super being; superconscious; thinking self; true self.

Consciousness. Before considering the vehicles of the consciousness, or meta-organisms (holosomatics), it is important to think about what the consciousness or ego is.

Energy. The consciousness is *more than energy*. Even if it were only energy, it would not exist without a substratum. Hence the existence of the ego and the vehicles for its manifestation.

Multidimensionality. The human being is a multidimensional being.

Instruments. Evidently, the human body, the holochakra, the psychosoma, or even the mentalsoma, are not – whether isolatedly or even when together in the condition of coincidence of all bodies, or the unified body – the consciousness, or the ego itself. These vehicles are merely instruments, since they do not think by themselves.

Attributes. Everything points to the fact that the consciousness presents final attributes of ample magnitude, even *beyond the faculty of thinking*, as can be observed in the state of cosmoconsciousness and the occurrences of extraphysical intuition.

Faculties. It has been suggested that the intraphysical consciousness has 3 basic capacities or faculties:

1. **Cognition:** the act of knowing or possessing knowledge.
2. **Affection:** sentiment.
3. **Volition:** desire.

Physiology. Mental phenomena would generally be restricted to the operation of one of these 3 faculties:

1. Cognition: the sense of perception, memory, introspection, intuition, inference and other sources of knowledge.
2. Affection: sensation, emotions, moods, personal characteristics and other manifestations of sentiment.
3. Volition: motives, desires, deliberations, decisions, choices, struggles, longings and actions or, in other words, the preponderant factors that influence and reveal acts of will.

Holosomatics. In another approach using holosomatics and thosenology, it can be said, in part, that:

1. Cognition (intuition, memory) is more restricted to the mentalsoma (*tho*).
2. Affection (sensation, emotions, moods) refers more to the emotional body (*sen*).
3. Volition (struggles, actions) materializes through the soma, with the energies of the holochakra (*e*).

Classification. The intraphysical consciousness, the human being per se, the structure of the psychic apparatus in his/her thinking essence, can be classified according to 3 specific consciential aspects:

1. **Subego.** The subego is the most obscure, subterranean, primitive, instinctive, genetic and animal part of the personality. The *id* which is autonomous, hypoconscious, subpersonal and neurological, maintains a direct relationship with the consciential energies of the holochakra.

2. **Ego.** The ego, per se, is the emotional, social part, the sensations of the personality – whether awake, or in the ordinary, physical waking state – that maintains a relationship with the consciousness, headquartered in the mentalsoma, but still bound to the parabrain of the psychosoma (parahead).

3. **Superego.** The superego is the part opposed to the animal, which is contrary to natural impulses, the *suspectometer*; the voice of the conscience, the paragenetics generated by its holobiography, the keeper of codes of ethics, that reaches the experience of cosmoethics and exists in direct relation to pure consciousness, in the mentalsoma.

Ultimate. Strictly speaking, the ultimate substratum of the being presents at least the following 8 characteristics:

1. It is independent.
2. It is nonmaterial.
3. It is noncerebral.
4. It cannot be compared to the life, mind, emotions or instincts of the human being.
5. It is not the ephemeral and changeable human personality.
6. It does not have limits.
7. It is not born, as we understand it.
8. It does not die, being therefore indestructible, the consciential principle that is self-animated after being created.

Life. The ego, or eternal consciousness, creation or emanation, the primary origin of which remains unknown, is beyond all transitory elements, this being the reason why the consciousness of the intraphysical projector ends up preferring, through personal experiences, another form of life besides physical existence, there not being in this any pretense of greatness or outstanding quality. It is simply a matter of skill, experience, knowledge and rationality.

Self-awareness. Self-awareness is the faculty or capacity whereby the human being is aware of his/her existence, or is aware of being conscious of his/her mind, thoughts and sentiments. This involves other mental faculties such as reason, memory and imagination.

Chimpanzees. Self-awareness is the single essential quality that differentiates humans from subhuman animals. This is because it is not found in any other living organism on earth, not even in chimpanzees, which sometimes momentarily seem capable of being aware of their existence and present a genetic makeup that is 96.7% identical to that of humans.

Blood. It should be stressed that, in the sanguineous relationship between humans and higher simians, the chimpanzee is the only simian having an “O” *blood type*, the universal donor.

Knowledge. In summary: even considering the existence of some tenuous form of self-awareness in other subhuman animals, the human being has an awareness of him/herself that is qualitatively greatly superior in this respect. The human being is not limited to knowing, he/she knows that he/she knows. The human knows him/herself when he/she so desires.

State. The state of the free consciousness (FC), in which the ego manifests itself solely and permanently through the mentalsoma, appears to be the greatest idea that we possess – in the current stage of terrestrial knowledge – regarding the natural or *raw* condition of the incorporeal nature of this selfsame ego.

Mentalsoma. In this case, the meaning of the term “mentalsoma” transcends the sense of a simple seat of logic, reason and other consciential attributes of the intraphysical consciousness. In fact, another neologism should be created in order to define the *mentalsoma* in this condition.

Singular. In spite of having various vehicles of consciential manifestation and being able to mobilize them at the same time, resulting in the condition of *double awareness*, each one of us has only one waking consciousness.

Functions. At least 7 basic functions can be attributed to the ego:

1. Thought (fundamental intelligence).
2. Impulse (instincts).
3. Sensation (coordination).

4. Sentiment (emotions).
5. Imagination (dreams, daydreams).
6. Will (destiny, free will).
7. Intuition (relative truths).

Realities. The expressions in parentheses, being presented in the plural, correspond more precisely to the levels of analytical and embryonic realities within us (egos).

103. TYPES OF HOLOSOMATIC VEHICLES

Definition. Holosoma (*holo*, whole, entire set; *soma*, body): instruments, bodies or vehicles through which the ego (the consciousness) manifests in the physical and extraphysical universes.

Synonymy: additional bodies; compound human; consciential instruments; consciential unistruature; consciential vehicles; corporeal grouping; cosmic bodies; encased bodies; external conformations of the ego; housings of the consciousness; integral whole; *koshas*; meta-organisms; metaphysical bodies; multi-ego; multiple ego; nonphysical bodies; packaged bodies; personal whole; pluri-ego; recipients of the consciousness; *rupas*; set of bodies; spiritual wraps; total human; wraps of the consciousness.

Vehicles. The great variety of evidence in the field of projectiology research makes it extremely difficult to explain all cases and phenomena, except by accepting the fact of exteriorization of the intraphysical consciousness in other vehicles of manifestation besides the human body (see fig. 103, p. 1,124).

Dissociation. Based on this premise, human individuality is not limited to the visible human body in the ordinary, physical waking state. It is made up of the set of elements that are encased, one inside the other, coexisting in harmony and which, under certain conditions, can be dissociated.

Interaction. Projections of the consciousness are precisely the consequence of the dissociation of these bodies or vehicles that are associated, interactive, coincident, encased, juxtaposed, aligned, interpenetrated or coexistent.

Coexistence. The vehicles of manifestation of the intraphysical consciousness, in the state of coincidence, coexist at the same place or space on earth, although each one vibrates at its own frequency, or dimension of extremely individual and distinct existence.

Types. The consciential vehicles range from the dense physical organism (human body) at the physical extreme, spanning through the parabodies (extraphysical vehicles) – the holochakra and psychosoma – to the subtle mentalsoma, at the extraphysical extreme. This set (organizational chart) can be perceived at our present evolutionary level.

Subtlety. There might be still more subtle manifestations. Who knows?

Reality. These vehicles are real, each in its own way, and are not *smoke* that disperses in the air.

Classification. For the practical application of these concepts, the vehicles of manifestation of the consciousness can be classified and named in 6 manners or according to basic variables:

- A. Vehicle 1 = Body 1 = B 1 = Human body (soma).
- B. Vehicle 1.5 = Body 1.5 = B 1.5 = Holochakra (energetic parabody).
- C. Appendix 1.5 = A 1.5 = Silver cord.
- D. Vehicle 2 = Body 2 = B 2 = Psychosoma (emotional parabody).
- E. Appendix 2.5 = A 2.5 = Golden cord.
- F. Vehicle 3 = Body 3 = B 3 = Mentalsoma (parabody of discernment).

Images. In the holosoma awareness technique, for awareness of the reality of the 4 coincident vehicles of manifestation of the intraphysical consciousness – the human body, the holochakra or the energetic parabody (that does not transport the consciousness), the psychosoma or the emotional parabody, and the mentalsoma – we can utilize various resources of multiple images or crude comparisons, especially the following 4: mirrors, furniture, dolls, and a kit including a sponge, sand and water.

1. **Mirrors.** Observe the reflected image of your human body, as though you were at the tailor's shop standing between double facing mirrors such that you see your own image (in an infinite progression of mirrors of multiple images, over the shoulder) repeated 3 times behind you.

2. **Furniture.** Study the interpenetration of a set of 4 pieces of furniture, such as Chinese tables, or even 4 perfectly encasing boxes that fit one into another, forming a harmonic set that occupies less volume and space.

3. **Dolls.** Examine a clipping of 1 simple model of dolls, or of the entire human body, that is well-proportioned, holding hands, made out of a sheet of white paper, folded back and forth 3 times; or 4 *matrioskas* (little mothers), painted, wooden Russian dolls that fit one into the other.

4. **Sponge.** Get an ordinary sponge, endeavor to fill it with fine sand, then submerge it in a bucket of limpid water. You will then observe the simultaneous, conjoined existence of 3 distinct, very evident substances, each one interpenetrating the other: the sponge (the human body), the sand within (the psychosoma) and the water (mentalsoma) flowing through the sponge.

Union. The holosoma represents the extremely complex union of living multileveled or *bio-para-psychic-social* systems.

Simultaneity. Each vehicle of the consciousness is simultaneously two realities, the computer and the programmer or, in other words:

1. **Computer.** Each vehicle is the computer of the next more evolved vehicle.
2. **Programmer.** Each vehicle is the programmer of the next less evolved vehicle.

Scale. In an operative ascending scale, or in the consciential organizational chart, the consciousness has power over all vehicles of the consciousness and directly or indirectly controls them from its basic headquarters, the mentalsoma.

Ascendancy. The mentalsoma, headquartered in the parabrains of the psychosoma, has direct ascendancy over the psychosoma and controls it through the parabrains and the golden cord.

CNS. The psychosoma, or the emotional body, headquartered in all the individual's *nerve elements*, is directly ascendant over the holochakra, or the energetic parabody, silver cord, chakras, human aura, and over the human body, or the instinctive body, controlling it through the central nervous system (CNS), namely the brain.

Characteristics. Various aspects characterize the vehicles of manifestation of the consciousness and need to be researched in order to discover their mechanism, dynamic and composition, especially with regard to the following 13 characteristics:

1. The human body in the ordinary, physical waking state.
2. The human body during lucid consciential projection.
3. The integral psychosoma.
4. The partial psychosoma.
5. The psychosoma with the holochakra.
6. The psychosoma without the holochakra.
7. The mentalsoma.
8. Self-invisibility.
9. Incorporeity.
10. The influence of the holochakra.
11. The silver cord, the force centers (chakras) and the aura.
12. Densities.
13. Indeterminate characteristics.

Separation. The human body and other vehicles of consciential manifestation are elements separate from ourselves. We are not merely our bodies. Beyond all forms, we are the eternal or permanent consciousness.

Environment. Each vehicle of manifestation of the consciousness varies regarding its nature, according to the environment where the consciousness has to act and the characteristics of that environment.

Adaptations. Intrapysical beings, when adapted to their environment, are *stronger* in the material world. Extraphysical consciousnesses, when adapted to their environment, are *stronger* in the evolved extraphysical dimensions.

Manipulation. Lucid consciential projection is based upon the consciousness' capacity to simultaneously, but separately, manipulate the human body and another vehicle of manifestation, whether the psychosoma or the mentalsoma.

Basics. Irrespective of the existence of all vehicles and instruments of manifestation of the consciousness analyzed here, the 3 basic elements of the intraphysical consciousness need to be emphasized, with practical life in view: the ego, the psychosoma and the human body.

Names. The consciential vehicles have been given diverse names throughout time and intraphysical societies.

Concepts. Concepts other than the synonyms mentioned in this section, when not equivalent but at least similar or analogous, as well as the correlative names used equally by various personalities, philosophers and researchers in general registered by human history to identify one vehicle or another or some of their primordial aspects, should be borne in mind. The following 12 are examples listed in alphabetical order:

1. **Animal-spirits**, by René Descartes (1596-1650).
2. **Animus**, by Lucretius (last century B.C.).
3. **Archetypal ideas**, by Plato (428-347 B.C.).
4. **Directing idea**, by Claude Bernard (1813-1878).
5. **Entelechies**, by Aristotle (384-322 B.C.).
6. **Internal sense**, by Mesmer (1734-1815).
7. **Luminous intermediary**, by Puységur (1751-1825).
8. **Monads**, by Leibnitz (1646-1716).
9. **Solar atoms**, by Pythagoras (572-497 B.C.).
10. **Substantial body**, by Emanuel Swedenborg (1688-1772).
11. **Transparent man**, by Cyrano de Bergerac (1619-1655).
12. **Vital principle**, by Barthez.

Neologisms. We can name the bodies of the main vehicles of the consciousness more accurately if we use roots from the Greek language:

1. **Soma** (physical body): human body, a term already currently in use.
2. **Deuterosoma** (*deutero*, second, two; *soma*, body): spiritual body, second body, the same as “psychosoma”.
3. **Cephalosoma** (*cephalo*, head; *soma*, body): mentalsoma.
4. **Holosoma**: the set of all the bodies when they are coincident, the individual in the ordinary, physical waking state.

Hierarchy. In a single transmission line of electric energy, *power* with a frequency of 60 Hz and *communication* with a frequency between 30 KHz and 500 KHz can be sent in a superimposed and coexistent manner. This constitutes a hierarchy of subsystems coordinated with different levels of complexity, such as organs, tissues, cells, organelles and macromolecules – infinitesimal beings.

Consubstantiality. The *human being* is his/her physical body (the consciousness is not the soma). Outside the soma, the human being (citizen) loses his/her substantial integrity. The human construct, in the intraphysical dimension, remains unintelligible outside this *consubstantiality*.

Sets. Some individuals are disturbed by the diversity of names given to the vehicles of the consciousness. We can offer these individuals 3 uniform sets of similar expressions to signify the same 4 consciential vehicles listed here as the physical body, holochakra, psychosoma and mentalsoma, in that order:

1. **Bodies:** human, energetic, emotional and mental.
2. **Somas:** soma, aerosoma I, aerosoma II and cephalosoma.
3. **Koshas:** *kosha, pranamayakosha, manomayakosha* and *vijnamayakosha*.

Hidden. Regarding the vehicles of manifestation of the consciousness, there are 5 very different occurrences that constitute their hidden features or, in other words, that which is still unknown with regard to their *modus operandi*:

1. **Silver.** Where does the silver cord hide when the consciential bodies are coincident in the ordinary, physical waking state?
2. **Psychosoma.** Where does the psychosoma hide when the vehicles of manifestation of the consciousness are in the natural state of coincidence?
3. **Golden.** Where does the golden cord remain during lucid projection of the consciousness in the psychosoma?
4. **Parahead.** Where is the mentalsoma located in the parabrain or, in other words, in the interior of the extraphysical head (parahead) of the psychosoma, when it is coincident or even when it is projected?
5. **Consciousness.** Where does the consciousness go and remain during the individual's temporary state of relative unconsciousness?

Cord. It seems that the silver cord does not *hide* in any specific place.

Particle. Each particle of the psychosoma appears to be connected to its physical analog. When the psychosoma distances itself from the soma, these connections come together forming the silver cord, just as different radio and TV signals can coexist.

Frequencies. We can only begin to understand the hidden features of the vehicles of manifestation of the consciousness, or the temporary location of these elements of the ego, in certain *circumstances*, by accepting the existence of different vibratory frequencies between these vehicles. Some conceal others, all interpenetrating in relative interdependence, just as occurs with the simultaneous physical and extraphysical dimensions of universal life.

Coexistence. These dimensions and vehicles are not superimposed but coexist in the same space and time.

Seats. From the perspective of the seats of the vehicles of manifestation of the consciousness, or the interpenetrating consciential bodies, 6 inferences can be made regarding the subjects presented, in their entirety:

1. **Holochakra.** The human body or soma houses the silver cord or holochakra.
2. **Psychosoma.** Although it receives basic orientation from the psychosoma, the human body also houses this vehicle.
3. **Parts.** From a sectorial perspective, or relative to the parts of the human body, for example, the hand houses the parahand, the leg houses the paraleg, and so on.
4. **Brain.** The human brain houses the parabrain of the psychosoma.
5. **Parabrain.** The parabrain of the psychosoma houses the mentalsoma.
6. **Mentalsoma.** The mentalsoma probably houses the consciousness.

Bibliography: Andreas (36, p. 91), Bentov (119, p. 134), Besant (129, p. 12), Blavatsky (153, p. 128), Crookall (343, p. 14), Durville (436, p. 27), Greenhouse (636, p. 133), Guéret (659, p. 161), Meek (1030, p. 37), Norvell (1138, p. 168), Osborn (1154, p. 61), Powell (1278, p. 1), Prieur (1289, p. 11), Rampa (1361, p. 76), Sculthorp (1531, p. 156), Shay (1546, p. 10), Steiner (1610, p. 55), Vieira (1762, p. 73), Yogananda (1894, p. 381).

104. PRE-RESOMA

Definition. Pre-resoma: the activation and encasing of the extraphysical consciousness, by way of the psychosoma, in the holochakra, thereby initiating the connection of the silver cord in the incipient soma.

Synonymy: ante-incarnation; birth of the silver cord; connection of the holochakra; creation of the holochakra; extraphysical incarnation; first birth; first rebirth; first resoma; holochakral *incarnation*; human pre-birth; incarnation of the etheric double; initial human rebirth; *mini-incarnation*; previous *incarnation*; *proto-incarnation*.

Theory. In presenting the extremely logical theory of pre-resoma, which serves to explain various extraphysical and physical events and phenomena related to the human consciousness, the author reminds those who would object to it that they should refute it with logic, proposing another more rational theory to replace it. This is a fundamental rule of science.

Stages. Pre-resoma indicates the conditions that specify the different stages of the consciousness in the complex process of resoma/desoma.

Conditions. There are 11 different consciential conditions that occur in dense pre-physical/physical/post-physical *chronological order*:

1. **Pre-resoma.** The pre-resomant: the first connection of the holochakra (energy added to the extraphysical consciousness) in matter for the formation of the new soma in the introductory process of human embryogeny. This *addition of consciential energy* is the first step toward resoma.

2. **Resoma.** The resomant: human conception already with the complete union of the egg from the mother's gynosoma with the sperm from the father's androsoma.

3. **Fetus.** The fetal consciousness: the fetus in development.

4. **Newborn.** The newborn: the soma or, more precisely, the holosoma still in a rigorous process of physical restriction and funneling of the extraphysical consciousness or the loss of hyperacuity.

5. **Infant.** The infant: existential consolidation occurs at 7 years of age.

6. **Adolescent.** The adolescent: the youth (pre-intraphysical consciousness).

7. **Intraphysical consciousness.** The adult consciousness per se: organic or biological maturity at 26 years of age.

8. **Pre-desomant.** The pre-desomant: the aged person, the individual who is between sixty-five and eighty-four years of age or, more appropriately, the intraphysical consciousness who is eighty-five years of age and over.

9. **Desomant.** The desomant: the terminally ill person pertaining to desomatics or thanatology (pre-extraphysical consciousness).

10. **Recent-desomant.** The recent-desomant: the traces of the holochakra after first desoma.

11. **Extraphysical consciousness.** The extraphysical consciousness: the extraphysical consciousness per se, or the errant extraphysical consciousness.

Restriction. The restriction of the consciential attributes begins in the pre-resoma period in order for the consciousness to adapt to the conditions of the intraphysical funneling of human existence.

Transformation. At this point there may be a visual extraphysical transformation of the extraphysical consciousness, as well as its planned juvenilization (rejuvenescence through self-transfiguration of the psychosoma), including attitudes, interests, occupations and the nature of its life (existential program) in accordance with the human conditions it will encounter in the upcoming intraphysical life, in a preview of the impending life (*simulated resoma*).

Nuptials. In the pre-resoma condition, the extraphysical consciousness (kin, blind guide, intruder, helper) often extraphysically attends the wedding (nuptials) of its future parents (when the bride is not pregnant).

Engagement. The extraphysical consciousness can even energetically (cardiochakra) participate or intervene (affinity) in the articulations (engagement) for the upcoming wedding.

Cupid. This inspired the myth of *cupid* or the *little angel* with the appearance of a child and, therefore, already extraphysically restricted.

Hypothesis. To what degree do the future parents, in certain cases, emanate consciencial energies for the formation of the initial trace of holochakral energies of the extraphysical consciousness that is a candidate to resoma while still in the condition of a pre-resomant?

Psicociese. Pre-resoma or the constitution of the holochakra is that which allows the occurrence of pithiatism, *psicociese* or psychological (human) pregnancy.

Subhumans. Through this, it is observed that pre-resoma seems to occur with subhuman animals or, in other words, they also exhibit *psychological pregnancy* or psychic gestation.

Gestation. Human (or subhuman) gestation per se is genetic, being a cellular, organic and dense union or creation of the embryo of the soma.

Holochakra. Psychological gestation is holochakral, being merely an energetic, cellular union without dense organic substrates.

Bibliografia: Vieira (1762, p. 23).

105. RESOMA

Definition. Resoma: the activation and encasing of the extraphysical consciousness (mentalsoma + psychosoma) in the condition of pre-resoma – by way of the holochakra – in the soma or human body (human conception + fetus).

Synonymy: birth of the soma; birth; cellular incarnation; cellular resoma; creation of the vitalized soma; junction of the soma; organic resoma; rebirth; second birth; second resoma; vitalization of the soma.

Projection. Resoma is a *fixed* and prolonged projection of the desomant consciousness (extraphysical consciousness) for a specific period, thereby constituting the holosoma (integral or involving 4 vehicles) of the human being.

Prodigality. In a surprisingly prescient mechanism, life begins again at every new birth of a human being with extreme prodigality or even an apparent waste or dissipation.

Sperm. A single seminal emission from the genitourinary organ (originating from the masculine sex glands: testicles) of the androsoma contains 300 million sperm or the total number of the population of an above average sized country.

Population. Less than two dozen seminal emissions represent a quantity equivalent to the current human population of this planet.

Eggs. The gynosoma (female human body) contains 700 thousand eggs at birth.

Emissions. Only 400 eggs will be emitted, the equivalent of 1 every 28 days in the course of slightly more than 3 decades of genital life.

Ephemerality. In spite of the entire aforementioned prodigality, the prescient mechanism of human life, in order to support itself on this planet, does not allow uninterrupted or very long-lasting existences, but only short (current maximum: 13 decades), temporary or ephemeral existences in series, without exception.

Death. The death of the human body (desoma) is the condition which is indispensable for the survival of the human species and the continuation of learning on the part of the consciousnesses on this mega-school-planet.

Immortality. A humanity that has individuals who become immortal would, within a few years, become suffocated, lacking the energy, the food and the space necessary for its existence or survival. The human species would disappear from the face of the earth.

Intraphysical society. Without the desoma of individuals – or of the human body – there would be no human society (intraphysical society), human history, human future or hope for human beings (intraphysical consciousnesses).

Abortions. In cases involving a series of abortions carried out by the same consciousness, it leaves the pre-resoma condition, enters the resoma condition, returns to pre-resoma and, in this way, returns to resoma many times in succession without achieving the condition of a being which has undergone pure desoma, or second desoma.

Suicides. It is presumed that cases of successive abortions occur frequently with the consciousnesses of suicidal individuals that have many aggravating circumstances. This occurs in order to attenuate karmic debts or disturbances. This is popularly referred to as the *burning* or *purging of karma*.

Stillborn. The stillborn is the human body, or the soma, which is born without a pre-resomant consciousness to vitalize it, or with an empty brain (anencephaly, when it exists) from the beginning of the process of gestation, or from the fetal period.

Bioethics. *Headless clones* of subhuman animals are already being created in order to offset the undersupply of organs for human transplants, triggering heated controversy in the bioethics community.

Stillbirth. Stillbirth is the birth of the soma alone (devoid of the consciousness) which, in this case, is a pathological or morbid occurrence.

Bibliography. Vieira (1762, p. 23).

106. LUCID PROJECTION AND THE HUMAN BODY

Definitions. Human body: the body of the individual of the *Animal* kingdom, *Chordata* phylum, *Mammalia* class, *Primate* order, *Hominidae* family, *Homo* genus, *Homo sapiens* species, the most elevated level of animal development on earth; the physical substance or material structure of every human being; the body that is nourished by food, feels the effects of fatigue, suffers wear, degeneration and disintegration.

Synonymy: alpha body; animal body; bioelectric mechanism; bioform; biological body; biosoma; body-house; brain-body; cage of flesh; capsule of the ego; carapace of the psychosoma; carnal body; carnal chrysalis; carnal involucre; cellular attire; cellular prison; cellular vehicle; city of nine doors; compressor of the self; container of the internal bodies of the consciousness; corporeal residence; corruptible body; crude body; dense body; dense organism; discardable body; earthly body; electrobiochemical mechanism; emitting physical body; evident body; exterior body; external body; genetic body; goblet of clay; heavy body; hominal body; human aggregate; human engine block; human magnet; human organism; instinctive body; larva-body; lithosoma; living machine; megaphone of the consciousness; mind-body; mortal armor; mortal body; mundane body; natural body; normal body; organic form; physical body; physical deep-sea diving suit; physical *habitat*; physical involucre; physical self; primary body (for the man); psychophysical organism; respiratory machine; sarcophagus of carbon; skiff of flesh; skin of the consciousness; *soma*; somatic body; *stula*; temple of the soul; terrestrial body; terrestrial shell; three-in-one body; tridimensional body; vital object.

Androsoma. The male human body – androsoma – has approximately 60 trillion cells; 5 million hairs; 650 muscles; 208 bones; 100 joints; and 59,652 mi (96,000 km) of arteries, veins and capillaries.

Organism. The person, considered to be a living, *physical ecosystem*, receives the name of organism.

Comparisons. The physical body of human beings – the most limited and imperfect expression of the consciousness – besides the synonymy presented above, is still labeled or compared (analogies, metaphors) with a box, burden, car, cell, city, clock, dungeon, electronic instrument, grave, heavy

attire, mantle, microcosm, microuniverse, oven, overcoat, sanctuary, steam engine, tomb, trench, tunic of skin and other objects.

Mechanics. There are evident similarities between the functions of the human organism and those performed by apparatuses and systems used by mechanics. The following are 14 examples:

1. Bones: reinforced concrete.
2. Brain: electronic switchboard.
3. Circulatory system: irrigation plant.
4. Ears: diapasons.
5. Eyes: cameras.
6. Heart: pump.
7. Incisor teeth: scissors.
8. Kidneys: filters.
9. Liver: glycogenic central heating.
10. Lungs: bellows.
11. Molar teeth: pestle.
12. Muscles: elevating machines.
13. Stomach: chemical laboratory (or biodigestor).
14. Synovia: oiler.

Registers. The marvelous mechanism of the human body, formed by these approximately 60 trillion cells – each one individually having capacitance and inductance – equipped with all types of extremely precise clocks and measuring devices, registers and responds to, aside from the 5 basic senses, every physical rhythmic change in its surroundings due to many environmental factors: electric fields, magnetic fields, gravity, cosmic influences, ionization, light, pressure, cosmic rays, temperature, time and humidity.

Relationships. The relationships of the holosoma and its components with the sciences can be very illuminating. Broadly speaking, the human body has a more direct relationship with biology, anthropology and medicine. The energetic parabody has a more direct relationship with acupuncture. The emotional parabody has a more direct relationship with psychology. The mentalsoma has a more direct relationship with parapsychology. The entire holosoma has a more direct relationship with projectiology (or holosomatics). Conscientiology studies the consciousness, or the ego per se, beyond the holosoma.

Dynamic. The soma is only a vehicle for carrying us through human life. The consciousness never stops and does not have a static human appearance or structure.

Resynthesis. Throughout its useful life, during the phase of biological growth and beyond, the human body undergoes profound and constant alteration in the continuous process of destruction-reconstruction, or the elaborate resynthesis of its material components. The cells are substituted or replaced by fresh material derived from its sources of nutrition: the air of respiration, food and ordinary drink.

Renovation. It is currently accepted that general cellular renovation of the 5 fundamental systems of the human body is completed every 158 days:

1. Structural.
2. Muscular.
3. Circulatory.
4. Nervous.
5. Lymphatic.

Lives. This means that every intraphysical consciousness undergoes resoma at least twice a year and that a single human life spanning 5 decades literally constitutes more than 100 brief uninterrupted interconnected lives.

Characteristics. The human being shares many characteristics with other animals. He/she is, however, an animal that practices art and science.

Eyes. The human being's intellectual activities are conditioned by the eyes. The sense of vision dominates the human perspective of the external world.

Gynosoma. Women continuously have mammae (gynosoma).

Sexosomatics. Men adopt the frontal position during sexual relations. Men are practically the only primates that do not have a bone inside the penis.

Intentionality. Humans have the effective and constant capacity of assigning a use to things in advance, with a purpose or intention underlying their behavior. This is rarely seen in subhuman animals, with the exception of the chimpanzee.

Stimuli. In the condition of intraphysical beings, we are constantly bombarded by all types of sensory stimuli that the sense organs of the human body and the proprioceptive sensations stemming from this selfsame body unceasingly register.

Sensations. Because it is dense and tangible, the coarsest or most *impenetrable* of all vehicles of manifestation of the consciousness, being a special structure for the greater intraphysical restriction of the *self*, the human body permits animal, coarse and intense sensations, including pain and orgasm. This leads the unwary intraphysical consciousness to mistakenly think that only this body and no other vehicle in its complex vital organization – namely in its unified body (holosoma) – exists.

Incapacity. Because it is so enslaved by the perception of physical reality, as it is assimilated by the 5 basic organic senses, the intraphysical consciousness becomes incapable of accepting (conviction) its true nature or recognizing its multivehicular constitution.

Philosophers. For the majority of adults – including thinkers, philosophers, scientists and intellectuals in general – it becomes incomprehensible, difficult and almost impossible to accept the fact that the consciousness exists outside the human body as something separate or separated from it, or to even ponder this deeply.

Inhibition. This is one of the basic inhibiting factors (autosuggestion, self-hypnosis, somatization) of lucid projection and is the reason why this phenomenon has still not achieved unanimous acceptance by the members of the human species.

Cenesthesia. Complex cenesthetic sensations provide the intraphysical consciousness with an inner perception and, at the same time, the sense of the existence of the human body. The existence of cenesthetic images has been proven by psychopathology.

Constituents. The following are 32 constituents or parts of the human body that are considered as themes for reflection in the practices of Orientalism: bile, blood, bones, cerebral hemispheres, fat (lipids), feces, flesh, hair of the head, heart, intestines, kidneys, liver, lungs, lymph, medulla, mesentery, mucous, nails, phlegm, pleural membrane, pus, saliva, serum, skin formations, skin, spleen, stomach, sweat, tears, teeth, tendons and urine.

Zeal. We live in dense matter zealously taking care of the human body, which gives us a lot of work and requires great expenditures from us when endeavoring to satisfy respiration, hunger, thirst, sex, hygiene, as well as sheltering and serving it from morning to night, year-round, throughout human life (lifetime). All this from the time we are born on the face of the earth until this selfsame body is deactivated by final projection, or biological death (first desoma).

Worship. There is currently a blossoming of impassioned worship of the human body, the first physical abode.

Sports. This is expressed through all types of sports and gymnastics, including choreographed gymnastics, gymnastics for senior citizens, narcissistic gymnastics, and others. They have the objective of achieving physical shapeliness, restoring lost self-confidence and ensuring continued mental well-being and social integration.

Compulsiveness. Basic care of the human body is practically compulsory and inevitable.

Disasters. If we leave the body to itself, disasters such as the following 6 will occur:

1. **Oxygen.** If we do not breathe fairly oxygenated air, we die from asphyxiation within a few minutes.

2. **Diet.** If we do not eat (food), we die from inanition within days.

3. **Liquids.** If we do not drink, we die from thirst in less time than from hunger.
4. **Hygiene.** If we do not cut our hair, we develop a mane.
5. **Nails.** If we do not cut our nails, we cannot satisfactorily use our hands and feet.
6. **Bath.** If we do not take a bath, we soon become a foul-smelling pile of trash.

Image. That is why we continuously gaze fixedly at our image while contemplating ourselves in the mirror – an ever-present theme in our concerns regarding waking conscious life – attentive to the conservation of physical and mental health and the means for satisfying the condition of *well-being*.

Concentration. As a result of this profound single-mindedness of every intraphysical consciousness – intense and continuous concentration upon the human body – it is always much easier to believe that the human body, controlled by the brain, the physical seat of the consciousness, is the sum total and the sole specimen of our being, and that we are merely *biochemical machines*.

Vehicles. Lucid projection, however, shows the interested individual that intellect, reasoning, imagination, critical judgment, memory, advanced perception, sentiment (deeply rationalized emotion) and all other functions of the consciousness can exist in a pure form, independent from the human body, manifesting the self through the other vehicles which are more evolved than the soma.

Aspect. We exist. This does not require proof. But the human body, 60% of the weight of which is water, is only one aspect of our total being.

Confusion. The intraphysical consciousness, who is used to identifying him/herself with external clothing, typically makes the following 3 types of mistakes:

1. **Attire.** Confuses the human body with his/her clothing.
2. **Ego.** Confuses his/her vehicles of manifestation with the ego.
3. **Personality.** Confuses his/her transitory wrapping with the eternal personality.

Illusion. Matter seems very real, inflexible, hard and solid to humans in the ordinary, physical waking state. The basic sensory organs give the *illusion of the solidity* and *material* nature of objects.

Physics. However, contemporary physicists affirm that matter is neither as solid as it appears, nor is it the way that we perceive it. For example, if all the space between the atomic particles that compose matter were to be removed through a compression process, the human body of an adult would be smaller than the point of a pin. This is because 99.99% of the human body is empty space.

Devoid. In other words: the human body, including the brain, is mostly water and, in fact, both are mostly “devoid” of any “solid matter”.

Matter. Matter, in the sense of a solid, compact and impenetrable body, does not exist.

Differences. Matter itself, at ambient temperature, shows appreciable differences in its manifestations. The following are 4 examples:

1. **Liquid.** *Mercury* is a liquid metal.
2. **Solid.** *Lead* is a solid metal.
3. **Gas.** *Oxygen* – the foundation of intraphysical life – is a gas.
4. **Glass.** *Glass* is actually a super-cooled liquid that does not have the crystalline structure that characterizes true solids.

Objectivity. Incidentally, it merits adding that some researchers place the “objective existence” of things in doubt. They think that all of this is no more than a huge “mental construction.”

Ponderations. The referred to evidence can be pondered by the reader who nurtures 3 categories of doubt:

1. **Resoma.** Doubt regarding the critical condition of the extraphysical consciousness in the process of resoma in the human body, which begins immediately after biological conception.

2. **Connection.** Doubt regarding the connection of the consciousness in the condition of physical restriction imposed by the human body during the entire intraphysical existence.

3. **Relationship.** Doubt regarding the intervehicular relationship of the human body with the psychosoma when it is presumed to have merely one thousandth of the weight of that body while projected in the extraphysical dimension but still over the planetary crust or within the troposphere.

Energy. All the material of our human body – an energetic structure – can be controlled by our intraphysical consciousness. This can be seen in the effects of yoga techniques, the processes of biofeedback and, mainly, the extraordinary effects of the basic mobilization of consciencial energies (BME).

Divisions. The human body can also be studied through the following 5 divisions:

1. Right/left.
2. Front/rear.
3. Top/bottom.
4. Head/body.
5. Trunk/members.

Chakras. It is interesting to point out that the left half of the human body presents the insertion point of the 2 isolated essential basic chakras, in the corresponding location in the holochakra and psychosoma: the cardiac and the splenic. The *upper* division shows the insertion points of 4 chakras and the *lower* division shows the insertion points of 3 chakras.

Head. The division of the head alone shows the insertion points of 3 basic chakras.

Trunk. The insertion points of all the other essential chakras are in the trunk. There are no insertion points of main chakras in the members, but only of secondary or tertiary chakras.

Somatopsyche. According to psychology, the condition of the individual's self-awareness of his/her own human body is referred to as *somatopsyche*.

Spaces. According to proposed hypotheses, the psychosoma seems to occupy a more general four-dimensional space, from the moment of encounter of two portions of energized matter, the sperm and the egg.

Deprivations. There only needs to be an increase in physical restriction, namely a greater sensory deprivation – pain, hunger, thirst, anesthesia and others – in order for the intraphysical consciousness to project outside the human body, as though it were being expelled, *squeezed* out, moved in the psychosoma from the place it occupies. This is, hypothetically speaking, probably due to the field effects (physics).

Particles. The facts suggest that the psychosoma is made up of particles which are different from dense physical ones. If its particles were of the same nature as dense physical particles (molecules, atoms, electrons and others), there would be an excessively strong interaction between them. This would make lucid projection impossible, namely the discoincidence of at least 2 vehicles of manifestation of the consciousness.

Inactive. During the period of complete projection in which the consciousness remains outside, the inactive or temporarily unoccupied body remains inert, passive, *unconscious* or in an apparent sleep state.

Latency. Through the essential connection of the silver cord, vegetative and organic life maintain a minimum of vital processes, respiration, a barely perceptible pulse, circulation, and the natural physiology of the organism, through the autonomic nervous system, in a form of latent life.

Cadaver. The human body without the consciousness resembles a human cadaver.

Suspension. In this state in which the sensory systems and the motor systems are temporarily suspended, the projector's *intraphysical assistant*, as long as he/she is sufficiently observant, can sometimes even clearly hear the bubbling sounds made by intestinal gasses, when close to the inactive body and the brain, which has been emptied of the consciousness.

Similarities. The situation of the inactive human body during prolonged projection is often reminiscent of a cadaver, although the latent vital signs allow one to unquestionably distinguish one condition from the other.

Stillborn. It is likewise reminiscent of the condition of the lifeless stillborn fetus nested in the uterus and the yogi who is voluntarily buried alive for a period of time. It is also reminiscent of projective autoscopy.

Aircraft. This situation is similar to an aircraft flying on autopilot while the pilot temporarily leaves the cockpit to visit the airplane lavatory, although this particular case is more adequately likened to lucid projection while the soma is in movement.

Mimicry. During the exteriorization stage of the consciousness in the psychosoma when the consciousness is sometimes not very lucid, while projected from the human body, extraphysical movements are poorly reproduced, as though mimicking, due to simple perceptible body reflexes. This occurs independent from and beyond the habitual physiological movements involved in natural sleep.

Reflexes. However, when the consciousness feels that it is projected with full lucidity and is able to extraphysically translocate itself outside the sphere of energy that surrounds the human body (psychosphere), it becomes incapable of passing its movements – whether moving a hand, foot, or turning over in bed – directly to the physical body. This is because the body displays a deep and generalized absence of reflexes while the human senses are inactive.

Interiorization. This measure can only be taken through total interiorization or, at least, through partial interiorization of the consciousness in the psychosoma. In this case, the holochakra would be so rarefied (extraphysical particles more distant from each other) that the flow of energy necessary for the exchanges of consciential command from the psychosoma to the human body does not occur. This special condition is akin to the fine wire with high resistance which, nevertheless, cannot conduct a great amount of current.

Reactions. When projected in the *extraphysical* dimension, the *intrapysical* consciousness can, under certain conditions, present manifestations which are most notably marked by indifference toward the human body. This is expressed in many ways, such as the following 8 types of subtle relationships which are similar, though not identical:

1. **Insignificance.** The human form appears insignificant.
2. **Strangeness.** Contemplating the human body as if it belonged to a stranger.
3. **Indifference.** Total indifference toward the human form (appearance).
4. **Dispassion.** Observing the human body dispassionately.
5. **Disinterest.** Having absolutely no interest in his/her own human body.
6. **Unemotionality.** Looking at the physical body without emotion.
7. **Unconcern.** Being completely unconcerned regarding the human body.
8. **Impersonality.** Viewing the physical body in an impersonal manner.

Reluctance. Many intraphysical consciousnesses, when projected in the extraphysical dimension, display an undisguisable reluctance to return to the human body. This is expressed in various ways, such as the following 8 most common manners:

1. **Contrariety.** Showing deep contrariety to return.
2. **Hardship.** Feeling the return to be a painful hardship.
3. **Desire.** Not demonstrating any desire to return.
4. **Obedience.** Obeying, against their will, the irresistible order to return.
5. **Stay.** Having the insistent desire to stay there forever.
6. **Disappointment.** Displaying acute disappointment regarding the return to human life.
7. **Rebellion.** Showing great rebellion against returning to dense matter.
8. **Thought.** Even getting to the point of thinking: “Why not let the body die?”

Attire. Every physical object has its *extraphysical duplicate*. This is why there is a type of energetic connection, which is still not fully characterized and defined, between the human organism and the objects it wears or comes in direct contact with, such as: all types of attire, rings, earrings, glasses, contact lenses, dentures, prosthetics in general, plastic items, all artifices of vanity, and others.

Prosthesis. The human or *intrapysical* body is nothing more than a temporary prosthesis that the extraphysical consciousness – which already has 2 extraphysical parabodies (psychosoma and mentalsoma) – uses when it manifests on the planetary crust. This results in 2 facts:

1. **Mother.** The mother is the preeminent *professional prosthetist*.
2. **Uterus.** The uterus is a *prosthetics workshop*, installed to serve extraphysical consciousnesses or similar personalities from the extraphysical dimension.

Cybernetics. The resources of cybernetics, or mechanisms for the technical extension of the human being, are *prosthetic products*, such as the following 3:

1. **Computer.** The *computer* is an external prosthetic for enlarging biomemory (mnemosomatics), namely the cerebral dictionary (autobiography).
2. **Automobile.** The *car* is a temporary prosthetic for extending the two human legs (somatics) or the potentiation of the cerebellum (psychomotricity).
3. **Robots.** In robot wars, or *prosthetic wars*, no one dies. Only the *robots – prosthetics of humans* – are exterminated or deactivated.

Suicide. This occurs in the same way with human suicide. Those who kill themselves or commit self-murder only annihilate the temporary prosthesis: the intraphysical body. For this reason, every suicide (self-destroyer) is an extremely frustrated desomant intraphysical consciousness because it will never be able to kill the actual consciousness which is, even for itself, a reality that is *deathless* or incapable of being *assassinated*.

Paraphysiology. From now on, in this section dedicated to analyzing the vehicles of manifestation of the consciousness, the limits of the *human* constitution and physiology are no longer those determined by orthodox or conventional anatomists and physiologists.

Heterodoxy. The observations gathered here do not allow themselves to be adapted to concepts that currently govern orthodox biology and medicine.

Epistemology. That is why the contents of this book – driven by the facts – transcend the limits of traditional science, as it is habitually accepted, and the most strongly defended theory of knowledge. This indicates that the present is already an appropriate time, demanding an epistemological revolution or a gnoseology which is based on new foundations (paragnoseology). It is common knowledge that epistemology is the study of “how we know what we know.” This is when a new paradigm is needed in order to replace the decadent conventional mechanist Newtonian-Cartesian paradigm.

107. PINEAL

Definition. Pineal (Latin: *pinus*, pinecone): the gland of endocrine secretion which is extremely well protected at the center of the human brain (another gland of endocrine secretion) – of which, however, it is not a part – enclosed between the 2 cerebral hemispheres, atop the spinal column.

Synonymy: base of the rational soul (René Descartes); *conarium*; cyclopean eye; epiphysis; eye of Shiva; mental eye; pineal body; pineal eye; pineal gland; *place of the self*; sensitive antenna; third eye; third sight.

Historical. All indications are that the pineal gland was best described for the first time in the year 300 B.C. by the Greek physician Herophilus and the Greek anatomist Erasistratus, both from Alexandria. They attributed this organ with the function of being the *valve of the memory*.

Unique. This organ has always intrigued anatomists because, whereas the entire brain is duplicate, the pineal is unique in the brain in that it has no duplicate.

Nomenclature. The pineal gland received its name because it is shaped like a pine cone. It is also called the *third eye* because, in its formation, it begins as an eye.

Cells. The cells of the pineal gland are called *pinealocytes*.

Anatomy. In anatomical terms, the pineal gland is an oval, piniform corpusculum or, in other words, is similar to the seed of a pine tree, or is conical.

Pea. The pineal gland is a small organ. It is the size of a pea, has a grayish pink color, weighs no more than 100 mg, and is 5/16” (8 mm) long and 3/16” (5 mm) wide in humans.

Diencephalon. The pineal gland originates in the epithalamus, which is the structure of the diencephalon, in the dense tissue of the choroid screen, above the anterior quadrigeminal tubercula and behind the third ventricle.

Autonomic. The pineal gland is innervated exclusively by the autonomic nervous system.

Melatonin. The pineal gland secretes the hormone called melatonin (*5-methoxy-N-acetyl tryptamine*), which inhibits the chemistry of sexual maturation and seems to react to darkness.

Light. In other words: light inhibits the pineal gland’s production of melatonin.

Substances. It is accepted that the pineal gland is the only source of melatonin in the human body. There is also a series of brain chemicals inside the gland.

Physiology. Up until some decades ago, the pineal organ was only seen as an evolutionary relic or an anachronistic remnant of evolutionary development, a type of appendix encased in the center of our brains, not serving any biological function.

Hormone. Scientists proved the error of this belief by discovering that the pineal gland stops secreting its hormone, melatonin, when the individual is exposed to a bright light of 2,500 luxes, or approximately the intensity of indirect sunlight on a clear spring day.

Lux. The lux is the quantity of light received at a distance of 3’4” (1 meter) from a standard candle.

Segregation. Melatonin is normally only secreted in the darkness of night.

Evidence. With new scientific discoveries, researchers admit that the human pineal gland still functions as an “eye” that is sensitive to light.

Waves. It is suspected that the pineal gland emits and receives *biomagnetic waves*.

Effects. The following are 14 effects that melatonin has on important sexual factors:

1. It delays the onset of puberty.
2. It reduces the weight of the gonads.
3. It reduces ovarian progesterone.
4. It reduces the hormone that stimulates the serum follicles.
5. It reduces serum luteinizing hormone.
6. It reduces the synthesis of testosterone.
7. It reduces the luteinizing hormone of the pituitary.
8. It reduces the factors that liberate hypothalamic gonadotropin.
9. It increases prolactin of the serum.
10. It increases testosterone metabolism in the liver.
11. It increases the synthesis of progesterone.
12. It increases serotonin in the pituitary gland.
13. It inhibits uterine contractions.
14. It suppresses spontaneous or induced ovulation.

Sleep. Melatonin not only affects sleep, producing an increase in REM cycles, but also enriches our dreams with greater vividness. These activities also liberate a substance from the pineal gland called *vasotocin*, which is the most potent sleep-inducing factor.

Parapsychopathology. It is suspected that there are parapsychopathological disturbances which stem from abnormalities or alterations of the pineal gland, related to human blindness.

Chronobiology. Biorhythmology is the biological science (chronobiology) of physiological analysis that studies the vital or internal rhythms, rhythmic variations, endogenous clock or body cycles, notably the following 4:

1. **Resomatics.** The biological or circadian rhythm (*circa diem* or *approximately one day*) or a 24-hour activity cycle. Here we can include: appetite, sex, defecation, micturition and mental capacity. There are time indicators in the circadian rhythm: clocks, regular meal times, work shifts.
2. **Waking.** Sleep/wake cycle, sleep/wake alternation or sleep-rest activity.
3. **Gynosomatics.** The hormone cycles related to gynosomatics or those of women: ovulation/menstruation.
4. **Existential seriation.** Birth/death or resoma/desoma.

Medications. The normal temperature of the human body and its capacity for absorbing medications changes depending upon the time of day. Body cycles which are normally synchronized desynchronize themselves.

Cycles. The sleep/wake cycle is interconnected to over one hundred other more or less 24-hour corporal cycles.

Clock. Medical researchers affirm that the pineal gland influences the regulation of the individual's biological clock or physiological biorhythm, seasonal rhythms or circadian changes, relative to the *cosmoclimatic rhythm* and the *day/night cycle*, given that it is somehow responsible for readjusting our internal clocks (chronobiology) when we cross time zones.

Disturbances. It is recommended that those who suffer from these problems after long flights to distant time zones (jet lag) wherein there is a substantial alteration in the time of day due to the differences of the time zones (flights in a westerly or easterly direction) get sufficient exposure to sunlight until the human body becomes synchronized again.

Jet lag. Jet lag is characterized by fatigue, changes in mood, inefficiency and similar symptoms. Older people suffer from this disturbance more than young people.

Note. It is important to note that the biological clocks referred to here should not be confused with the common biorhythm graphic calendars that are sold commercially and are based upon the presupposition that the rhythms begin at birth, at a zero point, with forecasts of precise cycles of creativity (33 days), sensitivity (28 days) and physical strength (23 days) that are counted from this zero point. The existence of these rhythms has still not been scientifically demonstrated.

Cord. Parapsychology studies admit that the pineal gland is the fulcrum of the final energetic connection of the silver cord in the human body. This is why the projector sometimes feels a certain intracranial pressure at the final moment of lucid takeoff in the psychosoma.

Speculation. So far, this subject is mere speculation, from a scientific point of view, due to the complexity of the cortical functions that have still not been clarified. The silver cord requires new and more convincing responses.

Point. One's awareness is attracted to the point between the eyebrows, the third eye or the epiphysis, on 5 occasions:

1. **Hypnagogy.** When wishing to achieve the hypnagogic state, the condition of alpha waves, or the alpha state, because the practitioner turns the eyes upward.
2. **Somnambulism.** When entering into a very ordinary somnambulistic state, because the somnambulant's eyes turn upward.
3. **Self-desoma.** When the intraphysical consciousness promotes a certain type of self-desoma, or induced final projection, also looking upward.
4. **Desoma.** The eyes of a cadaver (desoma) turn upward as well.
5. **VS.** When trying to install the vibrational state (VS) in an instantaneous manner.

Curiosities. In pineal gland research, the following 5 relevant, or at least curious, observations should be borne in mind:

1. **Sensitives.** Meticulous comparative studies of necropsies show a greater volume of the epiphysis in cadavers of sensitives or parapsychic intraphysical consciousnesses.

2. **Hindus.** Other comparative studies of necropsies show an epiphysis twice the normal size in brains of Hindus, as compared with the average size found in the brains of Europeans.

3. **Acid.** Lysergic acid (LSD), which is structurally similar to serotonin, a neurotransmitter that is directly related to the pineal gland, is used as a stimulus, a psychophysiological potentiating factor or a hallucinogenic catalyst. In some cases, it opens the doorways to extraphysical consciential perceptions (paraperceptions).

4. **Chakras.** Much has been said about it, but there is still no proof of the relation between the pineal gland and the 2 essential chakras in the encephalic area: the coronochakra and the frontochakra.

5. **Apparatus.** The pineal gland has a great similarity in form and structure with a certain piece of the receiving apparatus of a wireless telegraph, which also contains certain small particles that look like the sand-like tissue of the gland.

Technique. A technical approach for those who easily wake up in the middle of the night and have difficulty in falling asleep again is, upon awakening, to leave the lights off. Only 15 minutes of illumination are sufficient to suspend the production of melatonin, the hormone that controls sleep.

108. EXTRAPHYSICAL EXAMINATION

Definition. Extraphysical examination: the assemblage of information obtained by the projected intraphysical consciousness from an analysis of its physical body, projected psychosoma, or the vehicles of manifestation of the intraphysical consciousness (the human body, holochakra, psychosoma and mentalsoma) in the coincident condition; or even the analysis of the psychosoma of the extraphysical consciousness.

Synonymy: extraphysical anamnesis; para-anamnesis; paraphysical self-analysis.

Categories. There are two categories of extraphysical examination:

1. The extraphysical self-examination.
2. The extraphysical hetero-examination, or the examination of another.

Self-examination. It is always better if the projected intraphysical consciousness endeavors to perform, by him/herself, the extraphysical examination of another personality – whether a projected intraphysical consciousness or an extraphysical consciousness – only after performing an extraphysical examination of his/her own psychosoma.

Characteristics. The projected intraphysical consciousness can focus his/her attention on countless characteristics of the vehicles of manifestation of the consciousness (holosoma) during the extraphysical examination, notably the following 11 variables:

1. Holochakra.
2. Human aura.
3. Silver cord.
4. Psychosoma.
5. Mentalsoma.

6. Personal form, whether complete or incomplete, humanoid, solid, transparent, oval, a small circle, a colored cloud, a point of awareness or mental focus.
7. A center of energy (mentalsoma).
8. The consciousness apparently without a body, amorphous (mentalsoma).
9. Insertions or connections of the silver cord (resoma).
10. Navel, nevus, scar and its extraphysical relationships.
11. Examination of the fetus specifically in regard to the pregnant woman consciential projector.

Maturity. The experience of extraphysical self-examination of the projected consciousness substantially contributes toward the acquisition of maturity or consciential holomaturity.

Bibliography: Monroe (1065, p. 168), Steiger (1601, p. 140), Vieira (1762, p. 84).

109. HOLOSOMATIC COINCIDENCE

Definition. Holosomatic coincidence: the condition of harmonious coexistence, interpenetration, juxtaposition, alignment, interdependence and interrelationship between the ego, or the consciousness, the mentalsoma, the psychosoma, the holochakra and the human body, also including the golden cord in this complex of structures, or the connection between the mentalsoma and the psychosoma, as well as the connection of the psychosoma with the human body, or the silver cord.

Synonymy: alignment of the vehicles of the consciousness (an obviously incorrect expression); coalescence of the consciential vehicles; condition of the unified body; condition of concentric bodies; holosomatic interweaving; state of coincidence; multi-organism state; singular state; connection of the bodies.

Mentalsoma. The mentalsoma, the vehicle which is always *more* coincident than the others, is headquartered in the parabrain or, in other words: in the extraphysical head of the psychosoma even when the consciousness is projected in this vehicle.

Bodies. The bodies can be coincident when they are concentric, occupying the same space.

Discoincidence. The bodies can also be out of coincidence – or in the condition of discoincidence – and leave or enter the state of coincidence.

Unified. The human body or soma and the consciousness in the ordinary, physical waking state, form the most coincident body of all: the unified body.

Waking. The ordinary, physical waking state, the state of the intraphysical consciousness in which his/her vehicles of manifestation are totally coincident, shows that 2 or more bodies can simultaneously occupy the same place or space, and interact with each other, as long as each vehicle is in its own specific dimension of existence or manifestation.

Variations. Undoubtedly, the *degree* of coincidence of the bodies, or vehicles of manifestation of the consciousness, varies from person to person.

Locking. Some consciousnesses actually live more *locked* in the human body than others. We are unaware of the real factors that so strongly interfere in order to maintain more or less permanent and intense coincidence.

Intraphysiology. The instance wherein the consciousness is in the human body in the ordinary, physical waking state represents the condition of coincidence of all vehicles of manifestation of the intraphysical consciousness.

Extraphysiology. However, coincidence or purely extraphysical coupling can occur, whether of the holochakra with the psychosoma and mentalsoma, or only of the psychosoma with the mentalsoma.

Extraphysical consciousnesses. Extraphysical coincidence is that which is specific to extraphysical consciousnesses and intraphysical consciousnesses who are temporarily projected from the human body.

Law. There is a law of indistinguishability which states: the bodies (vehicles) of manifestation of an intraphysical consciousness, when fully coincident, thereby comprising the unified body or holosoma, become indistinguishable to the ordinary physical perception of other intraphysical consciousnesses.

Bibliography: Monroe (1065, p. 221), Muldoon (1105, p. 62), Prieur (1289, p. 56), Vieira (1762, p. 14), Walker (1786, p. 107).

110. DISCOINCIDENCE OF THE VEHICLES OF MANIFESTATION

Definition. Discoincidence of the vehicles of manifestation of the consciousness: the departure of any vehicle of manifestation from the condition of coincidence or from the connection of the consensual bodies.

Synonymy: decoupling of the vehicles of manifestation; departure from holosomatic coincidence; disconnection of the bodies; disconnection of the consensual vehicles; disjunction of the bodies; holosomatic disengagement; non-alignment of the bodies.

Types. There are 3 basic types of discoincidence of the vehicles of manifestation of the intraphysical consciousness: minidiscoincidence, maxidiscoincidence and final discoincidence.

1. **Minidiscoincidence.** Minimal discoincidence, or minidiscoincidence, which is more common with regard to the extraphysical members (paralegs, parafeet, para-arms, parahands) or the paratrunk of the psychosoma, occurs more frequently: in traveling clairvoyance; in semi-separations; in natural sleep; in everyday shocks or psychological states; and in almost all other altered states of consciousness and parapsychic phenomena.

Evolution. The state of minidiscoincidence can evolve to complete discoincidence of the vehicles of consensual manifestation or to partial interiorization.

2. **Maxidiscoincidence.** Maxidiscoincidence involves the simultaneous departure of the parahead – obviously including the parabrain – the paratrunk and the paramembers of the psychosoma from their tight coexistence with the human body.

Psychosomatics. This maxidiscoincidence constitutes the complete projection of the intraphysical consciousness in the psychosoma at a distance from the human body, while being vitalized only by a fine string of the maximally-extended silver cord, appearing like a thread or a strand of hair.

3. **Desoma.** The integral, always definitive, discoincidence of the vehicles of consensual manifestation, constitutes final projection, desoma or biological first death, which occurs upon the definitive rupture of the silver cord.

Consciousness. These 3 types of discoincidence can occur in a conscious or unconscious manner for the intraphysical consciousness.

Signs. The following are the 5 most common psychophysical signs or sensations of discoincidence of the vehicles of manifestation of the intraphysical consciousness:

1. **Awakening.** Awakening suddenly in the physical body after a nightmare.
2. **Emptiness.** The sensation of *walking on clouds* or walking in a void.
3. **Heart.** Feeling like *one's heart is in one's mouth*.
4. **Dream.** Dreaming and perceiving that one is dreaming. This is due to an extracorporeal dream or a discoincident dream.
5. **Stars.** *Seeing stars*.

Holochakra. A frequent type of discoincidence is the *partial* exteriorization of the holochakra, which occurs after the *maxidiscoincidence* of a major projection of the consciousness in the psychosoma.

Sleep. It is presumed that sleep – natural discoincidence or minidiscoincidence – serves to recuperate the psychosoma's extraphysical or cosmic energy and temporarily sanitize the human organism's state of cellular intoxication.

Xenophrenia. Discoincidence of the vehicles of consciential manifestation is an essential triggering factor for a great number of altered states of consciousness (xenophrenia). These occur soon after the influence of diverse factors: depression; physical illness; drugs; intense emotion; hypnotic state; intense mental stress; ingestion of alcohol; ordinary sleep.

Geniuses. It is generally accepted that geniuses' vehicles of manifestation of the consciousness are slightly discoincident during their creative moments (pangraphy).

Psychopathies. Certain psychopathies (mental disturbances) present chronic or long-lasting discoincidence, as in the case of certain types of schizophrenia. This shows that vehicular discoincidence can be natural or pathological. With regard to this aspect, the phenomenon of waking discoincidence should be analyzed.

Parapsychism. Simple minidiscoincidence, whether spontaneous and nonlucid or provoked and lucid, of the parahead of the psychosoma, exiting from tight coexistence with the human head, as well as the mentalsoma exteriorizing from the parahead, located in the parabrain of the psychosoma, predisposes the manifestation of most types of parapsychism. This speaks in favor of the importance of the preponderant action of the coronachakra and frontochakra upon the other chakras.

Ectoplasm. As a rule, the exteriorization of ectoplasm begins with discoincidence, even when partial, of the vehicles of manifestation of the intraphysical consciousness of the ectoplasmic sensitive: the human body, the holochakra and the psychosoma.

Bibliography: Ebon (453, p. 123), Muldoon (1102, p. 122), Stanké (1595, p. 112), Vieira (1762, p. 14), Walker (1786, p. 108).

111. HOLOCHAKRA

Definitions. Holochakra: the vibratory, energetic, luminous, vaporous and provisional envelope that structurally coexists and envelops the human body, being directly related to the exteriorization of energies, the silver cord and the chakras; the intermediary energetic agent between the psychosoma and the human body (see fig. 111, p. 1,125).

Synonymy: aerosoma I; aetheric body; ballast of the psychosoma; Bardo body (Tibetans); biocosmic body; bioplasmic body; contrabody; diaphanous body; *djan*; energetic armor; energetic body; energetic parabody; energetic tow; energetic vehicle; energosoma; ephemeral body; etheric body; etheric double; etheric veil; first energy body; great phantasm; human body-psychosoma bridge; *kesdjun* body (Georgi Ivanocitch Gurdjieff: 1949); leptohylic body; leptomeric body; luminous shell; odic body; *pranamayakosha*; pranic body; reflection of the physical body; semiphysical vehicle; *umbra*; unifying body; vehicle of prana; vehicle of vitality; veil of the human body; vital body (Rosicrucians); vital double; vital human copy; vitality body.

Invisibility. The holochakra, as an energetic vehicle, always remains invisible to the sight of the ordinary individual.

Creation. It is logically assumed that the holochakra is created prior to human conception or in the extraphysical pre-resomatic period (intermissiology).

Antiquity. The holochakra was known as a component of the (human-extraphysical) individual or intraphysical consciousness by the ancient Assyrian, Chaldean, Chinese, Egyptian, Essene and Hindu *initiates*.

Present. Nowadays, the holochakra is a theme of study for esoterics, Rosicrucians, Theosophists and yogis.

Medicine. The holochakra is still totally unknown by conventional allopathic medicine. It is, however, utilized in Chinese medicine as well as to explain the mechanisms of the workings of homeopathy, acupuncture, do-in or acupressure, and *shiatsu*.

Recess. The permanent cultivation of voluntary, intentional or self-lucid discoincidence of the vehicles of consciential manifestation or, in other words, some type of lucid consciential projection, is a preponderant factor against the implantation of projective recess.

Form. In other words: the lucid projector remains *projectively in shape* by regularly projecting. Projective recess, regardless of the reason for its generation, is a condition which indicates that the intraphysical consciousness is *out of shape*, from a projectiological point of view. This corroborates the semimaterial condition of the holochakra and the psychosoma, and the consciencial projector's quality as an extraphysical athlete.

Bibliography: Aliança (13, p. 151), Andréa (33, p. 24), Andreas (36, p. 86), Babajiananda (65, p. 58), Battersby (92, p. 22), Besant (129, p. 37), Carton (252, p. 98), Castaneda (258, p. 201), Cavendish (266, p. 83), Champlin (272, p. 165), Crookall (343, p. 118), Guéret (659, p. 60), Hodson (729, p. 39), Holroyd (736, p. 97), Kilner (843, p. 38), Leadbeater (897, p. 71), Maes (983, p. 141), Perkins (1236, p. 51), Powell (1280, p. 100), Prieur (1289, p. 106), Steiger (1601, p. 113), Vieira (1762, p. 73), Walker (1781, p. 53), Wang (1794, p. 187), Xavier (1881, p. 99).

112. PARA-ANATOMY OF THE HOLOCHAKRA

Definition. Para-anatomy: the transcendent anatomy of the vehicles of manifestation of the consciousness, excluding the human body or the soma.

Synonymy: extraphysical anatomy; meta-anatomy; parapsychoanatomy; transanatomy; transcendent anatomy.

Contexture. The holochakra emerges from electric currents circulating through the nervous system and extends approximately 3/8" (1 cm) beyond the outline of the human body. It has a dense contexture in primitive human beings (human-animals) and a subtle and delicate contexture in consciencially more evolved human beings (human-intraphysical consciousnesses).

Characteristics. The following are 9 more relevant characteristics of the holochakra:

1. A humanoid form that is generally larger than the human body.
2. Body of vitality.
3. *Doppelgänger* (Germany) or *phantom double*.
4. Energetic form of the human body.
5. Luminosity.
6. Coloration which is sometimes black and white.
7. Hybrid nature or physical and extraphysical structure.
8. Differences between the intraphysical consciousness and the extraphysical consciousness that have undergone the first desoma.
9. It seems to be more connected to the umbilicochakra or the area of the solar plexus.

Nadis. In the para-anatomy of the holochakra, attention should be given to the chakras, the human aura and the thousands of *nadis* (72,000, by conventional calculations) or small channels of energetic circulation, which form a web inside and on the surface of the holochakra, transmitting energy to the cells of the human body.

Discoincidence. The holochakra does not have sensory organs. It is the vehicle that partially becomes discoincident with the vehicles of manifestation of the intraphysical consciousness with ease. It is therefore the *most discoincident* of the 4 existing vehicles. It is directly related to the meridians of acupuncture and do-in (acupressure).

Simulacrum. The holochakra does not operate as a separate, individual vehicle for the manifestation of the consciousness. It does not gather information because it does not transport the physical brain or its corresponding extraphysical brain, the parabrains. As it is incapable of acting on its own, its projections by itself are almost always simple humanoid simulacra of the projector.

Formations. The holochakra is sometimes accompanied by vapor formations, violet clouds, mists or clouds of smoke.

Aura. The exteriorized part of the soma or the visible part of the holochakra constitutes the human aura.

Bibliography: Baraduc (76, p. 93), Crookall (338, p. 141), Ellison (478, p. 355), Guéret (659, p. 63), Maes (983, p. 145), Rampa (1367, p. 25).

113. PARAPHYSIOLOGY OF THE HOLOCHAKRA

Definition. Paraphysiology: the physiology of the vehicles of manifestation of the consciousness, excluding the human body or the soma.

Synonymy: extraphysical physiology; metaphysiology; parapsychophysiology; transcendent physiology; transphysiology.

Characteristics. The holochakra is the vehicle of vitality, *prana* or cosmic energy. It is not an instrument of lucidity of the consciousness. It absorbs energy and distributes it throughout the human body as an energetic intermediary between the human body and the psychosoma.

Unintelligence. The holochakra does not operate as a separate vehicle for the manifestation of the consciousness because it is not a direct instrument of the consciousness or a true vehicle of the intelligent principle.

Relationships. The holochakra, or holochakrology, has direct relationships with 16 consciential conditions or relevant phenomena – as well as others, obviously – that involve the intraphysical consciousness:

1. **Soma.** The human body or the soma.
2. **Connection.** The silver cord (energetic connection).
3. **Parabody.** The psychosoma or emotional parabody of the consciousness.
4. **Chakras.** The chakras or force centers.
5. **Sexochakra.** The sexochakra, *kundalini* or serpentine fire (sexosomatics).
6. **Psychosphere.** The protective shell or psychosphere of the person or intraphysical consciousness (personal holothosene).
7. **Aura.** The human aura or the energetic photosphere of the intraphysical consciousness.
8. **Vision.** The post-desomatic panoramic vision of the extraphysical consciousnesses (former intraphysical consciousnesses) which have recently arrived at extraphysicality or the intermissive period and have still not passed through second desoma.
9. **NDE.** The phenomena of the near-death experience (NDE).
10. **Desoma.** The first death, biological death or cardiopulmonary and cerebral (encephalic) death.
11. **VS.** The vibrational state (VS).
12. **Exteriorization.** The exteriorization or liberation of energies.
13. **Parapsychism.** The parapsychic manifestations that act as catalysts of consciential energies.
14. **Phenomena.** The parapsychic phenomena having physical effects.
15. **Autoscopy.** External autoscopy.
16. **Projections.** Multiple consciential projections.

Gestation. Being the main factor responsible for the elaboration of ectoplasm, the holochakra plays a predominant role in the *final projection of the pregnant woman* (gynecology, gynosomatics) and in controversial transcendental photographs.

Renovation. The holochakra reacts to all of the individual's thoughts and emotions, influences the functions and controls the metabolism of the human body, influences the nutrition and repair of worn-out or diseased cells, substituting them with other healthy ones, recuperating the materials lost from the human body, which renews itself completely every 158 days (hypothesis).

Hypnosis. Hypnosis generally acts upon the holochakra of the consciousness to a considerable degree.

Soma. There is a total interdependence and close solidarity between the holochakra and the human body. Alterations in one vehicle provoke alterations in the other.

Vitality. The organizing vital principle that originates from the consciousness in the psychosoma manifests through the energies of the *pranic parabody* or holochakra.

Percentage. The facts show that the holochakra, as an energetic intermediary that allows the continuation of human life, cannot be *totally* projected from the human body because this would provoke biological death or first desoma.

Portion. It should therefore be understood that every manifestation or projection of the holochakra represents the exteriorization of only a certain portion of its energies and potentialities. This is because a minimal amount of these forces always remains, in all existential circumstances of the intraphysical being, vitalizing the dense form or the organs and organic systems.

Orbiting. When a *portion of the holochakra* projects alone, or in an isolated manner, without the psychosoma and mentalsoma (the seat of the consciousness) or, in other words, an energetic projection without the consciousness, it represents nothing more than an orbiting body, or an *accompanying body* of the psychosoma. A great percentage of the holochakra's energies never leave their insertions, which are generalized or spread throughout the structure of the soma. This only occurs upon desoma (medulla oblongata).

Consciousness. The psychosoma cannot be projected by itself without the mentalsoma and without the consciousness. These vehicles can only be projected when the consciousness goes together with them.

Discoincidence. Nevertheless, the consciousness can project a portion of the holochakra without accompanying it. The consciousness can also project in the psychosoma, leaving it projected (discoincident) as well, and then departing only by way of the mentalsoma.

Semilucidity. Lucid dreams, or semilucid projections, almost always occur when the consciousness projects in the psychosoma, using a greater portion of the semiphysical substances of the holochakra. It is still not known why this occurs.

Hypothesis. At this point, it is worthwhile posing the following question: Do the exteriorized portions of the psychosoma – called ectoplasmic arms, pseudopods, psychic rods, levers and prolongations by some – that cause the mysterious movement of physical objects in ectoplasmic experiments, sometimes stem solely from the compound elements of the holochakra, and other times also by internal, biological, cellular elements of the human body?

Ballast. The holochakra acts like ballast for the psychosoma, densifying and “materializing” the structure of this vehicle of manifestation when it projects, resulting in the so-called “laden psychosoma” which *transports* the consciousness.

Imitation. In external autoscopy, the exteriorized holochakra precisely imitates the gestures and postures that the consciousness makes in the ordinary, physical waking state. This imitation is executed unconsciously. It seems that the holochakra has some type of repetitive and conditioned *mechanical instinct*.

Division. In the same phenomenon of external autoscopy, the exteriorized holochakra can execute the actions that the consciousness in the ordinary, physical waking state *thinks* while performing other different actions. This demonstrates that individuals who are able to divide their *attention* are naturally predisposed to external autoscopy.

Cords. There are 3 categories of connection between the vehicles of manifestation of the intraphysical consciousness:

1. **Soma.** The human body (soma) has the umbilical cord between mother and fetus.
2. **Psychosoma.** The psychosoma has the silver cord with the soma.
3. **Mentalsoma.** The mentalsoma has the golden cord with the psychosoma.

Question. The observant individual can thus pose the following question: Might the holochakra have some similar connection?

Connection. The facts indicate that the holochakra, by itself, is already a connection between the human body and the psychosoma, given that the silver cord is only one of the components of the holochakra, which manifests in certain circumstances.

Regeneration. Based upon the fact of the *phantom member* issue, which is considered to be a biological and parabiological remnant of human regeneration, the most probable hypothesis for the advanced occurrence of regeneration of the adult human body can initially be based upon the following 3 elements:

1. **Will.** The powerful will of the amputee.
2. **Bioenergy.** His/her ability to exteriorize the holochakra, or bioenergy (bioenergetic field).
3. **Psychosomatics.** His/her awareness of the existence of the psychosoma.

Fields. The condensation and relative solidification of the energies of the aura or, more precisely, the holochakra, around the individual's human body, under certain conditions, forms a bioenergetic field, an extraphysical sphere of dense energy, like a shield or protection for the epidermis and the superficial fascia (formerly the *hypodermis*).

Isolating. This type of extraphysical isolation (isolating material) occurs in at least 2 parapsychic phenomena:

1. **Incombustibility.** The phenomena of incombustibility pertaining to the individual (limited field).
2. **Parasurgery.** *Pararegeneration* (enlarged bioenergetic field) in instances of *para-anesthesia*, *para-asepsis* and *parahemostasis* occurring during parasurgery performed on the bodies of the surgeon's patients, a *pararegeneration* (amplified bioenergetic field).

Effects. The holochakra (energetic parabody) operates as a sealant (desensitizer) in the phenomenon of incombustibility (not burning the feet) and as a sensitizer (desealant) in the phenomenon of the installed bioenergetic field (sensation of human heat).

Cause. What is the mechanism of these 2 antagonistic phenomena? There must be a single cause that explains the 2 effects.

Bibliography: Andreas (36, p. 53), Butler (227, p. 67), Crookall (343, p. 118), Fortune (540, p. 52), Guéret (659, p. 61), Maes (983, p. 152), Vieira (1762, p. 73).

114. LOOSENESS OF THE HOLOCHAKRA

Definition. Looseness of the holochakra: the condition of the relatively free operation of energetic parabody, or holochakra, in relation to the emotional body, or psychosoma, and the human body.

Synonymy: pranic projection; projection of the holochakra.

Paraphysiology. In the post-projective period, during lucid projections in series, there is frequently a benign looseness or a greater freeing of the holochakra. This phenomenon is connected to the normal paraphysiology of the vehicles of manifestation of the consciousness. In this condition, the holochakra leaves the state of coincidence of the consciencial vehicles with ease.

Clothes. The holochakra – when it is looser from the soma even during the ordinary, physical waking state – seems like very loose, lightweight clothing that the projector is wearing over the human body as well as the regular clothing. The extra folds wave around him/her, as though it were gossamer, even during the ordinary, physical waking state.

Self-transfiguration. This *loose clothing* characteristic of the holochakra seems to influence the mechanism of self-transfiguration of the psychosoma.

Sensation. Any type of developed sensitive who is somewhat more self-observant can perceive and detect this condition and hypothesis of the looseness of the holochakra. The sensation is really very characteristic of *looseness* or as though something had become loose inside us and continues to accompany us, although remaining connected, floating around us.

Causes. The following are 12 factors, among others, which predispose the condition of looseness of the holochakra and can be considered its essential causes:

1. Vibrational state (VS).
2. Assistential projection.
3. Lucid projections in series.
4. Direct projection in the mentalsoma.
5. The experience of cosmoconsciousness.

6. Awakening of the *kundalini* or the energies of the sexochakra.
7. The condition of parapsychism due to any type of manifestation.
8. Hydromagnetic shower.
9. Aeromagnetic refrigeration.
10. General surgical anesthesia.
11. The maintenance of an aura of health in good condition.
12. The existence of a protective shell or the personal psychosphere (individual holothosene).

Intoxication. *Vibratory intoxication* of the organism, the blocking of energies or energetic imbalance, is the condition in which the intraphysical being is not able to circulate the consciential energy within him/herself.

Detoxification. Full looseness of the holochakra is only achieved when a more complete energetic detoxification of the vehicles of manifestation of the projector's consciousness has occurred. This is why it happens more commonly after an assistential projection, such as one in which the projected projector, besides having absorbed energy in the extraphysical dimension, also donated energy for the extraphysical consciousnesses or intraphysical consciousnesses that are ill or needy (energivorous).

Coronochakra. One of the processes for maintaining prolonged parapsychological looseness of the holochakra is to occasionally provoke, e.g.: every two hours, in certain periods, an energetic shower through the coronochakra triggered by the will, always maintaining personal psychological balance, without irritation or negative ideas.

Effects. The condition of looseness of the holochakra provokes the following 13 well-defined effects, among others:

1. **VS.** Installation of a spontaneous vibrational state, either with or without consciential projection.
2. **Extraphysical consciousnesses.** The perception by the projector, or by sensitives in general, through vibrations felt throughout the human body, of the presence of extraphysical consciousnesses, without seeing them directly.
3. **Shower.** The triggering of a more ordinary energetic shower with greater frequency.
4. **Aura.** Full installation of the conditions of the projective aura.
5. **Projection.** Indisputable self-confirmation of the recently completed lucid projection.
6. **Continuation-projection.** The predisposition of the lucid projector toward another projection, the continuation-projection, as well as the occurrence of lucid projections in series.
7. **Energy.** The frustrating sensation of a useless loss of consciential energy through energetic exteriorization from the entire soma-holochakra-psychosoma set.
8. **Announcement.** The facilitation of prior announcement of an imminent lucid projection between two consecutive lucid projections.
9. **Self-luminosity.** Facilitation of perception of the lucid projector's self-luminosity or the lights around oneself, which can sometimes be seen by witnesses around the projector, such as the *intraphysical assistant*, and clairvoyant relatives and sensitives, in the immediate post-projective period.
10. **Stature.** The false impression on the part of the projector, as well as the surrounding sensitives, that the projector's human body is taller in stature. The human body evidently does not become taller, but the coincident bodies are actually taller. This is because the effects of this vehicular condition, in this particular case, are extraphysical and not physical.
11. **Neurovegetative.** A predisposition toward the appearance of agreeable goose bumps and positive neurovegetative manifestations throughout the human body.
12. **Duration.** This condition of the looseness of the holochakra more commonly lasts only for some minutes, although it can last for hours, an entire day and, in exceptional circumstances, for days and weeks at a time. This is dependent upon the intelligent use and possible coexistence between the lucid projector and this psychophysical state.

13. **Donation.** The looseness of the holochakra allows the intraphysical consciousness to achieve the condition of a permanent universal donor of consciential energy. This is very important in penta and the works performed in the extraphysical clinic of the self-lucid consciential epicenter.

Waking. The condition of looseness of the holochakra is the most common type of phenomenon of waking dis coincidence for the intraphysical consciousness and is directly related to the installation of the bioenergetic field of the human being.

Reconnection. The facts show that the condition of full looseness of the holochakra, disconnected from the human body, can stop from one moment to another, through as yet unknown processes, thereby energetically reverting to the previous condition of severe ordinary coincidence of the human body, the holochakra and the psychosoma. Evidently, this sudden reconnection of the links of the holochakra may cause many occurrences of projective recess, being one of the evident causes of this selfsame phenomenon.

Mentalsoma. Looseness of the mentalsoma of the extraphysical-sensitive-consciousness relative to the extraphysical head of its psychosoma (parahead) and the parabrain also occurs in the extraphysical dimension, as the extraphysical consciousness, in this situation, obviously has neither the holochakra nor the human body.

Interaction. The following are 3 projective occurrences which, after a certain level, are interdependent and therefore interact and amalgamate, generating a condition of highly expressive projectability and parapsychism:

1. **Projections.** A series of lucid projections or continuous consecutive self-aware projections.
2. **Looseness.** The state of healthy looseness of the holochakra.
3. **Discoincidence.** The maintenance of a healthy state of waking dis coincidence of the intraphysical consciousness.

Bibliography: Crookall (338, p. 141), Ebon (453, p. 114), Maes (983, p. 141).

115. PARAPATHOLOGY OF THE HOLOCHAKRA

Definition. Parapathology: pathology of the vehicles of manifestation of the consciousness, excluding the human body or the soma.

Synonymy: extraphysical pathology; metapathology; parapsychopathology; transcendent parapathology; transpathology.

Characteristics. Various occurrences can be listed within the scope of parapathology of the holochakra. The following 8 are some of these variables:

1. **Looseness.** Pathological looseness of the holochakra.
2. **Projection.** Morbid disconnection or dis coincidence of the intraphysical consciousness.
3. **Parapsychoses.** Post-desomatic parapsychoses of extraphysical consciousnesses.
4. **Sexochakra.** Premature awakening of the energies of the sexochakra.
5. **Repercussions.** Phenomena of parapsychophysiological repercussions of holochakral origin.
6. **Amputation.** Consequences of amputation of members of the soma.
7. **Retention.** Inability to retain consciential energy.
8. **Chakras.** Parapathology of the chakras.

Alienation. Pathological looseness of the holochakra facilitates the occurrence of the projector's alienation from the commitments of human life. It is closely related to countless syndromes and psychopathologies encountered in cases of psychiatric hospital patients.

Dissociation. Dissociation of the holochakra, which normally allows the projection of this same vehicle, can be dependent upon a mental state in which the intraphysical consciousness is not able to control his/her mental processes. Certain cases of external autoscopy should be included in these considerations, including the classic case of Emília Sagée.

Illnesses. Diverse human illnesses have their origin in energetic alterations between the psychosoma and the human body or, in other words, the holochakra, it sufficing to observe the processes of acupuncture, do-in or acupressure.

Image. Various occurrences suggest that those suffering from migraine, epilepsy, or patients suffering from disturbances in their corporeal image (distortions), e.g.: feeling that their legs are shorter or that they do not exist, or even thinking that they have an extra arm, may consist of energetic exteriorizations of the denser holochakra, with or without considerable help from the imagination and morphothosenes.

Bibliography: Fortune (540, p. 17), Guéret (659, p. 61), Powell (1278, p. 35), Rampa (1361, p. 40).

116. HUMAN AURA

Definition. Aura (Latin: *aura*, breeze): a field of an unknown nature, with some magnetic characteristics, having a luminous appearance to sensitives, extraphysical consciousnesses and projected intraphysical consciousnesses, on certain occasions, the colors of which are probably connected to the energy field and the activities and thoughts of those involved, such as living beings, adults, children, fetuses, animals, plants, minerals and physical objects, and even extraphysical consciousnesses (self-luminosity) (see fig. 116, p. 1,126).

Synonymy: auric egg; bio-aura; circle of radiance; electro-aura; external vestment of the psychosoma; extraphysical calling card; extraphysical medical chart; extraphysical warning system; human atmosphere; human glory; human light; human nebula; human rainbow; luminous psychosphere; magnetic aura; mental defense; mystical oval; parapsychic constellation; personal nimbus; physical aura; psychic halo; psychic photosphere; psychic radar; sphere of sensation; vital aureole.

Aspects. With regard to its characteristics, 3 aspects of the aura should be singled out:

1. **Omnipresence.** It is evident in *all* things and not only in some.
2. **Movement.** It becomes radically modified upon every movement made by the object contained within it.
3. **Envelope.** It generally appears to be an ornament or ornamental envelope in which the object or being appears to be encased, as though it were in a container.

Operation. The human aura typically has a large vibrant ovoid form, crossed by many currents of light in constantly moving rays and vortexes.

Warning. In the human being, the aura works like an extraphysical warning or defense system, or psychic radar generally not perceived by the average human being in the ordinary, physical waking state.

Image. The human aura, usually invisible – as with the scent of a flower that is identified – does not submit itself to human hypocrisy. This is because it always reflects the exact, raw image of the individual, representing his/her true calling card, or extraphysical medical chart, which is seen or read by clairvoyants, sensitives, initiates, extraphysical consciousnesses, lucid projectors and even subhuman animals, in certain cases.

Light. The nature of the aura is similar to that of a light which is simultaneously corpuscular and vibratory.

Size. The volume, size, outline and density of the aura are extremely variable.

Dimensions. The ordinary person emits an aura of approximately 4" (10 cm). The positive parapsychically-developed individual has an aura 3 or more times this size.

Film. It is presumed that the holochakra is only partially responsible for the human aura, as well as for the so-called auric film that surrounds it, because the extraphysical consciousness, after passing through second desoma, or discarding the holochakra, still presents a certain aura.

Secondary. More common secondary or effluent auras exist around a person's head and hands.

Nature. The nature of the human aura is generally characterized by the following 9 variables:

1. Coloration.
2. Density.
3. Format.
4. Invisibility.
5. Luminosity.
6. Substance.
7. Subtlety.
8. Vitality.
9. Volume.

Waves. The electromagnetic field of the aura, composed of a myriad of lines of force, emits waves.

Classification. In order to identify and classify the human auric atmosphere, it should be observed that it can present itself with at least the following 9 characteristics:

1. **Opacity.** Dull or brilliant.
2. **Extension.** Narrow or wide.
3. **Serenity.** Disturbed or calm (temperament).
4. **Health.** Unhealthy or healthy (holochakral homeostasis).
5. **Purity.** Maculated or pure.
6. **Color.** Multicolor or unicolor (sensations).
7. **Empathy.** Unfriendly or charming (empathetic).
8. **Holothosene.** Retracted or engaging (holothosenics).
9. **Presence.** *Withered* or powerful

Brilliance. Depending upon circumstances and emotions, the aura contracts or dilates, intensifies or fades in brilliance.

State. The human being's state of health and age influences the conditions of the aura, which is renewed many times in the course of an intraphysical existence (lifetime).

Categories. There are various categories of human aura, among which the following 5 can be singled out:

1. **Miniature.** The common miniature aura, belonging to the ordinary intraphysical consciousness, who only nurtures so-called tropospheric interests. This aura extends only a few inches (centimeters) from the concrete limits of the soma.
2. **Healthy.** The aura of health is an aura which is healthy, positive, strong and pleasant to behold.
3. **Confused.** The confused aura is that belonging to ill persons, especially psychopaths (madmen).
4. **Mega-aura.** The mega-aura is the aura of the *serenissimi* which reaches vast distances through the impulsion of consciential energy.
5. **Nimbus.** The aura surrounding the head, also called the *nimbus*, *gloria*, *halo*, *aureole* or *mystical oval*, when very dark, is generally indicative, to the clairvoyant, of the individual's imminent desoma.

Interaction. Human auras interact with each other, from a positive as well as from a negative point of view. This creates attraction, including auric couplings and repulsions between persons.

Operation. Through their auras, human beings everywhere incessantly operate as energetic or parapsychic receivers or sponges, as well as emitters or donors of consciential energy.

Theorems. We can posit 2 theorems with regard to the human aura in relation to thosenology:

1. **Volume.** The intensity of thought or sentiment determines the *volume* of the human aura (the category of the *emphasis* of the self-thosene).
2. **Coloration.** The quality of thought or the sentiment determines the *coloration* of the human aura (the category of the *emphasis* of the self-thosene).

Maintenance. There are 22 spontaneous psychophysiological resources, or extraphysical antipollutant detoxification and vibratory defense techniques, among others, that allow any type or category of projector or sensitive to maintain the cleanliness of the aura of health:

1. Absorption of environmental energies.
2. Aeromagnetic refrigeration.
3. Brief phlegm.
4. Discharging or neutralizing, as well as absorbing self-exteriorizations.
5. Energetic showers.
6. Guided meditation, prayer or oration.
7. Hydromagnetic showers.
8. Light sniffing.
9. Localized involuntary muscular contractions (myoclonuses).
10. Physical, mental and consciential hygiene.
11. Positive concentration of the auric self-image.
12. Practicing healthy, non-radical sports.
13. Shivers with energetic or extraphysical foundations beyond the sensations of the soma.
14. Special diets.
15. Stretching.
16. Swimming in the ocean.
17. The absence of antiphysiological addictions (self-weak traits).
18. Unexpected bilateral tearing of the eyes.
19. Varied individual signals of parapsychism (signage).
20. Vibrational state (VS).
21. Walks in forests and gardens.
22. Yawns with parapsychic foundations.

VS. Without a doubt, the most efficacious of all the 22 above-mentioned resources is the voluntary installation of the vibrational state.

Kirlian photographs. Many studious individuals attempt to play down the reality of the human aura, which seems to arise in the controversial *Kirlian photographs*, through various suppositions, such as: chemical effects; control of information; corona effect; effects of electrical conductivity; electronic aura; faulty technology; heat effects; models of energetic fields; odor molecules; odoriferous covering; odoriferous envelope; photographic defects; scent molecules; and others. Independent of this, however, the human aura seems to remain ostensive and evident, in the same manner, for those who have *eyes to perceive it*, namely clairvoyant sensitives.

Objects. At least the following 7 objects present larger auras than other objects, and are easily identified by the projected projector's consciousness:

1. **Art.** Spectacular works of art (Florence, Italy).
2. **Worship.** Certain personal objects or those pertaining to worship, idolatry or adoration.
3. **Images.** Images of temples in general.
4. **Tombstones.** Tombstones in cemeteries (tombs, mausoleums).
5. **Books.** Mystical books or those relating to catechesis.
6. **Monuments.** Noteworthy statues and monuments in general.
7. **Personal.** Objects of long-standing use or those of personal use (prized).

Psychosoma. The psychosoma, when leaving the state of coincidence of the vehicles of manifestation of the consciousness, is sometimes mistakenly perceived by clairvoyants as the human aura.

Note. The *human* energetic aura is the vibratory magnetic field most intimately connected to the human body. It should thus not be confused with the following 5 basic categories of other distinct auras:

1. **Projective.** The specifically *projective* aura.
2. **Extraphysical.** The *extraphysical* aura or the condition of extraphysical self-luminosity.
3. **Pathologies.** The *epileptic* aura, pertaining to the convulsive syndrome, a signal that proceeds an epileptic crisis, as well as *neuropathic halos*. Both are strictly pathological conditions.
4. **Psychophysiological.** Psychophysiological auras, such as: the *sensitive* aura, the *motor* aura and the *psychic* aura, denoting anguish, fear, terror and hallucination.
5. **Electronic.** The *electronic aura*, corresponding to the corona effects in electronics.

Psychosphere. The *psychosphere*, as it is referred to in this book, of the intraphysical or extraphysical consciousness, is the assemblage of energetic manifestations of the consciousness within the personal holothosene, which envelops the entire holochakra, the aura and the other manifestations of its intentionality in any consciential dimension. The psychosphere always encompasses, for example, the consciential energy (the *e* of thosene) of the consciousness' *holothosene* and even its personal *materthosene*, the nucleus of its holothosene.

Bibliography: Andreas (36, p. 84), Bennett (117, p. 83), Black (137, p. 151), Blasco (151, p. 253), Boswell (174, p. 55), Cardillo (242, p. 58), Carrington (245, p. 53), Cavendish (266, p. 48), Coquet (301, p. 233), Crouzet (344, p. 234), D'arbó (365, p. 174), Depascale (392, p. 13), Drury (414, p. 60), Edmunds (461, p. 94), Fodor (528, p. 17), Greenhouse (636, p. 69), Hapgood (678, p. 321), Hodson (729, p. 114), Kilner (843, p. 1), Krippner (864, p. 171), Leadbeater (900, p. 129), Meek (1028, p. 250), Montandon (1071, p. 47), Moss (1096, p. 159), Powell (1278, p. 7), Prieur (1289, p. 35), Rampa (1361, p. 32), Regush (1382, p. 122; 1383, p. 93), Steiger (1601, p. 144), Toben (1688, p. 77), Vieira (1762, p. 65), Walker (1781, p. 15), Wilson (1858, p. 123).

117. SILVER CORD

Definition. Silver cord: the semimaterial attachment that keeps the psychosoma linked to the human body with an initial connection in the psychosoma and another in the soma.

Synonymy: binding of the psychosoma; aeriform tie; *aka* cord (Huna); anchor of the psychosoma; animic thread; aromatic cord; astral cable; astral cord; astral thread; band of phosphorescent light; brilliant ribbon; cable of light; cable of the physical diving suit; conduit of life; cord of connection; cord of energy; cord of ethereal matter; cord of flames; cord of life; cord of light; cord of od; diaphanous cord; elastic cord; elastic force; electric connection; energetic communication; etheric cord; etheric line; etheric thread; etheric umbilical cord; extra member of the human body; extraphysical magnet; extraphysical multiplex conduit; filament of a spider's web; fine and luminous cord; fine and silky cord; fine cord (Kol); fine cord of light; flexible rod; fluidic cord; fluidic line; fluidic tie; fluidic umbilical cord; foreign appendix; fragile luminous thread; hidden chain; human body-psychosoma intercorporeal connection; intangible cable; intangible cord; intermediary connective tie; irradiant energy current; lifeline; line of light; line of vital force; linking cord; living cord; long neck; luminous filament; luminous hose; luminous spider's web; luminous thread; magnetic cord; nebulous cord; pajama cord; perispiritual cord; phosphorescent tail; prison guard; psychic cord; ray of light; ray of moonlight; ribbon of light; scintillating cord; scintillating thread of light; security cord; semimaterial tie; semiphysical connection; shadowy line; shadowy ray; shaft of light; shaft of moonlight; silky thread; silvery appendix; silvery connection; silvery cord; silvery light; small junction of a spider's web; smoky cable; spider's silk; spiritual link; string of silver; strip of light; *sutratma*; temporary extension; thin ribbon; thin thread of silver; thread of a spider's web; thread of the consciousness; trail of silvery light; tube of energy; vaporous cord; variation on the umbilical cord; vital current; vital intermediary; vital magnetic cord; vital tie; weak silvery light; whitened cord.

Parabiophysical. Much like the pineal gland and ectoplasm, the silver cord is a parabiophysical element or, in other words: although it is somehow rooted within the physical cells, its energetic manifestations transcend the limits of dense matter, or the areas pertaining to *physical* biology, crossing into parabiology.

Ecclesiastes. Chapter 12, Verse 6 of the book of Ecclesiastes, the Preacher, in the Bible (Old Testament), is recalled by scholars of the silver cord: “Remember Him before the silver cord is broken and the golden bowl is crushed...,” in order to confirm the existence of this energetic appendix. Some researchers, however, contend that the cord refers to the spinal cord, or the spinal medulla, and not the connection between the physical body and the extraphysical body.

118. PARA-ANATOMY OF THE SILVER CORD

Pivotal. The silver cord is the pivotal factor of the phenomenon of projection of the intraphysical consciousness in the psychosoma, besides being the *pivotal factor* of biological *death* or that of the human body (desoma).

Characteristics. Among the characteristics of the para-anatomy of the silver cord, at least the following 10 can be singled out:

1. **Minicords.** The branches or the various minicords or fine, elastic scintillating cords close to the human body.
2. **Root.** The main root when the silver cord becomes distant from the human body.
3. **Heat.** The heat and bareness of naked human tissue.
4. **Thickness.** Thickness, varying diameters and ducts.
5. **Weight.** Weight, volume, density, format and extendibility.
6. **Sensitivity.** Sensitivity to touch and heat.
7. **Brilliance.** Brilliance, luminosity, silvery coloration and phosphorescence.
8. **Pulsation.** Pulsation.
9. **Texture.** Texture.
10. **Action.** A more extensive or vigorous sphere of action or perimeter.

Sensations. Few consciential projectors see and examine the silver cord clearly or self-convincingly. However, a great number of them, almost the majority of veteran experimenters, *sense* its presence, action and force.

Error. Due to inexperience, some projectors erroneously attribute these sensations to other unknown causes and factors, including nonexistent intrusion or unknown forces.

Nonexistence. Other projectors affirm the nonexistence of the silver cord because they have never seen it.

Observations. The characteristics of the silver cord can be identified through 3 distinct observations:

1. **Difficult.** In the first observation, which is difficult, the projector is able to examine its own silver cord.
2. **Rare.** In the second observation, which is rare, the projector detects the silver cord of another projected intraphysical consciousness.
3. **Extremely rare.** In the third observation, which is extremely rare, the fortunate projector simultaneously observes the silver cords of more than one projected intraphysical consciousness.

Irrelevance. The act of seeing the silver cord is neither a vital issue nor is it one of greater relevance.

Development. The novice projector should not be concerned if he/she has never seen the silver cord, as this does not represent any obstacle to the full development of lucid projections.

Presence. The projected intraphysical consciousness can sense the active presence of the silver cord without seeing it.

Near-death. It is worth highlighting that, in many near-death experiences (NDE), the intraphysical consciousness projected in a forced manner spontaneously witnesses, for example, the surgeon, surgical assistants, the anesthetist and the nurses moving from side to side, busy in the surgery room, in order to save the projector's human body which is ill or has suffered an accident. On this occasion, the consciousness, when inexperienced regarding the subject, becomes afraid that any one of these persons might sever the silver cord, which is visible or extremely ostensive *only to the projector*, being connected between the consciousness and the inactive soma on the operating table.

Single. The intraphysical consciousness has only a single silver cord, although it is made up of countless connections that come together forming a main connection. It is sometimes seen as 2, 3 or more cords. Furthermore, all this exists beyond the psychosoma, mentalsoma, its intriguing connection with the psychosoma (golden cord) and the global action of the holochakra.

Gathering. Besides, that which is called the *silver cord* can actually be interpreted as a gathering of *regional silver cords*, or minicords of specific areas, whether of the head (parahead); an arm (para-arm); a leg (paraleg); a foot (parafoot); a finger (parafinger); and others.

Denomination. There are those who refer to this selfsame silver cord as a *copper cord* when it is *more dense*, vigorous, within the extraphysical sphere of energy, and in partial projections related to the vegetative area of the human body.

Tension. The tension and diameter of the intercorporeal connection are greater at a shorter distance from the human body.

Diameter. Within a distance of 2" to 6" (5 to 15 cm), the silver cord has a diameter of 2" (5 cm). At a greater distance, more than 33' (10 meters), for example, it is as thin as a (sewing) thread.

Change. In a lucid projection, one never knows when the silver cord will completely disappear, with only the *golden cord* remaining or, in other words, when a consciencial projection in the psychosoma will end and a consciencial projection in the isolated mentalsoma will begin.

Immateriality. One inference, however, seems to be evident regarding the silver cord, that the connections can be listed in an ascending scale of dematerialization (or immateriality), according to its popular names, in the following manner:

1. **Copper.** First, the copper cord.
2. **Silver.** Second, the silver cord.
3. **Gold.** Third, the golden cord.

Color. The coloration of the silver cord varies from person to person, although the brilliant and phosphorescent white color predominates, hence its popular name.

Differences. The silver cord, like the human body, has its peculiar differences from person to person, being stronger or weaker according to the physical age and extraphysical development of the intraphysical consciousness.

Base. Based upon the supposition, as evidenced by the facts, that the psychosoma is a semimaterial body and that the silver cord, a substance (reality) that is unknown to us, is still more material than the psychosoma and that sometimes, when exteriorized close to the human body, weighs more than the psychosoma. It can thus be logically concluded that the base of the silver cord in the human body is intracellular.

Structures. Although having a main encephalic base (pineal gland and medulla oblongata), the silver cord branches out and comes from all intracellular structures of the organism, from head to feet.

Branches. If the silver cord has an intracellular origin, its branches – analogous to the system of veins of the human body – have a purely physical origin, perhaps stemming from organizing force fields, in order to keep it from going in all directions, the irradiating center of which is found in the encephalic region.

Connection. It is important to emphasize that the silver cord is a connection of the holochakra and *is not the entire elongated holochakra*. The holochakra is a much more complex element than the silver cord, despite all the intriguing possibilities of the manifestation of this appendix.

Materiality. The space factor seems to act intensely upon the branches of the silver cord, which has great force when physically close to the human body and gradually loses force when more distant from it. This surely speaks in favor of the pattern of the materiality of the structure, nature or, in fact, the anatomy of the silver cord.

Classification. The silver cord can be classified according to its connections in the human body: the encephalic, umbilical, digital, manual, podal or dorsal silver cord.

Binding. The *binding* silver cord is that which retains the psychosoma in the physical base, in the bedroom.

Connections. It is put forward, as a hypothesis, that the connection of the silver cord in the human body is established by the medulla oblongata and the brain. It may maintain a relationship with the pineal gland and a series of intracellular branches throughout the organism and seems not to terminate in the individual's skin, but gives the impression of entering the human body, establishing deep connections there with the vital centers of all the organs.

Extremities. Two categories of extremities should be considered in the connections of the silver cord:

1. **Greater.** The greater extremity, called the *conical root*, which is the more potent end, has a varied point of insertion that is ordinarily located in the region of the head, exiting from the frontal or nuchal region. Its physical base is located inside the head and may be the medulla oblongata or the epiphysis. This connection only disappears upon first desoma.

2. **Lesser.** The lesser extremity, the fine, more rarefied root, has its point of insertion and base in the psychosoma. This connection only disappears upon second desoma.

Density. In certain extraphysical situations, the silver cord seems to be denser and heavier than the psychosoma or, in other words, hypothetically weighs more than 3.5 oz. (100 g), if we consider the psychosoma to have a total weight of 2.5 oz (70 g).

Nature. The silver cord participates in the material nature of the human body as well as the extraphysical nature of the psychosoma. It is therefore a composite of components of the structures of the human body and the psychosoma, being a hybrid element or an energetic intermediary. Its structure is composed of a conglomerate of luminous energy corpuscles with a nature that is closer to the psychosoma than to dense matter. It is therefore, in this analogy, a substance that is similar to or more subtle than ectoplasm, which is denser or more biological.

Analogies. Contemporary lucid projectors have compared the silver cord with: a cord, thread, band, light, neon, strip, elastic tube, staircase, current, snake, ray of light, and even with the umbilical cord.

Bibliography: Bardon (80, p. 318), Baumann (93, p. 47), Bord (170, p. 10), Crookall (325, p. 87; 343, p. 83), Greene (635, p. 60), Greenhouse (636, p. 33), Rampa (1367, p. 24), Vieira (1762, p. 53).

119. PARAPHYSIOLOGY OF THE SILVER CORD

Characteristics. Among the characteristics of the paraphysiology of the silver cord, at least the following 17 variables deserve singling out:

1. **Connection.** Soma-psychosoma link or connection.
2. **Free will.** Agent of extraphysical free will (freedom).
3. **Retention.** Retaining and freeing of the psychosoma.
4. **Vitality.** Vitality, sensitivity and flexibility.
5. **Retractability.** Undefined retractability and extendibility, along the entire cord.
6. **Tenuity.** Density, tenuity, invisibility and visibility.
7. **Projection.** Active in the occurrence of the phenomena of lucid projection.
8. **Automatism.** Unconscious automatism (mechanicalness).
9. **Impulses.** Bi-directional vital impulses.
10. **Point.** Critical point in the potency of retention of the psychosoma.
11. **Exteriorization.** Active in the mechanisms of exteriorization of consciential energies.
12. **Volitation.** Access to unimpeded volitation (extraphysiology).
13. **Chakras.** Relationship with the chakras.
14. **Desomatics.** Active in the transition of biological death or desoma.
15. **Holochakrology.** Relationship with the entire holochakra.
16. **Reins.** Operates as the reins of the intraphysical being or intraphysical consciousness.
17. **Clairvoyance.** Relationship with traveling clairvoyance.

Functions. The following are 5 other functions of the silver cord that are less evident or even more subtle:

1. **Forms.** Responsible for the differences in form (appearance, physiognomy) between the extraphysical consciousness and the intraphysical consciousness or the projected intraphysical projector.
2. **Repercussions.** Execution of physical and extraphysical repercussions.
3. **Density.** Regulation of the psychosoma's density through gradation of the ballast of semimaterial energetic substance through the holochakra, sometimes dispensing with interiorization, whether in the physical base or at a certain distance.
4. **Potentialiation.** Responsible for the variation of the amount of energy and its consequences.
5. **Disappearances.** Sponsoring of sudden disappearances in instances of extraphysical defense.

Duration. The integral silver cord only exists from the moment of physical, biological conception until the final projection or first desoma, when the human body is deactivated.

Remnants. Remnants of the silver cord remain connected to the psychosoma, in the holochakra, and disappear with the second desoma or, in other words, upon deactivation of the holochakra.

Umbilicochakra. Many projectors, especially novices or those still lacking extraphysical agility, imagine that the psychosoma only leaves the human body through the solar plexus or, in other words, from the area of the umbilicochakra. The facts seem to demonstrate, however, that this observation is only partially correct.

Exit. The silver cord exits the human body through the solar plexus, but it also, and mainly, leaves simultaneously through the essential connection, the cranium (the seat of the brain) and the extraphysical head (parahead) of the psychosoma, which is the seat of the mentalsoma or, more precisely, the seat of the consciousness or ego.

Anatomy. Visualization of the exit of the silver cord from the area of the solar plexus is facilitated by the anatomy and even by the para-anatomy of the vehicles of manifestation of the intraphysical consciousness.

Eyes. The physical eyes easily see the navel, as it is more distant. This obviously cannot occur with regard to the area of the cerebral cortex.

Difficulty. In light of this, it is very difficult for the intraphysical consciousness to attempt to see the silver cord leaving the human body and to perceive the occurrences of the trance simultaneously, or in a single experience.

Sinciput. To begin with, due to the intraphysical projector's psychological conditioning through physical vision, it becomes impossible to see the center of the cranium or sinciput (top of the head).

Takeoff. This act can be realized – despite being difficult to achieve, even for the projector's extraphysical vision – during the lucid takeoff of his/her own psychosoma, when it is transporting the consciousness.

Abdominal. The partial exit of the psychosoma leaving the abdominal area (animal-human) is easily seen extraphysically by the consciousness which is still stuck in the physical head. This is why many novice projectors witness the occurrence.

Cranium. However, the same does not occur with regard to departure from the head of the psychosoma through the cranium, or the head of the human body, the *only* exit from which the consciousness leaves the cellular organism and one that very few veteran projectors perceive in an unquestionable manner.

Retraction. The silver cord spends most of its useful life retracted or hidden within the cells, without showing itself.

Shackle. The silver cord is the hidden shackle of the intraphysical consciousness, who is always a prisoner of intraphysical restriction.

Examination. The technique for examining the silver cord involves the act of slowly returning to the human body. This is an occasion in which the increase in thickness of this energetic connection, or its links, fine threads and the other details of its reality can be observed.

Conception. The biological conception of the human body triggers the creation of the silver cord which, in theory, is inexistent in the psychosoma of the extraphysical consciousness that undergoes resoma, except in resomas or existential programs of a less evolved nature (existential miniprogram). In this case, the basic connection of the silver cord in the psychosoma plays a primordial role in the paraphysiology of this appendix.

Absorption. The sometimes lightning-fast absorption of the silver cord by the human body provokes the condition of *admonitory discomfort*.

Recapturing. The recapturing of the silver cord by the human body is performed by the entire human body, but mainly by the projector's physical head. Recapturing signifies interiorization of the silver cord and psychosoma.

Holochakra. The basic holochakra can remain in the human body without the intervention of the projected silver cord.

Sensations. The physical sensations of the dense human body suffocate the sensations caused by the silver cord.

Action. The closer the silver cord is to the human body, the more vigorous its action. The more distant it is, the weaker its action becomes.

Conduction. Among the functions of the silver cord, the bi-directional conduction of energies between the psychosoma and the human body should be singled out. This allows the partial or total departure and interiorization of the psychosoma.

Isolated. The silver cord also departs from the harmony of the holosoma unaccompanied or alone or, in other words, without the psychosoma or the consciousness. This explains why the phenomenon of the exteriorization of the holochakra is always partial.

Properties. The silver cord has an infinite capacity for extension. It maintains an average range of a greater power of action of approximately 13' (4 m) from the human body, starting from the center of the cranium or, more precisely, the center of the physical brain.

Pivotal. With regard to desomatics, the silver cord is often confused with a tunnel or a passage when it departs and returns to the human body. It is the pivotal factor in brain death, as the first desoma or deactivation of the dense organism only occurs upon the rupture of the silver cord.

Appendix. The silver cord, as an appendix of the human body, controls the vital vegetative processes of the inactive physical body – whether respiratory, circulatory, or others – during lucid projection.

Permanence. Nevertheless, the silver cord, operating as an energetic intercorporeal connection with the psychosoma, remains with the psychosoma even after the first death or deactivation of the human body, until the occurrence of second desoma, which is the definitive deactivation of the holochakra (its last connections).

Potency. *Projective potency* (projective range) is the capacity of extension of the projector's silver cord.

Chamber. Some projectors only project close to the human body in the bedroom (their chamber), without ever projecting thousands of miles (kilometers) away. Is this only due to their *extraphysical inhibition* or to an insufficient projective potency? Each case needs to be analyzed individually.

Test. The following is currently the most logical *test of the remainder of one's life*: if the lucid projector wishes to rationally know if he/she will still live a long time in the human body or, in other words, wishes to ascertain the approximate duration of his/her survival, or the time remaining until undergoing desoma at the correct moment, it is sufficient to project and examine the silver cord while in the extraphysical sphere of energy, close to the human body.

Paranape. If the experimenter notes that the silver cord is vigorous, strong, dense, firm and full of energy at the *paranape* of the psychosoma, he/she can safely conclude that he/she has every possibility of continuing to live in the intraphysical dimension for quite some time.

Debilitation. The abovementioned technique is logically based on the silver cord's tendency to appear weak, debilitated and less potent in its actions, according to the reduction in the intraphysical consciousness' vitality, the closer he/she gets to the first desoma or biological death.

Instruments. Consciential energies are inexhaustible, although the same is not true for intraphysical instruments that are obsolete.

Torpidity. Physical torpidity is the first sign of freedom from the connections of the silver cord, a common occurrence prior to takeoff of the psychosoma. Without physical torpidity, an *entire* exteriorization of the cord does not occur, only a partial one, evidently maintaining the physical connection in both cases.

Respiration. It is the silver cord that provides the sensation of a loss of respiration upon takeoff and the resumption of respiration upon interiorization of the psychosoma. In certain circumstances, it is involved in the acquisition of clarity of extraphysical illumination, or the projected projector's paravision.

Occurrences. With regard to the connections of the silver cord with the human body, the following 3 occurrences merit particular attention:

1. **Growth.** As a semimaterial connection, the silver cord grows along with the human body, the child having a *smaller* cord than the adult.
2. **Aging.** The silver cord also *ages*, accompanying the natural senescence of the organism, by losing a portion of energy or its ability to act, as it follows the gradual weakening or the *loss* of a certain percentage of the soma's physical cells.
3. **Spreading.** This last fact speaks in favor of the theory that the silver cord spreads (distributes) itself throughout the human body when in the coincident state, connecting every physical cell to its corresponding extraphysical cell.

Psychosoma. The process of exteriorization of the silver cord, under certain conditions, seems to be closely connected to *physical* imbalance, vibrations, turbulence and generally lateral oscillations. These states affect the psychosoma soon after takeoff, when it remains floating over the human body lying on the bed. This is similar to alternating electrical current, which alternately flows in reverse directions.

Semiprojection. This occurs because the silver cord remains only semiprojected, having a greater circulation of unstable and zigzagging energy that alternates between the human body and the psychosoma in a lightning-fast manner.

Conductivity. The conductivity characteristic of the silver cord, transporting energy from the human body to the psychosoma during lucid projection, is more intense in the vicinity of the dense body than at a distance of hundreds of miles (kilometers) from same.

Types. Based on the above, it can be concluded that there are at least 2 very distinct types of conductivity of the silver cord:

1. **Proximity.** The first type, *less extraphysical*, in the proximity of the human body, wherein the silver cord is thicker.

2. **Distance.** The second type, *less physical*, at a distance from the human body, within the range of the psychosoma's maintenance by the silver cord, beyond the 13' (4 m) radius, far from the material body, wherein the silver cord is rarified and practically invisible.

Pulsations. On certain occasions, the evident vital pulsations of the energetic current of the silver cord can be observed. Upon each pulsation in the physical-extraphysical direction, for example, the psychosoma becomes more vital and dense while the human body *apparently* becomes *more and more lifeless*.

Double. The pulsations of vitality become easier for the projected projector to detect during lucid projections with the denser compound double, wherein they are more evident.

Crossings. The silver cord plays a decisive role every time the intraphysical consciousness, projected in the psychosoma, crosses from one extraphysical dimension to another more or less evolved extraphysical dimension.

Case study. On one occasion, the author experienced passing through 5 consecutive dimensions in a two-hour period, through 5 consecutive projections with continuous self-awareness.

Return. In the first two crossings, the author returned to the human body. In the others, it was not necessary to return, although the *admonitory warning* of the silver cord occurred.

Corrections. In the first crossing, it was possible to remain somewhat lucid inside the human body, only to correct the mouth that was open, by placing a pillow supporting the mandible (lower jaw, chin).

Close. In the second crossing, it was possible to come close to the physical form without interiorizing.

Lucidity. In each crossing from one dimension to another, the psychosoma gradually became perceptibly more rarified and subtle. This was accompanied by amplified lucidity of the consciousness, which increased more and more each time, without blackouts, and even with an intensification of tachypsychism or the quick elaboration of thoughts, deductions, extraphysical-physical comparisons and critical judgment. It was clearly perceived that one vehicle of manifestation, the psychosoma, was being used the entire time.

Message. In certain cases of parapsychic transmission, it seems that the communicant consciousness takes direct and temporary possession of the projected intraphysical sensitive's silver cord, transmitting its message through the silver cord. This is still an obscure point of parapsychism that the author leaves here, as a relevant work hypothesis.

Automatism. Certain processes of traction and distension of the silver cord seem to be automatic and, when triggered suddenly, proceed irreversibly to the end. This is why one may think that there must be an automatism of subconscious origin in its operations, in some cases. The same occurs with

the holochakra. Actually, the holochakra and the silver cord, in certain manifestations, seem to be one and the same thing.

Root. The silver cord sometimes seems to be or operate like the seed or root of the psychosoma, a fact which is better perceived in partial separations, when the silver cord first leaves the human body as though it were the initiator of the process.

Interaction. In some cases, when close to several living human bodies and within the 13' (4 m) radius around the physical heads, the silver cords, when denser and more potent, interact between the consciousnesses that are projected simultaneously, either with or without lucidity.

Contiguity. This causes disagreeable effects or impressions of contiguity through the exteriorization of sensitivity, unexpected and undesirable repercussions, through joint *contacts* and movements.

Couples. This contiguity effect is the reason why, when producing concomitant lucid projections with several persons, or involving various psychosomas, in the same physical base, it is best to do so keeping a distance greater than 26' 3" (8 m) between the human bodies, which is not practical. This gives rise to the "repercussions of couples".

Twists. In takeoffs performed by *rolling the psychosoma*, rapid and violent twists of the silver cord around the psychosoma occur naturally. Sometimes, 3 or more successive turns can occur without any consequence for this appendix. The same happens in major *spiral takeoffs* of the psychosoma.

Curiosities. The projected projector can disguise the ostensive presence of the silver cord in certain extraphysical districts and also suffer the influence of terrestrial gravity.

Paranavel. Furthermore, the silver cord does not manifest any umbilical appearance in the area of the psychosoma's navel (paranavel).

Hypotheses. The following are 3 hypotheses to be researched within this context:

1. **Autoscopy.** What is the relationship between the silver cord and autoscopy?
2. **Ideoduct.** Would it be possible to build a mental, artificial, electro-electronic silver cord or *ideoduct*, a hybrid interworld apparatus for the transmission of mental waves from one consensual dimension to another?
3. **Coronatron.** Would it be possible to build a *coronatron*, another hybrid apparatus closely connected to the intraphysical consciousness' coronochakra, with the objective of intensifying his/her acquisition and exteriorization of energy?

Bibliography: Baumann (93, p. 43), Crookall (325, p. 90), Rampa (1361, p. 140), Vieira (1762, p. 147).

120. SPHERES OF ACTION OF THE SILVER CORD

Action. The silver cord exercises its activities in 3 well-defined fields of action:

1. **Inside.** The silver cord has a minimal active capacity in the biological realm when multifractionated and passive within the human body.
2. **Outside.** The silver cord exercises greatest and almost full control over the subconscious will and the psychosoma when it leaves the human body, within a 13' (4 m) radius, or inside the extraphysical sphere of energy (personal psychosphere).
3. **Distant.** As though it were a fine luminous thread, the silver cord keeps the psychosoma projected in the extraphysical dimension (or energetic dimension) when it acts at a distance from the human body beyond the abovementioned 13' (4 m) radius relative to the brain (encephalic).

Intruder. The silver cord has been the "terrible intruder" of many individuals who are fearful and ignorant of extraphysical reality.

Ignorance. Due to their ignorance of the existence and operation of the silver cord, many individuals have suffered extreme terror upon thinking they had been overtaken by an all-powerful intruder that had *grabbed them from behind* when projecting from the human body.

Retention. This happens because they are unaware of the retentive force of the silver cord which keeps them close to the soma (intrapysical anchoring) (see fig. 120, p. 1,127).

Fear. It is necessary to combat infantile fear and perform a detailed analysis of the silver cord. In the majority of the above-cited cases, there is obviously no intruder at all.

Admonitory. The brief and characteristic *discomfort* provoked by the insistent *call* from the silver cord for the intrapysical consciousness projected in the psychosoma to return to the human body is classified as *admonitory*. In this case, the admonitory discomfort is taken for the *intruder* of many intrapysical consciousnesses who find themselves extraphysically impeded from leaving their own bedroom (chamber).

Vacuum. The silver cord's retractive power over the intrapysical consciousness projected from the human body in the psychosoma is so potent, in certain cases, that the projector has the sensation of being vigorously sucked as though there were a permanent *vacuum* around the bed where his/her inactive dense body rests.

Bibliography: Rogo (1444, p. 85), Vieira (1762, p. 176).

121. REDUCTION OF THE SILVER CORD

Material. The physical percentage of the semimaterial nature of the silver cord cannot be ignored, as one of its basic connections is implanted precisely in the human, cellular, physical body or soma.

Retractability. This is why it is important to analyze – in its paraphysiology, as well as in its attribute of retractability – the phenomenon of the reduction of the silver cord.

Occurrences. In the act of reducing the volume of the silver cord, 2 very clear phenomena occur:

1. **Reduction.** A reduction in width, diameter, activity, materiality and potency.
2. **Increase.** An increase in length, extendibility, passivity and dematerializability.

Dichotomy. The intrapysical consciousness only perceives the phenomenon of *energetic dichotomy* of the silver cord – simultaneous reduction and increase – when it is defined that one portion remains in the human body and the other goes with the projected psychosoma, after a great deal of accurate self-observation.

Time. The phenomenon of the silver cord's reduction in volume can occur in 3 ways with regard to *time*:

1. **Instantaneous.** Rapidly or instantaneously.
2. **Slow.** Slowly.
3. **Gradual.** Gradually or in stages.

Projection. Any of these 3 modes, with regard to time, occur in two ways in relation to consensual projection:

1. **Soon.** Immediately upon takeoff, which is most frequent.
2. **Subsequent.** Later, during the period in which the intrapysical consciousness is projected.

Effects. During the reduction of the volume of the silver cord, 6 basic characteristics of projection are defined:

1. **Density.** The degree of density of the projected psychosoma.
2. **Direction.** The possibility of the psychosoma projecting with or without the holochakra, depending upon whether, at the moment prior to the reduction, the energies of the silver cord have flowed in the direction of the psychosoma or not.

3. **Freeing.** The possibility of the intraphysical consciousness producing a projection distant from the human body, freeing it from the area of intense activity inside the extraphysical sphere of consciential energy.

4. **Duration.** The possibility of a more prolonged consciential projection occurring, which lasts for many minutes or hours and not only for brief seconds.

5. **Self-lucidity.** The level of magnitude of the projected intraphysical consciousness' extraphysical self-lucidity.

6. **Memory.** The possibility (personal universe or holothosene) of the projected intraphysical consciousness' mnemonic resources (mnemosomatics).

Bibliography: Vieira (1762, p. 137).

122. PARAPATHOLOGY OF THE SILVER CORD

Characteristics. Among the characteristics that comprise the parapathology of the silver cord, at least the following 3 categories of consequences can be singled out:

1. **Takeoff.** Consequences of imperfect takeoff.
2. **Interiorization.** Consequences of imperfect interiorization.
3. **Repercussions.** Consequences of physical and extraphysical repercussions.

Psychopathies. There is still no indication of proof, but it is logically and rationally suspected that alterations in the silver cord have a substantial influence upon the disturbances or syndromes that affect intraphysical personalities, especially with respect to psychopathies or advanced mental illnesses.

Accident. The accidental rupture of the silver cord can occur in certain mortal circumstances, such as the dislocation of air pressure due to the nearby explosion of a powerful bomb, provoking fear, shock (*shock wave*) and vibration, and thus expelling the intraphysical consciousness from the soma in a violent projection in the psychosoma or, in other words, a traumatic and sudden dis coincidence (*pathological extraphysical escape*).

Marionettes. In certain cases of parapathology, the silver cord of the ill intraphysical consciousness operates as if it were a set of marionette strings for the extraphysical intruders.

Rupture. The intentional rupturing of the silver cord by the intraphysical consciousness (*extraphysical suicide*) and the intentional rupture provoked by another (*extraphysical homicide*) are two occurrences that are theoretically possible but impracticable, in light of the retractile power of these appendices and their *retraction-fractionation-distribution trinomial* which is realized throughout the human body within tenths of a second.

Desoma. The process of first desoma, deactivation of the human body, seems not to have its beginning in the cells of the soma, but in the structure of the silver cord.

Decomposition. The rupture of the silver cord generally triggers decomposition of the human body. However, the facts indicate that the rupture of the silver cord can occur without decomposition of the soma being initiated.

Ignorance. The mechanisms of these occurrences are thus far entirely unknown or undiscovered, requiring more ample self-investigation and research.

Unprotectedness. There is, in fact, no such thing as an unprotected projector.

Assistance. In theory, all intraphysical beings have intangible support and constant extraphysical assistential protection (helpers, evolutiologists) available to them in order to project with or without lucidity.

Security. This assistential resource, in and of itself, constitutes a security mechanism that is quite superior to the paraphysiology of the silver cord.

Report. There is no recorded report, throughout human history or in projectiological literature, of an occurrence of the rupture of the silver cord during a lucid projection.

Indestructibility. The silver cord seems to be indestructible up until the moment of correct (personal success) or incorrect (personal error) desoma.

Unawareness. Nevertheless, this certainly and rationally could occur without the intraphysical consciousness being aware of the fact. The parapatology of the silver cord will, in the future, clarify this subject.

Bibliography: Baumann (93, p. 45), Crookall (333, p. 64), Rampa (1361, p. 115).

123. ECTOPLASM AND THE SILVER CORD

Definition. Ectoplasm (Greek: *ektós*, outside; *plasma*, mold, substance): the mysterious, omnimodal protoplasmic substance that flows from the human body of the ectoplasmic sensitive and through the manipulation of which – whether by his/her subconscious or by way of extraphysical consciousnesses – superphysical phenomena occur, including materialization or ectoplasmy, which can be a partial or complete manifestation.

Synonymy: animalized fluid; atmosplasm; first matter; *hylê*; ideoplasm; pachyplasm; primordial substance; psychoplasm; teleplasm; vitalized ether.

Comparison. Various authors of projectiological works compare ectoplasm to the silver cord. Strictly speaking, however, they are very different from each other, as will be shown in the next chapter.

Differences. In the final analysis, it is verified that the differences are unquestionably more pronounced than the similarities.

Derivation. It is perhaps more accurate to consider ectoplasm as a condensed derivative of the silver cord, although its immateriality and manifestations are different.

Approximations. Nevertheless, in order to begin a technical analysis, the following are 10 characteristics of ectoplasm that are very similar to the manifestations of the silver cord:

1. **Channel.** The silver cord is connected to the human body of every intraphysical consciousness – including the lucid projector and the ectoplasmic sensitive – like a feeding channel, or a connection involving bi-directional vital impulses, looking like the umbilical cord. Ectoplasm also operates in both these manners.

2. **Interaction.** Upon manifesting, both of these consciential instruments demonstrate the existence of a constant interaction between 2 bodies or vehicles of the consciousness, the dense, physical human body and the less dense, extraphysical psychosoma.

3. **Form.** Both tend to assume the human (anthropomorphic) form of the physical body when manifesting, whether it is of the ectoplasmic sensitive or the lucid projector, including a detailed duplication of the face, following the action of the vital fields of the cells of the human organism or the preexisting *biological organizing model*. In essence, both ectoplasm and the silver cord are derived from the holochakra.

4. **Instability.** In both phenomena, ectoplasmy and projection of the consciousness in the psychosoma, there is an unstable balance of the human *physical form* with the other *humanoid form*, namely the psychosoma.

5. **Will.** The manifestations of both ectoplasm and the silver cord are restricted to psychological factors derived from the will and emotivity. In this case, the influence of the psychosoma (emotional parabody) is evident.

6. **Cords.** Both ectoplasm and the silver cord frequently appear in the form of a thread or threads, a cord or cords.

7. **Perimeter.** Both maintain their more intense activities within a defined perimeter centered at and surrounding the projector's human body or the ectoplasmic sensitive's human body.

8. **Return.** As they are both highly susceptible elements, they demonstrate a clear inclination to return and be reabsorbed by the human body of the intraphysical consciousness from whence they emanate, even evidencing abrupt interiorization or sudden retraction.

9. **Repercussion.** Ectoplasm and the silver cord exhibit an evident predisposition toward the appearance of physical repercussion phenomena in the human body that have an extraphysical origin.

10. **Consciousness.** Both facilitate the appearance of a type of ephemeral double awareness in the being (intrapysical consciousness) who is responsible for the phenomena.

Biodegradable. In the interest of useful speculation, it is worth investigating the possible relationship between enigmatic ectoplasm and another biodegradable, highly perfected and enigmatic material of controverted existence, called *angel's hair* – devil's jelly, spider's web – interpreted as being an excess of materialized energy, according to UFOlogy reports.

Hypotheses. It is presumed that, according to the types of cells of the ectoplasmic sensitive's human body, which are predominantly involved in its composition, ectoplasm can, for example, be: osseous, muscular, neurological or dermal. Two hypotheses can thus be put forward: Is *dermatogenic* ectoplasm more often used in the production of mute ectoplasmic forms? Does *neurogenic* ectoplasm predominate in the production of luminous ectoplasmic forms?

Healing. Varicolored ectoplasm – including the first mass, which is initially olive-green, later dark and then white, smelling like herbs and looking like chewing gum – is also similar to poison that is removed from patients, as a natural element of multimillenary primitive healing therapies. This demonstrates its familiar characteristic of rapid disappearance upon coming in contact with the surrounding air.

Case study. An example of this was observed in the greatly publicized, albeit unsuccessful, treatment based on herbs and incense burning performed in Rio de Janeiro, Brazil by the Brazilian scientist Augusto Rushi (1916-1986), attended by Raoni, a *Txucarramãe* Indian chieftain and the peai Sapaïm of the Camaiura tribe. This shows that ectoplasm may just as likely be composed of healthy cells or organic substances as pathological substances extracted from the human organism. (*Medeiros, Rogério; Manchete*; Rio de Janeiro, RJ, Brazil; magazine; weekly; N. 1764; year 34; February 8, 1986; illus.; p. 12, 13).

Phenomena. In light of observations made over time, ectoplasm is a singular partially biological compound substance that appears in the following 4 diverse areas of parapsychic investigation:

1. **Metapsychics.** In the old materialization phenomena of metapsychics.
2. **Parasurgery.** In heterodox surgeries or parasurgeries performed by sensitives in various countries.
3. **Umbanda.** In certain phenomena occurring during the rituals of *Umbanda*.
4. **Indigenous.** In the healings performed by indigenous peoples.

124. COMPARISONS BETWEEN ECTOPLASM AND THE SILVER CORD

Differential. In spite of the *10 similarities* referred to in the previous chapter – small parallels which, in the end, are surpassed by striking differences – the following *20 differential characteristics* between ectoplasm and the silver cord definitively show that both elements, according to their general properties, differ from each other and should not be confused:

1. **Essence.** Ectoplasm, in essence, is an exteriorized substance that is more *material* than immaterial. The silver cord, whether a single extraphysical energetic thread or many extraphysical energetic threads, is *more immaterial* than material.

2. **Vehicle.** The *less vital* action of ectoplasm depends upon the structure of the human body. The *more vital* action of the silver cord always affects the structure of the psychosoma.

3. **Action.** The exteriorization of ectoplasm does not occur in all phenomena of projection of the intraphysical consciousness in the psychosoma. The silver cord is somehow active in *all* phenomena that involve the psychosoma, even in certain manifestations of ectoplasm.

4. **Exit.** Ectoplasm flows from the 9 natural orifices of the human body (gynosoma and androsoma), mainly from inside the mouth, nose and ears. The silver cord mostly exits from inside the physical head, without any relationship to the 9 natural orifices of the entire *human organism* or even with the natural orifices of the *human head* in particular.

5. **Coloration.** Ectoplasm can have various colors, including black. The *silvery* cord obviously received its name as it has a color which is opposite to black: clear, white or *silver*.

6. **Elasticity.** The elasticity of ectoplasm reaches a maximum of some dozens of yards (meters) in length. The extendibility of the silver cord appears, in theory, to be practically infinite.

7. **Temperature.** As a rule, ectoplasm lowers the temperature of the immediate human surroundings upon being exteriorized. Exteriorization of the silver cord has no relationship with the ambient human temperature.

8. **Gaze.** Ectoplasm is sensitive to the direct gaze of intraphysical consciousnesses in general who are in the ordinary, physical waking state. The silver cord, even when exteriorized with great potency, is generally not seen by most waking intraphysical beings.

9. **Dependency.** Ectoplasm seems to be dependent upon the holochakra and the human body. The silver cord maintains an evident direct relationship with the psychosoma, besides the holochakra and the human body. Ectoplasm seems to be more dependent upon the silver cord than vice versa.

10. **Docility.** Ectoplasm is more docile to the will or psychodynamic command of the ectoplasmic sensitive and even submits itself to the will of strangers. The silver cord frequently, if not almost always, opposes the will of the projected intraphysical consciousness (automatisms) and seems not to even respond to the will or psychodynamic command of other consciousnesses.

11. **Particles.** Although there is a similarity between the rapid return or retraction of ectoplasm and the silver cord to the human body – as mentioned in the previous chapter – ectoplasm has the characteristic of returning to its donor together with foreign particles that have adhered to its structure. The interiorization of the intraphysical consciousness projected in the psychosoma can cause physical repercussions in the human body, although this is not an identical occurrence.

12. **Illumination.** Ectoplasm is ultra-sensitive to ordinary white light, while the silver cord is not. This shows that, in an *ascending scale of immateriality*, ectoplasm ranks lower and the silver cord ranks higher.

13. **Solidity.** The extremely versatile ectoplasm can manifest in liquid, solid, dry and hard states, materializing shapes of persons, animals and objects. The silver cord seems to be far firmer, more rigorous and conservative in its attributes, lacking this multimodal versatility. The silver cord never adopts a liquid state, for example.

14. **Repulsion.** As it is cold, gelatinous, adhesive, humid, unctuous and viscous, ectoplasm goes through various states, such as: flaky, diffuse, gaseous, milky, liquid and plasmatic. It is also sometimes repelled by physical touch. The silver cord decidedly does not present these characteristics.

15. **Odor.** Ectoplasm emanates a characteristic odor reminiscent of ozone. The silver cord does not have any odor.

16. **Composition.** In rare laboratorial microscopic analyses of the structural composition of ectoplasm – a transitory liquid, semi-solid and solid substance – leucocytes, epithelial cells, fat globules, mucous and characteristics of albuminoidal matter were found. The silver cord is a structure which is apparently much *simpler*, although more *powerful* in its manifestations.

17. **Cysts.** Ectoplasm can be compared to the inner membrane of an egg and the strange formations called *dermoid cysts* that have components analogous in structure to human skin. They contain organized matter, fat, hair, teeth and glands, sometimes even with teratoid remnants. The silver cord cannot be compared to these elements.

18. **Combinations.** Ectoplasm presents *parachemical combinations* with minerals that do not come from the human body, plants or even the clothing of the ectoplasmic sensitive. The silver cord does not feature these parachemical combinations.

19. **Rupture.** Ectoplasm has already been cut into its exteriorized segments, detaching portions for laboratory analysis, without resulting in significant traumas to the ectoplasmic sensitive. It is known that the silver cord, when ruptured, provokes the deactivation of the intraphysical (intraphysical consciousness) projector's human body. In other words: ectoplasm is the parapsychophysical agent of ephemeral ectoplasm, which lasts a few hours at most; while the silver cord is the intervehicular agent of the extraphysical consciousness that currently (1998) remains a resonant for an average period of 7 decades.

20. **Independence.** With all this evidence, it seems that ectoplasm often manifests without the direct action of the silver cord. The silver cord, in the majority of projective occurrences, does not seem to depend upon ectoplasm in order to manifest.

Dissimilarities. Phenomena show that consciencial energy, the silver cord and ectoplasm, although presenting certain superficial similarities, are manifestations coming from the intraphysical consciousness which are undoubtedly different due to the following 3 factors:

1. **Energy.** In its essence, consciencial energy is the *mobilization* of pure force.
2. **Cord.** The silver cord is an intervehicular *connection*, or an appendix for coupling and uncoupling.
3. **Ectoplasm.** Ectoplasm is consciencial energy that is composed of differentiated *elements*, including those which are organic.

Corporification. With respect to the capacity for corporification, it is important to consider 2 relevant aspects:

1. **Various.** Ectoplasm seems to corporify vehicles (or their appearance) and promote manifestations of its owner (ectoplasmic sensitive) and another or others (more than one intraphysical consciousness).
2. **Single.** The silver cord is only able to corporify the vehicle and promote the manifestations of its owner (ectoplasmic sensitive) or its singular origin (one intraphysical consciousness).

Dematerialization. Lastly, the structures of these different elements can be rationally classified into an ascending scale of dematerialization in 4 basic levels:

1. **Liquid.** The human body or soma: a structure that is both solid and liquid.
2. **Gaseous.** Ectoplasm: a structure that is also gaseous.
3. **Energetic.** The silver cord: an energetic structure derived from the holochakra.
4. **Field.** The psychosoma: a structure that has a close relationship with the field process (physics).

Explanation. However, this still does not explain much. Further research is lacking. This is one more challenge for all experimenters.

Bibliography: Andrade (27, p. 111), Crookall (325, p. 172), Crouzet (344, p. 381), Holzer (743, p. 192), Sachs (1489, p. 15), Scott (1529, p. 63), Vieira (1762, p. 55).

125. PSYCHOSOMA

Definition. Psychosoma (Greek: *psyckhé*, soul; *soma*, body): the vehicle of the consciousness that acts in the paratropospheric extraphysical dimension or *close* to the terrestrial crust, as well as in the extraphysical dimension that is more *distant* from the planetary crust of this planet.

Synonymy: accommodating vehicle; aero body; aerosoma II; *aka* body; *ambiroa* (Tanala); *andadura* (Bakairi, South America); animic body; apparitional body; apparitional double; apparitional duplicate; aristogenesis (Osborn); aromal body (Fourier); *asisi* (Orokaivans); astral body; astral configuration; astral double; astral self; astral twin; *astroeidê* (Neoplatonism of the school of Alexandria); *astroeide*; astro-mental body; astrosoma; ballast of the mental body; *baodhas* (Zend-Avesta); beta body; biomagnetic duplicate (Hernani Guimarães Andrade); body of desires (Tibetans); body of emotions; body of resurrection; body of the soul; breeze (Pomo); brilliant body; bubble-body; butterfly (Burma); butterfly body; celestial body; *cha* (Bushmen); coincident hidden body; continent vehicle; crystal glass; deuterosoma; discarnate body; *doppelgänger* (Germany); double body; double of the sensitive; double; dreaming body; ectosoma; *eidolon* (specter: Greek traditionalism); eloptic radiation; emotional body; emotional parbody; emotive body; energy-body; *enormon* (Hippocrates: 460-356 B.C.); *Ens astrale*; envelope of the soul; essence of the soul (*Ila*); etheric sosie; *evestrum* (Paracelsus: 1490-1541); extra body; extraphysical equivalent; extraphysical sosie; extraphysical twin; fetch (Ancient Bretons); finer body (Friedrich Wilhelm Joseph von Schelling: 1775-1854); floating body; fluidic body (Leibnitz); fluidic double; fluidic involucre (Alfred Erny); fluidic organism; fluidic vestment; fluid-perispiritic envelope; four-dimensional body; *gangan* (Maltese); glorious body (early Christians); *hambarnan* (Indonesia); hidden guest (Maurice Maeterlinck, Nobelist in literature in 1911: 1861-1949); human double; humanoid body; *hun* (Chinese); igneous body; imago (Latin traditionalism); immaterial body; imponderable body; incorporeal self (Rundi); incorruptible body (Gross); inner fantastic body (Johann C. Friederick Zöllner: 1834-1882); intangible body; interior body; internal body; invisible body; invisible double; *isithunzi* (Zulus of South Africa); itinerant double; *iunga* (Tapirape); *jivi* (Santhi); *jiwa* (Gond, India); *kama-rupa* (esoteric Buddhism); *kasith* (Mataco); *kespix* (Yahgan); *kha* (Egypt); *khi* (Vietnamese); *khouan* (Laotians); *kino-aka* body (Hun); *kra*; larva (Romans); light vehicle; *linga sharira*; living double; luciform body; luminous body; magnetic double; *manaperi* (indigenous Goianese; Brazil); *manomayakosha* (Vedanta); *mauli* (Pukapukans); *mbisimo* (Zande, Africa); meta-organism (Lazarus de Paczolay Hellenbach: 1827-1887); metasoma (Bret); mirror-body; morphogenetic model; moth body; *moya* (Tonga); *mwelolo* (Manus); mysterious thing (Cuénot); *nepesch* (cabalists); nephosoma; *neurara*; neuric aura (Dodee); *ngancha* (Aranda, Australia); nomogenesis (Bergh); nonphysical body; *ocililemba* (Mbundu); *oquema*; *oqueumata*; other self (Bushmen); *ot-jumulo* (Andamanese, East Asia); out-of-body body (OBB); parabrains body; parallel body; parapsychic body; passionate soul; perispirit (Allan Kardec); perispiritic body; perispiritic vehicle; personal double; phantasmic body; phantom body; phantom double; *pieu* (Miao); plastic intermediary; plastic mediator (Ralph Cudworth: 1617-1688); pneumatic body; pre-existing body; pre-physical body; primordial body; projected body; psychic body; psychoform (Teilhard de Chardin: 1881-1955); *purba* (Cuna, South America); quasi-material vehicle; radiant body; rarified body; replica body; reserve body; *rouach* (Jewish cabala); scintillating light (Chinese); second being; second body (parapsychology); second body of energy; second self (Carajás); second skin; secondary body (for humans); semimaterial body; sentient body; shadow (Bakairi, South America); sidereal body; *sigá* (Mossi); sixth awareness (Buddhism); small ghost; *somode* (*Somod*); *somurgo*; spiritual body (Paulo de Tarso); spiritual double; spiritual organism; subtle body (Aristotle); subtle carriage of the soul (Plato); subtle double; subtle flesh of the soul (Pythagoras); subtle organism (Leibnitz); *suckshuma upadhi* (Raja Yoga); *sumangar* (Makassar); superphysical body; supplementary body; surplus body; *Swarth*; tenuous body; thanatic body; *thankhi* (China); *thunos*; traveling double; traveling soul (Apaches); twin body; two in one body; *udjichog* (Ojibwa); *uhane* (Marquesans); ultraphysical body; *umbra* (Ancient Rome); unfolded form; *utai* (Japan); vehicle of emotion; vital body (Rosicrucians); *warro* (Murngin); wraith; *yagu* (Yapese); *yalo vinaka* (*Lau*); *zelem*.

Importance. The extensive list (exhaustive style) of denominations for naming the psychosoma shows the *importance* of its functions among the vehicles of manifestation of the intraphysical consciousness in earth's current evolutionary stage. At the same time, it shows the common *unfamiliarity* with regard to its nature and functions in all types of intraphysical societies and (indigenous) *nations*.

Self-awareness. The majority of individuals have self-awareness with regard to the human body, but they do not have this same self-awareness with regard to the psychosoma. This is regrettable, because it is a condition that brings generalized negative consequences in human existence for all humanity.

Emotionality. In modern society, 4 common but extremely pathological occurrences can be evidenced:

1. **Gambling.** Unrestrained gambling.
2. **Alcoholism.** Alcoholic beverages ingested in excess (alcoholism).
3. **Toxicomania.** Drug abuse involving light, heavy, legal and illegal drugs.
4. **Sensationalism.** Journalistic sensationalism in general.

Objective. All 4 of these actions have the objective of reaching and, above all, actually do reach the psychosoma or emotional parable of the *human-animal*. The following is merely one example: the sensationalism of the press (newspapers or news magazines), radio and television, in certain intraphysical societies, has as its news flashes the exploitation of crime, sex and violence, in a shocking exposition of facts, issues, events and ideas. These generate many illustrated follow-up stories in a concerted effort to awaken intense emotions, provoke strong sentiments, call attention with unusual appeals to the senses, or awaken uncommon or extreme beliefs.

Control. Although all individuals have and use a psychosoma, few people have self-awareness regarding the existence of this vehicle because they are not able to control it correctly or operate it with full lucidity and agility when manifesting outside the human body.

Realities. The following are 5 subdisciplines of conscientiology or connected, interdependent, consequent or priority realities that many people are lacking on earth at the end of the twentieth century, presented here in logical or chronological order:

1. **Psychosomatics.** Conventional scientists insist on continuing to ignore the *psychosoma* or, in other words, one of the essences of the entire body of research presented by this book.
2. **Evolutiology.** They consequently do not use *evolutionary intelligence* with self-awareness, a mode of intelligence which is more complex than the others.
3. **Serenology.** Without evolutionary intelligence, they do not identify the existence of *Homo sapiens serenissimus*.
4. **Cosmoconscientiology.** Without the identification of *serenissimus*, they do not experience *intercommunicative cosmoconsciousness* or the phenomenon of maximum interconsciential communicability.
5. **Communicology.** Without communication in the state of maximum expansion of the mentalsoma – cosmoconsciousness – they do not detect the existence of *conscientese*.

Research. For this reason, the more that individuals can be made aware of the existence of the psychosoma, study it and research it in depth, the better it will be for everyone's comprehension, well-being and consciential development.

Moss (1096,

p. 196), Muldoon (1105, p. 279), Murphy (1112, p. 71), Pensamento (1224, p. 31), Perkins (1236, p. 52), Powell (1278, p. 1), Prieur (1289, p. 144), 1 Corinthians 15:44, Rampa (1361, p. 76), Schutel (1525, p. 28), Seabra (1534, p. 121), Shay (1546, p. 13), Smith (1574, p. 55), Steiger (1601, p. 219), Steiner (1610, p. 52), Todd (1689, p. 52), Vieira (1765, p. 5), Walker (1781, p. 32), Wang (1794, p. 147), Yogananda (1894, p. 35).

126. PARA-ANATOMY OF THE PSYCHOSOMA

Characteristics. Among the characteristics of the para-anatomy of the psychosoma, at least the following 10 variables can be singled out:

1. Format.
2. Insertion of the silver cord (the first one, prior to resoma).
3. Force centers.
4. Nature, composition, structure and luminosity.
5. Aura.
6. Coloration.
7. Average weight of 2.47 oz. (70 g) (a hypothesis).
8. Volume, mass and density.
9. The percentage of rarefied matter.
10. Differences between the psychosoma of the intraphysical consciousness and the extraphysical consciousness.

Seat. When the vehicles of the consciousness are in the coincident state, the seat of the psychosoma extends throughout the human body.

Presentation. In certain circumstances, the psychosoma – a vehicle that is as objective to the intraphysical consciousness projected with lucidity as the human body in the intraphysical dimension – can present itself in two manners:

1. **Simple.** Simple or adequate.
2. **Compound.** Compound, in this case when combined with part of the energies of the holochakra.

Form. In evolved extraphysical dimensions, the psychosoma does not have a fixed form, nor is it rigid or condensed in any particular way.

Gelatin. The psychosoma is sometimes similar to gelatin that needs to be removed from a mold: the human body.

Comparisons. Morphologically speaking, the psychosoma of the projected intraphysical consciousness, and even the psychosoma of the extraphysical consciousness, appears more substantial than transparent to the eyes of sensitive intraphysical observers, although simultaneously appearing diaphanous, as often happens with *clouds*. Such a comparison or analogy clearly illustrates the reality of the density of the psychosoma.

Ageless. With regard to form, the psychosoma is *ageless* or, in other words: it does not age, strictly speaking. However, it transfigures itself.

Composition. It is presumed that at least 3 components which are somewhat familiar to humans may make up part of the composition of the semi-physical structure of the psychosoma:

1. **Particles.** Elementary particles.
2. **Fields.** Electromagnetic and gravitational fields.
3. **Light.** Photons (light).

Morphothosene. Nevertheless, the psychosoma is essentially a thought-form or a morphothosene in light of its property of transfiguration.

Evidence. Over the course of the past 2 centuries, diverse researchers have singled out experimental signs in persistent attempts at evidencing the reality of the psychosoma, especially through the following 5 resources:

1. **Doubles.** Supposedly authentic photos of the supposedly materialized psychosoma of an intraphysical consciousness projected close to the human body (controversial photos of doubles).
2. **Emanations.** Photos of nebulous, dense and colored emanations on the deathbed (desoma).
3. **Molds.** Wax molds made of the feet and hands of personalities through ectoplasmic sensitives.
4. **Marks.** Impressions made from parts of the psychosoma on smoke-stained surfaces.
5. **Effects.** Physical effects directly provoked by the projected intraphysical consciousness.

Repetition. However, this experimental evidence lacks universal acceptance, which means that the experiments should be repeated or insistently reexamined for a period of time.

Bibliography: Blackmore (139, p. 1 29), Boswell (174, p. 128), Carrington (245, p. 279), Delanne (381, p. 145), Frost (560, p. 33), Greenhouse (636, p. 97), Martin (1002, p. 23), Rogo (1444, p. 22), Vieira (1762, p. 138).

127. PARAPSYCHOPHYSIOLOGY OF THE PSYCHOSOMA

Characteristics. Within the characteristics of the parapsychophysiology of the intraphysical consciousness' psychosoma, at least the following 21 variables can be singled out:

1. **Sensations.** It makes human sensations possible.
2. **Interface.** It serves as a bridge or interface between the free mind and the dense human brain.
3. **Action.** It serves as a vehicle of awareness and action.
4. **Uniform.** It is the basic subtle uniform of the *paratropospheric* projector.
5. **Self-transfigurations.** It shows malleability or parapsychophysiological self-transfigurations, thereby allowing the attainment of morphothosenes or thought-forms and extraphysical clothing.
6. **Light.** It grows, is elastic and irradiates its own light.
7. **Irradiation.** It irradiates its own energy.
8. **Foundation.** It performs basic general operations (psychosomatic foundation).
9. **Projection.** It is active in lucid and nonlucid consciential projection.
10. **Thosenology.** It is sensitive to thoughts or thosenes, representing the *sen* of thosenes.
11. **Tangibility.** It allows tangibility in certain instances.
12. **Apparition.** It allows the apparition of the intraphysical projector to other intraphysical beings.
13. **Parapsychism.** It presents plasticity, which predisposes extraphysical parapsychism.
14. **Predisposition.** It predisposes the action of the silver cord.
15. **Paragenetics.** It is related to paragenetics, genetics and the growth of the human body.
16. **Emotionality.** It functions as the parabody of desires or the emotional parabody.
17. **Holochakra.** It is related to the holochakra through the silver cord and *ballonnement* (ballooning).
18. **Magnetism.** It is an instrument that is sensitive to magnetic influences, including those of the human body.
19. **Paramimicry.** It allows the phenomenon of extraphysical mimicry or paramimicry.
20. **Senses.** It is the reason why the senses of smell and taste appear less in the perceptions of the intraphysical consciousness who is projected in the paratropospheric dimensions.
21. **Sounds.** It is related to intracranial sounds.

Factors. The psychosoma is influenced by material factors such as the earth's gravitational pull, the density of matter and surface tension upon passing through thick material structures (extraphysical self-permeability) on certain occasions.

Plates. It also influences photographic plates (telekinesis) and sensitive physical instruments.

Condenser. The psychosoma is the consciousness' cosmic energy condenser, whether it is an intraphysical or extraphysical consciousness.

Regulators. The silver cord regulates the density of the intraphysical consciousness' psychosoma, which varies from one human lucid projection to another. If the silver cord regulates the density of the psychosoma, this same density, in turn, regulates the condensation, subtlety, fluidity or rarefaction of the psychosoma, establishes its vibratory orbit and permits the absorption of *subtle matter* from and in the extraphysical environment or district. All this is directly dependent upon the will of the projected intraphysical consciousness.

Thought. Thought, whether conscious or unconscious, has a powerful effect upon the density of the psychosoma of the intraphysical and extraphysical consciousness.

Intermediation. In the complex intermediation or the interface performed by the intraphysical consciousness' psychosoma between the machine – in this case the human body – and the consciousness headquartered in the mentalsoma, its greater density allows the projected human projector to be seen by a greater number of extraphysical consciousnesses.

Selection. The energetic fields that compose the paratropospheric extraphysical districts, make a spontaneous and balanced selection of projected extraphysical and intraphysical consciousnesses through the vibratory density of the psychosoma of each one.

Formula. The following is a coherent formula in evolutiology: a permanent reduction in the semiphysical density of the psychosoma gradually occurs, in a continuous manner, in direct proportion to the increase in the general evolutionary level of the consciousness.

Free will. As a result of the principle of this formula, the psychosoma itself restricts the sphere of action of consciential free will.

Malleability. The malleability of the psychosoma permits multiple successive translocations of the consciousness to extraphysical districts and environments of different densities.

Return. In rarefaction of the intraphysical consciousness' psychosoma, energies are returned to the human body with the objective of reducing ballast. This leaves the projected intraphysical consciousness with a minimum of the holochakra's energies and makes it unnecessary to interiorize.

Rarefaction. Rarefaction can occur in 2 ways:

1. **Interiorization.** With the interiorization of the psychosoma in the human body.
2. **Cord.** Through the silver cord, whether the intraphysical consciousness is physically close to or distant from the physical base.

Condensation. Condensation or rarefaction of the psychosoma can also occur through the silver cord either with or without interiorization of the projected intraphysical consciousness.

Scale. The psychosoma establishes the scale of extraphysical opacity, translucency, transparency and luminosity. These allow a distinction to be made between: intraphysical consciousnesses, extraphysical consciousnesses and projected intraphysical beings.

Self-defense. This temporary variation in the density of the psychosoma acts as an extraordinary resource of extraphysical consciential self-defense because the consciousness can switch from one extraphysical environment or district to another.

Relationships. The psychosoma of the intraphysical consciousness maintains functional relationships with the human body, the holochakra, the silver cord and the mentalsoma.

Impossibilities. Strictly speaking, real pain, lesions, wounds or accidents are not possible while in the psychosoma, as they occur with the human body.

Simulacra. When the simulacra of these events occur, it is due to the influence of the *parapsychological* conditioning of the inexperienced or ill intraphysical consciousness, whether or not he/she is projected. This can even occur to extraphysical consciousnesses.

Unique. The psychosoma is unique as a vehicle of manifestation of the intraphysical consciousness because it simultaneously has two intercorporal connections:

1. **Rudimentary.** The rudimentary connections of the silver cord.
2. **Evolved.** The evolved connections of the golden cord.

Effects. Only the psychosoma allows the intraphysical consciousness and the extraphysical consciousness to feel the effects of the action of energy currents and *extraphysical hydromagnetic storms*.

Repulsion. In certain cases, the magnetic field of the awakened consciousness' psychosoma generates automatic repulsion on the part of ill, projected intraphysical consciousnesses, intrusive extraphysical consciousnesses, intruders in general and viscous energivorous parapsychopaths (extraphysical consciousnesses). Rare instances of this nature occur between intraphysical consciousnesses.

Intermediary. The psychosoma of the intraphysical consciousness is the intermediary parabody between the machine (the human body) and the same consciousness headquartered in the mentalsoma, a condition which is represented in the following two manners:

1. **Intraphysical consciousness.** The intraphysical being is the consciousness that still has an integral psychosoma.
2. **Extraphysical consciousness.** The extraphysical consciousness is the consciousness that has a free psychosoma, lacks the silver cord, part of the holochakra (or the entire holochakra) and the human body.

Survival. The psychosoma survives and continues to be entirely functional after the first and second desomas or deactivation of the human body and holochakra.

Disappearance. The psychosoma only definitively disappears upon the third desoma or in the definitive transformation of the *Homo sapiens serenissimus* into the free consciousness (FC).

Emotions. In the same way that the mentalsoma is directly responsible for the consciousness' flow of sentiments (*high conscientiality*), the psychosoma, as it is close to the holochakra and human body, is responsible for the consciousness' emotional manifestations (animality or instinctive reactions).

Cohesion. Through the psychosoma, with the support of the holochakra, the intraphysical consciousness executes the cohesion of the myriad of cells that compose the animal or human body, maintaining the apparent stability of the living form. This occurs paradoxically through the constant, always *renovated* and *renovating* movement of the atoms.

Stability. This stability of the living human form receives two very common names:

1. **Memory.** Within the context of time it is called *memory*.
2. **Substance.** Within the context of space it is called *substance*.

Proof. Human proof or corpus delicti does not apply to the psychosoma, as seen by the following 5 facts, among others:

1. **Impressions.** The psychosoma does not leave impressions, signs, marks, vestiges or residues wherever it goes on the earth's crust.
2. **Shadow.** Strictly speaking, the psychosoma does not cast a shadow when it is in sunlight.
3. **Footprint.** It leaves no footprints on the earth's surface.
4. **Fingerprint.** It leaves no fingerprints on objects.
5. **Odor.** It does not emanate a distinctive odor in the human environment.

Will. Nevertheless, many of these facts can occur due to the density of the psychosoma, according to acts of will and the creation of morphothosenes.

Growth. The psychosoma does not need to grow, whereas the human body obviously grows.

Duration. The psychosoma takes on the humanoid form of the adult, intraphysical being, transfiguring itself according to the will of the consciousness, while it exists. The psychosoma disappears or, in other words, is discarded, when the consciousness achieves the condition of free consciousness (FC).

Appendices. It is worth repeating that the golden cord is the *appendix* that belongs to the psychosoma, in the same way that the silver cord is the *appendix* that belongs to the human body or soma.

Learning. The intraphysical consciousness has to learn to control the projected psychosoma just as a child learns to physically balance him/herself and take the first human steps in his/her new intraphysical existence.

Weight. The basic average weight of the projected intraphysical consciousness' psychosoma seems to be 1 thousandth of the weight of the human body that houses it.

Variations. The density, the silver cord and the holochakra, as a whole, acting like equipment or a load, have a great influence upon the weight of the projected intraphysical consciousness' psychosoma. This vehicle can therefore have different weights (variations) in a single lucid projective experience.

Composition. As the psychosoma is not a reality of fixed forms, its composition can vary from moment to moment. It is thus considered to be the parabody of desires, or the mutable or unstable emotional parabody.

Intoxication. It is still not known if the excessive accumulation of the *waste material* of the intestinal bolus – with the installation of intestinal constipation and consequent organic intoxication – has an influence upon the weight of the intraphysical consciousness' projected psychosoma.

Strength. Repeated facts show that the intraphysical consciousness, when projected from the human body, has greater strength or can at least generate considerably more energy in the extraphysical dimension than when coincident or restricted *inside* the human body, in the ordinary, physical waking state.

Exteriorization. Part of the psychosoma can leave and free itself from any part of the human body. However, the intraphysical consciousness only leaves in the psychosoma through the head, whether through the sinciput, forehead, nuchal region or the parietal and temporal sides of the cranium.

States. There are many consciential conditions or states in which the psychosoma leaves the condition of coincidence with the other vehicles of manifestation and remains bound only by the silver cord, as in the case of: sleep, hypnosis, anesthesia and lucid projection.

Laws. The facts lead us to the logical conclusion that the psychosoma of the intraphysical consciousness contains all the *organogenic laws*, according to which the human body is formed due to paragenetics and retrosomas which were deactivated in his/her multimillenary past.

Aspermic. However, the psychosoma is an *aspermic* body: it does not produce a “seed.”

Ballast. The psychosoma sometimes acts as the ballast of the mentalsoma, densifying and “materializing” the structure of this vehicle of manifestation when it projects while transporting the consciousness. It thereby forms the so-called “laden mentalsoma”.

Physical. The intraphysical consciousness projected in the psychosoma can unquestionably operate in this physical dimension, or in consensual reality, thereby generating the following phenomena, among others: physical bilocation, exteriorization of motricity, false arrival, projective parapyrogenesis, projective poltergeist, projective raps and projective telekinesis.

Phenomena. The existence of the psychosoma of intraphysical and extraphysical consciousnesses explains the most varied psi phenomena, which include: raps, poltergeist, intuitive writing, automatic drawing, radiesthesia (radionics), ideoplasty, apparitions, xenoglossy, clairvoyance, inner voices when non-pathological, telepathy and predictions.

Paraprojection. The parapsychophysiology of the psychosoma amplifies the manifestations with respect to the intraphysical consciousness, notably in the phenomena of *lucid paraprojection*, which is also parapsychophysiological.

Instruments. The fingers, hands, arms, feet, legs, senses and the human body as a whole are natural instruments of the intraphysical consciousness. On the other hand, the heart and liver, for example, are only instruments of the human organism.

Question. If the silver cord, holochakra, extraphysical perceptions and psychosoma as a whole are paranatural instruments of the consciousness, what are the instruments exclusively of the psychosoma?

Volitation. Since it does not have bones, joints and muscles, the projected intraphysical consciousness' psychosoma does not need the basic physiological components of biomechanics (kinesiology), namely the analysis of the human body's movements. This is a discipline which is of overall interest to orthopedics (traumatology), rehabilitation, physical education and athletic techniques. On the other hand, the psychosoma needs to be parapsychologically addressed with regard to balance, due to planetary gravitation, extraphysical posture, walking, floating and volitation or, in other words, lucid, free and unimpeded flight outside the human body, which is at rest and with the *brain emptied* of the consciousness at that time.

Transfigurations. Among the characteristics and functions of the psychosoma, the following 6 should be singled out:

1. Extraphysical elasticity.
2. Extraphysical imponderability.
3. Extraphysical permeability.
4. Extraphysical translocation.
5. Luminosity.
6. Transfigurations that can be either conscious (self-transfigurations) or unconscious.

Resomatics. The more prolonged transfigurations of the psychosoma occur during the period of consensual restriction, in the process of resoma of the extraphysical consciousness, in *paragenetic/genetic blending* with vivified matter, thereby composing the intraphysical vehicle, namely: the soma.

Visual. The *parapsychological* (extraphysical psychology) reflexes stemming from the human body of physical life, still conserve the most frequent or typical appearance of the consciousness during the subsequent intermissive period.

Marks. Cases of birthmarks or blemishes suggestive of existential seriation and studied by researchers are clear evidence of the parapsychopathological disturbances of the psychosoma, which are responsible for the transference of physical impressions of the human body of the previous intraphysical life to the human body of the current intraphysical life.

Confusion. The properties of the psychosoma are so transcendent in relation to the soma that they confuse the projected intraphysical consciousness with regard to the interpretation of its extraphysical experiences. This is worsened due to the fantasies of the oneiric and semilucid states that interfere in subsequent analysis of the projective experiences.

Withdrawal. Another subtle property of the psychosoma is the inversion of the relative positions of the volitator and the scenery during volitation: in this case the consciousness *allows* the scenery to pass before it while *apparently* remaining at a *standstill* or intraconscientially withdrawn (para-introspection).

Dehydration. The prolonged projection in which the psychosoma is laden with ectoplasm extracted from the cells of the soma provokes *dehydration* of the joints of the soma, which is at rest in the physical base. This generally occurs after a half-hour long projection. The absorption of extraphysical energies through the laden psychosoma by the projected intraphysical consciousness allows the subsequent *recuperation* or compensation of the joints with the replacement of the soma's liquids and cells.

Bibliography: Delanne (381, p. 16), Greenhouse (636, p. 59), Leadbeater (899, p. 57), Moss (1097, p. 196), Powell (1278, p. 23), Vieira (1762, p. 85).

128. PARAPSYCHOPATHOLOGY OF THE PSYCHOSOMA

Disturbances. The occurrences of parapsychopathology of the psychosoma can be classified into 2 types:

1. Minidisturbances.
2. Maxidisturbances.

Minidisturbances. Among the minidisturbances of the parapsychopathology of the intraphysical consciousness' psychosoma, the following 4 types of occurrence can be singled out:

1. Extraphysical consequences of the amputated member.
2. Blindness, advanced myopia and daltonism.
3. Buzzing (certain manifestations).
4. Extraphysical attacks (psychosoma of extraphysical consciousnesses).

Discoincidence. Still within the minidisturbances of the parapsychopathology of the psychosoma, partial discoincidences of the psychosoma occur due to spontaneous physical causes. The following 8 serve as examples:

1. **Contusion.** Cranial contusion.
2. **Stars.** The physical effect of “seeing stars.”
3. **Stomach.** The sensation of having one’s “heart in one’s mouth” when a potent and fast elevator is ascending or descending (roller coaster).
4. **Step.** The sensation of stepping into thin air upon stepping onto the wrong step or when climbing down a ladder.
5. **Brake.** The sensation due to the abrupt braking of a vehicle.
6. **Discoincidence.** The provocation of discoincidence, with a primitive parapsychic objective in the gyrations of *Umbanda*.
7. **Shock.** Discoincidence due to a major shock.
8. **Sneeze.** Discoincidence due to a strong sneeze in predisposing circumstances.

Maxidisturbances. Among the maxidisturbances of the parapsychopathology of the psychosoma, the following 12, among others, can be singled out:

1. Extraphysical sexual mania (*para-sexaholic*).
2. Pathological discoincidence.
3. Self-intrusion or extraphysical obsession.
4. Oneirophobia.
5. Certain cases of epileptic petit mal (pathological absence).
6. Extraphysical oligophrenia or deficiency in the development of the intraphysical consciousness’ conscial attributes.
7. Extraphysical coma or paracoma of intraphysical consciousnesses who have *locked intraphysical existences*.
8. Consequences of air dislocation due to the explosion of a nearby bomb, with the effect of a wave of shock and vibrations, violently expelling the psychosoma from the human body.
9. Pathological transfigurations.
10. The state of the psychosoma as though it were atrophied, *withered* or *cracked*, looking like the bark of a tree.
11. Extraphysical lycanthropy (zoanthropy).
12. *Retroparapsychic scars* of the psychosoma.

Realities. Fortunately, the undeniable personal evidence of lucid projection leads the intraphysical consciousness to a supreme level of veracity regarding psychophysical realities that allows him/her to distinguish between, locate and identify the two basic spheres of conscial life.

Extremes. This fact occurs ranging all the way from the apex of sublimity, with the most ennobling aspects of the human personality, to the inferior extreme of the shadowy meanderings of the most abject multiexistential, paragenetic and holobiographical deficiencies and psychoses in the world of psychopathology and conventional human criminology.

Experiences. Thus, with the accumulation of experiences outside the human body, the individual no longer has any doubt regarding the possibilities of positive or healthy and negative or ill realizations of the intraphysical consciousness who temporarily liberates him/herself from the dense vehicle.

Consequences. The individual’s personal condition engenders the consequences of the sublime modeling of fraternal social assistance to ill individuals, invalids or the disenfranchised, as well as the identification of robbery, pillaging, sexual assault and even the perpetration of large-scale homicides, massacres and genocides full of tragedy.

Rehearsals. Frequently, when a criminal affirms, “I was out of my mind” at the moment of a criminal act, his/her intraphysical consciousness – often before the act – was actually outside him/herself. In other words, he/she was outside the human body, whether aware or unaware of this fact, whereupon he/she deliberately perpetrated the criminal act. This now confirms his/her prior morbid propositions and endorses the *extraphysical rehearsals which have already been performed*.

Extraphysiology. Conclusion: the extraphysical dimension, mainly the paratroposphere, has continued to serve, throughout the millennia of human history, as a permanent *consciential laboratory*, as much for the healthy and liberating creations of good or cosmoethical geniuses, as for the sick and evolutionarily stagnating creations of evil or anticosmoethical geniuses.

Thought. For the will – the generator of force – thought acts as an agent of manifestation in the modeling of creative as well as destructive acts, creating everything from abnegated social assistants to the intraphysical intruder, the incubus and succubus which know no morals, boundaries, scruples or social education (sociopaths, sociopathies).

Company. Acting upon all of this is the balanced or demented company that the intraphysical consciousness chooses while in the ordinary, physical waking state or while outside the body. This is because likes attract, interact and often end up in a type of symbiotic and energetic interdependence between the dimensions of consciential life, creating diverse obscure syndromes.

Genetics. It is important to note that many cases of morphological disturbance of the soma that manifest along genetic lines during the phases of human gestation and ostensibly appear upon rebirth can, in certain cases, be directly attributed, either in part or in whole, to parapsychopathologies of the psychosoma.

Variations. The following are 6 types of basic morphological variations in the human body – sometimes considered teratological – that are always of enormous clinical relevance:

1. **General:** variations in constitution; nanism; gigantism; asymmetries of development; and dystrophic syndromes.
2. **Trunk:** variations in the vertebral column and variations in the thorax.
3. **Head:** variations in the cranium; facial types; ocular variations; variations in the ears; facial fissures; and buccal variations.
4. **Hands and feet:** hyperdactylia or polydactylia; hypodactylia or ectodactyly; mega, brachy, macro and microdactylia; hyper and hypophalangism; clinodactyly; and syndactyly.
5. **Genitals:** hermaphroditism; ectopias; duplications; penile fissures; polymastia; amastia; and gynecomastia.
6. **Integument:** dyschromias; *dystrichoses*; and variations of phanerosis.

Psychology. Within the scope of human emotional manifestations (psychology) restricted to the psychosoma, all excess generally jeopardizes and causes problems due to the action of consciential immaturity or the absence of reflection, pondering and discernment.

Case study. With regard to this aspect, 5 occurrences can be seen:

1. **Superprojection.** The negative effects of a mother’s or father’s overprotection of a son or daughter where, for example, “The mother smothers the child with affection?”
2. **Compassion.** Blind and disturbing compassion that facilitates interconsciential or intrusive influences.
3. **Intention.** Isolated good intention lacking discernment.
4. **Will.** Good will alone, also without discernment, which is why it is affirmed and lucid consciential projectors confirm: the paratropospheric extraphysical dimension is overcrowded with parapsychotic post-desomatic extraphysical consciousnesses.
5. **Hospitals.** Psychiatric hospitals filled with unhappy mental patients.

Psychosomatics. So-called psychosomatic medicine – simultaneously addressing the human body and the consciousness, which are interrelated and considered together, treating disturbances or organic lesions produced by psychic influences (emotions, desires, fear and fixed ideas), combating certain types of gastrointestinal ulcers, functional colopathy, *anphotonias* and other disturbances – is

actually beginning to enter, albeit superficially, the still obscure realm of the parapsychopathology of the psychosoma or the “body of *human* consciousness,” which is above all directed by the intraphysical consciousness which is always headquartered in the mentalsoma.

Desoma. When the intraphysical consciousness discards the human body through the *first desoma*, most illnesses known to classic (physicalist) medicine or, in other words, all *organic* or cellular illnesses (organic nosology or nosography), lose their *raison d’être*. This is because the alleged cause or singular motive for these pathologies – the *soma* – ceases to exist.

Second. When this same consciousness, having recently become an extraphysical consciousness, discards the remnants of the connections of the holochakra in the psychosoma through *second desoma*, all the illnesses restricted to imbalances in consciential energy, as in disturbances treated by acupuncture and do-in, or the so-called *pathological awakening of the kundalini* or, in short, all disturbances which have arisen as a direct result of *primary* consciential energies, lose their *raison d’être*. This is because the supposed cause or singular motive of these disturbances – the *holochakra* or its remnants – ceases to exist.

Illnesses. However, neither all organic illnesses nor the energetic disturbances of the consciousness cease to exist, as would be expected, after the first and second desomas.

Paragenetics. This does not occur due to the properties of the psychosoma (the emotional paralogy), which is capable of forming and maintaining these illnesses and disturbances – or their characteristic effects and symptoms – stemming from its structure, through the powerful action (psychological paraconditioning that forms the individual paragenetics) of the will through the mentalsoma and the self-transfigurations of the psychosoma.

Holokarma. This gives rise to *holokarmic illnesses*, or chronic disturbances established over centuries that continue from one human life to the next (multi-existentiality, personal holobiography), from one soma (*retrosoma*) to the next, or from one holochakra (*retro-holochakra*) to the next, restricted to the parapsychopathology of the psychosoma and the mentalsoma.

Medicine. The interested reader will note the logic of the explanations presented above and the regrettable condition of classic, conventional or physicalist medicine, which still only concerns itself with 1 vehicle of consciential manifestation, the human body. It still needs to discover, understand and address 3 more vehicles of consciential manifestation in conjunction.

Game. In this tragic game through the maintenance of the health of the consciousness, conventional medicine, which is currently excessively commercial, has thus far, over the centuries, continued to lose 3 to 1.

Bibliography: Fortune (540, p. 48), Vieira (1762, p. 161).

129. COMPARISONS BETWEEN THE SOMA AND THE PSYCHOSOMA

Modeling. The psychosoma is the *modeling agent of the soma*, or the human body. It acts subordinated to genetic laws and respects the biogravitational field in which it breathes and develops.

Replica. This is why one vehicle is a replica of the other.

Expressions. The opaque human body expresses the psychosoma in the dense intraphysical dimension. The luminous psychosoma expresses the human body in the rarefied extraphysical dimension.

Objects. The human body is a *terrestrial* object that walks in the intraphysical dimension. The psychosoma, however, is an *aerial* object that volitates.

Energizing. The holochakra, including the silver cord, is the intermediary energizing agent of the interrelationship between the psychosoma and the soma. It permits both to operate together in perfect union, while in the state of coincidence and dis coincidence. It always endeavors to maintain and prolong the vitality of the existing structures or physical and extraphysical, mental (psychological,

biomemory) and consciential health – holosomatic homeostasis – from the organism’s conception to its deactivation through the biological first desoma.

Hygiene. Physical hygiene is the maintenance of the *human machine*. Mental (or consciential) hygiene is the maintenance of the *extraphysical paramachine* (psychosoma).

Creations. The psychosoma as the duplicate of the soma, or vice versa, has inspired curious customs and creations over time, including the following 3:

1. **Greeks.** The ancient Greeks avoided looking at their own image reflected on the surface of water as the shadow of the human body appeared to them to be the dark side of their own self.

2. **Stevenson.** Robert Lewis Balfour Stevenson (1850-1894) wrote the celebrated *Dr. Jekyll and Mr. Hyde*.

3. **Wilde.** Oscar Fingall Wills Wilde (1854-1900) wrote the novel *The Picture of Dorian Gray* in 1891.

Inhibition. Over the many thousands of winters and summers of human history on earth, successive generations of intraphysical beings have kept the psychosoma operating only as an *inhibited* (or constrained) vehicle of manifestation between the impulses of the consciousness and the impressions received through the human body, in the intraphysical dimension, and in the state of coincidence of the bodies (vehicles) of consciential manifestation.

Ignorance. Intraphysical consciousnesses, even the generations alive today, are generally unaware that the psychosoma can act in its own extraphysical dimension, using its own resources which are far more evolved than those of the physical body, and that the consciousness (the will) can act directly upon it. This includes the will of the intraphysical consciousness.

Consequences. The abovementioned conjuncture results in two extremely serious consequences:

1. **First:** the first consequence is that no fewer than 4 billion beings of flesh and blood – the majority of the current members of humanity – upon sleeping every night, leave the physical body or at least remain discoincident in their vehicles of manifestation, experiencing actual ephemeral minideaths, *retaining* the consciousness *inside* the psychosoma, whether 1½” (4 cm) or 13’ (4 m) away from their own physical body. It remains there futilely waiting for the physical impulses of this same inactive body or, more precisely, the impulses of the brain, which is filled with neurons, interactions, synapses, glias and other elements, but is *empty* for a certain period because the consciousness is temporarily removed from it.

Hibernation. Naturally projected intraphysical consciousnesses, under the influence of the paraphysiology of their own psychosoma, maintain themselves in this condition of unnecessary deep hibernation which is characteristic of extraphysical infancy. They thereby sadly waste evolutionary opportunities of inestimable value, submerged in a deplorable inertia, the extension of which often amounts to 1/3 of the period of terrestrial life (8 hours in a daily 24-hour period).

Miniprojections. Short nonlucid consciential projections or miniprojections are only of value because they are a natural process of absorbing immanent energy in the extraphysical dimension, an aspect which is important for human life.

Dormitory-planet. From an extraphysical evolutionary perspective, the earth can be considered to be an immense day care center (mega-nursery), or *dormitory-planet*.

Unconsciousness. Terrestrial humanity still sleeps the pathetic sleep of deep unconsciousness.

Blockage. The billions of unconscious, intraphysical consciousnesses who leave the physical body night after night, year after year, and are temporarily freed in the extraphysical body (psychosoma), do not awaken to the other greater reality. This is because they *ruminate* on their own blocked and paralyzing thoughts, in a closed circuit.

Somnambulists. These *extraphysical somnambulists* enter the extraphysical dimension without perceiving it and see nothing. This is because, in this case, the ego paraphysiologically leaves the physical body but, despite this, is unable to *get out of itself*, remaining mired in its own egotistical morphothosenes, gravitating around itself (*mega-ego*), in neutral.

Conditions. The saddest part of all is that among these somnambulants are persons of all existential and cultural levels and conditions, from all countries, spread throughout all continents. They are indifferent to this waste and the majority do not even reflect on the issue.

2. **Second:** the second consequence refers to those intraphysical consciousnesses who became extraphysical consciousnesses again and remain unconscious, somnambulant or semiconscious, sometimes for long periods, in the paratropospheric extraphysical dimension, because they keep waiting to feel the physical vibrations of the deactivated body of dense matter that they lost definitively in the *first desoma*, but with which they remain deeply conditioned. They thus do not enter into any extraphysical activity in their new interexistential interval or intermissive period in the new *environment* or district.

Sleep. The obvious conclusion of this lamentable situation is that terrestrial humanity is *sleeping too much* during human existence (lifetime) and even after desoma (intermissive period).

Solution. The solution to the problem is to put an end to the idleness of the psychosoma, when in the condition of an intraphysical consciousness, as well as during the post-desomatic phase. There is no other immediate solution. Does the reader have any other solution to offer? What is your opinion?

Awakening. It is essential that there be an awakening to the extraordinary resources that the psychosoma can offer. This will allow it to act freely so that consciousnesses can then also act directly in the mentalsoma in an unimpeded manner, thereby dispensing with the intermediary vehicles of manifestation.

Resource. There is only one efficient resource for the *initial* extraphysical awakening of humanity: lucid projection in the psychosoma.

Problem. The schools of transcendent theoretical studies, the more advanced parapsychic practices and all attempts at self-knowledge of the intraphysical consciousness help greatly, although none of them has resolved this long-standing problem as yet.

Development. The era of unfounded fear, superstitions, beliefs, abstruse rituals and cheap mysticism has passed.

Awareness. Every intraphysical consciousnesses who wishes to can now know with certainty that they have their own light, their human aura and inner potential to be developed using their own will, through their own efforts and consciential energies.

Time. Those who wish to develop their latent parapsychic powers in this era of extraphysical emancipation have no time to lose.

Power. Through lucid projection, which offers dozens of uses and can be produced by anyone, the only requirement is *mental discipline* or self-organization, the third consciential power after will and intentionality (quality), in order to achieve unlimited positive applications in daily life. This is not asking too much.

Discipline. It is evident that without discipline no one achieves improved personal performance of any type, anywhere, under any conditions.

Warning. Finally, it is always good to remind everyone of a warning that is one of the basic laws of projectiology: *never try to project the consciousness with a negative or anticosmoethical intention*. The unhealthy results of this will, first of all, affect the ill-willed projector.

Cosmoethics. Elevated ethical principles (cosmoethics) are indispensable in order to have superior, healthy, extraphysical consciential experiences.

Bibliography: Frost (560, p. 187), Martin (1002, p. 40), Moss (1096, p. 197), Muldoon (1105, p. 277), Vieira (1765, p. 5), Walker (1786, p. 19), Xavier (1879, p. 21).

130. THEORY OF IRRUPTION OF THE PSYCHOSOMA

Definition. The theory of *irruption of the psychosoma* in the intraphysical dimension takes as a postulate – a fact or effect recognized without previous demonstration – that the emotional parabody, through the evolution of the intraphysical consciousnesses of a planet, insinuates itself, shows itself or *arises forcefully* in diverse circumstances in human life.

Dimensions. According to extraphysiology, there are extraphysical events which suggest that one dimension, through the evolution of the average consciousnesses that inhabit it (holothosene), tends to progress toward the next more evolved consecutive or *contiguous* dimension beyond it.

Evolutiology. Thus, there may be more evolved planets with a more rarefied or subtle physicality than that of the earth and which can be reached and inhabited with semidematerialized terrestrial somas, thereby facilitating more intensive, instantaneous and advanced multidimensional projections.

Analogy. We can use the analogy here of the deciduous tooth, or the child's *milk tooth* (odontology), which is replaced by the natural, *adult* or permanent tooth that irrupts (irruption) when the appropriate period of *biological maturity* of the intraphysical consciousness' soma arrives.

Parabiology. The same occurs with the soma that is gradually replaced by the psychosoma when the natural time of the soma's *parabiological evolution* (somatics and psychosomatics) arrives.

Deciduous. Thus we can conclude that the soma is, to a certain degree, deciduous or susceptible to being eliminated, either in whole or in part, in a transitory or more permanent manner, by the psychosoma (first desoma) and even manifestation in the intraphysical dimension without the soma (the phenomenon of the *ungenerated* or *agénères*).

Scope. The broad scope of the explanation of the theory of irruption of the psychosoma in the human dimension comes in contact with multiple areas of intraphysical life and conscientiology. The following are 5 examples:

1. **Research.** Research performed on bioluminescence, cellular regeneration, general bioethics and genetic engineering will eventually enable the tangibility or intraphysical manifestation of the psychosoma's properties in this intraphysical dimension through the soma in a direct fashion.

2. **Bioluminescence.** Bioluminescence applied to the human body will approximate the *luminosity* of the psychosoma.

3. **Regeneration.** Cellular regeneration of the soma will permit this vehicle to approximate the property of *transfiguration* of the psychosoma.

4. **UFOlogy.** If these events occur they will explain a series of theories on controversial UFOlogical phenomena and will have great influence on interplanetary travel and the terrestrial life of intraphysical consciousnesses on other planets in the inevitable and future colonization of celestial bodies close to earth.

5. **Energies.** The theory of the *abundance of consciential energies* of current terrestrial reality already paves the way for the establishment of the foundations for the more ample irruption of the psychosoma in intraphysical life. This is currently occurring due to demographic explosion, an increase in the number of mini-connections of energetic flow or holochakral links in somas, establishing the connection of the psychosoma, which allows the extraphysical consciousness to temporarily anchor itself in dense matter and live as an intraphysical consciousness in this human dimension.

Cells. The histological factor or cellular alterations – matter vivified by consciential energies – represent the most relevant variables in these occurrences.

Explanations. This advanced theory of irruption of the psychosoma – presented here in order to be debated, invalidated and refuted – rationally explains countless aspects of consciential phenomena within paraphenomenology (conscientiology) that are still obscure. The following 27, selected from many others, are examples:

1. Auric coupling between intraphysical consciousnesses (holochakrology).
2. Exteriorization of motricity.
3. Extraphysical elongation of the soma (holosomatics).
4. False arrival (intraphysiology).
5. Human parateleportation.
6. Interconsciential possession (conscientiotherapy).
7. Internal and external autoscopia (paraphysiology).
8. Intraconsciential (animic) and parapsychic (per se) energetic signage.
9. Isolated cases of disappearance of persons or somas (desomatics, self-desoma).
10. Macrosoma (macrosomatics).
11. Materialization or projective ectoplasm (macro-PK).
12. Para-anesthesia.
13. Para-asepsis.
14. Paracatrization.
15. Parahemostasis.
16. Parapsychic diagnostics (conscientiotherapy).
17. Pararegeneration.
18. Parasurgery.
19. Physical bilocation of the intraphysical consciousness (projectiology).
20. Physical dematerialization (paraphenomenology).
21. Projective heteroscopy.
22. Semimaterialization.
23. Sympathetic assimilation of consciential energies (holochakrology).
24. The anonymity of *Homo sapiens serenissimus* (evolutiology, serenology).
25. The apparition of the projected intraphysical consciousness to other intraphysical consciousnesses (paraphenomenology).
26. Traveling clairvoyance (projectiology).
27. Waking dis coincidence (holochakrology).

Accident. A physical accident (pathology) that involves the brain (cranial fracture) can trigger the appearance (paraphysiology) of energetic and parapsychic signage, based on the auditory mechanisms, for example.

Break. In this case, it is as though the fracture *had broken* the rigidity and integrity of the structure of the holosomatic connection between the vehicles of manifestation.

Crack. Energetic signage serves as an *artificial crack* or *wedge* that remains open between the existential dimensions of the intraphysical consciousness.

Anticipation. Such an accident paradoxically anticipates the evolved condition of irruption of the psychosoma through the soma.

Fiction. In science fiction movies, the moment when the *extraterrestrial* personality erupts from the throat of the terrestrial personality is a crude analogy to the irruption of the psychosoma through the soma.

Macrosomatics. Intraphysical consciousnesses who have a macrosoma would be the most predisposed to irruption of the psychosoma.

131. THE SOMA AND CONSCIENTIAL PRIORITIZATION

Definition. Consciential prioritization: placing preference or evolutionary option in first place, exercised according to the consciousness' level of maturity regarding free will, in the realization of its personal rights.

Synonymy: evolutionary discernment; maturity of free will; evolutionary option.

Holosoma. Consciential prioritization becomes important and basic in the approaches of projectiology which, above all, prioritizes the holosoma, or the set of vehicles of manifestation of the consciousness.

Brain. The soma, or the human body is, above all, the brain.

Soma. All implements of the human body, besides the brain, exist due to and in order to serve as instruments which are dependent upon the brain or the intraphysical seat of the consciousness (extraphysical consciousness or intraphysical consciousness).

Projectiology. The projectiological perspective respects the choices of others or, in other words, the free will of others. However, projectiology cannot prioritize its research based on those intraphysical consciousnesses who are impassioned and adventurous, still lost and centralized in the organic segments and secondary appendices of the soma, the individual's animal body, the most coarse vehicle of the consciousness.

Parabrain. With respect to this primary consciential vehicle – the soma – projectiological objectives are centered in the 2 cerebral hemispheres, which reflect the parabrain in order to prioritize the evolved manifestations of the mentalsoma or the parabody of discernment.

Interests. Extraphysical consciousnesses undergo resoma and are concerned with interests, objectives and the execution of different existential programs. Interests hypermotivate and determine priorities.

Rights. Each person has his/her personal right to do what he/she wishes with his/her physical body. Some individuals become regrettably lost in their prioritizations regarding the soma.

Psychosoma. When someone constantly prioritizes his/her choices based upon the emotional parabody – the psychosoma – he/she inevitably thereby remains at the level of subhuman animals.

Heart. Legions of intraphysical consciousnesses dislocate the vital center of organic existence – the heart – to other secondary components of the human body.

Immaturities. There are myriad examples of less intelligent consciential interests or consciential prioritizations that are faulty, insensitive, immature and demonstrate evolutionary inexperience.

Realities. Instead of placing all *human realities* in the service of the consciousness, or its imperishable *intraconsciential reality*, some individuals place the consciousness in the service of all *other secondary realities*, emphasizing the frame of the painting and not its message. The following are 5 of these immaturities.

Wheel. It is common knowledge that the wheel and the automobile were invented merely as an extension of the legs, in order to accelerate the locomotion of humans by utilizing the brain and thereby allowing a more rapid and efficient physical dislocation from one place to another.

Feet. However, there are those who throw their entire intraphysical life away or, in other words, risk and waste their entire human body in a primitive manner, only prioritizing the feet, or essentially living with and for the legs.

1. **Podalic.** We thus encounter *podalic consciousnesses* or cheetah-consciousnesses.

Cheetah. It is common knowledge that the cheetah (*Acinonyx jubatus*), with a large body and a *small head*, is the fastest land animal on the face of the earth. It can reach incredible speeds of up to 69.6 mi/hr or 102 ft/sec (112 km/hr or 31.11 m/s). The following are some examples of podalic consciousnesses: the marathon runner with a fixed idea (monoideism); and the most glaring example of all, the motorcyclist.

Motorcyclist. The motorcyclist places his/her entire human life at risk when riding a powerful machine. It is common knowledge that the motorcycle was created, manufactured and is irremediably maintained in *critically dangerous conditions* in the likewise highly unsafe intense urban transit of the megacity, metropolis or megalopolis. This temerity, even when superficially rationalized, or when employing all available ego defense mechanisms, clearly evidences an unconscious, subconsciously inserted, or even conscious suicidal tendency which is characteristic of consciential immaturity.

Reconciliation. Many people die prematurely in motorcycle accidents, therefore making it practically impossible to rationally introduce and include the motorcycle within the context of consciential maturity, or to reconcile the condition of the motorcyclist or even the passenger within the context of multidimensional self-awareness, which is considered to be the greatest objective of projectiology.

Motorcycle. A 400 cc motorcycle, when at rest, weighs 308 lbs. (140 kg). At a speed of 100 mph (160 kph), or 146 fps (44.4 mps), including the motorcyclist's weight of 154 lbs. (70 kg), resulting in a total weight of 462 lbs. (210 kg), this all reduces – based upon sophisticated equations – to only 2.2 lbs. (1 kg.). Under these conditions, a simple stone on the road with a 1 1/8" (3 cm) diameter is capable of destabilizing the *motorcycle-motorcyclist set*.

Mathematics. In current intraphysical society, the interests of industry, commerce, the economy, sports, leisure, transportation, transport and others, including the omnipresent exploitation of youth, make it impracticable to nurture any hope for a substantial alteration in the framework of this mathematical context of consciential immaturity of the motorcyclist-motorcycle, human-machine set.

Claws. There are also those who throw away their intraphysical life or, in other words, risk and waste their entire human body in a primitive manner, only prioritizing their magnesium-covered fingers and toes. With human life at the tip of their fingers, now transformed into claws, they scale artificial and natural structures. In these highly critical conditions, the slightest mistake results in the climber's human body falling and being smashed on the ground, the asphalt or the concrete below.

2. **Digital.** In this way we come across *digital consciousnesses*, the modern spider-men and spider-women, or spider-consciousnesses.

Madness. These individuals bordering on stark madness by scaling with their bare hands – a radical suicide-sport generated by mountain climbing – challenge precipices with their hands, without ropes or spikes, hanging at altitudes of 328' (100 m), for example, from cliffs, elevated walls of rock and/or brick, without any equipment, applying only magnesium powder to their hands to give them greater adhesion and sensitivity, securing themselves using the holes and fissures of rocks and constructions.

Paradox. There is an impressive innate paradox in this context of spider-persons which is detected through two observations regarding the rationally incontestable facts:

A. **Confidence.** On the positive side, the extreme confidence of the consciousness in the *sophisticated machine*, the human body.

B. **Abuse.** On the negative side, the abuse and unconcern regarding the utilization of this *perishable instrument*, the selfsame human body.

3. **Gastric.** There are also *gastric consciousnesses*: obese gastronomes who prioritize dilation of the *stomach* and die prematurely from overeating.

4. **Muscular.** There are also *muscular consciousnesses*: male athletes and, more recently, female athletes who prioritize (muscular) hypertrophy of the *biceps* through bodybuilding (a generalized fad nowadays) or weightlifting (halterophilia), overloading the heart and prematurely deactivating the soma.

5. **Sexual.** Finally, *sexual consciousnesses* should also be borne in mind: those women and, more recently, men who prioritize the sexual organs by performing the so-called *oldest profession*, prostitution.

Consciousness. Note here that the consciousness has no sex.

Self-critique. Each intraphysical consciousness has his/her essential interest. What is most important for us, beyond heterocritique, is self-critique.

Questions. In light of the above, it is always worthwhile and indicative of intelligence to ask ourselves the following 3 questions: What is my predominant fundamental interest? What has my maximal consciential prioritization been? Do I live a life that is centered in my consciousness through the use of the brain or do I still vegetate through my organic, animal or subhuman components?

Projectiological Bibliography: Formiga (539, p. 49).

Specific Bibliography:

1. **O' Callaghan, Karen;** *Our Amazing World: Fascinating Facts*; 158 pp.; illus.; alph.; 28 cm x 21.5 cm; hb.; England; Brimax Books; 1986; p.13.

132. CHAKRAS

Definition. Chakras: nuclei or limiting fields of energy that basically constitute the holochakra – the vehicle of energy inside the human body – which connects this body with the psychosoma, serving as connection points through which force flows from one vehicle of the consciousness to the other (see fig. 132, p. 1,128).

Synonymy: biochemical centers; bioenergetic centers; chakral organs; circles of energy; cones of energy; energetic channels; energetic disks; energetic knots; energetic macrovortices; energetic nuclei; energy centers; extraphysical frequency accelerators; force centers; fulcrums of force; *chorlos*; lotus; microcosmic centers; *padmas*; sensory centers; vital centers; vital doorways; vital transducers; vortices of energy; wheels.

Relationships. Based upon rational inferences, it is presumed that there are at least 3 categories of particular and logical relationships between certain chakras and other vehicles of manifestation of the consciousness, although the dynamics of these particular relationships are still very obscure in our current research:

1. **Mentalsoma.** The (encephalic) coronochakra has a particular relationship with the mentalsoma (parabody of discernment) with respect to the transmission of ideas.

2. **Psychosoma.** The (thoracic) cardiochakra has a particular relationship with the psychosoma (emotional parabody) with respect to the emotional world of the intraphysical consciousness.

3. **Holochakra.** The (vegetative) splenochakra has a particular relationship with the holochakra (energetic parabody) in the coexistence of the ego with energies, in any environment.

Bipolarity. In the analysis of bipolarity patterns, it is worth noting that the energetic communications between the vehicles of manifestation of the consciousness present 3 objective peculiarities with regard to the chakras and the left side of the human body, suggesting that the left side binds the extraphysical consciousness more firmly in the intraphysical dimension:

1. **Hemisphere.** The brain (coronochakra: mentalsoma) presents 2 cerebral hemispheres, given that the left hemisphere seems to predominate in the more human manifestations of the intraphysical consciousness (ideas). There must be an intrinsic relationship between the mentalsoma and the nurturing of ideas.

2. **Heart.** The heart (cardiochakra: psychosoma) is located in the mediastinum – between the 2 lungs – somewhat to the left in the thoracic or cardiorespiratory cavity (oxygen). There must be an intrinsic relationship between emotions and oxygen.

3. **Spleen.** The spleen (splenochakra: holochakra) is located to the left in the abdominal or vegetative (food) area. There must be an intrinsic relationship between consciential energy and food.

Nature. Based on the fact that most people are dextral (right-handed), it is inferred that the natural orientation holds the extraphysical consciousness more to the left, with two objectives, among others:

1. **Rearguard.** The left hemisphere, the heart and the spleen, in a *defensive* rearguard.

2. **Vanguard.** The consciousness communicates with the human dimension to the right, the front line of *attack*, even with the right hand and arm, through decussation of the pyramidal tract or the crossing of cerebral functions.

133. PARA-ANATOMY OF THE CHAKRAS

Characteristics. Among the characteristics of the para-anatomy of the major chakras, at least the following 6 variables can be singled out:

1. The sexochakra, splenochakra and umbilicochakra force centers of the human-animal.
2. The cardiochakra, laryngochakra, frontochakra and coronochakra force centers of the human-consciousness.
3. The formats of the force centers.
4. The colorations.
5. The reverberances.
6. The intensities of consciential energy.

Formats. The force centers are similar to 4 objects:

1. **Plates.** The depressions similar to small plates or vortices.
2. **Radar.** The concave radar hemispheres, or rose petals.
3. **Water.** The vortices that water forms when a sink is unstoppered at its bottom. The whirlpool that appears – with its mouth in the upper area of the liquid (surface) and the apex that is coincident with the drain opening – produces an image very similar to the vortices or chakras.
4. **Propeller.** The image that is approximately 8” (20 cm) in diameter made by large airplane propellers when rotating at high speed.

Vortex. Seen from the front, for example, the chakra has a substantially circular form and its spiral rotation produces certain radiations. A cross section view shows that each chakra or vortex is a depression in the holochakra. The opening is in the most external part and the apex of the cone is practically at skin level. The shaft of the vortex, which is an extraphysical extension, terminates at some point close to the human organism.

Areas. The chakras also present spirals or *intravortical nervures* and, although these are located in certain specific areas or organs of the human body, they are not identical to these areas.

Diameter. In the ordinary individual, each major chakra appears where the nervous tissue is more concentrated. These chakras have a diameter of ¾” to 1¼” (2 to 3 cm) and a weak luminosity.

Evolution. The forms and luminous characteristics of the energy centers gradually grow along with the personal evolution or extraphysical improvement of the intraphysical consciousness.

Use. The more evolved the consciousness, the more it perceives and uses the functions of the chakras intelligently.

Types. The chakras can be classified into 4 types according to their size, expression and function: great, large, medium and small.

Vigor. In every intraphysical consciousness certain chakras can be more vigorous than others.

Knots. Besides being mental pictures of the *chakral knots* or energetic fulcrums that manifest in the extraphysical-body-dimension (extraphysicality) to the human-body-dimension (intraphysicality), the subtle force centers have been seen from different perspectives according to different metaphysical traditions, including the following 7:

1. The energies of the Tantra.
2. The hierarchies of the Neo-Confucians.
3. The *keni-kou* intervals of the Taoists.
4. The *kosas* of the Vedanta.
5. The *sefirot* of the Cabala.
6. The transmutation series of the alchemists.
7. The *vijnanas* of the Yogacara.

Gradation. All these manifestations, in one way or another, obey the vibratory gradation of the human personality's energetic vortices, derived from his/her consciousness.

Total. It is estimated that there are approximately 88,000 (conventional calculation) chakras in each intraphysical consciousness, but only 30 are considered sufficiently important to receive a name.

Analysis. The classical analysis provided here addresses the 7 major or great chakras:

1. Coronochakra.
2. Frontochakra.
3. Laryngochakra.
4. Cardiochakra.
5. Umbilicochakra.
6. Splenochakra.
7. Sexochakra.

Buddhism. Tibetan Buddhism recognizes only 5 main chakras, combining the first with the second and the sixth with the seventh.

1. **Sexochakra.** The first chakra – root, radical, fundamental center, sexochakra, genesic, *muladhara* or anchor of the consciousness – is located outside, in the area of the perineum, between the sacrum and the genital organs. It points downward and is associated with the four bones of the coccyx.

Flower. The sexochakra has a starlike or triangular format. It has a reddish color, is compared with a four-petaled flower, is the seat of the *kundalini*, serpentine fire, igneous power or the brute consciential energy in men (androchakra or androsex) and, evidently, in women (gynochakra or gynosex).

Geoenergies. The sexochakra initiates its action receiving geoenergies through the soles of the feet (*pre-kundalini*) and the legs.

Instincts. The sexochakra has a close relationship with the human body, the cellular systems, the so-called *instincts*, animality, sexuality, geoenergies (telluric energies), *kundalini*, the organs and genesic glands, and the organic immaturity of the soma.

Activation. All other chakras are activated by the basic chakra because it acts like a *bipolar key*, feeding the other chakras.

Passions. In the psychosphere of the young intraphysical consciousness, in which the sexochakra predominates, the energies create an emotional holothosene of intense pluridimensional involvement. This can frequently end up predisposing and provoking violent amorous passions. In these complex occurrences, there is a direct relationship between the mentalsoma, the psychosoma, the sexochakra, the cardiochakra and the person's physical form (soma, appearance).

Intraphysical consciousness. Most of these cases of violent amorous passions, or various kinds of tragic emotional adventures experienced by youths, is centered in the young woman who heightens the passion in a man, or in various men simultaneously, as well as kindred intraphysical and extraphysical intelligences.

Separation. There is a fine line, within those egos involved, between a healthy condition and psychopathology, pure romantic love and morbid hatred, the intraphysical consciousness-consciousness and the intraphysical consciousness-animal.

2. **Umbilicochakra.** The second chakra – umbilicochakra, *manipura* – is located slightly above the navel and is associated with the fifth lumbar vertebra.

Green. The umbilicochakra generally presents a greenish color.

Sympathetic. It is related to the solar plexus, as it is the extraphysical counterpart of the sympathetic nervous system.

Abdominal brain. It is also called the *archeus-director*, belly-brain, abdominal brain, moral-heart-of-the-entrails or the hub-of-the-soul.

3. **Splenochakra.** The third chakra – splenochakra, *swadhistana* – situated over the area of the spleen, selects and distributes the vitalizing energies throughout the organs of the human body.

Projection. Through the natural vivification that it provides, the splenochakra enables the intraphysical consciousness to lucidly project (takeoff) from the human body in the psychosoma.

4. **Cardiochakra.** The fourth chakra – cardiochakra, thoracic, *anahata* – having a yellowish color, vitalizes the heart and lungs. It is an influential agent in the human personality's emotivity. The cardiochakra has a close relationship with the psychosoma, emotionalism, romanticism, adult infantilism (Peter Pan syndrome), the thymus, psychological immaturity and artistic tendencies.

5. **Laryngochakra.** The fifth chakra – laryngochakra, cervical chakra, *vishuda* – is located close to the area where the spinal column meets the medulla oblongata.

Communication. Being the intermediary between the organic manifestations of the vegetative area and mental manifestations, the laryngochakra is especially active in the consciousness' communication, being the controller of the masses.

6. **Frontochakra.** The sixth chakra – frontochakra, glabellar, pineal, *ajna*, third eye, third sight, mental eye, "Christ's eye" or the headlight of the forehead – is located between the eyebrows, projecting itself outward from the center of the forehead.

Clairvoyance. The frontochakra displays a close relationship with clairvoyance in all its forms and manifestations.

Pulsation. Those who, while in the ordinary, physical waking state, frequently feel the frontal chakra vibrating, pulsating or throbbing, do so because the *kundalini* and the other chakras, with the exception of the resplendent coronal chakra, have already been fully awakened for a long time. This is a common occurrence among developed sensitives of all types of manifestations or phenomenological modalities of parapsychism.

Power. For this reason, the frontochakra is a center of directive power through which *revelation* occurs – interdimensional communication or the final bastion of reason and analysis in the microcosm of the human personality or the microuniverse of the intraphysical consciousness.

7. **Coronal.** The seventh chakra – coronochakra, megachakra or *sahasrara* – the most important chakra, expands upward from the top of the cranium or the sinciput, in the area of the anterior fontanel or bregma.

Crown. Turned upward like a crown, the coronochakra allows the expansion of the consciousness, frees the mentalsoma from the parabrains of the psychosoma, constitutes the luminous aureole or the upper part of the human aura, as well as the *cap full of nodules*, as seen in oriental engravings, also called the *lotus of one thousand petals*.

Sentiments. The coronochakra has a close relationship with the mentalsoma, the pineal gland, rationality, the more elevated sentiments, serenity, consciential balance, and organic, psychological and consciential maturity (holomaturity of the intraphysical consciousness).

Transcendence. In fact, the coronochakra is not actually a chakra like the others, because it is encountered beyond the mind or, in other words, it transcends the condition of the human consciousness encased in the braincase, in the ordinary, physical waking state.

Awakening. Awakening of the coronochakra occurs as a result of the work of gradual energetic awakening performed in the other less important chakras, especially in the frontochakra.

Others. The chakras can also be extraphysically sensed and seen in the palms of the hands, the articulation of the cubitus (formerly the *elbows*), shoulders, knees, pelvis and in the soles of the feet.

Circles. The medium-sized vortices form circles around the main vortex, acting like satellites. The small vortices, being more numerous, are located on the periphery of the holochakra and are, in turn, natural satellites of the medium-sized chakras.

Evidence. Up until now, the evidence for the existence of chakras, as with the phenomenon of lucid consciencial projection, remains almost entirely subjective, individual and experiential.

Pulsations. In spite of all the anatomy and physiology studies that the author has attended at accredited universities, he has not been able to explain the *very physical* pulsations and movements in his human body through the research performed in the area of biological science or medical science. One example of this is the pulsations and movements that occur in the region of the forehead (glabellar area) corresponding to the frontochakra. They are sometimes involuntary, unexpected and very intense, even occurring in the full ordinary, physical waking state.

Vehicle. This individual, tangible fact, which was sensed and then repeated day after day, month after month, year after year, can only be attributed to another vehicle of manifestation of the consciousness.

Forehead. There are no organs or anatomophysiological conditions in this organic area – the forehead – that justify the abovementioned ostensive sensations or manifestations. They occur in a fully conscious manner while in the ordinary, physical waking state with the eyes open during the day. Sophisms, arguments, abstruse scientific or scientific explanations and useless expenditures of time are all pointless.

Acupuncture. This fact exists and can be felt or experienced by anyone who so desires. All that is required is to perform the basic mobilization of consciencial energies (bioenergies), or begin a more in-depth study of traditional Chinese medicine or acupuncture, its meridians, points and channels of energy (*nadis*).

Bibliography: Bardon (80, p. 43), Dychtwald (444, p. 94), Guéret (659, p. 65), Leadbeater (897, p. 71), Powell (1280, p. 32), Walker (1782, p. 315), White (1831, p. 121).

134. PARAPHYSIOLOGY OF THE CHAKRAS

Transformers. The chakras capture, separate and distribute the immanent energies that exist in the physical-extraphysical universe, transforming them into consciencial energies. In other words, they maintain energetic transferences throughout the totality of the human being or the exchanges between his/her biopsychic presence and the external energies.

Accelerators. The chakras generally act as accelerators of the vibratory frequency of the human body (soma), together with the holochakra which unites the human body with the psychosoma through the silver cord.

Characteristics. Among the characteristics of the parapsychology of the chakras, the following 8 variables can be singled out:

1. **Function.** The presumed function of each energy center.
2. **Colors.** The varied colors of each chakra according to its performance.
3. **Repercussions.** The regional physical repercussions and the energy centers.
4. **Awakening.** The consequences of the awakening of the coronochakra.
5. **Sexosomatics.** The sexochakra and the *kundalini*.
6. **Cosmoconscienceness.** The coronochakra and samadhi.
7. **Brain.** The coronochakra and the *empty brain* condition.
8. **Sensations.** The physical and extraphysical sensations of the frontochakra.

Interrelationship. One of the most important subjects, in this particular, is the obscure interrelationship between the force centers, especially the relationship of the coronochakra with the epiphysis (pineal gland), the coronochakra with the medulla oblongata, the coronochakra with the nodules of the right and left auricular pavilions (tragi), the frontochakra with the tragi, and the relationships of the chakras with the human body, the holochakra and the psychosoma.

Coronochakra. The reactivation of the coronochakra provides the intraphysical consciousness with extraphysical self-awareness or, in other words, lucid projections during natural sleep. The

frontochakra predisposes the reactivation of the coronochakra and the energetic manifestations in the center of the encephalon and the pineal gland.

Relationships. The sexochakra is directly related to sexual excitability or the libido, the 2 orgasms of the man, the penile and the anal; and the 3 orgasms of the woman, the vaginal, the clitoral and the anal.

Orgasms. The intensification, circulation and channeling of the energies of the sexochakra, passing through the other force centers, promoting the vibrational state and expansion of the consciousness, provides the following two categories of orgasm:

1. **Anthropomorphistic.** The *anthropomorphistic orgasm*, or the one occurring throughout the human body by way of the psychosoma.

2. **Holo-orgasm.** The *cosmic orgasm* (holo-orgasm), characteristic of greater samadhi, which transcends sex or all earthly sensations and planetary emotions. It occurs by way of the mentalsoma, ranging from the initial efforts of the human-animal to the sublimation of the human-consciousness.

Plexuses. The chakras have a close relationship with the health or illness of the social being (intrapysical consciousness). In this sense, it is customary to relate each chakra with certain glands that are anatomically close to its base, as well as with nervous plexuses. The following are 6 examples:

1. **Carotid.** The carotid plexus (frontal chakra or frontochakra).
2. **Pharyngeal.** The pharyngeal plexus (laryngeal chakra or laryngochakra).
3. **Cardiac.** The pulmonary and cardiac plexuses (cardiac chakra or cardiochakra).
4. **Splenic.** The splenic plexus (splenic chakra or splenochakra).
5. **Solar.** The solar plexus (umbilical chakra or umbilicochakra).
6. **Pelvic.** The pelvic and coccygeal plexuses (radical chakra or sexochakra).

Sexosoma. There are remarkable differences between men (androsoma) and women (gynosoma) with regard to the parapsychology of the chakras, due to the secondary sexual characteristics. The following 2 aspects serve as examples:

1. **Androsoma.** The laryngochakra of the man operates more intensely in the individual with a full beard.
2. **Gynosoma.** The cardiochakra, in turn, acts particularly more vigorously in the lactating woman and, generally, in the woman with normal mammae (*breasts*).

Frontochakra. It is interesting to note the various uses of the area of the frontochakra, such as the following 4 variables:

1. **Massages.** Massages, as used by some lucid projectors in order to project from the human body with lucidity.
2. **Pressure.** Digital pressure, as used by other lucid projectors in order to recall the recently completed consciential projection.
3. **Hypnosis.** Also with the pressure of a finger, as used by hypnotists or magnetizers (as they were called) since the nineteenth century, in order to make the hypnotized person reproduce information provided in previous hypnotic experiments, even being called “somnambulistic memory points” by them, in this case.
4. **Signal.** In mystical rituals and practices, such as the commonplace “sign of the cross” that attempts to simultaneously stimulate the activation of 3 chakras: the cardiochakra, the frontochakra and the laryngochakra, in that order.

Cerebellum. It is presumed that the *kundalini*, or the energy of the sexochakra, is activated by the functions of the human cerebellum. There is still no scientific proof to support this hypothesis.

Bibliography: Gomes (617, p. 60), Gooch (617, p. 213), Miranda (1050, p. 137), Powell (1279, p. 240), Vieira (1762, p. 146).

135. PARAPATHOLOGY OF THE HOLOCHAKRA AND VAMPIRISM

Definition. Bioenergetic vampire: the intraphysical being whose consciential energies are imbalanced and who is continually parasitic toward others, generally in an unconscious manner.

Synonymy: bioenergetic drain; *bioenergetic thief*; carrier of the *bioenergetic exhaustion syndrome*; consciential black hole; consciential energy parasite; holochakral exhauster.

Parapathology. The bioenergetic vampire – an intraphysical consciousness, for example – can either live with no morbid extraphysical influence, such as solitary human drainage, or can be aided and worsened in his/her imbalances and excessive energetic absorptions by ill or energivorous extraphysical consciousnesses.

Holochakra. This condition of human vampirism is restricted to the parapathology of the holochakra or the energetic parabody and is better understood through projectiotherapy or conscientiotherapy.

Characteristic. The fundamental characteristic of the bioenergetic vampire is an insatiable or uninterrupted absorption of consciential energy, with a constant anxiety for an unattained bioenergetic replenishment, satiation or compensation, in an attempt to fill a *bottomless pit* in his/her disturbed, imbalanced or blocked chakras which are operating chaotically.

Causes. The most common cause of installation of bioenergetic vampirism is bioenergetic imbalance of an affective nature, with an egotistical foundation. One example of this is the person who lives in a constant state of sexual deprivation.

Effects. The basic effects of the vampire's bioenergetic imbalance begin with his/her dependence upon family members. At a more advanced stage, there is a pathological or intense irruption of the energies of the sexochakra (*kundalini*).

Awareness. The vampire may or may not be aware of the parapathological conditions of his/her holochakra.

Ignorance. He/she does not understand why other persons do not enjoy his/her company, until discovering and endeavoring to balance him/herself without jeopardizing others.

Repulsion. However, he/she instills an instinctive repulsion in others, including pets, in certain cases. This is due to his/her surreptitious, undermining, absorbing and exhausting activity with regard to the consciential energy of others.

Hand. In a certain phase, while energetically imbalanced, the intraphysical vampire is constantly placing his/her more defensive hand – the right or left hand, depending on whether he/she is left-handed or right-handed – over the stomach, the heart, the abdomen or the throat, swallowing from time to time, as though attempting to use the palm of the hand to stop the unrestrained exit of energies from his/her umbilicochakra, cardiochakra or laryngochochakra, to no avail. Well-defined parasymphathetic disturbances are established at this point.

Affectivity. While still in adolescence, in the beginning of the adult phase, the intraphysical consciousness obviously does not encounter an adequate or permanent affective partner with whom to form an evolutionary duo. This is because his/her friends break off the friendship without explanation, as they themselves do not understand why they are uncomfortable in his/her presence.

Antipathy. The ordinary social being, in a process of consciential robotization, is generally parapsychically undeveloped and unable to readily identify why they do not find the vampire to be agreeable.

Chemical. Another individual, or victim of the vampire, considers chemical or allergic explanations which, in this case, prove insufficient.

Thief. Only the sensitives who are more advanced and lucid with regard to bioenergetic control are able to identify the vampire as an *energetic thief*, a fulcrum of vital exhaustion, a living, mobile energetic drain.

Syndrome. The following fields are mere palliatives in these cases of bioenergetic drainage: medicine in general, limited to the human body and the 5 basic senses; psychiatry in particular;

psychology in general; psychoanalysis in particular; ordinary psychotherapy; psychosomatics; homeopathy; and even classic acupuncture. They do not achieve lasting results in the remission of the *holochakral exhaustion syndrome*.

Therapy. The therapy has to be performed in the holochakra, but stemming from the mental soma and directed toward a *self-cure* and not a *heterocure*. The more aware the intraphysical consciousness becomes of his/her disturbance, the easier it will be to have a remission of the parapatological process.

Tumult. The bioenergetic exhaustion that the vampire provokes around him/herself creates constant tumult. When it is unconscious, the individual – who is often a youth with irreproachable looks and full of youthful vigor – does not understand why he/she becomes a *group repellent* and everyone quickly and quietly leaves, in a *para-instinctive* reaction.

Reasons. The intraphysical consciousness who is a victim of bioenergetic exhaustion looks for physical reasons, such as bad breath, body odor, foot odor or other similar causes. He/she consults a doctor and often takes prescription medication, goes on intense diets and even blames his/her liver, without hitting upon the true cause which lies in his/her holochakra.

Isolation. The bioenergetic vampire can end up in a regrettable state of social, physical, affective and even intellectual isolation that is imposed due to his/her characteristic of uninterrupted absorption, or *unfriendly and pathological* assimilation, without compensatory donation of consciential energies, through his/her *evil eye* (popular reaction) or his/her condition of a *killjoy*.

Retention. The bioenergetic vampire is not able to retain consciential energy, which is impermanent in his/her psychosphere, for any length of time. He/she feels comfortable for a few moments and seems to be balanced and replenished. However, he/she returns to the previous condition of exhaustion in a matter of minutes or hours.

Waste. The worst part of all is that this bioenergetic dissipation is generally not well-utilized. It becomes a waste, is squandered unconsciously or is even absorbed by constant or occasional extraphysical intruders.

Intruders. It is nevertheless worth noting that there are intraphysical vampires who even provoke repulsion in pets and – stranger still – in ill extraphysical consciousnesses or intruders that are weaker than the vampire. This is because they are unable to avoid or overcome the action of exhaustion or to take advantage of the condition that they suffer when in the presence of this human drain, who is an extremely powerful living *black hole* that attracts and drains all nearby energetic sources.

Animal. There are parapatological cases that have their beginning with intrusive influence and a single intrusive extraphysical consciousness. Then, after bioenergetic imbalance is installed, the intruder consciously or unconsciously retreats from the intrusion victim, like an animal that instinctively flees from a poisonous plant or a venomous being, leaving him/her to fend for him/herself. The vampire thus continues to stir up the *entropic bioenergetic dust* wherever he/she goes.

Relationship. The bioenergetic vampire never remains unnoticed. He/she attracts attention, even when silent, in a type of unspoken notoriety wherever he/she goes, like an inexplicable but stigmatizing repellent. This can create difficulties in relating with family members, classmates, workmates and, evidently, with people in general.

Self-awareness. The only efficient recourse for the lasting bioenergetic counterbalancing of the vampiric state is the self-awareness obtained and put into action regarding the problem by the interested person him/herself. This individual, now maintaining bioenergetic self-balance, no longer needs the consciential energy of others. He/she ceases the regrettable process of uncontrollable absorption and thereby ceases to play the sad role of a bioenergetic drainer. His/her presence is no longer disgraceful or instinctively repulsive and the vampire can once again coexist normally with other beings.

Orientation. The parapsychic being or projectiotherapist who discovers and identifies someone as a bioenergetic vampire, generally through sympathetic assimilation, sensing the symptoms and signals that disturb the other person, should employ the maximum possible conscientiological orientation in the act of helping and assisting that individual.

Address. The parapsychic being needs to observe the relative severity of the vampirism process, the degree of psychic and parapsychic understanding of the personality in question, the time, location and circumstances in which to expose the problem, and the best way to verbally address the issue.

Self-analysis. This is of vital importance because the person can see and feel him/herself portrayed in such a manner, hemmed in by so many precise details in a naked self-analysis, that he/she ends up becoming desperate if not well-prepared beforehand.

Shock. In this case, the shock of becoming aware of the truth can worsen the illness instead of curing it. The patient can undergo desoma due to an attempted cure.

Remission. The basic solution for remission of the condition of bioenergetic vampirism is for that person to refrain from egoism, personal problems, and to think altruistically of others, without hidden agendas, maintaining a regular affective life. He/she needs to help others, overcoming his/her conditions without asking or looking for anything else for him/herself, dedicating him/herself to the assistance of others, without any ifs ands or buts, self-corruptions or pathosenes, demands or restrictions.

Altruism. Pure and applied solidary assistential altruism is the only real and definitive resource for stopping conscious and unconscious bioenergetic draining between consensual principles.

Bibliography: Fortune (540, p. 56), Karagulla (814, p. 158), Vieira (1762, p. 58).

136. THEORY OF INTERCHAKRAL RELATIONSHIPS

Definition. Interchakral relationship: the parapsychological interaction between one chakra and another, or between various major chakras of a single person.

Synonymy: chakral interbonding; chakral interconnection; interchakral interaction.

Interaction. Besides the parapsychic interaction between the organs, organic systems and the major chakras, or force centers – in this case the holochakra – there are relationships between the energies of one chakra and the energies of another chakra, or even various chakras, in the same individual.

Theory. In the theory of chakral relationships, various types of interaction are highlighted between the chakras themselves, as well as between the chakras and the physiology of the human being. The following are 12 examples:

1. Sexochakra-sexuality, or conception (women).
2. Sexochakra-laryngochakra.
3. Umbilicochakra-gestation (women).
4. Cardiochakra-mammae or lactation (women).
5. Cardiochakra-laryngochakra.
6. Laryngochakra-crying (more with regard to children).
7. Laryngochakra-languages (more with regard to adults).
8. Laryngochakra-communicability, beards (men).
9. Laryngochakra-frontochakra.
10. Frontochakra-coronochakra (mentalsomatics).
11. Frontochakra-multidimensionality, or clairvoyance.
12. Frontochakra-psychosoma.

Sexochakra. As an example of complex interchakral relationships, we can see what actually technically occurs regarding the bioenergetic reflexes between the sexochakra – located in the *human-animal* area – and the laryngochakra, located in the *human-consciousness* area.

Effects. The following 8 effects can be singled out as the main causes of bioenergetic relationships between the *kundalinic*, radical or sexochakra (perineum) and the laryngochakra (throat) in the same person:

1. Among the possible manifestations of the libido, or sexual excitability, whether in a man or a woman, is constriction of the throat.
2. The tongue, located between the mouth and the throat in the oral cavity, serves as a spare sexual organ by those men or women who use it preponderantly in sexual intercourse.
3. Anal orgasm can immediately generate hypophonia – a reduction in the tone or timbre of the voice – in both men and women.
4. Multiple anal orgasms can cause the effemination of the man's voice and accentuated femininity in the woman's voice.
5. Bathing the anus with hot water using the jet of the bidet, in the practices of feminine or masculine masturbation, can cause multiple anal orgasms and momentary but immediate alterations in the tone or timbre of the voice in women as well as in men.
6. Bathing the anus with cold water using the jet of the bidet can immediately cause hypophonia in women as well as in men.
7. Bathing the anus with water using the jet of the bidet can temporarily, but immediately, affect the verbal communicability of the man or woman.
8. Fellatio (throat), performed either by a man or a woman, can generate (penile, anal, vaginal, clitoral, simple or multiple) orgasms in the person performing the act.

Predominances. It is worth observing that the intraphysical consciousness suffers the characteristic predominance of the energies of a specific major chakra, according to the evolutionary phase of the his/her human life. We can therefore highlight the initial predominance of the sexochakra upon conception; soon thereafter the umbilicochakra; then the cardiochakra; subsequently the laryngochakra; and, finally, the frontochakra, as illustrated below.

Gestation. Physical or animal human life is consolidated through the umbilicochakra (human-animal) during gestation up until the loss of the umbilical cord upon birth. Logically then, for this reason, gestation is the *first* and most *animal* period of the human being's life or, in other words: his/her arrival in intraphysical life.

Trajectory. The cry of the newborn signals the moment at which the predominance of the umbilicochakra (umbilical cord) is lost. It is also the beginning of the predominance of the laryngochakra in human evolution toward the final predominance of the encephalic chakras, in the ascendant animal-consciousness trajectory, or the sexochakra-coronochakra crescendo.

Cry. The initial animal cry keeps the newly resonant extraphysical consciousness connected to his/her extremely new human body, which is now free, outside the mother's body. The sounds of the cries are directly derived from the energies of the laryngochakra (throat).

Substitute. Crying is the natural, immediate *substitute* for the umbilical cord.

Encephalic. During existence, the human being gravitates or evolves (human-consciousness) toward the predominant use of the energies of the encephalic chakras (coronochakra and frontochakra). From this, other interconnections are born: the medulla oblongata and the silver cord (projection of the consciousness in the psychosoma); the pineal gland and interdimensional exchanges (parapsychism); the parabrains and the golden cord (projection of the consciousness in the mentalsoma).

Cardiochakra. There is a clear correlation between emotions and high risk in specific types of cancer. Emotions affect the hormonal regulation mechanism. The interconnection of the cardiochakra and the woman's mammary glands (prolactin) is evidenced in breast cancers, when there is a higher risk in women who suffer from chronic solitude (emotions and the cardiochakra), or from social isolation (deprivation of communicability and the laryngochakra). The same does not occur with the socially solitary man.

Imbalance. The laryngochakra-cardiochakra interconnection, or the language-cardiovascular system interconnection, is seen in tests with hypertensive individuals. Language (verbal) is a function which is unique to the human body and the human being. The absence of social contact impairs the human being's health due to the imbalance of the laryngochakra.

Membrane. There is something that can be called a *social membrane*, or a *second skin*, which is constituted through social communicability. A lack of social communicability represents a lack of human solidarity, the main application of human life, or the act of assistentially and conscientially serving others.

Language. The relationships of the human-animal (the 5 basic senses) during his/her life are developed through speech (language) or, in other words, through the energies of the laryngochakra in the human-consciousness area. In human communication we literally project our emotions (cardiochakra) in that which we say (laryngochakra).

Evolution. The relationships of humans, *via laryngochakra*, derived from the accumulation of physical experiences, need to be substituted by clairvoyance (parapsychism), *via the frontochakra*, through the accumulation of physical-extraphysical experiences. Only this *intraparapsychic* evolution allows the individual to guard against chronic solitude, or social isolation, one of the causes of premature death of the human being, thereby expanding his/her circle of interdimensional or multidimensional relationships.

Solitude. The sensation of solitude or isolation affects the human body (soma). The solitary individual feels disconnected from the living universe, especially in relation to nearby social beings. The solitude that is felt – whether it is *heated* or hostile (cardiovascular problems), or *cold* or depressive (neoplasias) – lowers one's resistance to illness, weakening both the cardiovascular and the immune system.

Multidimensional. Solitude is eliminated in the person who coexists, in a self-aware and multidimensional manner, with extraphysical or desomant intraphysical – but living – consciousnesses, besides human beings or subhuman animals.

Projectability. Conclusion: solitude does not exist for those who are aware of the energetic dimension. In other words: the developed clairvoyant will never be alone. Thus, logically, self-aware projectability is the *last* and most *consciential* period of the social being's life, the dignified solution of human life.

Executive. These considerations suggest that the 2 major chakras not highlighted here in the analysis of the predominance of energies – the splenochakra and the coronochakra – perform distinct *executive* functions with regard to the soma and the other chakras. The splenochakra distributes the energies throughout the body in order to keep it healthy, without imbalance. The coronochakra leads the intraphysical consciousness to energetically leave the soma in order to achieve more evolved experiences in other dimensions, in the psychosoma and the mentalsoma.

137. LUCID PROJECTION AND THE GOLDEN CORD

Definition. Golden cord: the presumed energetic element that keeps the mentalsoma connected to the parahead or, more precisely, to the parabrain of the psychosoma.

Synonymy: extraphysical remote control; gold cord; intercorporal psychosoma-mentalsoma connection; mental extraphysical passport; quintessential cord.

Intervehicular. The golden cord is the direct, intervehicular connecting element of the intraphysical as well as the extraphysical consciousness. It is situated between the extraphysical dimension per se and the pure mentalsomatic dimension.

Energy. The evidence of the golden cord suggests that the consciousness cannot do without energy, not even to enter (or leave) the mentalsomatic dimension.

Characteristics. Among the characteristics of the golden cord, at least the following 7 variables can be singled out:

1. **Homology.** Homological supposition.
2. **Key.** The key to the mentalsomatic dimension.
3. **Reins.** The reins of the unevolved extraphysical consciousness.
4. **Para-anatomy.** A *para-anatomy* that is still completely unknown.

5. **Paraphysiology.** A *paraphysiology* that is still obscure.
6. **Energies.** Ambivalent energetic conduction, both sending and receiving.
7. **Action.** Action that lacks space-time-form.

Insertion. Based on the fact that the extraphysical consciousness projects itself in the mentalsoma directly from the psychosoma, it is inferred that the golden cord – the *remote control* connection that exists between the psychosoma and the mentalsoma – has its insertion point in the psychosoma.

Departure. Thus, by analogy, the intraphysical consciousness who projects in the isolated mentalsoma leaves directly from the parabrains of the psychosoma and not from the human body.

Consolation. The attentive reader should not aprioristically repudiate the transcendent themes and suppositions of this and the following chapters of this section.

Hypotheses. If the science of our terrestrial civilization has not yet arrived at the point of considering these subjects, which are considered to be excessively surrealistic, prudently considering them to be mere speculative or conjectural hypotheses, it consoles itself with the fact that it will get there someday, just as – it is supposed – the science of many other civilizations on myriads of inhabited planets dispersed throughout the universe has already done.

Exobiology. Exobiology will eventually support many affirmations that are made by projectiology, corroborating the verifications obtained through lucid exoprojections in many places by different human projectors.

Maintenance. Every field needs a maintaining agent. No field remains in space simply for the sake of remaining there.

Supposition. It is presumed that the mentalsoma must have the *unconscious* function of maintaining the existence of its own field through the structures of fixed thoughts (the *tho* of thosene). Might this constitute the golden cord?

Parahead. The parahead is the most important part of the psychosoma.

Integrity. The connection between the golden cord and the parahead or, more precisely, the parabrains, the foundation of the psychosoma, maintains this same psychosoma *intact* or integral. If this were not the case, its extraphysical (semiphysical) structure would come undone.

Bibliography: Vieira (1762, p. 218).

138. PARA-ANATOMY OF THE GOLDEN CORD

Observations. The term *para-anatomy* – although it may not seem correct when applied to the connection that keeps the mentalsoma, the *formless* vehicle of the consciousness, bound to the parabrains of the psychosoma – is used here in order to allow a better understanding of new, original material, as there is no other more adequate expression.

Nature. The nature of the golden cord – whether that of the intraphysical consciousness or the extraphysical consciousness – is energetic or, in this case, quintessentialized, and extremely obscure within the current framework of our knowledge and research.

Connections. It is rationally presumed that there are two energetic connections for the golden cord:

1. First connection: directly in the mentalsoma.
2. Second connection: directly in the extraphysical head or parahead (parabrains).

Energy. The golden cord does not seem to operate like a *cord*, but an energetic connection, similar to a *remote control* extending out from the parabrains of the psychosoma and *magnetically* securing the mentalsoma.

Base. It is presumed, as a tentative hypothesis, that the base of the remote control is, however, in the mentalsoma and not in the psychosoma which, at first sight, would be the natural homologous fact.

Command. This evidences that the golden cord operates in a manner contrary to that which occurs with the silver cord, whose greater command, in an ambivalence of forces (bi-directional energetic canal) seems to have its base in the human brain.

Bibliography: Vieira (1762, p. 218).

139. PARAPHYSIOLOGY OF THE GOLDEN CORD

Observations. Just as with the word *para-anatomy*, the term *paraphysiology* does not seem apt when applied to the connection that maintains the mentalsoma, a *formless* vehicle of the consciousness, bound to the parabrains of the psychosoma. However, it is being used here in the interest of greater understanding, as it addresses a new and original subject and there is no other more adequate expression.

Cohesion. During the entire evolutionary stage of the intraphysical consciousness or extraphysical consciousness *inside* the parabrains of the psychosoma, the golden cord would be the connecting element responsible in terms of the psychosoma-mentalsoma cohesion remaining healthy and stable in any intraphysical or extraphysical circumstance.

Passport. The golden cord is the connecting element (passport) by way of which the intraphysical or extraphysical consciousness leaves the extraphysical dimension per se and enters the mentalsomatic dimension, and vice versa.

Resistance. It is presumed, as a working hypothesis, that the golden cord, over the consciousness' many millennia of evolutionary experiences or its holobiography, resists the successive and alternate biological shocks of resomas and desomas, in the cycle of multiple human existences and intermissions, and only disappears upon deactivation of the psychosoma, in the third death, when the consciousness achieves the condition of free consciousness (FC) and continues to exist from that point on in the mentalsoma, in a situation that is still incomprehensible in terms of the current rationalizations of humanity.

Bibliography: Vieira (1762, p. 218).

140. COMPARISONS BETWEEN THE SILVER CORD AND THE GOLDEN CORD

Differential. In the sole interest of clarifying a deeper study of the consciousness, it is pertinent to establish the following 11 original comparisons or homologous deductions between the intercorporeal connections of its vehicles of manifestation.

Comprehension. If, in practice, this comparison is unworkable, because each of these connections acts in a different dimension of life, then, theoretically speaking, speculative analysis yields valuable and original clarifications for comprehension of the vehicles of manifestation of the consciousness.

1. **Roots.** The silver cord encompasses the entire human form in its roots, from head to toe. It is presumed that the golden cord only connects the consciousness, from the extraphysical head of the psychosoma (the parahead or, more precisely, the parabrains) to the mentalsoma, from one dimension to another.

2. **Insertions.** The silver cord is more material, with one of its points of insertion being located directly in the human body. It is presumed that one of the golden cord's insertion points is located directly in the mentalsoma, in a doubly extraphysical condition that is difficult to evaluate. This is because, when it leaves the intraphysical dimension, it passes through the extraphysical dimension per se and reaches the pure mentalsomatic dimension.

3. **Nature.** The silver cord has form, volume, weight and even well-defined motor and tactile processes. It is presumed that the golden cord is merely an energetic element under the remote command of the mentalsoma.

4. **Dependence.** The silver cord is a distinct connection that is more dependent upon the psychosoma than the human body. This is because it disappears in two stages, upon the first and the second desoma. It is presumed that the golden cord is a distinct element that is more dependent on the mentalsoma than the psychosoma. This is because it disappears when the consciousness achieves the condition of free consciousness (FC).

5. **Appendices.** The silver cord is, without a doubt, an appendix of the human body. It is presumed that the golden cord is, in fact, an appendix of the psychosoma.

6. **Sensations.** The silver cord carries sensations firstly to the consciousness in the psychosoma (the parabody of emotions). It is presumed that the golden cord carries the consciousness' thoughts in the mentalsoma.

7. **Inferiority.** The silver cord is the *inferior* or still unevolved connection element of the psychosoma. It is presumed that the golden cord is the *inferior* connection element of the mentalsoma.

8. **Plurality.** The silver cord is renewable or, in other words, is replaced at each new desoma, myriads of silver cords arising and disappearing for each consciousness, as is the case with holochakras. It is presumed that the same singular golden cord remains during the entire evolution of the ego, until the consciousness reaches the condition of free consciousness, when the golden cord disappears or is discarded together with the psychosoma.

9. **Sphere.** The silver cord receives a considerable amount of influence from the extraphysical sphere of energy, including gravitation and experiences over time. This does not seem to occur with the golden cord.

10. **Growth.** The silver cord expands and shrinks or contracts and extends, *growing* with the psychosoma only during a single human life. After reaching adult form, it does not grow any more. It is presumed that the golden cord accompanies the mentalsoma, *growing* with it in some manner. The mentalsoma expands with evolution, although it does not have a defined form as we know it in the intraphysical dimension.

11. **Guardians.** The silver cord is the guardian of the extraphysical dimension for the intraphysical consciousness, when he/she is in the ordinary, physical waking state. The golden cord is the guardian of the mentalsomatic dimension whether the consciousness is in the ordinary, physical waking state or in the extraphysical dimension per se.

141. LUCID PROJECTION AND THE MENTALSOMA

Definition. Mentalsoma: the vehicle of manifestation of the intraphysical consciousness when this consciousness acts in an isolated manner, without the human body, the holochakra and the humanoid form of the psychosoma, headquartered in the unified body (holosoma), in the parabrain of the psychosoma.

Synonymy: ball of light; body of sentiments; body of the intellect; body of wisdom; bubble of energy; *cephalosoma*; content vehicle; dream body; focus of living light; formless body; intellectual body; intuitsoma; luminous globe; mass of living energy; megamind; mental ball; mental sheath; mnemonic body; mobile center of energy; noemasoma; parabody of discernment; parapsychic body; psychic body; punctiform consciousness; rational body; seventh consciousness (Buddhism); third attention; third element; *vijnamayakosha*.

Characteristics. Among the characteristics of the mentalsoma, at least the following 14 variables stand out:

1. **Formlessness.** The mentalsoma as a formless creation.
2. **Form.** Misty oval shapes, or white, gold or blue balls of energy.
3. **Organ.** The existence of the mentalsoma beyond the human sensory organs.

4. **Extremities.** The manifestation of a body lacking extremities, neither hands nor feet.
5. **Flexibility.** The most flexible independent vehicle of the consciousness manifests beyond the *light cone*, in the mentalsomatic dimension.
6. **Exchange.** The exchanging of vitality with the psychosoma through the golden cord.
7. **Stage.** Represents the vehicle of the essential stage of free consciousness.
8. **Imperceptibility.** The mentalsoma is imperceptible to the human eye because it transcends form and space as we see and sense it in the ordinary, physical waking state.
9. **Lucidity.** Levels of awareness (lucidity) and the mentalsoma.
10. **Cosmoconsciousness.** Cosmic self-awareness, whether continuous or sporadic (cosmoconsciousness).
11. **Holomemory.** Continuous integral memory or holomemory.
12. **Sexuality.** The consciousness in an existential condition that is free from the sexual impulse.
13. **Differences.** The differences of the mentalsoma for the intraphysical consciousness and the extraphysical consciousness.
14. **Paraperceptions.** The general paraperceptions of relative omniscience, as well as omnivision and omni-audition.

Seat. In the coincidence of the bodies of the intraphysical consciousness, the seat of the mentalsoma is in the extraphysical head of the psychosoma (parabrain) and not in the head of the human body (brain).

Carapace. The psychosoma thus constitutes the carapace of the mentalsoma.

Steps. In consciential evolution that is already in process through myriads of successive intraphysical lives, the consciential or intelligent principle *vegetates* when it is a plant, *sensualizes* when it is an animal and *intellectualizes* when a human being.

Self-mimicries. However, intraphysical consciousnesses generally continue to repeat the first two stages (plant or flora, botany; and subhuman animal or fauna, zoology) over long periods of time extemporaneously – in many cases without any greater usefulness (dispensable, inconvenient or useless self-mimicries) – thereby being dislocated in evolutionary time on this assistential *hospital-megaschool-planet*. It is reasonable to think that the evolutionary spiral does not demand so many repetitions. This can be seen in the following 3 stages:

1. **Revegetation.** From an evolutionary perspective, the intraphysical consciousness who is already in the self-creative period, only “revegetates” when he/she allows his/her physical, biological, carnal, cellular and ephemeral body to predominate. In this case, they are “more tree than consciousness,” rooted in the soil, “remain stationary” and content themselves with the reactions of plants or *vegetalism*.

Ontology. They are bound by (cellular) roots to a specific, fixed or immobile intraphysical location (*little egotistical world*) that, in evolutionarily terms, pertains to a previous evolutionary stage (retrosomas) which should have already been fully overcome. They thus concentrate themselves in egokarma, without getting out of themselves, in disharmony with their *ontological structuring*.

2. **Reanimalization.** The intraphysical consciousness only *re-sensualizes* or, in other words, reanimalizes him/herself when constantly deciding his/her destiny through action (free will) based predominantly upon his/her psychosoma or emotional parabody (thosenes with an *emphasis on sen*). In this case, these are those dynamically, psychologically, juridically and ethically more irrational consciousnesses. He/she contents him/herself with the reactions of subhuman animals, abdicating from the characteristics of *Homo sapiens sapiens*.

Groupkarma. He/she thus *re-endures* the predominance of specifications characteristic of subhumanity that evolutionarily pertain to a previous stage. He/she concentrates in groupkarma, like *group-souls*, living in direct confrontation or in radical contradiction with his/her essential constitution, seeing things through the eyes of a subhuman animal.

3. **Intellectualization.** The intraphysical consciousness actually only becomes intellectualized when he/she directs human existence based upon a preponderant action of the mentalsoma. Only the lucid individual has an effective intellect and is able to be intellectual, fully using his/her mentalsoma

– the vehicle of reason, the nucleus of discernment or the parabody of *sentiments* – instead of the parabody of emotions or desires. He/she thus fully and coherently interconnects his/her evolutionary consciential reality (hyperacuity, holomaturity).

Polykarma. He/she concentrates him/herself in polykarma or consciential multidimensionality, living in both theory and practice (theorice), according to the intellect, cosmoethically. Which phase characterizes you?

Fifty. During its resoma of up to 75 years of age, the consciousness almost always lives 2/3 of this time under the predominance of the psychosoma and only has a chance to begin living under the predominance of the attributes of the mentalsoma after 50 years of age, in the final third of human life, after it has already overcome the animal impulses and all blind emotionalism in its decisions.

Distance. Most consciousnesses do not end up living in the human body with some predominance of the mentalsoma. This is not only because they remain far from this condition, as they have achieved the *second childhood*, continuing to be *eternally young*, but also because they have still not awakened to the realities of the full, multidimensional life of the lucid consciousness.

Illusion. It can thus be seen that the human body and the holochakra, sustained by the psychosoma, are systems that simultaneously allow the manifestations of the consciousness and obfuscate it under a fog of thick illusion.

Alarm clock. For this reason, the mentalsoma is actually the only efficient alarm clock of the consciousness for its own continued evolution.

Maturities. For the intraphysical consciousness, maturity of the consciousness in terrestrial life will continue for many millennia to be conditioned by the biological maturity of the social being's human body.

Ages. In other words: physical or biological age influences and conditions mental, psychological age which, in turn, is able to more or less reflect the extraphysical and real age of the extraphysical consciousness that became an intraphysical consciousness.

Survival. The dilation of the useful period of the human's lifetime will continually allow greater action of the mentalsoma over consciousnesses. This is because the individual in full maturity will have more time and a better opportunity to think and act in a useful manner after the periods of menopause (gynosoma), andropause (androsoma), retirement, family responsibilities, professional responsibilities and the *fermentations of terrestrial attractions*, dedicating him/herself to liberating tasks (clarification task, penta, polykarmality) without having only human goals or interests of mere physical, organic or animal survival.

Control. After 40 years of physical age, the intraphysical consciousness becomes more predisposed to the production of lucid projection in the mentalsoma. This is because he/she shows a greater tendency to be free from exacerbated emotional ecstasy, maintaining better inner control over his/her manifestations.

Emotionalism. Excessive animal emotionalism is contrary to mental or rational life and acts as an obstacle to the production of consciential projection in the mentalsoma.

Neophobia. However, some lustrums later, when the individual is in his/her sixties and beyond, it becomes more difficult to produce lucid projection – for those who were not previously accustomed to the phenomenon – due to the stratification of the human body, excessively consolidated habits, a deep-rooted existential routine, arteriosclerosis and the full strength irruption of peevishness, crankiness, apriorism, misoneism or neophobia.

Expansion. The projection with expansion up to the condition of full cosmic consciousness or cosmoconsciousness seems to only appear after 30 or 40 years of physical age (see Bucke, Richard Maurice).

Looseness. In the extraphysical dimension, there is a looseness of the mentalsoma of the more lucid sensitive-consciousness or extraphysical consciousness in relation to the parabrains of the psychosoma when, in that phase, that consciousness does not have the holochakra, the silver cord or even the human body.

Tracking. According to the helpers, the galaxies and planets are placed extremely distant from each other in order to, among other reasons, stimulate consciousnesses to overcome the bonds of

matter through cosmic investigation using lucid projection outside the denser vehicles of manifestation. This has the objective of reaching more distant places, or those situated within the confines of the physical and tropospheric (crustal) universes using the free mentalsoma in the environment called the *mentalsomatic dimension*, which is common to all intraphysical and extraphysical consciousnesses.

Hypotheses. The following are two questions for research related to this theme:

1. **Emotional.** Could it be that resoma on earth, and on other evolutionarily similar planets, only occurs for the specialized animal-emotional development of the individualized consciousness manifesting through the psychosoma?

2. **Intellectual.** Might there be other appropriate processes and *resomas* for the intellectual-sentimental (rationalized emotion, *superdiscernment*) development of the consciousness manifesting through the mentalsoma, after it definitively frees itself from the psychosoma (third desoma)?

Development. The habit of elevated reflection, mental concentration and serene, constant, successive and guided study of advanced and non-mundane subjects, develops the mentalsoma of the consciousness.

Cenesthopathy. In certain consciential projections in the isolated mentalsoma, the precise notion of inexistence of any type of body or vehicle of consciential manifestation arises. This should not be confused with cenesthopathy or, in other words: the loss of awareness of one's own human body in the ordinary, physical waking state, a very different psychopathological condition, which is one type of cenesthetic disturbance.

142. PARAPSYCHOPHYSIOLOGY OF THE MENTALSOMA

Term. The term *parapsychophysiology* does not seem to be appropriate when applied to the mentalsoma, a *formless* vehicle. It is used here, however, in order to provide a better understanding of the subject because no other more adequate expression exists.

Mind. The mentalsoma is the vehicle of manifestation of the consciousness that is suited to the mentalsomatic dimension, which is also called the *universal mind*.

Characteristics. Among the characteristics of the parapsychophysiology of the mentalsoma, at least the following 15 variables can be singled out:

1. **Omnipresence.** Omnipresent cosmic mind.
2. **Transmission.** Transmitter of images, thoughts and sentiments.
3. **Thosenization.** Irradiator of mental energetic waves or thosenes.
4. **Morphothosenology.** Projector of morphothosenes or thought-forms.
5. **Megapsychometry.** Psychometrizer of the universe.
6. **Magnification.** Magnifier of everything or of an understanding of the consciousness.
7. **Omniscience.** The personal notion of omniscience and omnipresence.
8. **Mentalsomatic.** Sponsor of mentalsomatic projection and the consciousness apparently not having a body or vehicle of manifestation, occurring when the projected projector looks at itself and sees, senses or finds nothing of *substance* or structure relative to its thosenizing nucleus (pointer of the consciousness).

9. **Projectability.** Permits consciential projection while the human body is temporarily left in movement.

10. **Punctiform.** Permits the punctiform consciousness' presence in space.

11. **Takeoff.** Direct invariable takeoff from the coincident or projected psychosoma.

12. **Paraperceptiology.** Permits the consciousness to operate as a sensitive in the mentalsomatic dimension, in certain circumstances.

13. **Psychosomatics.** Maintains the structure – perhaps that of the field (physics) – of the psychosoma.

14. **Exchange.** Action of the golden cord.

15. **Paraphenomenology.** Simple separation, double separation, with and without the simultaneous projection of the psychosoma.

Impossibilities. When isolated, the mentalsoma does not allow at least the following 4 operations:

1. **Matter.** Direct action upon matter.

2. **Psychomotricity.** Motor effects.

3. **Intrusion.** Extraphysical attack upon the projected intraphysical consciousness.

4. **Deintrusion.** Classic deintrusive consciential projection.

Invulnerability. It shows itself to be invulnerable to the action of force currents and extraphysical hydromagnetic tempests.

Recontact. In certain instances, the mentalsoma enables the intraphysical consciousness to perceive the following sequence of 10 occurrences during the process of *recontacting* with material creations, in the act of interiorizing into the extraphysical head (parahead, parabrain) of the coincident psychosoma and, therefore, in the human body:

1. **Space.** Space and our intraphysical manifestation.

2. **Forms.** Forms and our relationships with material reality.

3. **Time.** Chronological time in the condition of our creation.

4. **Gravitation.** Planetary gravitation and its influence upon the intraphysical consciousness.

5. **Weight.** Somatic weight and the *towing* of the soma.

6. **Respiration.** Respiration or the 2 lungs and its enslaving influence.

7. **Circulation.** The beating of the heart and its continuous operation.

8. **Volume.** The volume of the human body.

9. **Restriction.** Accentuated compression or mental tension, characteristic of consciential restriction imposed through prolonged interiorization of the consciousness in matter or through resoma.

10. **Awakening.** Physical awakening of the consciousness and its lucidity, which is always reduced in the waking state.

Loosening. The mentalsoma loosens the tensions of the intellective circuits, promoting the free flow of ideas or uninterrupted thosenization.

Relaxation. As a general rule, a lucid mental and pure projection is equivalent to a period of intellectual relaxation or taking a series of effective nutritional substances or, in other words: extraphysical energy, which is spontaneously absorbed to the cerebral hemispheres of the intraphysical consciousness.

Brains. Based on the fact that the mentalsoma of the extraphysical consciousness leaves the psychosoma temporarily inactive during the lucid, extraphysical or mental paraprojection of the extraphysical consciousness, it can be concluded that the seat of the mentalsoma is in the extraphysical head (parahead) or, more precisely, in the parabrain of the psychosoma.

Differences. Hence, it can also be inferred that the parabrain of the psychosoma, despite being a matrix of the human brain, is very different from it, at least due to the following 3 occurrences:

1. **Density.** It does not have very dense matter in its structure.

2. **Transfiguration.** It has the attribute of changing shape.

3. **Freedom.** It allows the departure and free expansion of the mentalsoma.

Hemispheres. All this makes one think that the mentalsoma, just like the parabrains of the psychosoma, is constructed of 2 hemispheres – similar to the human brain – although with possibilities of structural variations that we (intrapysical consciousnesses) are still unaware of when manifesting in the mentalsomatic dimension.

Growth. Although lacking a defined form, the mentalsoma grows constantly, in some manner, along with the evolution of the consciousness.

Appendix. The mentalsoma does not have any appendix of its own. This is because the intercorporeal or intervehicular connection of the golden cord is more rooted in the psychosoma, with which it disappears when the consciousness (*serenissimus*) reaches the evolutionary condition of free consciousness (FC).

Potential. Lucid projection in the mentalsoma or, in other words, the freeing of the integral mind of the personality, potentiates the performance of the psychic faculties of the intrapysical lucid projector the following day. The individual, at least temporarily, is almost euphoric and is in better shape to coordinate personal thoughts, use memory, and work intellectually with the imagination and critical judgment.

Adjust. The mentalsoma is the most powerful vehicle for adjusting, balancing and homogenizing the holosoma. The employment or practical use of the mentalsoma by the intrapysical consciousness has the quality of curing certain indispositions generated by the altered physiology of the human body, energetic imbalances characteristic of the holochakra and affective disturbances that disrupt the psychosoma.

Technique. Thus, gastric distress, from eating something the organism cannot process (chemical instinct, food intolerance), for example, can easily and quickly be overcome in a spontaneous manner if the intrapysical consciousness gets to work using the mentalsoma, through a productive and absorbing intellectual task that tends to amplify his/her lucidity (hyperacuity) regarding consciential multidimensionality.

Occupational therapy. This work ends up being an effective resource of occupational therapy or, more precisely, upon harmonizing the vehicles of manifestation of the intrapysical consciousness, there is a remission of possible existing disturbances, in a self-therapeutic reaction.

Indissociability. At our current evolutionary level on earth, the intrapysical consciousness shows itself to be indissociable from the mentalsoma, in which the consciousness remains headquartered all the time, regardless of its manifestation or wherever it goes in its consciential projections.

Extinction. This indissociability will one day extinguish. According to current research, when, how and in what way the consciousness will manifest itself is not known.

Sentiments. Just as the psychosoma is directly responsible for the manifestation of the consciousness' primary emotions, the mentalsoma is responsible for the afflux of the consciousness' elevated sentiments.

Rationalization. The way of the growth of the consciousness intentionally acting from the mentalsoma upon the psychosoma, until the point at which the ego, in the first consciential vehicle, completely controls and directs the second vehicle, has been developing through the conquest of gradual rationalization.

History. For example, 3 stages can be observed in recent human history:

1. **Christianity.** First, primitive Christianity arose as a rationalized form of Judaism.
2. **Protestantism.** Second, Protestant Christianity developed as a rationalized form of Catholicism.
3. **Parapsychology.** Third, parapsychology appeared – at least in its early stages – as a more functional alternative form of religion or, in other words: a type of *religion substitute*.

Self-experimentation. In light of all these processes of secularization or *mental laicization of the sacred*, projectiology offers the practical part of consciential life, definitively dispensing with all manner of faith or belief, offering personal knowledge through rational self-experimentation with *inner and multidimensional cosmoethical renewal*.

Decline. At a certain point in this evolution, it is evident that religion will definitively cease to have any *raison d'être* for the more lucid intraphysical consciousness. As currently seen with the rapid acceleration of history, 2 categories of *imperial decline* will occur simultaneously:

1. **Materialism.** The decline of the Newtonian-Cartesian reductionist paradigm or the *materialist empires* of immature science.

2. **Dogmatism.** The decline of religions or *religious empires* as a whole.

Rationality. We cannot rationally *argue with the facts*.

Hypotheses. The following are two projectiological research hypotheses that are pertinent in this context:

1. **Frontochakra.** What is the relationship between the frontochakra and the golden cord?

2. **Coronochakra.** What is the relationship between the coronochakra, or its energies, and the mentalsoma?

Bibliography: Powell (1279, p. 14), Steiger (1601, p. 133), Walker (1781, p. 71).

143. RELATIVISTIC SPACE-TIME

Definition. Space-time: the unification through relativity of the concepts of space and time in the *space-time continuum* wherein space loses its isolated character and time ceases to be independent from the frame of reference, given that the physical phenomena no longer only pass through space, or occur in time, but take place in a more complex four-dimensional entity that is space-time, a broader notion of which will be presented below.

Synonymy: light cone; space-time continuum.

Intangibility. The reader who is concerned or, perhaps more precisely, nauseated by the intangibility and the “surrealistic” nature of some chapters in this section, would do well to bear in mind that nowadays there is nothing impractical or unscientific about intangible things.

Invisibility. It can be seen that science concerns itself more and more with intangible and invisible things in practical daily life, such as fields and waves, which brings these cogitations closer to or places them – in many aspects and perspectives – in harmony with the laws of physics.

Interval. In order to broaden the notion of space-time, it is necessary to define a value referred to as the interval in which the product, the maximum velocity of propagation of the interactions of known matter, which coincides with the speed of light in a vacuum, 186,282 miles (299,000 kilometers) per second (*c*), and the time interval between two events ($t_2 - t_1$) in a certain frame of reference, would be a fourth complementary coordinate, besides the existing three, namely *x*, *y* and *z*. The interval between two events would then be given by the equation:

$$S_{1,2} = [c^2 (t_2 - t_1)^2 - (x_2 - x_1)^2 - (y_2 - y_1)^2 - (z_2 - z_1)^2]^{1/2}$$

where the indices 1 and 2 refer to each one of the events; as opposed to the ordinary interval in tridimensional space

$$r = [(x_2 - x_1)^2 + (y_2 - y_1)^2 + (z_2 - z_1)^2]^{1/2}$$

and with time “*t*” as the independent coordinate of space, in classic physics.

Invariance. The interval “*s*” between events is the same in all inertial systems of reference (which are not found to be under the influence of external forces). In other words, it is an invariant in relation to the transformation from one system of reference to any other.

Constancy. This invariance is the expression of the constancy of the speed of light in any system of reference.

Light. When the velocity of 2 events occurs at a speed slower than that of light in a vacuum, the intervals are referred to as being timelike, as opposed to being spacelike. As shown in fig. 143, there is only one “x” coordinate and time “t”, in order to facilitate visualization (in fact, there would have to be 4 axes, x , y , z and t that are perpendicular to each other, which would be impossible in our tridimensional space), we have a planar graphic representation of space-time divisions.

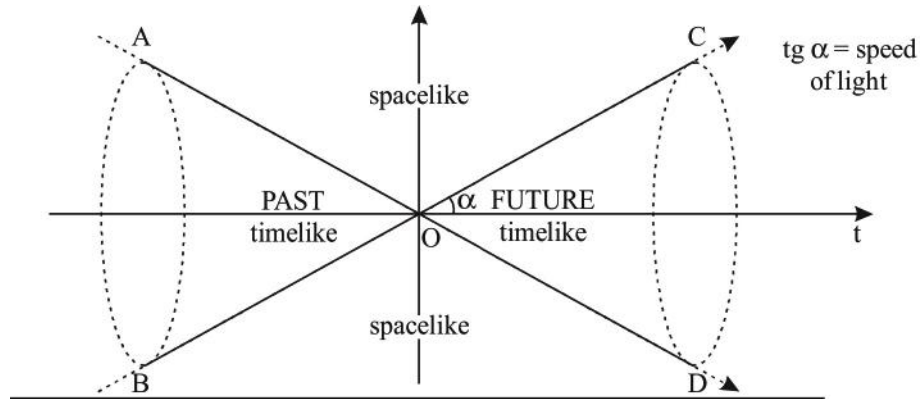

Figure 143

Time. Taking any event, designated as “O,” at the beginning of the spatial and temporal coordinates, in order to examine how to find the other events relative to event O, the rectilinear and uniform movement of a particle that passes through the origin O, is a straight line that passes through O and whose tangent of the angle of inclination with the t-axis supplies the velocity of the particle. All lines that represent movements of particles can be found only inside the domain AOB and COD. The intervals between any event of this domain and the event O are timelike or temporal. In this domain, for $t > O$, in the region COD, all events occur *after* O, or are in the future relative to O, in all systems of reference. This domain is also called *absolute future* relative to event O. The events of domain AOB are called *absolute past* relative to event O.

Regions. Matter, as well as known and proven physical phenomena, including all known interactions, are inside these regions, which are also called the “light cone.”

Velocity. The velocity of a material object, according to existing observations, must be less than or, at most, equal to the speed of light, in cases in which the object is transformed into *photonic energy*.

Space. In the regions AOC and BOD, the interval between any event and event O is spacelike or spatial. From this it can be concluded that, in any system of reference, these events occur at different points in space.

Concepts. The concepts of *simultaneity*, *before* and *after* are relative. For any event in this domain there are frames of reference wherein it occurs *after* event O, frames of reference wherein it occurs *before* O, and frames of reference wherein it occurs *simultaneously* with O. Little or nothing is known about the spacelike intervals in physics.

Own. Figure 143 illustrates a frame of reference that pertains to where one is. When observed from 2 different comparable systems of reference, both space and time flow in a particular and different manner. The reader may wish consult specialized works for further clarification.

Hypotheses. It can be seen that, in the domain of spacelike intervals, one can be at various points (or all points) of space at the same instant, or travel, if without the dense material body, *at a velocity faster than the speed of light*. In other words, one can go to the future, the past, or remain in the present.

Projection. Projective experiences in the mentalsoma, for example, lead us to propose or hypothesize that the phenomena observed in this state can be within the scope of spacelike intervals. This is reflected in the thoughts of Bernhard Riemann (1826-1866), who proposed the existence of space as being independent of metric (measurements of distance and angles), given that spatial metric is the result of the existence of matter and the forces between matter. The mentalsoma remains independent from it, coexisting in this space without metric.

Types. Incidentally, there are 5 operations of departure and return of the intraphysical consciousness from the consciential seat in consciential projections, when utilizing the isolated mentalsoma:

1. **Coincidence.** The mentalsoma leaves (projection) the parabrains of the psychosoma when it is still coincident with the human body.
2. **Discoincidence.** The mentalsoma leaves (projection) the parabrains of the psychosoma when it remains discoincident with the human body.
3. **Coincident interiorization.** The mentalsoma returns (interiorization) to the parabrains of the psychosoma which is coincident with the human body.
4. **Discoincident interiorization.** The mentalsoma returns (interiorization) to the parabrains of the psychosoma which is discoincident with the human body.
5. **Inversion.** The psychosoma (parabrains) projects and continues to the free mentalsoma, outside the human body, and absorbs it in a process of inverse interiorization.

Bibliography: Bentov (119, p. 3), Talbot (1642, p. 162), Toben (1688, p. 63), Vieira (1762, p. 198), Wolman (1863, p. 749).

144. PARAPSYCHOPATHOLOGY OF THE MENTALSOMA

Parapsychopathology. The parapsychopathology of the mentalsoma, which is still very obscure, seems to be extensive and encompasses an actual specific and complex parapsychopathology that often manifests itself through extraphysical consciousnesses in the extraphysical dimensions that are suitable for the free rein of the psychosoma and not in the pure mentalsomatic dimension.

Unconsciousness. The temporary loss of self-awareness, or *post-desomatic unconsciousness*, is one of the disturbances that affect the mentalsoma of intraphysical consciousnesses that return to the status of extraphysical consciousnesses through recent desoma. They are more easily detected by the intraphysical projector projected with lucidity.

Parapsychoses. Unconsciousness is one of the more common *post-desomatic parapsychoses*. In this case, it often represents a mere continuation of senile psychosis (Alzheimer's disease).

Monoideism. The simplest parapsychosis manifests when the consciousness (extraphysical consciousness), which has recently returned to the intermissive period, does not perceive that it has passed through biological death (desoma) and has lost the human body (soma) which it was using up until a short while ago. This condition is well-known to members of parapsychic deintrusion sessions. It is also called *posthumous monoideism*.

Extraphysical melancholy. Post-desomatic parapsychosis generally occurs to all those who are unprepared to take on extraphysical life upon desoma. Sadly, nowadays, this still constitutes the great majority of terrestrial humanity and can occur after extraphysical melancholy.

Ignorance. The parapsychotic generally has no interest in knowing that its human body is dead. This is because it considers its continued consciousness as absolute proof that it has not undergone desoma, despite the deeply rooted belief it may nurture regarding its own immortality and as fanatic as its religious beliefs may be.

Viscous. Parapsychotic extraphysical consciousnesses, due to their continuous hunger for consciential energy (energivorous extraphysical consciousnesses), can also appear to be viscous or, in other words, to have slowness, viscosity and detailedness in their manifestations.

Visitant. This is why they tend to implacably join with the visitant in certain circumstances or extraphysical environments, even when it is a projected intraphysical consciousness that they unconsciously follow as much as possible and wherever possible.

Assistentiality. It is extremely important that the intraphysical projector be aware of this fact regarding assistential projections.

Symptomatology. In this condition of *unconsciousness*, the ill extraphysical consciousness generally does not perceive the following 6 realities:

1. **Location.** Where it actually is.
2. **Community.** The new sphere of life in which it lives.
3. **Freedom.** The freer conditions that it can enjoy.
4. **Time.** The time and environment in which it lives.
5. **Intercommunication.** Its possible new relationships.
6. **Consequences.** The consequences stemming from this new consciential condition.

Animal. Unconsciousness leads the human consciousness that has recently returned to the condition of an extraphysical consciousness to temporarily relive an animal phase or, in other words, an irrational phase which it has overcome through its multiexistential experiences a long time ago.

Intermission. It undergoes the extraphysical experience of the intermissive period similar to the restricted consciousness of the subhuman animal which, either intraphysically or extraphysically, does not present real self-awareness. That is to say, it does not know who it is, as an individual personality, and does not correctly situate itself in extraphysical space and chronological time. It also does not perceive the transformations of its environment and does not manifest the basic indications of correct psychological orientation.

Psychosoma. The consciential disturbance of unconsciousness, in this case, is of the mentalsoma but reflects itself entirely and manifests itself especially through the psychosoma (emotional parabody) of the extraphysical consciousness.

Holochakra. This disturbance even persists after the experience of its second desoma or the definitive discarding of the remnants of the holochakra.

Therapeutic. One of the processes for the recuperation and cure of unconsciousness and the installation of a greater consciential awakening in the extraphysical dimension takes place in the setting up of live theatrical acts with various groups of patients (parapsychodrama). These include the participation of self-aware, assistant-extraphysical-consciousnesses that coexist with these patients. They also *portray* with them, over periods of time, didactic-therapeutic theatrical pieces and dramas, preparing them for extraphysical life or another upcoming or impending intraphysical life.

Duration. If we view them from the perspective of human chronological time, these prolonged dramas, experiences or laboratories last for weeks and months, just like short and simulated prior human existences. In order for them to occur, it is not necessary that the chronological scale of intraphysical life be observed. They are virtual intraphysical mini-existences (*mock trial, simulated auction of Teles, practice test*) although being mental. What percentage of these do not recuperate? What percentage of them do not go through the second desoma?

Character. The author came across an old helper that appeared *fatter* in its extraphysical visual appearance. It was transfigured, wearing exotic clothing and, according to this helper, had been completely engaged in these conditions for months, according to terrestrial chronological calculations. It was performing a role in a long dramatization in a district of the tropospheric extraphysical dimension in a large cast of *unconscious patients* with the main aim of recuperating them.

Absorption. In these absorbing or monopolizing circumstances, the helper could not attend to any other task on the planetary crust. This is why we had not seen each other since the previous year. This was mentioned when extraphysically introducing me to the participants of the simulated but live theatrical piece.

Traumas. Post-desomatic parapsychoses also occur due to small psychological traumas that the intraphysical consciousness may have suffered in his/her last days in the human body.

Fixation. A minimal psychological trauma, such as deception, mistakes, self-guilt, grief or friction, binds the consciousness to a secondary terrestrial problem that is difficult for the ego to eliminate immediately.

Parahygiene. This becomes transformed into a fixed idea, a tenacious monoideistic or adherent theme. The extraphysical consciousness wishes to remove it from its mind (paramind, parabrain) and perform mental parahygiene, but is unable to do so.

Holothosene. The persistent, traumatic and absorbing idea keeps the extraphysical consciousness immersed in the terrestrial themes and climate (holothosene). This completely impairs the consciousness after its being freed through the *first* desoma or final projection.

Gerontology. In this case, the greater the physical age (longevity, gerontology, from sixty-five to eighty-four years of age, eighty-five years of age and over) of the intraphysical consciousness, the more complex and deeper the post-desomatic parapsychosis will be. This is due to senility, arteriosclerosis, Alzheimer's disease, grouchiness and cantankerousness, which facilitates the installation of the fixed idea.

Parasleep. Post-desomatic restorative sleep or *parasleep* is the overall most indicated resource, from the beginning, for alleviating the intraphysical consciousness that became an extraphysical consciousness from a traumatic or absorbing idea. However, the extraphysical consciousness does not always achieve this renewing tranquil sleep. In this aspect, all improvement depends, above all and aside from everyone (helpers, evolutiologists, *serenissimi*), upon the consciousness itself.

Prophylaxis. Those who wish to free themselves from the mental and ethical disturbances that overwhelm any consciousness after the biological shock of desoma, should immediately begin to perform an effective prophylaxis of all fixed, involving and stubborn ideas, actually *cleansing* the time, space and consciencial energies of any *personal fossilization*.

Desoma. Those who undergo desoma leave the human body *here* but continue with their emotional and mental bodies *there*. Those who nurture fixed and stubborn ideas are well-advised to start preparing themselves now, for their own benefit.

Requisitions. The recent desomant that is a victim of a post-desomatic traumatic fixed idea is more hampered and takes longer to renew itself when it leaves young loved ones behind in intraphysical life who need the lost presence and affection, as well as deeply desiring and insisting upon seeing the personality again, having its company and knowing how it is doing.

Messages. Among these are the suffering individuals and parents who regularly go to mediums and *multiform channelings* to *receive messages*. The mental waves install morbid affective currents. It is always the recent desomant that suffers more, which, at this point, requires extraphysical renewal.

Encounter. In theory, the human lucid projector should not anxiously provoke an encounter with a recent desomant, regardless of who it is. It is always more prudent, intelligent and useful to let events spontaneously follow their natural extraphysical course. The most rational and productive approach for all is to maintain positive mental and affective waves in favor of the memory of the one who underwent desoma, albeit without making insistent, egoistical, obsessive and *magnetizing* requests that always disturb, impair and benefit no one in this situation.

Oligophrenias. Extraphysical oligophrenias, *frenastenias* or *olipsiquias* are syndromes or disturbances that are characteristic of pathology of the mentalsoma. In other words, they are mental deficiencies of the extraphysical consciousness that are reflected in the psychosoma. They seem to be generated by unrestrained emotions between biological shocks of *resoma* and *desoma*. This results in the following effects: deficiency in mental development, lack of mental concentration, lack of coordinated critical judgment and other mentalsomatic alterations.

Alterations. With reference to intraphysical consciousnesses, the temporary parapsychopathological alterations of the projected human consciousness are generated by disturbances in the parapsychophysiological activity that occur between the cerebral hemispheres (the head of the human body), the *paracerebral hemispheres* (the parahead of the psychosoma), and the mentalsoma situated in the parahead (or, more precisely, in the parabrain) of the psychosoma.

Causes. Among the causes of the parapsychopathological alterations of the projected intraphysical consciousness, at least the following 5 occurrences can be singled out:

1. **Conditioning.** Psychological conditioning imposed by the repressions of the physical restriction of the human body, generating *parapsychological* or extraphysical conditioning.
2. **Dissipation.** Temporary consciential (parapsychological) draining of consciential energy.
3. **Intoxication.** Intraconsciential intoxication of energetic origin.
4. **Illnesses.** Physical illnesses with extraphysical repercussions.
5. **Interdependence.** Alterations in the interdependence between the cortical areas and the silver cord, or the golden cord.

Types. Among the types of states of the projected intraphysical consciousness with alterations – which are parapsychopathological, in most cases – the following 2 can be singled out:

1. **Obnubilation.** Extraphysical obnubilation of the projected consciousness, or the morbid distraction of the normal course of parapsychic processes, is essentially characterized by 5 reactions:

- A. **Lucidity.** Reduction in the degree of extraphysical lucidity, with slowness of comprehension, difficulty in perception and the elaboration of extraphysical impressions.
- B. **Thought.** Alteration in the train of thought (pointer of the consciousness).
- C. **Evocation.** Disturbance of fixation and evocation.
- D. **Disorientation.** A certain degree of extraphysical disorientation.
- E. **Sleepiness.** More or less accentuated extraphysical sleepiness.

2. **Euphoria.** Paradoxically, extraphysical euphoria is negative in most projective occurrences. This state can lead the consciousness to ridiculous states of inconsequential contemplation and profound sentiments of beatitude which, in the end, contribute nothing positive to the projected consciousness. On the contrary, extraphysical euphoria subsequently brings about the following 3 reactions:

- A. **Learning.** The sensation of irreparable loss of an opportunity to learn outside the human body.
- B. **Waste.** The notion of wasting extraphysical time.
- C. **Energy.** The frustration of squandering consciential energy.

Effects. Among the effects of parapsychopathological alterations of the projected intraphysical consciousness, at least the following 16 can be singled out:

1. Diverse self-obsessions.
2. Nonlucid projection.
3. Indifference or apathy when faced with extraphysical experiences.
4. Extemporaneous sidetracking of extraphysical attention.
5. Incoherence in observations made regarding extraphysical events.
6. Appearance of unexpected or inappropriate mental targets.
7. The state of the erratic projector.
8. Loss of extraphysical freedom.
9. The installation of semilucid projections or another altered state of consciousness lamentably imposing itself over the lucid projection.
10. Extraphysical trauma.
11. Abrupt imposed interiorization.
12. Premature cessation of the lucid projection.
13. Loss of the educational opportunity of projective experiences.
14. Prolonged projective recess.
15. Fragmentary or completely annulled post-projective recall.
16. The phenomenon of voluntary *personism* (*mystifying psychophony*) or involuntary *personism*.

Problems. The intraphysical consciousness can encounter 2 similar problems, among others, of retardation due to his/her condition of physical restriction:

1. **Retardation.** First, for example, the well-known pathological state in which the cranium does not develop together with the human brain. This can even cause fused bones that do not leave space for the brain to grow. This provokes terrible headaches (cephalalgias) and *mental retardation*.

2. **Consciential.** Second, the condition in which the consciousness projects in the expanded mentalsoma and is unable to pass the recollections of the experiences to the parabrains (of the psychosoma) and the human brain. This generates *consciential retardation*.

Sentiments. The deep alterations in the manifestations of the consciousness' sentiments are inserted into the scope of the mentalsoma's influence. In this case, it is not known when they are simple effects of the emotions (psychosoma, *with an emphasis on the sen* of self-thosenes) or when they are actual sentiments or, in other words, thoughts that are rationally linked to emotions (mentalsoma, *with an emphasis on the tho* of self-thosenes).

Bibliography: Swedenborg (1639, p. 80), Vieira (1762, p. 153).

145. PREDOMINANCE OF A CONSCIENTIAL VEHICLE

Definition. Predominance of a consciential vehicle: the preponderant and continued action of the consciousness – intraphysical consciousness (4 vehicles) or extraphysical consciousness (2 vehicles) – through 1 metaorganism in particular, when it ends up monopolizing the entire holosoma.

Synonymy: consciential vehicular preponderance; monopoly by a vehicle of manifestation; predominance of a metaorganism.

Clarity. According to the parapsychology of the holosoma in the experiential universe of the consciousness, there can be an evident, more or less clear, predominance of 1 specific consciential vehicle.

Types. The diversification of consciential experiences ends up comprising various types of vehicular predominances with regard to the group of similar variables, such as the following 12:

1. Accidental, self-provoked or hetero-provoked.
2. Animal (human body) or extraphysical (mentalsoma).
3. Appropriate or avoidable.
4. Brief or prolonged (chronology).
5. Defined or ambivalent (paradoxical).
6. Gratifying or assistential (reparation or evolution).
7. Healthy (physiological or parapsychological) or unhealthy (pathological or parapsychological).
8. Intraphysical, projective (extraphysical) or desomatic.
9. Preparatory or executive (existential program).
10. Regressive or renovating.
11. Self-aware or unconscious (self-lucidity).
12. Sporadic or frequent (chronicity).

Intraphysical. There are phases of human activity with such a clear and absolute predominance of the action of 1 vehicle of manifestation upon the holosoma, or 1 consciential segment over the *entire* intraphysical consciousness, that there is no room for doubt.

Categories. The following, for example, are 4 categories of action of 1 consciential segment:

1. **Muscles.** In the phases of monopolization by the human body, matter and muscles predominate. The following are some examples: the athlete who is hibernating immersed in intensive training; the manual laborer who starts a new job; the professional model with a busy schedule.

2. **Energies.** In the phases of monopolization by the holochakra, *exchanges* and consciential energies predominate. The following are some examples: the actress at the start of a theatrical season;

the professional pianist on tour; the popular singer in his/her first season of shows; the lucid consciencial projector, when he/she is an extraphysical prisoner of the silver cord, in the phase in which he/she is unable to leave the physical base on more enriching projective excursions.

3. **Emotions.** Desires and emotions predominate in the phases of monopolization by the psychosoma. The following are some examples: the newlywed during the *honeymoon* (energetic maxi-springtime); the traveler who takes a vacation in his/her hometown (wistfulness, nostalgia), or native country.

4. **Ideas.** The intellect and ideas predominate in the phases of monopolization by the mentalsoma. The following are some examples: the author who goes into isolation in order to write a new book; the scientist in the initial phase of a *research cycle*; the student in the intense phase of study for college entrance examinations.

Conflict. Irreconcilable existential (or extraphysical) conditions generate intrapsychic dilemmas and conflicts that lead the consciousness to install the wrong, eccentric, dislocated, extemporaneous or paradoxical predominance of one vehicle of manifestation over the others. The predominance is always destructive in such a condition.

Change. The change that has occurred may merely relate to the positive or negative quality of vehicular predominance and not the consciencial vehicle itself. The following are 3 examples:

1. **Newlywed.** The newlywed who, at the beginning of her *honeymoon* (positive predominance of the emotional body), is notified of the unexpected desoma (anticlimax) of her beloved mother (paradoxical negative predominance of the same emotional parabody).

2. **Athlete.** The focused athlete (positive predominance of the human body) who needs to take the college entrance examination for his/her chosen career studies (positive, but dislocated, predominance of the mentalsoma) in the same period.

3. **Author.** The author who goes to the countryside to write a book on economics (positive predominance of the mentalsoma) and falls in love with his/her neighbor (extemporaneous predominance of the emotional parabody) while there.

Evidence. The overall analysis of the predominance of each consciencial vehicle over the others clearly manifests 4 occurrences:

1. **Holosoma.** The existence of the holosoma.
2. **Action.** The particular action of each metaorganism.
3. **Physiology.** The physiology or parapsychology of each consciencial vehicle.
4. **Pathology.** The pathology or parapsychology of each consciencial vehicle.

Fermentation. No manifestations of the *integral* intraphysical personality can be counted on if he/she is in a specific phase of evolutionary fermentation, under the predominance of one consciencial vehicle.

Comprehension. The reader will coexist better with others, and with him/herself, if he/she understands this technical mechanism and endeavors to function adequately with these phases of consciencial performance. This will avoid annoyance, intolerance and misunderstanding in the dynamic of intraphysical existence.

Parapathology. In theory, all monopolization by the action of 1 consciencial vehicle over the others, when excessively prolonged, becomes spurious or parapathological, and in fact constitutes a *para-hypertrophy* or an exorbitance of functions.

Use. If we have various vehicles of consciencial manifestation, it stands to reason that it is in order to use all of them together and harmoniously, in peaceful coexistence, in order to gradually free ourselves from those that we can deactivate during the progress of consciencial evolution.

Exception. To permit the predominance of one vehicle of consciencial manifestation over the others is an exception-behavior for the consciousness.

Pattern. The harmonized use of the multiple vehicles of manifestation that make up the holosoma is the pattern-behavior for the consciousness.

Deactivations. The following are 3 examples of tendencies of consciousnesses regarding somatic deactivations:

1. **First.** The *natural* tendency of the moribund individual (mostly in desomatics) is to deactivate the human body (first desoma).

2. **Second.** The *intermissive* tendency of the recent desomant intraphysical consciousness (now an extraphysical consciousness), when more lucid, is to discard the remnants of the holochakra (second desoma).

3. **Third.** The advanced *evolutionary* tendency of *Homo sapiens serenissimus* (*serenissimus*) is to free him/herself from the psychosoma once and for all (third desoma).

Retrogression. The *general* condition of the predominance of 1 consciential vehicle over the holosoma operates in direct opposition to these evolutionary tendencies, in this case, in retrogression. In this case, only 1 metaorganism is activated to the detriment of the others, with the consciousness not discarding any of them: without bringing about any evolutionary advantage.

Desomants. The desomant intraphysical consciousness also goes through phases of a predominance of 1 specific vehicle of manifestation. The following are some examples: the soma, soon after the desoma of the intraphysical consciousness, in cases of post-desomatic parapsychosis; the holochakra, until it overcomes the second desoma, in certain cases; the psychosoma, in the period in which the consciousness meets its loved ones that have already gone through desoma (extraphysical consciousnesses); the mentalsoma, during field trips, in preparation for a new life and a new upcoming existential program.

Incomprehension. Legions of human beings remain intranquil, uncomprehending or angry regarding the alleged disregard or indifference from their former relatives, friends and colleagues, which are now desomant. According to these individuals, they do not respond to their desires, evocations, prayers, whims and personal egotisms. In many cases this occurs because they do not understand the dynamic of the occurrences and incidents of the experiential phases of the desomant intraphysical consciousnesses.

Intrusions. The desomant intraphysical consciousness often cannot even maintain itself in a balanced manner. How then will it be able to understand the situation, respond to critical complaints of others or assistentially intercede in favor of another? On other occasions it will be so deeply involved in the contexts of experiences, dimensions, remote environments and consciential energies that useful dislocation from one place to another becomes impractical.

Questions. Are you, experimenter, currently in an evident phase of the predominance of 1 vehicle of manifestation? Which vehicle? Is the predominance conscious or unconscious? Is the existential phase healthy or pathological?

Duration. Logically and rationally, one should only allow a prolonged (duration) predominance of one consciential vehicle if it is of the mentalsoma – the parabody of discernment – and, even then, if it is healthy.

Bibliography: Vieira (1672, p. 134).

146. DESOMA

Definition. Desoma: the painless deactivation and discarding of a vehicle of manifestation of the intraphysical consciousness.

Synonymy: demise; deactivation of the consciential vehicle; discarding of the consciential covering; death; thanatosis; way of mutation.

Transmutations. Death represents a change in the level of the consciousness (consciential principle) through the deactivation and discarding of one of its vehicles of manifestation. This is similar to various known natural events, such as the following 5 evolutionary transmutations:

1. **Tree.** The tree growing new leaves.
2. **Bird.** The bird molting its feathers.
3. **Fruit.** The fruit discarding its skin.

4. **Insect.** The insect (cicada) substituting its exuvia.
5. **Reptile.** The reptile (snake) shedding its skin.

Types. There are 3 types of death or desoma in the specific case of the consciousness:

1. The first death.
2. The second death.
3. The third death.

Disintegration. Each death or desoma constitutes the paralysis and consequent definitive disintegration of a certain instrument, machine, vehicle or body through which the consciousness acted.

Reactions. Further, each death can represent 4 reactions:

1. **Shock.** A consciential or parabiological shock.
2. **Crisis.** A positive growing crisis (healthy stress) for the consciousness.
3. **Transition.** A defined period of evolutionary transition for the consciousness.
4. **Change.** A radical change for the ego that is generally painless and for the better.

Taboos. The deaths, however, within human customs, still remain intensively involved in excessive taboos, conditioning, preconceptions, beliefs, superstitions, emotionalism, misunderstanding, low-level information, bad information and disinformation.

Qualification. Despite all this, deaths or desomas, in their 3 types of manifestation, are experiences which are more agreeable than disagreeable.

Birth. Each death, or discarding of a consciential vehicle, actually constitutes a type of birth of the consciousness in another far more evolved form of existence.

147. FIRST DESOMA

Definitions. First desoma: deactivation and discarding of the human body with the rupture of the silver cord, returning the intraphysical consciousness to his/her condition as an extraphysical consciousness, still with the holochakra, psychosoma and mentalsoma as its vehicles of manifestation; passage of the intraphysical consciousness from the intraphysical state to the extraphysical state.

Synonymy: biological death; brain death; changing of matter; cytological death; deactivation of the human body; deactivation of the physical body; death of the human body; decession; definitive unfolding; demobilization of the human body; discarding of the human body; discarnation; disembodiment; disoccupation of the human body; dying; end of animal human life; final detachment of the perispirit; *final discoincidence*; final projection; final takeoff of the psychosoma; full corporal death; last detachment; last human projection; last semiphysical projection; liberation from the human body; lysis; molecular death; monothanatos; natural death; obit; passing; perishing of the soma; physical death; *primothanatos*; release of the imprisoned consciousness; self-lysis (suicide); somatic death; thanatological event; trespass; trespassing.

Ego. It is more appropriate to understand 2 facts that are similar and complementary regarding desoma:

1. **Burial.** Human existence, resoma or intraphysical rebirth, is actually the *burial of the ego* – directed by the mentalsoma, in the parabrains of the psychosoma – into the human body (soma), from the beginning of biological conception, during physical growth, and up to organic and psychological maturity.
2. **Exhumation.** Desoma or biological death is the *exhumation of the ego* from the human body, given that the deactivated soma actually dies and decomposes.

Elimination. The transition of first desoma – deactivation or permanent cessation of the vital functions of the human body (cardiopulmonary death and encephalic death) – do not offer the

intrapysical consciousness any means of escape. It also definitively eliminates from the *freed* consciousness: myths, taboos, mysticisms and mystification of all types that confuse the human mind when engaged in comprehension of extraphysical realities.

Conquest. Lucid projection, or physical and temporary minideath, permits this vital conquest while still in human life.

Types. There are 2 basic types of first desoma regarding the time factor:

1. **Sudden.** Sudden death, which includes syncope and asphyxia.
2. **Slow.** Agonized or slow death.

Intentionality. According to intentionality, there can also be two categories of first death:

1. **Voluntary.** Voluntary, in this case, suicide.
2. **Imposed.** Imposed, which occurs through illness, organic deterioration or accident.

Cemetery. Strictly speaking, the cemetery is the last physical base of the human consciousness (intrapysical consciousness) in his/her final projection, last semiphysical projection or the biological death of the soma.

Impure. From the perspective of the vehicle of manifestation, the *impure* extraphysical consciousness is that which only passed through deactivation of the human body (first desoma), without freeing itself from the *remnants of the holochakra* (second desoma).

Liberation. According to what can be observed in the phenomena of projectiology – e.g.: in farewell projections – the death of the physical body does not constitute a *cessation* of energy, but represents more of a *liberation* of energy for the consciousness.

Transference. First desoma, with regard to the human body, occurs because, with the rupture of the silver cord, consciential energy (vital fluid) can no longer be transferred from the consciousness (mentalsoma) through the psychosoma and the holochakra to the human body. From this point on, the soma begins to gradually disaggregate, installing organic chaos and the annihilation of the cells.

Law. The death of the human body and its utilization as a cadaver, or used matter, obeys the *law of conservation of energy* which states that: energy is neither created nor destroyed, but transformed.

Alternation. One of the most complex and controversial subjects in desomatics or thanatology is the bold hypothesis of the exchanging of the intraphysical consciousness in a human body, at an adult age, for another consciousness that is extraphysical, which alternates in the utilization of the vehicle of manifestation of the consciousness.

Splicing. In the hypothesis of alternation – human life without infancy, the transplanting of the entire human body, transmigration in adulthood, adult resoma or the *theory of walk-ins* – there would be an inexplicable rupture of the silver cord that would then be *spliced* to the silver cord of the extraphysical consciousness, which would still have one or, in other words, part of the holochakra. In this case, there would be no deactivation of the human body in the process of changeover of command, which would continue with another consciential, holochakral, psychosomatic and, obviously, mentalsomatic command.

Tenant. In the hypothesis of successive adult lives, or substitution of the consciousness, there would be an experience of first desoma for one consciousness (the first tenant, the donor of the human body) and a simultaneous rebirth in the intraphysical dimension of another consciousness (the second tenant or the walk-in) already as an adult by resurrection through the loan of a cadaver, or even the continuation of another's living human body.

Cannibalization. In a way, this existential alternation is a type of cannibalization, or a removal of usable parts from one piece of equipment in order to better reuse them in another.

Advantages. Those who defend this hypothesis of successive adult lives allege that its occurrence affords 4 essential advantages:

1. **Soma.** Utilization of the human body (soma) of an adult.
2. **Memory.** Conservation of memories that are more vivid than those which are stored, in the manner of organismic or cellular memory, a fact that is extraordinarily difficult to understand.

3. **Maturity.** Elimination of time lost with childhood.
4. **Avoidance.** Avoidance of the temptations and problems characteristic of inexperience during youth.

Possession. Eastern beliefs accept that adult resoma can occur through possession by an extraphysical consciousness – which has just left its human body – of another human body, at the same instant that it is abandoned by its former occupant, there being a productive goal which justifies the occurrence.

Christ. There is also a hypothesis that Jesus of Nazareth, the Christ, was reborn at adult age, precisely on the occasion of his baptism, and thus the existence of the obscure periods of his earlier life, prior to his public life of only 3 years.

Case study. There are reports of exchanges of consciential direction in the East, whereas the most well-known and controversial cases in recent decades, in the West, are the following 2:

1. **Rampa.** Cyril Henry Hoskin – Carl Kuan Suo, or Tuesday Lobsang Rampa, in 1949 (Rampa, 1353, p. 94).

2. **Paladin.** David Paladin (1926-1944) – Wassily Kandinsky (1866-1944), the father of abstract painting (Banerjee, 74, p. 45). In 1985, Mr. David Paladin still lived (?) in the United States of America.

Dissociation. These cases related to the hypothesis of successive adult lives, or walk-in beings, according to more conscientious researchers, should not be confused with the phenomenon of possession or with “dual personality,” characterized by psychiatrists, psychoanalysts and psychologists as “dissociation of personality” or “secondary personality”.

Possession. Until the present, however, interconsciential possession is certainly *the most rational hypothesis* for explaining these phenomena in most of the abovementioned cases. Existential recycling clarifies certain other cases.

Obscurity. There are still countless obscure facets regarding the death of the human body.

Capgras. Would there be certain rare cases of Capgras syndrome – the illusion of doubles or the illusion of sosies, when the person believes that a friend or relative was substituted by a perfect sosie – related to *walk-in beings* or the possession of adults by ill extraphysical consciousnesses?

Disconnection. It is important to highlight the fact that the consciousness that has recently arrived at the intermissive period does not always immediately disconnect from its cadaver in the act of rupturing the silver cord.

Evidence. A great deal of evidence has been presented by clairvoyant sensitives who see the psychosoma of the individual close to the cadaver, as well as communications from extraphysical consciousnesses tormented by the sensation of still feeling the human body in decomposition.

Apparitions. Besides, in this particular phenomenon, circumstantial indications sponsored by post-desomatic apparitions carry far greater weight.

Scratch. A typical case of apparition is that of *scratches* accidentally made on the *face* of the recently deceased young girl by her mother while dressing the body (cadaver) for burial, which were subsequently covered with makeup, thus keeping the fact secret out of embarrassment.

Disfigurement. This small accident was only made public 9 years later by the brother of the deceased who saw his sister in an apparition, disfigured by the scratches.

Impressions. This proved that, up until the cadaver was dressed, the consciousness of the girl, perhaps already having undergone the rupture of the silver cord, still felt the impressions of the human body and in some way was still located inside it. The girl thus suffered the extraphysical repercussion of the *scratch on her face* as it appeared when her psychosoma was seen by her brother (Ebon, 453, p. 14; Myers, 1114, p. 27).

Hypotheses. This occurrence raises various hypotheses that can contribute to our research. The following are 4 examples:

1. **Energies.** Even after the rupture of the silver cord or, in other words, passage through the first death, does the consciousness still feel the impressions of the human body through the energetic remnants of the holochakra? This seems to be the case in certain extraphysical instances or circumstances.

2. **Pain.** What are these extraphysical circumstances? Could it be that the consciousness of the girl felt the pain provoked by the scratch? This might be the case. Considering these aspects, should the act of cremating cadavers be analyzed in detail?

3. **Self-transfiguration.** Could the consciousness of the girl have seen the scratch on her body during decomposition and modeled or sculpted the scratch on her para-face through self-transfiguration, in the same manner as human stigmatizations? Does this hypothesis seem less probable?

4. **Burial.** Could the silver cord already have been ruptured at the instance of the scratch – or was the youth actually buried alive?

Emotionalism. Soon after the first desoma, the tendency of the intraphysical consciousness that has recently arrived in the intermissive period is to turn the attention inward to internal or intraconsciential life and, above all, to live in sentiments and in the parabrains (of the psychosoma, or emotional parabody), and not in the external world.

Parapsychosis. If the intraphysical consciousness – now an extraphysical consciousness – is evolutionarily still dominated more by animal emotions, or the nonpositive or less evolved sentiments of human life, it has no foundation for the manifestations of its emotionalism. The consequences of this are feelings of anguish, anxiety, extraphysical melancholy and post-desomatic parapsychosis.

Infernos. These antagonistic conditions between internal life and the external world generate the shadowy paratropospheric dimensions and the concepts of hell and *Hades* created by the cosmologies of myriads of religions and theological infernos.

Clairvoyance. One of the lesser and subjective sources of evidence, although not without value for this reason, of the transition of first desoma is the clairvoyance of those sensitives who see intraphysical beings undergo desoma, including the final takeoff of the psychosoma of the moribund individual.

Waste. First desoma should be studied in far greater depth in order to someday avoid the sadness and misfortune of the great waste of tears, worry, time, energy and expenditures related to cadavers, that has been occurring in all countries or on all continents, throughout the centuries, even in this proud age of science and technology, as well as this age of *acceleration of human history*.

Relativity. The relative nature of human life cannot be forgotten: the awareness of the proudest of individuals is reduced every night through sleep; is disturbed in physical life due to illness; and, finally, his/her human body is irreversibly decomposed after desoma or biological death.

Maturity. With the passing of springs and summers, human life, when it is conscientially and evolutionarily productive, naturally manifests the extraphysical maturity or holomaturity of the consciousness. This is expressed by the following 8 unmistakable characteristics, among others:

1. **Disillusions.** An increase in disillusions typical of human immaturity, which are now discovered and identified.

2. **Nostalgia.** The irruption of deep, transcendent nostalgia within the intraphysical consciousness for a world better than that of the intraphysical dimension.

3. **Self-awareness.** A greater self-awareness of the prison or physical restriction characteristic of the human body.

4. **Conception.** A precise conception of the condition of the imprisoned living-dead consciousness, that transforms itself into the dead-living or resuscitated consciousness.

5. **Return.** The idea of the welcome return to its true origin or extraphysical point of origin (extraphysical hometown) after the completion of the personal existential program.

6. **Freedom.** The intense and gratifying longing (or para-longing) for the wide-open spaces of the extraphysical environments and communities.

7. **Happiness.** The happiness of observing one's own human body spontaneously and naturally decaying on its own – regardless of the care given to it – leading to its impending, inevitable, definitive disposal, which makes one change existential priorities.

8. **Anxiety.** The constant, albeit responsible, anxiety for an apparent late return, in the case of the prolonged wait of an elderly person (sixty-five to eighty-four years of age; eighty-five years of age and over).

Observers. Citizens in the United States of America, for example, do not confront the death of the human body in practice. Desoma is relegated to hospitals where the cadaver is covered up with a white sheet.

Responsibility. In this case, the responsibility is transferred to the medical team, while citizens maintain a safe distance as mere “innocent” bystanders.

Thanatophobia. Individuals do not want to confront deactivation of the soma because their fear of biological death – thanatophobia – is too deep-rooted. That is why they “bury their heads in the sand like ostriches,” an ego defense mechanism of retrocession.

Desomatics. This is why consolidation of the research and practices of thanatology and desomatics is so important.

Cerebral. The conditions that characterize brain (brain or human body) death, from a medical, clinical or surgical point of view, is the inexistence of voluntary respiratory movement, universal areflexia and dilation of the pupils.

148. SECOND DESOMA

Definition. Second desoma: deactivation and discarding of the holochakra, including retraction of the remnants of the silver cord and the aura of the holochakra, the extraphysical consciousness thereby remaining in the mentalsoma as well as in the psychosoma, which presents its own aura.

Synonymy: bithanatosi; creation of the astral shell; deactivation of the holochakra; death of the third day; discarding of the holochakra; extraphysical death; final desoma; final discarnation; post-death; post-discarnation; second discarnation; separation of the compound double.

Trace. In deactivation of the holochakra, the remnants of the silver cord vary according to whether the intraphysical consciousness, which has returned to the condition of an extraphysical consciousness, has or has not completed the existential period preestablished by its evolutionary orientation (evolutiologist). In this case, the remnants of its vital energy will have been partially or totally used up.

Purification. Second desoma constitutes the purification of all ectoplasmic emanations of the being (consciousness) that has departed from dense matter. The ectoplasmic emanations of the average intraphysical consciousness disintegrate 2 or 3 days after deactivation of the soma (human body).

Streamlined. From the perspective of the vehicle of manifestation, the *pure* or *streamlined extraphysical consciousness* is that which has already discarded the remnants of the silver cord through deactivation of the holochakra.

149. THIRD DESOMA

Definition. Third desoma: deactivation and discarding of the psychosoma with the rupture of the golden cord and the entrance of the extraphysical consciousness into the condition of free consciousness (FC), from which point it permanently manifests only through the mentalsoma.

Synonymy: birth of the free consciousness; consciential liberation; deactivation of the psychosoma; discarding of the psychosoma; dispensing with the psychosoma; extraphysical death; *moksha*; the end of erraticism; the end of serenism; the end of successive intraphysical lives; trithanatosi.

End. Third death signals the end of the migration of the ego, *Homo sapiens serenissimus* (*serenissimus*), the extinction of the cycle of the coming and going of resomas and desomas, or personal intraphysical existences. This is the inevitable objective of all consciousnesses or *sentient* beings.

Scale. Third death is the crowning of the evolution of the consciousness at the end of the seventh stage of the scale of continuous self-awareness. It thus initiates a new stage in eternal evolution, and one which is currently entirely unknown by humankind.

Mentalsoma. It is easier to understand the condition of erraticism of the extraphysical consciousness and much more difficult to understand the end of this same erraticism, or the condition of the *domicile* of the extraphysical consciousness in the mentalsoma in the mentalsomatic dimension. What occurs there? It seems that no one is yet able to satisfactorily answer this question.

Primothosene. People naturally always concern themselves with the challenging idea of the existence of the primothosene or the primary cause of the cosmos, or the *uncaused cause*. Perhaps still more disturbing is the idea of the mentalsomatic dimension where the extraphysical consciousness manifests itself forever, without appendices, as we know it, living in its holosomatics only with the mentalsoma, probably in a condition of continuous self-awareness.

Bibliography: Rampa (1361, p. 96), Vieira (1762, p. 214), Walker (1786, p. 22).

150. THE THREE DESOMAS

Ruptures. As can be deduced from the assertions made in the preceding chapters, the 3 desomas merely represent severances, ruptures, phasic mutations or separations of vehicles of manifestation that can be deactivated, discarded and decomposed, in light of the immortality of the consciousness.

Annihilation. None of the 3 desomas, whether analyzed separately or together, in any way imply a complete extinction or annihilation of the self, the consciousness or conscientiality.

Biological. Biological death, due to natural causes, always represents an occurrence that should be considered an authentic evolutionary process of the eternal consciousness and the development of the very vehicles of human manifestation of consciousnesses.

Reactivation. The deactivation of the bodies or vehicles of manifestation of the consciousness seems to be definitive. Their reactivation is impracticable.

Relay. The contrary would appear to be a regressive or unnatural occurrence, in spite of the existence of the above-cited controversial hypothesis of consciential relay, or direct resoma in adulthood which, in a certain aspect, would somehow sponsor this reactivation with the entrance of another consciousness into human life.

Assistant. The first and second desomas of others are occurrences for which lucid intraphysical projectors are called upon to help extraphysically during assistential projections. This turns the projected intraphysical consciousness into an authentic assistant of biological death, within desomatics and thanatology.

Discrepancy. Of the 3 desomas, or the 3 vehicular disposals of the consciousness, the discarding of the human body – desoma or biological death – is the most disconcerting and radical, or the one that presents the greatest environmental discrepancy for the ego.

Approximation. As strange as it may seem, discarding is the occurrence that actually most closely approximates the phenomenon of human lucid projection in its manifestations and effects. This is why it has continued to be so difficult throughout the millennia for the intraphysical consciousness to implement the natural habit of projecting the human body with lucidity to other dimensions beyond the tropospheric life in which we live in intraphysical existence.

Discrepancy. The discrepancy or disparity between the consciential environments or vehicular conditions is 1:1,000 when the intraphysical consciousness projects in the psychosoma (bearing in mind the *weight* of this vehicle) and 1:∞ (“infinity”) when the intraphysical consciousness projects only in the isolated mentalsoma. The lucid projector would do well to meditate deeply upon this topic.

Rebirths. The following is a hypothesis: just as there are 3 desomas, each successive life constitutes 3 rebirths or distinct stages: conception, parturition and human maturity.

1. **Conception.** First stage: biological conception or, in other words, the initial union of the psychosoma with the human body or resoma per se. At this point pre-resoma – or the act of creating the silver cord which initiates the action of the energetic body (holochakra) – has already occurred. This first stage is the period of cooperation or co-optation of the extraphysical consciousness undergoing resoma with another intraphysical consciousness (pregnant woman) or other extraphysical consciousnesses (the consciousness of another fetus or other fetuses, twins, triplets or xiphopaguses).

2. **Parturition.** Second stage: *délivrance*, or the act of birth per se, allows the extraphysical consciousness to begin to act freely and individually by itself in the intraphysical dimension and to temporarily be an intraphysical consciousness (*spatialization of the extraphysical consciousness*). Every individual leaves the womb as a male or female animal.

3. **Maturity.** Third stage: it is only in physical or biological maturity, after childhood, youth or at 26 years of physical age, that the intraphysical consciousness is able to entirely manifest itself (psychological maturity), revealing all the potential (paragenetics, innate ideas, charisma, holomemory, recuperation of cons) that he/she brings with him/herself. There are many consciousnesses that undergo resoma and desoma without having passed through the third stage.

Relationships. This phase of physical maturity is preceded by an effective consolidation of the intraphysical consciousness in a new human life, which generally occurs at about seven years of physical age. Physical maturity, however, has no direct relationship with most human codes (21 years of age).

Anchoring. Further, this physical maturity does not depend upon the condition of a greater psychophysiological anchoring of the resonant extraphysical consciousness, as the opposite generally occurs: the intraphysical being who is less physically anchored can achieve mental or psychological maturity more rapidly and, as a result, can achieve extraphysical maturity or holomaturity even more rapidly.

Double. Despite evolutionary obstacles, according to reports in extraphysical communities or environments, there are already intraphysical consciousnesses on this planet who are able to sponsor first and second desoma at the same time (*double desoma*). In this case, the consciousness, in a wholesale manner or all at once, promotes the positive, healthy donation of consciential energy – still human in nature – to ill (intraphysical and/or extraphysical) consciousnesses.

Immolation. In terms of tropospheric assistance, it is presumed that this energetic immolation may constitute the maximal, final realization that is attainable by the intraphysical consciousness (*serenissimi*), through a chakral self-desoma.

Exclusions. This act of consciential parahygiene promotes at least the following 4 exclusions:

1. **Trauma.** The biological or traumatic shock of desoma.
2. **Paraprophylaxis.** The condition of post-desomatic parapsychosis (paraprophylaxis).
3. **Self-efficiency.** *Wastes* in energetic applications (evolutionary self-efficiency).
4. **Vampirizations.** Interconsciential vampirizations by the extraphysical consciousness when *energivorous*.

Bibliography: Bennett (117, p. 29), Vieira (1762, p. 157).

151. COMPARISONS BETWEEN OCCASIONAL AND FINAL PROJECTION

Rupture. Biological death is the last cause for an involuntary projection when, with the rupture of the silver cord, the extraphysical consciousness can only undergo resoma in another human body (soma) in a new intraphysical existence.

Nature. Based upon the nature of human life, in the same way that both natural desoma and forced desoma exist, natural (spontaneous) lucid projection and forced lucid projection also occur.

Differential. The following are 6 basic differential characteristics between final projection, or deactivation of the human body, and ordinary consciential projection:

1. **Cord.** In final projection, the definitive rupture of the silver cord takes place, a fact which defines deactivation of the human body. In ordinary lucid projection, the silver cord is merely temporarily dislodged from its organic, physical base, to which it soon returns.

2. **Discoincidence.** In final projection, the definitive discoincidence of the vehicles of manifestation of the consciousness occurs, especially the psychosoma leaving the human body forever. In ordinary projection, there is only a temporary discoincidence of these vehicles.

3. **Sleep.** In most cases, final projection leads the consciousness to go through a period of extraphysical rest or so-called *restorative sleep*. In projection with continuous self-awareness, for example, the condition of uninterrupted wakefulness occurs during the entire process, with no sleep, dreams or nightmares of any kind.

4. **Vision.** Final projection consistently presents a retrospective panoramic vision that is often comprehensive with regard to the intraphysical consciousness' current human existence. It is uncommon for the panoramic vision to arise in consciential projection, although it sometimes occurs during certain near-death phenomena (NDE).

5. **Assistance.** Final projection invariably receives extraphysical assistance from helpers or extraphysical consciousnesses that are specialists in handling the processes of desomatics. Ordinary consciential projection most often occurs without the tangible or visible assistance of helpers.

6. **Deaths.** Final projection is the definitive *physical death* of the human body. Occasional ordinary projection represents a mere temporary *psychic (brain devoid of content) death* of the human body, which remains in the *empty brain* condition.

Doorways. The doorways to consciential projection – the ordinary, physical waking state, daydreams, sleepiness, natural sleep, ordinary dreams, nightmares, the hypnagogic state and extracorporeal sleep – are the same ones through which the consciousness achieves final projection (biological or somatic death).

Possessions. The human body, the clothes in which it is dressed and the personal effects that remain with the soma constitute the immediate possessions of the human projector that are left behind on the occasion of his/her final projection.

Processes. There are 2 processes which are relatively characteristic of biological shocks:

1. **Condensation.** Resoma is an extraphysical-physical condensation process.

2. **Decomposition.** Desoma is a physical-extraphysical decomposition process (dissipation, evaporation or gasification).

Bibliography: Bozzano (184, p. 149), Druly (414, p. 39), Shay (1546, p. 28), Steiger (1601, p. 107), Xavier (1883, p. 209), Yogananda (1894, p. 245).

**152. COMPARISONS BETWEEN THE PSYCHOSOMA OF THE
INTRAPHYSICAL AND EXTRAPHYSICAL CONSCIOUSNESS**

Differential. The intraphysical consciousness projected in the psychosoma and the extraphysical consciousness – the deceased consciousness or the supraliving being, which normally manifests itself through the same vehicle, having already passed through the second death or, in other words, having deactivated the holochakra – present a number of differential characteristics when compared. This greatly aids in the identification of extraphysical consciousnesses encountered by the lucid projector in his/her experiences. The following are 17 notable examples:

1. **Cord.** The fundamental difference with regard to the psychosoma of the intraphysical consciousness and that of the extraphysical consciousness is in the connection with the human body – the silver cord – which is inevitably connected to it and, as free as it may be in the extraphysical dimension, in a projection in the psychosoma, will always be far more strongly bound than the healthy extraphysical consciousness that has already passed through second desoma.

2. **Holochakra.** The psychosoma of the projected intraphysical consciousness can exhibit the energies of the holochakra, including the dense irradiations of the human aura, which does not occur with the healthy extraphysical consciousness in the state of (extraphysical) coincidence, when it has already passed through second desoma.

3. **Resoma.** Resoma or human life itself is always a parody or a poor imitation, a copy of the extraphysical life of the extraphysical consciousness when free and healthy, or devoid of disturbances related to post-desomatic parapsychopathology, beginning with the possible manifestations of the psychosoma of the intraphysical consciousness that are greatly muffled or restricted with regard to sensations. Resoma is a process which is diminishing, funneling, delimiting, reducing, microsynthesizing and restricting for the ego or the extraphysical consciousness.

4. **Restriction.** Analysis of the extraphysical period of lucid projection leads the experienced projector to understand that in intraphysical life the intraphysical consciousness suffers a consciential restriction or constriction at a ratio of 1,000:1, or a reduction to one thousandth. This is similar to what happens regarding weight, between the human body and the psychosoma, when the intraphysical consciousness goes from having the sensation of weighing 154 lbs. (70 Kg) to the lightness of 2.47 oz. (70 g). This rationally indicates that the plenitude of consciential life is annulled at a level of 99.9%, with the physical restriction that is imposed through resoma or human existence.

5. **Period.** The difference between the *brief* extraphysical period of the intraphysical consciousness' projection and the *prolonged* interval between the extraphysical consciousness' human lives (intermissive period) shows the projector's consciousness that it is necessary to take advantage of the chance for extraphysical freedom as far as possible. This fact disturbs the intraphysical projector's choice regarding his/her mental targets, leading to indecision in his/her extraphysical behavior: simultaneous choices of destinations; interruptions due to interference from another chosen consciential target; gate-crashing-projection; and others.

6. **Perceptions.** From the data presented, it can be concluded that any comparison between the possibilities of the capacities and perceptions of the *intraphysical* projector, projected in the psychosoma, and the *extraphysical consciousness* manifesting through the same vehicle, will always result in the verification of a negative difference in manifestations, against the human projector. This generally starts at a ratio of 1:1,000 (99.9%) or at least on an order of 1:100 (99%).

7. **Weight.** The psychosoma of the projected projector, even without the holochakra and even when in a condition of low condensation, will always be denser and heavier than the psychosoma of the free extraphysical consciousness that is manifesting through this vehicle. This is because the projected projector does not lose the insertion of the silver cord in the psychosoma, as well as the remnants of semiphysical energies, which are always quite visible or perceptible and active.

8. **Volume.** The projector's psychosoma always appears *fatter, swollen* or apparently larger in volume than the *thinner* psychosoma of the extraphysical consciousness. This is not only due to density, through the silver cord when active, but is also due to the existence of the laden holochakra, which is *over* or interpenetrant with the psychosoma, which is a frequent occurrence during lucid projections.

9. **Self-luminosity.** The psychosoma of the extraphysical consciousness is more luminous, brilliant and transparent than the psychosoma of the projected intraphysical consciousness. This is due to his/her greater density, which gives him/her greater translucence or even complete opacity. It is also why the projected consciousness has difficulty in maintaining serenity and *natural* manifestations, including self-luminosity.

10. **Energy.** Physical energy, or that of the human body, which the psychosoma of the intraphysical consciousness carries with it when projecting, is so different in quality or nature from the energy of the psychosoma of the evolved extraphysical consciousness, e.g.: the helper, that it is used with the helper's orientation and aid in treating ill intraphysical consciousnesses and even extraphysical consciousnesses with post-desomatic parapsychosis during the experienced projector's assistential projections.

11. **Time.** The intraphysical projector who is more influenced by the conditioning of chronological time and only rarely has a free period of projection with full lucidity endeavors to take greater advantage of the opportunity. This makes it such that the events seem to transpire more rapidly for the projector, but this is not always the case.

12. **Transfigurations.** It is easier for the extraphysical consciousness to transfigure its lone, *streamlined* psychosoma or one that is devoid of the holochakra and the amount of dense physical matter, than it is for the projected projector to do so. This fact gives the ill extraphysical consciousness an advantage in confrontations with the projector which is projected from the human body in dimensions that are still very paratropospheric.

13. **Alterations.** Extraphysical consciousnesses more frequently present pathological alterations of the psychosoma, which does not easily occur with the psychosoma of the projected intraphysical consciousness. This fact favors the veteran projector.

14. **Performance.** The superexcitability of the projected projector when desiring to take maximum advantage of his/her *extraphysical minivacations* always impairs the full use of his/her possibilities for manifestation, as well as his/her choice of destination and performance outside the human body in general. This does not happen with the extraphysical consciousness, which is aware of its more permanent extraphysical existence.

15. **Confrontations.** The abovementioned aspects speak in favor of the fact that, in consensual confrontations during extraphysical attacks by ill extraphysical consciousnesses and in deintrusive tasks during projection, the projector always receives the cooperation of the helper, without which any extraphysical conflict would be impracticable. This is due to the disparity of forces that favors the extraphysical consciousness – even when it is an ill one – as long as it has a fair amount of consensual lucidity.

16. **Troposphere.** There are not as many healthy extraphysical consciousnesses on the terrestrial crust as one might presume. In certain localized areas, one can only find a considerable number of ill extraphysical consciousnesses that are in lack of physical energies (energivores) trying to satisfy their still human material sensations. In a rough comparison, it is not worthwhile for the *healthy* extraphysical consciousness to leave its comfortable *residential neighborhood* or extraphysical community located in a better extraphysical dimension only to lose its way in the dark meanderings of the *basfonds* of the paratropospheric dimension together with humans.

17. **Gravitation.** The gravitational force of this planet only exercises a relative influence upon consciousnesses that are disturbed by their psychological reflexes or on the occasions when they manifest with an excessively condensed psychosoma. However, this fact does not affect the healthy extraphysical consciousness, but can affect the projected projector, in certain circumstances.

153. COMPARISONS BETWEEN THE PSYCHOSOMA AND THE MENTALSOMA

Format. With respect to format, the consciential manifestations through the human body (or the unified body) occur along the longitudinal direction of the psychosoma. This is why the human is a social being that has a *long*, vertical, erect form (even when the upper and lower members are extended, lengthwise or longitudinal) and a center of gravity in the encephalic or superior extremity.

Omnidirectional. The consciential manifestations through the isolated mentalsoma occur through the universal component of *formlessness* or omnidirectionality. The *antigravitational* mentalsoma does not have length or a longitudinal direction.

Differential. The following are 20 differential factors that allow the consciousness to distinguish the vehicle of manifestation in which it is projecting on that occasion and the disparities between lucid projections in the psychosoma (always transporting the mentalsoma in the parabrains) and those in the isolated mentalsoma:

1. **Takeoff.** The takeoff of the intraphysical consciousness in the psychosoma can be perceived by the projector *throughout* his/her human body. The takeoff in the mentalsoma only occurs in the cortical area or only within the braincase (encephalon).

2. **Self-awareness.** The psychosoma enables levels of awareness above the ordinary, physical waking state. The mentalsoma permits the condition of cosmoconsciousness or maximal expansion of the consciousness (hyperacuity).

3. **Disconnections.** The psychosoma only projects from the human body in a simple or single disconnection. The mentalsoma projects from the psychosoma (parabrains) while the latter is coincident with the human body or even when it is discoincident, at a distance from the human body. In this case, a double disconnection occurs.

4. **Dimensions.** The psychosoma only travels in paratropospheric or crustal extraphysical dimensions and in native or pure dimensions. It also permits direct manifestation with the physical, human dimension, including telekinesis and other phenomena, acting at a *motor* or even tactile extraphysical level. The mentalsoma enables understanding from a *mental* or maximal transcendent visual perspective, although it does not permit motor or tactile manifestation, acting at a direct and pure consciousness-to-consciousness level.

5. **Coincidences.** The psychosoma always renews its *coincidence* with new human bodies (somas) during lifetimes. The mentalsoma always remains at the same coincidence with the psychosoma until the third desoma.

6. **Form.** The psychosoma has some type of humanoid or other form. This is due to the transfigurations and self-transfigurations that are *seen* and *perceived* by the consciousness, including extraphysical clothing. The mentalsoma is formless or incorporeal. In fact, the term *body* is not even appropriate for naming it as a vehicle. The consciousness feels *invisible* even to itself in this vehicle.

7. **Growing.** The psychosoma continues to insert the four-dimensional, humanoid form of its evolution, until reaching adult human form, at which point it no longer grows. The mentalsoma always *grows* in some manner during the evolution of the ego.

8. **Connection.** The psychosoma *ostensively* and manifestly presents the action of the silver cord, particularly its retractable function, aside from various other defined aspects. The subtle golden cord, which connects the psychosoma to the mentalsoma, is not a visualizable intercorporeal element like the silver cord.

9. **Appendices.** The psychosoma, besides presenting a connection belonging to the human body – the silver cord – has the golden cord, which is its own connection with the mentalsoma. To our knowledge, the mentalsoma has no intercorporeal connection of its own.

10. **Weight.** The psychosoma provides the consciousness with a certain *sensation* of weight, albeit an extremely minor one, being hypothetically one thousandth of the weight of the human body. The mentalsoma does not allow the consciousness to perceive any sensation of weight.

11. **Emotionalism.** The psychosoma – the vehicle of emotion, the emotional body or that of desires – exacerbates the projector's emotionalism, that is common in his/her ordinary, physical waking state. The mentalsoma does not enable coarse emotionalism.

12. **Influences.** The psychosoma permits extraphysical attacks upon the projected projector by extraphysical consciousnesses and the performance of deintrusive projections. The mentalsoma neither allows extraphysical attacks nor does it allow deintrusive projections in the manner that it is performed. This is because the extraphysical approach occurs in the mentalsomatic dimension.

13. **Parapsychism.** The psychosoma enables the projected projector to operate as a sensitive when in the extraphysical dimension, in manners similar to those used in the intraphysical dimension or human life. The *parapsychic* perceptions, including the performance of a more ample parapsychism, are more advanced when the consciousness is operating in the mentalsoma.

14. **Participation.** The consciousness, when operating in the psychosoma, is more of a participant (protagonist) than an observer (spectator) of extraphysical events. The consciousness, when manifesting through the mentalsoma, is fully an observer, within its possibilities to do so and only participates in the facts *mentally*, or in a mentalsomatic dimension.

15. **Communication.** The psychosoma allows the consciousness to articulate extraphysical speech or *mechanicoid* transmental dialogue. The mentalsoma only enables pure extraphysical telepathy, including *conscientese*, and no other process of communication.

16. **Gravitation.** The consciousness, when projected in the psychosoma, can feel the action of gravitational and geoeenergetic forces upon it in certain paratropospheric extraphysical environments. These same forces never act upon the mentalsoma.

17. **Currents.** The consciousness, when projected in the psychosoma, can be carried along by extraphysical force currents which, in turn, are not active in the mentalsomatic dimension where the mentalsoma manifests.

18. **Tempests.** The consciousness projected in the psychosoma can feel certain effects of *extraphysical hydromagnetic tempests* which, in turn, are not active in the mentalsomatic dimension where the mentalsoma – the parabody of discernment – manifests.

19. **Visualization.** The psychosoma is *visualized* by a greater number of consciousnesses in 3 dimensions: the dense physical or human dimension (apparition of the projected intraphysical consciousness and physical bilocation), the paratropospheric extraphysical dimension and the *native* extraphysical dimension per se. The mentalsoma is *not* visualized by the extraphysical consciousnesses of these 3 dimensions and its presence is perceived in a different manner, at a purely parapsychic level, in the mentalsomatic dimension.

20. **Repercussions.** The psychosoma predisposes the occurrence of well-defined physical and extraphysical repercussions. The mentalsoma can detect the occurrence of some disturbance with the human body, although it does not allow the consciousness to suffer extraphysical traumas at a distance from this same human body.

Psychosoma. The consciousness that predominantly uses the psychosoma over the mentalsoma, besides leaning towards emotionalism, evidences at least the following 6 tendencies:

1. **Symbols.** He/she endeavors to express him/herself more through symbols, images or icons, in the form of objects, instead of concepts.

2. **Crutches.** This *psychosomatic* person still relies upon a greater number of psychophysiological *crutches*.

3. **Insecurity.** He/she is more needy than secure.

4. **Limitation.** His/her horizon or consciential microuniverse is more limited.

5. **Impoverishment.** His/her thoughts are impoverished and therefore closer to illogicalities, mental deficiencies, demential states and psychoses, and further from true maturity of the mentalsoma.

6. **Discordance.** His/her thoughts or thosenizations are still in stark discordance with the objective reality of the consciential dimension wherever he/she is.

Mentalsoma. The consciousness that predominantly uses the mentalsoma over the psychosoma evidences at least the following 8 more evolved tendencies:

1. **Agreement.** His/her thoughts are in greater agreement with the objective reality of the dimension of consciential life where he/she is on that occasion.
2. **Concepts.** He/she is able to express him/herself with concepts and not only with symbols.
3. **Dispense.** He/she dispenses with psychophysiological crutches.
4. **Maturity.** He/she has already discovered the value and necessity of consciential maturity.
5. **Microuniverse.** He/she has a more ample horizon or consciential microuniverse.
6. **Rationality.** He/she bases him/herself in rationality and not emotionalism.
7. **Security.** He/she is more secure than needy.
8. **Self-thosenes.** He/she enjoys a richer mental life and more productive self-thosenes.

Emotions. There is an evolutionary passage, born of balance and discernment, from the human-animal to the human-consciousness.

Aura. Any very strong sentiment charges the entire human body, energizes the mind and alters the coloration of the aura and the psychosoma.

Instincts. The consciousness that still lives more with the psychosoma is susceptible to being easily dominated by instinctive emotions, whether they are: aggression, anger, avarice, courage, despair, disagreement, disharmony, egoism, envy, equanimity, fear, frustration, grief, hate, hostility, indifference, jealousy, passion, possessiveness, rivalry, sadness, shame, vanity, violence and others.

Exchange. The consciousness that makes an effort to live more with the mentalsoma exchanges the above-cited sensations for positive elevated sentiments, or rationalized emotions, such as: agreement, compassion, disinterested friendship, fraternity, happiness, harmony, kindness, pure love, a sense of humanity, serenity, understanding and others.

Bibliography: Greene (635, p. 49), Vieira (1762, p. 73), Walker (1782, p. 296).

154. COMPARISONS BETWEEN THE MENTALSOMA OF THE INTRAPHYSICAL AND EXTRAPHYSICAL CONSCIOUSNESS

Different. According to logical suppositions derived from extraphysical facts, the intraphysical consciousness projected in the mentalsoma presents at least the following 6 basic characteristics which are different from the mentalsoma of the extraphysical consciousness:

1. **First.** The mentalsoma – in the mentalsomatic projection of the intraphysical consciousness, which leaves the state of coincidence of the ordinary, physical waking state and has still not gone through any of the 3 desomas – is different from the mentalsoma of the extraphysical consciousness with regard to lucid projection. Firstly, this extraphysical consciousness has already passed through deactivation of the human body and, depending upon the interval between its first and second desoma, is less likely to leave the psychosoma immersed in post-desomatic disturbance or in the phase of restorative sleep, as it is temporarily *more bound*.

2. **Second.** The mentalsoma – in the mentalsomatic projection of the intraphysical consciousness that has not yet passed through any of the 3 desomas – is different from that of the extraphysical consciousness, which has already passed through the second desoma, mainly with regard to a greater difficulty in exteriorizing. The extraphysical consciousness that has had its human body and holochakra deactivated is *less bound* and more inclined to have projection in the mentalsoma.

3. **Third.** The mentalsoma – in the mentalsomatic projection of the intraphysical consciousness who has not yet passed through any of the 3 desomas – is obviously very different from the free mentalsoma of the extraphysical consciousness that has already experienced the 3 desomas and has achieved the condition of free consciousness, therefore being beyond the prison of the evolutionarily inferior vehicles of manifestation.

4. **Takeoffs.** The extraphysical consciousness takes off from its *free psychosoma*, with the mentalsoma enjoying a much greater ease than the intraphysical consciousness who always has his/her *psychosoma bound* to the human body.

5. **Relief.** In the act of resoma, the following incorporate themselves into the human body simultaneously: the ego, the mentalsoma, the psychosoma and the foundations of the holochakra. In the act of desoma, the intraphysical consciousness, in the mentalsoma, is relieved of the human body (first desoma) and the holochakra (second desoma), remaining only with the psychosoma.

6. **Restriction.** The mentalsoma of the intraphysical consciousness undergoes *double restriction*: *inside* the psychosoma and *inside* the human body. The mentalsoma of the ordinary extraphysical consciousness experiences only a single restriction: *inside* the psychosoma.

Metaphor. Incidentally, the physical restriction imposed upon the consciousness, through the law of successive lives from biological conception to adulthood, can be better understood as consciential evolutionary impulsion by way of metaphor. The gardener goes to the garden and prunes and cuts the entire rosebush seeming to kill it, leaving only the stump of the trunk of the mutilated rosebush. Time passes, however, and during the subsequent summer the rosebush reappears, flowering exuberantly, with greater vigor and lushness.

Adaptation. The more unconsciously adapted the intraphysical consciousness is to the human environment, the less he/she feels the physical restriction of human life. He/she is fully well-adjusted – like an *autochthon* – to his/her environment or *habitat*.

Maladaptation. On the other hand, the more evolved the intraphysical consciousness is, the more consciously aware he/she is of the condition of physical restriction and the more effort he/she makes in order to disentangle him/herself from it. He/she thus lives in an instigating, challenging and conscious maladaptation, that is a function of successive lives. With this the individual amplifies his/her consciential powers and the scope of his/her interworld or multidimensional influence.

Ignorance. The more adapted the intraphysical consciousness is to the condition of physical restriction, the less harm he/she can inflict upon others. This is because he/she neither has the means nor the skill (*evolutionary know-how*) to expand his/her powers of consciential action. The wrongs performed by the individual are singularly restricted to the limits of the physical surface of the illusory world of matter.

Limitation. Thus, the condition of physical restriction, in and of itself, naturally delimits the possibilities of the intraphysical consciousness' action. This also signifies that all human wrongs, although a lamentable fruit of ignorance, and unnecessary up to a certain point, are always confined within the cosmos, are circumscribed, limited and relative.

Animal. The subhuman, wild, instinctive, violent animal remains constantly ready and continuously anxious to physically eliminate another animal (often a sibling), if possible with its own claws and teeth, in the constant struggle for survival or, in other words, the maintenance of its own physical life.

Weakness. Its power is *weak*, however, because its thought or *self-thosene* (zoothosene) is impotent.

Ineptitude. The human consciousness who wishes to inflict harm upon social beings, always fighting in some way in defense of its instinctive human body, is still not very distant from this unevolved condition of the wild animal, although he/she has cerebral hemispheres with greater consciential possibilities – a fact he/she is unaware of – which he/she obviously does not know how to use (evolutionary ineptness) to the full extent of its resources.

Restraint. Neither – dominated by the instincts characteristic of the animal body and the emotions characteristic of the psychosoma – possess the mental resources and are unable to achieve extensive results in their actions because they are naturally restrained and circumscribed by the condition of physical restriction of the consciousness.

Brain. Every intraphysical consciousness uses a greater or lesser but extremely individual percentage of the functional resources of the cerebral hemispheres. The more optimistic conventional sciences accept that when an individual is using his/her brain at a high level, the brain is still only using 21% of its potential, the remaining 79% thus being idle.

Violence. The act of violence is one of the more characteristic and typical signals of consciential adaptation to the condition of physical restriction of the intraphysical consciousness.

Control. It can easily be concluded that any act of violence in any part of the physical universe, as drastic as its apparent collective reflexes may seem, always has limited repercussions that are already forecast by other consciousnesses which are free from consciential restriction, are an *infinite number of evolutionary light-years ahead* and in greater control of everything that is happening here.

FCs. These consciousnesses – free consciousnesses or FCs – have already freed themselves from the condition of physical restriction, violence, animal emotions and the dominating influence of the emotional parabody in order to act with full consciential maturity directly through the mentalsoma (the parabody of discernment) through cosmic, extremely elevated sentiments, or with the rationalized emotions of greater holomaturity. This is the experience of continuous or permanent cosmoconsciousness.

Order. The holosomatic evolutionary conquests of the consciousness over itself presents a correct and ideal order that is better than others, as it is more efficient: the order of the (naturally ascending) crescendo.

Mastery. With regard to its vehicles of manifestation, the consciousness firstly needs to master the more rudimentary manifestations of the human body; then the manifestations of the consciential energies of the energetic parabody (holochakra); followed by the manifestations of the animalized emotions; and, lastly, the modelings of the mentalsoma.

Alteration. Any alteration of this logical order of evolutionary conquests still brings incurable gaps to the overall harmony of the consciousness’ microuniverse.

155. RELATIONSHIPS BETWEEN CONSCIENTIAL VEHICLES AND CONSCIENTIAL PHENOMENA

Patterns. In a comparison between the 4 vehicles of manifestation of the consciousness and the dozens of phenomena of projectiology, certain patterns clearly and logically emerge which, by being emphasized, enhance the precision and raise the level of understanding in the field of analysis of conscientiology in general.

Predominance. Some consciential phenomena presented may be controversial when they are subordinated specifically to one position, in a scale of development. However, maximum consensus needs to be attempted based upon a variable that is considered to be fundamental: the possible predominance of the manifestation of the consciousness based upon one vehicle in the generating acts of each phenomenon. Evidently, the level of evolution of the predominant consciential vehicle can be the factor which determines the evolutionary level of the phenomenon.

Scale. This is why, upon establishing a scale of ascending evolutionary magnitude of projectiological phenomena, based upon a predominant consciential vehicle, or 2, 3 or 4 vehicles of consciential manifestation that operate in sequence, there are 10 blocks of phenomena (see fig. 155).

Blocks

1	<i>Human body</i>			
2	Human body	Holochakra		
3	Human body	Holochakra	Psychosoma	
4	Human body	Holochakra	Psychosoma	Mentalsoma
5		<i>Holochakra</i>		
6		Holochakra	Psychosoma	
7		Holochakra	Psychosoma	Mentalsoma
8			<i>Psychosoma</i>	
9			Psychosoma	Mentalsoma
10				<i>Mentalsoma</i>

Figure 155

1. **Human body:** included here are all the phenomena which are only restricted to conventional anatomy, physiology and psychology, researched by official science or perspectives which are exclusively physicalist with regard to the ego. It should be stressed, however, that many physiological and pathological manifestations still involve the holochakra and other vehicles of consciential manifestations, hence the existence of acupuncture, do-in, acupressure and homeopathy.

2. **Human body and energetic parbody:** self-telekinesis; extraphysical double vision. Based on this phenomenological block, projectiological occurrences – researched by projectiology, or by holistic approaches to the ego – have their beginnings.

3. **Human body, holochakra and psychosoma:** animic or projective poltergeist; animic or projective raps; classic physical bilocation; consciential self-bilocation; external autoscopy; extraphysical repercussions during consciential projection; extraphysical telekinesis; human parateleportation; physical repercussions during consciential projection; projective catalepsy; projective ectoplasmy; resuscitative projection; semimaterialization; sonorous projection; the state of suspended animation; waking dis coincidence.

4. **Human body, holochakra, psychosoma and mentalsoma:** cardiac self-desoma; double awareness; double projection; extraphysical precognition; extraphysical retrocognition; internal autoscopy; phenomena concomitant with lucid projection; projective déjà vu; self-psychophony; traveling clairvoyance; umbilical self-desoma; voluntary self-combustion.

5. **Holochakra:** extraphysical parapyrogenesis; physical multilocation.

6. **Holochakra and psychosoma:** exteriorization of motricity; exteriorization of sensitivity; extraphysical clairvoyance; extraphysical elongation; extraphysical projective psychophony; false arrival; farewell projection; projective heteroscopy; projective pneumatophony; projective psychography; semifinal projection.

7. **Holochakra, psychosoma and mentalsoma:** creation of morphothosenes; extraphysical psychometry; extraphysical self-transfiguration; possessive projection; projective psychophony; zoanthropy.

8. **Psychosoma:** extraphysical euphoria.

9. **Psychosoma and mentalsoma:** extraphysical intuition; extraphysical telepathy.

10. **Mentalsoma:** conscientese; cosmoconsciousness.

Frequency. The specific consciential phenomena of intraphysical consciousnesses are included from phenomenological block 1 up to phenomenological block 4, but they even reach phenomenological block 10. The phenomena of projectiology more often occur in the area of phenomenological block 3 or, in other words, with the soma, holochakra and psychosoma together. This is to be expected, in light of our condition as intraphysical beings. For the same reason, soon thereafter the most often encountered projectiological phenomena fall within phenomenological block 4, or when the 4 vehicles of consciential manifestation act together. The consciential phenomena characteristic of extraphysical consciousnesses begin at phenomenological block 5 and span up to phenomenological block 10.

Energies. Strictly speaking, consciential energies come into play and participate in some manner in the development of every consciential phenomenon. What varies in each case is the nature or type of acting energy. Listed here are those projectiological phenomena in which consciential energy is the predominant, main factor, based upon the holochakra. These phenomena basically depend upon the mild or impactful consciential energies involved.

Phenomena. The mentalsoma obviously participates in every consciential phenomenon. However, it does not participate directly in the development of unconscious consciential phenomena.

Self-bilocation. The fact that one consciential vehicle predominates in the development of a projectiological phenomenon can be better approached and understood more simply. For example, upon studying the phenomenon of consciential self-bilocation and the human body, the real engine of the phenomenon, or that which actually generates consciential self-bilocation, is the holochakra, which allows the consciousness to generally see the human body through the psychosoma.

Déjà vu. It merits noting the fact that in projective déjà vu (block 4), the projected consciousness, in a first phase, sees something or experiences a certain extraphysical activity through the psychosoma

and, in a second phase, recalls the extraphysical occurrences through the human body in the ordinary, physical waking state. When the intraphysical consciousness is projected he/she experiences the déjà vu directly through the psychosoma, in most experiences. However, only the integral memory (holomemory), an attribute of the consciousness headquartered in the mentalsoma, is able to unite the two phases to compose the phenomenon of projective déjà vu.

Evolution. It can be verified that the greatest number of projectiological phenomena occur by way of the holochakra (energetic parabody) and the psychosoma (emotional parabody). This is coherent with human reality, because it corresponds precisely to the nature and evolutionary level of this planet. In the analysis of psychological phenomena, the human body predominates in the phenomenological set. In this projectiological analysis, immediately following the human body – which allows the consciousness to manifest in the concrete physical dimension of the forms and space of this planet – is the (as yet animal) psychosoma, which transports the consciousness and obviously predominates in the consciential dealings in this environment. Hence the characteristics of this scale, as well as the fact of the still considerable predominance of immaturity and emotionalism in human proceedings.

156. RELATIONSHIPS BETWEEN CHAKRAS AND CONSCIENTIAL PHENOMENA

Analysis. In analyzing the dozens of phenomena of projectiology relative to the chakras, the importance of the role played by the holochakra (energetic parabody) in the development of the human consciousness stands out.

Scale. The following is a list of the major chakras and the most common projectiological phenomena, presented in decreasing importance with regard to the 7 levels of energetic centers:

1. **All:** all the chakras together or the entire holochakra; self-telekinesis; double projection; extraphysical psychometry; waking disincidence; state of suspended animation; physical multilocation; extraphysical elongation; farewell projection; human parateleportation; resuscitative projection; projective pneumatophony; semifinal projection; zoanthropy; extraphysical repercussions during lucid projection; voluntary self-combustion; traveling clairvoyance.
2. **Coronochakra:** projective catalepsy; double awareness; projective déjà vu; extraphysical precognition; extraphysical retrocognition; projective psychography.
3. **Frontochakra:** extraphysical double vision; consciential self-bilocation; internal autoscapy; extraphysical clairvoyance; projective heteroscopy.
4. **Laryngochakra:** extraphysical projective psychophony.
5. **Cardiochakra:** cardiac self-desoma; exteriorization of sensitivity.
6. **Umbilicochakra:** (almost always involving the sexochakra and the splenochakra): projective ectoplasmy (vegetative); semimaterialization; animic or projective poltergeist; animic or projective raps; sonorous projection; extraphysical telekinesis; umbilical self-desoma; extraphysical parapyrogenesis; exteriorization of motricity; false arrival.
7. **Sexochakra:** interconsciencial possession; *congressus subtilis*.

VI - Philosophical Perspectives

157. PROJECTIOLOGY AND PHILOSOPHY

Definitions. Philosophy: the organized system of knowledge that seeks to explain the universe, the natural forces that operate within it, the purpose of existence, the correct manner for one to organize and live one's life, the relationship between humankind and the universe, and interrelationships within humankind; the science that studies all things through their fundamental reasons, acquired in light of natural reasoning.

Synonymy: culture of knowledge; extension of sciences; gnosis; investigation of knowledge; science of reasoning; set of doctrines; set of specific knowledge; wisdom.

Reason. It is a commonly accepted fact among the greatest researchers that science does not exist without philosophy. There are those who affirm that it would not be inaccurate to consider all sciences as subdisciplines of philosophy. Hence the reason for this section in this book.

Interpretation. The complete absence of a philosophy of life is as harmful as a false philosophy. To have an interpretation of the meaning of existence based on solid foundations is what most intraphysical consciousnesses wish, above all, to have. Projectiology can offer this.

Solution. Strictly speaking, there does not seem to be another solution, as seen in the following: the lucid human projector, upon discovering and experiencing other consciential dimensions – which surpass the restricted possibilities of merely physical experimentation of contemporary science – can only live in peace, firstly, through a philosophy based in multidimensionality; secondly, through projectiology, the science of multidimensionality.

Conceptualizations. When lucid consciential projections register, organize and transmit new concepts of the reality of the cosmos to human beings, they lead the individual to well-defined philosophical conceptualizations, such as the following 5, among many others:

1. **Metempiricism.** The extraphysical experiments would be metempiric as they are beyond empiricism, or in a condition the knowledge of which cannot be achieved through ordinary sensorial experience.

2. **Reevaluation.** Lucid consciential projection prompts the projector to *rethink* his/her entire existence or, in other words, the effect of addressing anew all of humankind's traditional problematic questions with a renewed sense of critiquing and greater depth, leading the projector to general redefinitions or the essential recycling of human existence.

3. **Quintessence.** The mentalsoma, frequently referred to in this book, would be the vehicle of manifestations of the quintessence of the ego, according to the concepts of Aristotle.

4. **Hyperuranus.** The mentalsomatic dimension, in turn, would be the hyperuranus according to Plato, the ideal world or that of the free consciousness.

5. **Universalism.** Universalism, derived from experiments with lucid consciential projection, is undoubtedly the true, well-defined and characterized philosophical doctrine. It will be addressed at a later point. It is not a compromised or closed philosophy, but an open, literally *universal* one devoid of factions.

Sciences. Philosophy maintains general relationships with all sciences and special relationships with each science.

Bases. Each science presents two bases:

1. **Experimentation.** A solid experimental base.
2. **Speculation.** A purely speculative part.

Projectiology. The science of consciential projection presents a purely scientific base – projectiology – and a characteristically philosophical part: *projectiosophy*, or projectionism.

Philosophosis. Contemporary common philosophy suffers the chronic disease of *philosophosis*: it remains mired in circumlocution, addicted to repetition, suffering from a lack of copy desk editing. The practice of lucid consciential projection provokes the remission of philosophosis.

Axioms. Projectiology, as all sciences, shares with philosophy the need to formulate presuppositions or axioms that can neither be proven nor disproven.

Projectionism. Projectionism is not a religion, a belief, a rationalized faith, Christian rationalism, a universal panacea or religiosity.

Multidisciplinarity. Projectionism is an area or scientific subdiscipline linked to conscientiology with multidisciplinary reflections that is a field of knowledge and animic-parapsychic research derived from an altered, albeit physiological or paraphysiological state of the consciousness.

Act. Philosophy and ideology can only act as *gray eminences* of the science of *projectiology*. Philosophy is always necessary and ideology will always be partial and fragmentary, with a function that is precisely opposite to that of science, namely to hide the real contradictions.

Elimination. Projectiology, as self-revelation – scientific, in this case – will permit the consciousness to eliminate at least the following 7 millenary lacunae:

1. **Self-sufficiency.** Eliminate the need for new revelations and religious beliefs, thus making one more self-sufficient.
2. **Experimentation.** Eliminate religious faith or belief of any type through personal experimentation.
3. **Discernment.** Eliminate fanatic religiosity by the use of a more ample discernment.
4. **Direction.** Eliminate human and extraphysical intermediaries (sensitives, archetypes and mythological blind guides) in interconsciential and multidimensional coexistence.
5. **Rationality.** Eliminate animal emotionalism, emphasizing rational, logical, reflexive and ponderous decisions in daily life.
6. **Parapsychism.** Eliminate mysticism in general, which only exists due to extraphysical inexperience or immaturity, through the libertarian self-experiences of the intraphysical consciousness.
7. **Evolution.** Eliminate, with time and new existences, the use of one's own psychosoma, finally becoming a free consciousness (FC).

Knowledge. The consciousness begins to obtain essential knowledge or precise information regarding life and the universe directly for itself in the mentalsomatic dimension, by way of the mentalsoma.

Principles. Projectiology instills the progressionist tendency of the intraphysical consciousness to live more by emancipatory personal principles than by human interest, personal desire or rules, even those which are ancestral or traditional but are outdated in the face of consciential evolution.

Proselytism. The individual process of consciential realization, the theory of successive intraphysical lives (existential seriation), the theory of holokarma, the theory of the clarification task and other principles identified by projectiology do not lend themselves to proselytism, catechesis or systematic indoctrination. They are deeply restricted to personal responsibility and occur with the intraphysical consciousness who is interested in learning by him/herself (self-education), performing his/her own research and achieving greater self-knowledge with his/her own motivation. It is futile to erroneously or uselessly attempt to profane the micro-universe of others (inculcation) who are not motivated or, more precisely, are immature in regard to these leading-edge relative truths.

Doctrines. In this book, there are direct analyses of lucid projection in light of diverse doctrines and lines of philosophy, such as the following 5:

1. Existential seriation (multiexistentiality, holoresomatics).
2. Materialism.
3. *Naphology*.
4. Universalism.
5. Yoga.

Complementary. Besides these, technical indications are found in the International Bibliography on works that address projectiology themes but specifically deal with complementary subjects, such as the following 22:

1. Anthroposophy.
2. Cabalism.
3. Castanedism.
4. Catholicism.
5. Christianity.
6. Esoterism.
7. Eubiosis.
8. Evangelism.
9. Hagiology
10. Hinduism.
11. Huna (*Hunismo*).
12. Jungianism.
13. Law.
14. Magic.
15. Rosicrucianism.
16. Shamanism.
17. Spiritism.
18. Swedenborgism.
19. Theosophy.
20. Umbandism.
21. Voodooism.
22. Zen Buddhism.

Tests. This section entitled *Philosophical Perspectives*, could also be called *Philosophical Projectiology*, not because it is not scientific, but because a good part of the best theorizations presented in these areas have still not been subjected to decisive scientific tests, because we have not yet discovered adequate scientific equipment to present quantitative pronouncements regarding this research.

Bibliography: Alexandrian (11, p. 288), Fisichella (520, p. 14), Plato (1271, p. 487), Plutarch (1264, p. 162), Rogo (1444, p. 183), Wang (1794, p. 13), Wheatley (1825, p. 5), Wolman (1863, p. 757).

158. THEORY OF PROJECTABILITY

Definition. Projectability: the animic faculty that can be essentially intraconsciential, acting without the help of other consciousnesses, or the consciential condition whereby the consciousness projects from the human body in the psychosoma, or projects itself outside both the physical body and psychosoma at the same time, in the mentalsoma, in both cases with regard to the intraphysical consciousness; or projects itself from the psychosoma only, in the mentalsoma, in this case with regard to the extraphysical consciousness.

Synonymy: astral power; consciential looseness; existential anti-seriation; faculty for projecting phantasms; gift for consciential projection; metaphysical power; projectiogenics; projectional capacity; projective ability; projective appetite; projective capacity; projective competence; projective faculty; projective performance; projective potency; projective potential; projective quality; projective talent.

Nature. Projectability, or the fundamental capacity of the projector to project, is neither a hereditary gift nor an exclusive privilege of anyone in particular, as it is inherent in children, men and women, as well as extraphysical consciousnesses.

Paraphysiology. All intraphysical and extraphysical beings have some rudiments of projectability. This condition is thus not pathological, being essentially physiological or, more precisely, paraphysiological.

Classification. Projectability, just as parapsychism, can be classified into two categories:

1. **Human**, as it manifests itself from the intraphysical dimension or, in other words, that of the intraphysical consciousness.
2. **Extraphysical**, that which is characteristic of the extraphysical consciousness.

Animism. Human projectability constitutes a characteristic essential type of animism, just as a certain type of paraperceptology is characteristic of parapsychism.

Explanation. Human projectability, which can even be an involuntary aptitude, explains why some people have a greater tendency than others to experience lucid projections of the consciousness from the dense body, not only spontaneously but also through intentional projection induced by the will.

Use. Projectability, as a human attribute, strictly speaking, has its roots in the unified body complex, or the physical-holochakra-psychosoma-mentalsoma-ego (holosoma) complex. It is independent of both the moral development of the projector, as well as his/her own full self-awareness of this animic condition (pertaining to the intraphysical consciousness).

Prevention. This means that *average projectability* alone is no assurance against *low morality*. The intraphysical consciousness does not become respectable just by having a lucid projection.

Qualification. The applications of projectability can be positive or negative, in accordance with the qualities and actions of the intraphysical consciousness.

Problems. All applied science presents moral problems that need to be confronted instead of avoided. We need only look at what is occurring at the end of this twentieth century, in the various areas of bioethics research (abortion, *surrogacy*, euthanasia, artificial insemination, transsexual operations, organ transplants) and their consequences.

Cosmoethics. In spite of everything, the genuine quality with which the intraphysical consciousness projects itself outside the human body becomes, in and of itself, irresistibly ethical, and those who develop their ethics *highly* – which only happens in accordance with cosmoethics, an indispensable prerequisite – naturally become responsible and do not use them spuriously or in order to harm others.

Mentalsoma. For instance, it is impracticable for the consciousness when manifesting itself in the mentalsoma, to reach the pure mentalsomatic dimension without really demonstrating ethical intangibility according to cosmoethics. Otherwise, one attitude will naturally exclude the possibility of the other.

Development. Human projectability is developed through the improvement of the performance of the intraphysical consciousness dedicated to proper exercise and training aiming to produce lucid projections in series.

Dedication. Projectability, in order to be developed, requires dedication and training on the part of the consciousness, as with any type of physical, intellectual, artistic or parapsychic improvement.

Recess. By merely waiting passively for spontaneous projections to occur, the projector will end up having natural periods of projective recess.

Predisposition. For this reason, the most intelligent approach, if someone wishes to develop psychophysical faculties, is to be willing to voluntarily provoke lucid projections, producing them with rationality, and cultivating them without discouragement.

Barriers. The most common barriers to the development of projectability are generally the following 8 variables:

1. Fear or projectiophobia.
2. The condition of *abdominal brainwashing*.
3. A hectic human life.
4. A lack of study on the subject of lucid projection.
5. A lack of motivation to project lucidly.
6. Mental indiscipline or lack of self-organization.
7. Bad intentions (unqualified intentionality).
8. Negative autosuggestions, such as: “I will never be able to project myself.”

Manifestations. Projectability can manifest more intensely in 3 different circumstances of human existence:

1. **Irruption.** In the irruption of involuntary lucid projections or those which are beyond the direct control of the intraphysical consciousness.

2. **Self-awareness.** In the production of voluntary lucid projections or those which are derived from the direct deliberation or the intraphysical consciousness who is self-aware with regard to projective phenomena.

3. **Potency.** In the sudden and exuberant awakening of a latent *projective potency*, triggered by diverse factors, such as the following 3:

A. **Paragenetics.** The immersion of the intraphysical consciousness into self-awareness of the projective phenomenon due to training performed in previous intraphysical existences (paragenetic parapsychism).

B. **Parapsychism.** Certain predisposing and special parapsychic conditions of human existence, the causes of which are still unknown.

C. **Health.** Cases dependent upon psychophysical equilibrium, health-illness, which affect the human being.

Bibliography: Armond (53, p. 14), Butler (227, p. 69), Guéret (659, p. 162), Norvell (1139, p. 150), Rigonatti (1402, p. 163), Rogo (1444, p. 1), Vieira (1762, p. 177).

159. THEORY OF THE LEADING-EDGE RELATIVE TRUTHS OF PROJECTIOLOGY

Definition. Leading-edge relative truth of projectiology: the maximal temporary reality for the intraphysical consciousness who is lucid with regard to his/her own practical life in multidimensionality.

Synonymy: hot subject of projectiology; precursory relative truth of projectiology; synthesis of projectiology; vanguard relative projectiological truth.

Premise. In the same way that, for us, no perfect consciousnesses, completely pure social beings, perfect works or definitive perfection exist, neither absolute nor eternal truth exist. Only relative truths are valid for us, which are permanently subject to refutations of all origins and types. This is the basic premise of science, the fundamental postulate of epistemology and rational research in general.

Controversy. The acuity of the intraphysical consciousness always passes first through the ordinary or rearguard relative truth, which is already established and pacific or is already *settled*. Only then, with lucidity and personal choice, does the consciousness attain the *new, hot off the press*, leading-edge or vanguard relative truth that arrives gradually, positioned right in the *eye of the storm* of controversy in the initial state of pre-science.

Superiority. To those egos who first grasp it, this leading-edge relative truth evidences its *status* of unmistakable superiority in relation to that relative truth which is already established and with which no one any longer exerts consciential effort, energy, space and time to prove, and which may now be out-of-date.

Yield. As a pattern of manifestation, leading-edge relative truth – although more difficult to choose and experience – always tends to produce more, conscientially speaking, in favor of evolution

of the ego itself and other surrounding consciousnesses. This is because the ego will always base itself on the highest or maximum conceivable common denominators.

Stages. In the development of the relative truths that directly interest us here, ranging from the rearguard to the vanguard of consciential experiences, we encounter 3 clear stages:

1. **Projectiology.** The theories of projectiology lead the ego to an understanding of the concept and experiential application of projectability.

2. **Projectability.** The advanced performance of projectability gradually leads the ego to the condition of consciential holomaturity or, in other words, organic, psychological and integral maturity.

3. **Holomaturity.** When consciential holomaturity is acquired, it leads the ego to the understanding of and the more intelligent option of applying leading-edge, relative truths, namely those relative truths found to be philosophically and scientifically at the vanguard of multidimensional or projectiological evolutionary research.

List. The following is a list of 20 leading-edge, relative truths of projectiology in a comparison with their alternatives. Common or rearguard truths are listed first, followed by their corresponding leading-edge or vanguard truths:

1. **Wholesale.** Choice of a *retail* approach vs. Choice of a *wholesale* approach.
2. **Clarification task.** Assistential task of consolation vs. Assistential task of clarification of consciousnesses.
3. **Polykarma.** Egokarmic and groupkarmic accounts vs. Prioritization of the polykarmic account.
4. **Self-awareness.** Faith of any type vs. Multidimensional self-awareness.
5. **Free will.** A resigned condition of abdominal brainwashing vs. Conscious derepressions with prioritizations based on free will.
6. **Existential program.** Personal impulsion of doctrines and beliefs vs. Personal impulsion of one's own principles for living human life and completing the personal existential program.
7. **Mentalsomatics.** Life led by the psychosoma vs. Life led by the mentalsoma.
8. **Cosmoconscientiology.** Egoistic cosmoconsciousness vs. Communicative cosmoconsciousness (state of cosmic consciousness).
9. **Cosmoethics.** Defense of the human moral vs. Applied (consciential impeccability) cosmoethics (cosmic moral).
10. **Universalism.** Parochial sectarianism vs. Open universalism.
11. **Holochakrology.** Indifference toward bioenergy vs. Practical holochakral self-awareness.
12. **Holobiography.** Living a repetitive human life vs. Self-awareness of the applied multiexistentiality of the consciousness (holobiography and existential completism).
13. **Penta.** The receiving of simple *mediumistic energetic passes* vs. The performance of penta.
14. **Bait.** The constant experiencing of unconscious mini-intrusions vs. Self-awareness of the condition of *extraphysical bait* in search of the experience of being a consciential epicenter.
15. **Self-projectability.** Mere nonlucid consciential projections vs. The production of projections with continuous self-awareness.
16. **Will.** Enslavement to parapsychological *crutches* vs. Experiences through the impulsion of the will, with self-discernment.
17. **Self-control.** Manifest personal insecurity vs. Self-control with lucid ambiguities (pattern-behavior and exception-behavior).
18. **Self-education.** Mere academic or orthodox specialism vs. A predominance of generalist self-education.
19. **Openness.** Closed esoterism vs. Open exoterism (consciential openness).
20. **Serenology.** A need for personality cults (idolatry) vs. The holothosene of the *serenissimi* (serenism).

Refutations. We thus have the above list of leading-edge relative truths of projectiology. Pragmatically speaking, for the author and some researchers, these truths are no longer *expressions*

“in quotes” of reality or merely simple concepts, but are in effect without logical fallacies, waiting to be overturned or invalidated by refutations, more original concepts or advanced restrictive ideas on the part of nonconformist heterocritiquing individuals.

State. For many, the vanguard relative truths of projectiology are still premature truths. Philosophically speaking, with reference to these concepts, the author has already left the states of ignorance, doubts and opinion behind him. All of this has become evident, a state of rational and reasonable certainty, without fear of being mistaken, because the evidence of these realities occurred in physical and extraphysical practice, and according to cosmoethics.

Proof. Unfortunately, projectiological proof is still more individual, experiential, participatory and extremely personal. Nevertheless, it is important to point out that it is not just subjective, but is also self-persuasive, convincing the interested individuals themselves.

Models. Truth, by itself, being useful as a criterion for the acceptance of a theory, makes it necessary that the concept demonstrates correspondence, coherence and pragmatism in relation to the facts. Therefore, the connection between theories and facts is being sought within this context with the models of projectiology because they surpass the acuity of verification of all terrestrial equipment employed in the physical sciences.

Synthesis. All the basic themes of projectiology are entirely antidogmatic, stripped or in the condition of a *compound fracture*, bared to volleys of refutation. This list represents, as closely as possible, the practical synthesis of the greater objectives of *human projectiology*.

Targets. It is opportune to suggest that you, the supercritical experimenter, should make the above-cited concepts the preferred targets of your most devastating heterocritiques and questioning.

Compact. The compact gathering of ideas makes the targets more instigating, more ample and less difficult to hit.

Exceptions. It would be more rational to revise these concepts, beginning with the identification of possible exceptions in the enunciated themes and conditions, in order to critique subsequently the following chapter on the leading-edge relative truths of *extraphysical conscientiology*.

160. THEORY OF THE LEADING-EDGE RELATIVE TRUTHS OF EXTRAPHYSICAL CONSCIENTIOLOGY

Definition. Leading-edge relative truth of extraphysical conscientiology: the temporary and maximal reality for the desomant intraphysical consciousness (already an extraphysical consciousness) which is lucid regarding its own life in multidimensionality.

Synonymy: synthesis of extraphysical conscientiology.

Preference. Projectiology will continue to be a scientific or self-evolutionary preference that is in the minority for a long time to come. This fact is very logical and natural in light of evolution, as we shall see.

Counterpart. Let us begin with a very human, social or temporal aspect. For example, the *International Institute of Projectiology and Conscientiology* – or everything that this human institution intends to accomplish and represent – merely signifies the physical, *Homo sapiens*-related counterpart of the rationally-presumable *Multidimensional Institute of Conscientiology*. This extraphysical institute researches even more transcendent issues pertaining to the consciousness than those which the IIPC researches and has as its objectives.

Comparisons. Everything that the IIPC applies on earth has its more advanced or evolved extraphysical corresponding part or counterpart. In this way, we can establish various comparisons: the first column lists the human part of the IIPC, or the leading-edge relative truths of intraphysical projectiology; the second column lists the extraphysical part of the leading-edge relative truths of

extraphysical conscientiology. Thus, we have the themes researched or the disciplines (subjects) of the courses here, in our intraphysical life, and the themes researched or disciplines of the courses in the extraphysical dimensions (intermission and intermissive courses).

Columns. The following is a list of sample themes, listed in two columns (see fig. 160). In the first column the leading-edge relative truths of intraphysical or human projectiology are presented. Then, in the second column, the corresponding leading-edge relative truths of extraphysical conscientiology are listed.

HUMAN PROJECTIOLOGY	EXTRAPHYSICAL CONSCIENTIOLOGY
1. International Institute of Projectiology and Conscientiology	vs. Multidimensional Institute of Conscientiology.
2. Human projectability.	vs. Self-aware interdimensionality.
3. Projective or projectiological courses.	vs. Intermisive or pre-resomatic courses.
4. Human telepathy (transference of thoughts).	vs. Superior conscientese.
5. Existential seriation in practice.	vs. Self-aware intermissivity or spirituality.
6. First and second desomas.	vs. <i>Moksha</i> or third desoma.
7. Aware groupkarmic <i>extraphysical bait</i> .	vs. Aware polykarmic helper.
8. The practicing of penta.	vs. Self-aware energetic erraticism.
9. Extraphysical clinic in the physical plane.	vs. <i>Invisible college</i> of the <i>serenissimi</i> .
10. Multidimensional self-awareness.	vs. Multidimensional self-cosmoconsciousness.
11. State of continuous consciousness.	vs. State of continuous cosmoconsciousness.
12. <i>Serenissimi</i> per se.	vs. Pure spirits per se.
13. Human leader-consciousnesses.	vs. Architect-consciousnesses of galaxies.
14. Primary intraphysical cosmoethics.	vs. Superior extraphysical cosmoethics.
15. Condition of consciential maturity.	vs. Condition of pure serenism.
16. Consciential era.	vs. Third post-space-time evolutionary course.

Fig. 160 – Comparison of leading-edge relative truths of projectiology-conscientiology

Minority. If we reflect upon the fact that the themes in the first column will be, for a long time, the *evolutionary preferences of the minority* in human societies, which are generally pathological or still immature, we can understand how much more distant the themes of the second column are from the average realities of human life.

Preferences. We can perform an analysis, for example, with regard to cosmoethics. We can see that *primary* cosmoethics is currently the cosmoethical preference that is in the minority for humanity, just as *superior* cosmoethics is currently the cosmoethical preference that is in the minority for para-humanity.

Hope. At any rate, it is already a personal relief, or a note of authentic group hope, that we are able to understand the *existence* of and accept, with discernment, the *logical justification* for thinking upon these themes.

Evolution. As a result of the inevitable evolutionary progress of consciousnesses, all themes of extraphysical conscientiology, in the second column, will one day be researched more deeply by all of us – consciousnesses currently in evolution as intraphysical beings – in order to *experience* them while still in the ordinary intraphysical life of this planet or in another evolutionary megaschool of the cosmos.

Multidimensionality. Do not accept any of the hypotheses upon which this chapter is based without first rigorously pondering and critiquing what is presented here. In order to analyze such transcendent conjectures, only multidimensionality exercised with a reasonable level of performance, can provide the keys capable of satisfying our rationality, logic and discernment.

161. COSMOETHICS

Definition. Cosmoethics: the set of broad intraphysical and extraphysical universal norms that are beyond the principles of social morality, euphemisms, social conventions, and transitory human laws and labels.

Synonymy: cosmic moral; dynamic moral; ethical intangibility; extraphysical behavior pattern; extraphysical impeccability; extraphysical moral; law of the avatars; optimization of wisdom; para-ethic; projective moral; pure neo-ethic; supermoral; universal law.

Phenomena. Strictly speaking, the phenomena of projectiology do not have any relationship with faith, religion, religiosity, philosophy, atheism, materialism or spiritualism.

Paraphysiology. The phenomena of projectiology are facts derived from human paraphysiology.

Sociability. Nevertheless, a greater engagement with lucid projection ends up having social and political content.

Philosophy. In light of the above, this section presents inevitable existing philosophical perspectives, but does so without participating in the ideological-political competitions in this period of humanity's development, because such an attitude would be contrary to legitimate scientific, objective, impartial, and universalistic behavior.

Pattern. The person endowed with animic faculties or developed parapsychic sensibilities is not necessarily a person with an elevated consciential standard or moral character.

Improvement. Parapsychic powers can be improved by anyone who dedicates some time to them.

Intellectuality. Nor do animic-parapsychic sensibilities themselves constitute advanced development in any other area, such as intellectuality. Often precisely the opposite occurs.

Evolution. For this reason, as previously mentioned, ordinary lucid projection can occur independent of one's level of ethics. Nevertheless, the evolution and productive development of experiences outside the human body inevitably only occurs, like a prerequisite, in a perfect coexistence with cosmoethics.

Sensitivity. On the other hand, the evolution of the ego (egokarmic, holokarmic) itself makes it so that the highly developed consciousness is also, inevitably, an active animist and sensitive.

Holomaturity. *Intellectual* capacity, in turn, has nothing to do with either *emotional* maturity or *global* consciential maturity or holomaturity.

Cosmoconsciousness. However, the individual who has already achieved the state of cosmoconsciousness no longer needs the rules of morality as understood in everyday existence.

Self-conscientiality. Serenity, certainty in regard to extraphysical life and the sense of awareness – self-conscientiality – of the rhythm of multidimensional life, possesses its own innate laws and ethics.

Ingenuity. Ingenuity thus lies in being able to morally and act creatively according to laws that stem from genius itself, something still quite rare among people.

Agent. The universality of the principles of cosmoethics establishes the norms of the lucid projector's code of behavior, who is, in truth, neither an angel nor a *devil* (Asmodeus: Book of Tobit),

but has potentialities for both good and evil, being a consciousness with unlimited freedom, without barriers or frontiers, as though being an invisible, multinational agent.

Secrecy. The lucid projector can operate behind the scenes in all sectors of planetary life in a secret, anonymous manner, sometimes directly upon unaware, unprepared and unready consciousnesses, or even those completely ignorant of one's existence as a lucid projector.

Development. Fortunately, the facts show that, without the principles of cosmoethics or, in other words, the framework of indispensable ethical values – or with unethical attitudes and actions – there is neither a development in one's lucid projections in general nor an improvement in one's consciential perceptions during lucid extraphysical experiments.

Effects. Among the effects stemming from cosmoethics, at least the following 12 can be singled out:

1. **Humanism.** The expansion of a sense of humanity (a sketch of megafaternity).
2. **Universalism.** The substitution of narrow-minded, parochial, telluric ideologies or geoenergetic materthosenes with other universalistic or cosmic concepts.
3. **Privacy.** The dilation of the concept of privacy (*domicentrism*).
4. **Self-weak-traits.** Self-awareness of the immediate consequences of self-weak-traits and conscious errors, through logical thoughts.
5. **Pathothosenes.** The identification of pathothosenes or unsuspected, *mental peccadilloes*.
6. **Affectivity.** An understanding, without preconceptions, of extraphysical or groupkarmic, paragenetic, ancestral, transcendent affectivity.
7. **Sexosomatics.** Comprehension of the extraphysical consequences of human or somatic sexuality.
8. **Paratroposphere.** An understanding of the absolute extraphysical sexual permissiveness that exists in the paratropospheric dimensions (*parapromiscuity*).
9. **Heterodoxy.** A loss of interest in segregationist orthodoxy and exacerbated corporatism (court favoritism, nepotism).
10. **Assistentiality.** An increased interest in anonymous and universalistic, educational, fraternal, interconsciential assistance.
11. **Politics.** Motivation by political causes of a universal nature.
12. **Religiosity.** The natural elimination of a need for religion and religiosity as they are currently understood and are practiced on the earth (intrapysical society, traditionalism).

Consciousnesses. Intrapysical and extraphysical consciousnesses on the planet are in evolution or, more precisely, are still not evolved to a degree such that they are not able to control the mentalsomatic or consciential dimension.

Categories. For this reason, consciousnesses can be divided into two general categories: more ill and less ill.

1. **More.** The more ill consciousnesses are those considered *evil*, those having bad intentions, being more egotistical, according to Manichaeic moral divisions of good and evil, or of human, social, conventional and deontological ethics.

Intrusion victims. Among these consciousnesses are major frank intraphysical intrusion victims and intruders, who are aggressive individuals immersed in secular imbalances and who still persist in highlighting the worst aspects of terrestrial life (mental derangement, deformed ideas, objects *charged* with ill energies, Mafioso institutions, locations with poltergeist activity). This terrestrial existence can, in this case, be seen, from this perspective, as a *deficiencyland*.

2. **Less.** The less ill consciousnesses are so-called *good* individuals, or those who endeavor to act correctly, being non-violent persons who seek to always have good intentions, and exhibit less egotistical attitudes or behavior than the average and, enjoying relative balance upon emphasizing the better aspects of human existence (balanced intraphysical consciousnesses, orthothosenes, objects in a healthy holothosene, locations with *therapeutic energies*), seen as a temporary stage.

Projectors. Among these consciousnesses are those that customarily produce lucid projections, have some extraphysical discernment and, strictly speaking, are the only ones who are truly able to develop their consciencial projections due to their adherence, without difficulty, to cosmoethics.

Reflexes. It is impractical to have a disparity between the projector's human life and its intercurrent and concomitant extraphysical experiences. There is an absolute interdependence between one condition and another.

Incorruptibility. Ethical incorruptibility of human life reflects cosmoethics in the extraphysical dimension, one being interdependent and interacting with the other.

Efforts. No evolutionary conquest of the consciousness is born of improvisation. The lucid projector who has mild and sporadic experiences is a common one. The advanced lucid projector, however, although completely anonymous, is the product of the sedimentation of his/her own individual multiexistential efforts over many centuries and untiring repetition of experiences.

Unawareness. Temporary departure from the human body with lucidity is accessible to everyone, including those who are completely unaware of extraphysical life and cosmoethics.

Variables. Nevertheless, the following 4 basic variables can vary greatly for each individual, element or being:

1. **Communities.** The extraphysical environments (communities) reached in projections.
2. **Company.** Extraphysical company (intruders, blind guides or helpers) encountered.
3. **Paraperceptions.** The quality of the individual paraperceptions of the intraphysical consciousness when freer or projected from the soma.
4. **Events.** The nature and level of the events experienced outside dense matter.

Cosmification. Projectiology naturally and spontaneously promotes an inner evolution ranging from the mere physical restriction of the human body, or planetary provincialism or chauvinism (parochialism), to the plenitude of *cosmification of the consciousness*, or the *universalism* of the ego's objectives.

Integration. In this way, the intraphysical consciousness grows, expands its conceptual horizons, transcends the limitations of the physical base, the bedroom (energetically shielded chamber) and the small, prosaic or animal problems of everyday life, and consciously integrates with the universe, infinity and the eternity of life.

Immunity. The ethic intangibility of the lucid projector who endeavors to live in accordance with cosmoethics, gives immunity to its defenses and makes it *invulnerable* to any negative forces.

Freedom. Whether coming from the intraphysical or extraphysical dimension, these negative forces can neither block the individual's decisions nor limit his/her always positive human actions or those beyond dense matter, if he/she (the consciencial epicenter) wishes, in spite of the occurrence of mini-intrusions and the condition of self-aware assistential bait, until arriving at the condition of evolutionary consciencial awareness of the *petifree being*.

Theorice. The advanced lucid projector does not give greater emphasis to either theory or practice (theorice) in particular and does not substitute one approach with the other, but endeavors to unite one effort to the other or, more precisely: joins the development of personal animic-parapsychic faculties to personal intraconsciencial growth (inner recycling or intraphysical recycling), improving itself (self-overcoming) through assistance (clarification task, penta) to other intraphysical and extraphysical consciousnesses.

Peace. Only cosmoethics allows the intraphysical consciousness to live in peace multidimensionally, because it presents subtleties that are only perceived from an extraphysical perspective.

Case study. The following is an example. A certain woman used to exalt to the heavens and evoke, in her public discourses, a female personality who had lived some time ago and that – as she knew perfectly well – had been herself in one of her previous human existences.

Conflict. In light of these facts, 2 aspects were shown to be in open conflict:

1. **Ignorance.** To those people who worshipped this evoked personality and were ignorant of the multidimensional identification of its lifetimes, this fact was perfectly natural, justifiable and even laudable.

2. **Para-hypocrisy.** To extraphysical consciousnesses, however, this repeated and insistent act was blatant vanity and total hypocrisy or, more precisely, para-hypocrisy.

Self-promotion. This *multi-existential self-promotion* continued for some time, until some extraphysical intruders questioned her regarding the matter, *paraface-to-paraface*, during one of her departures or lucid projections to the paratropospheric extraphysical dimension.

Positions. Through the efforts of the experience of lucid projectability, researchers and, little by little, the general populace, will acquire a new ethical consciousness, or cosmoethics, which will place humankind in a new position before nature and the intraphysical consciousness, evolutionarily free, in a new position within the cosmos (wholeness).

Bibliography: Castaneda (258, p. 21), Humphreys (766, p. 140), Muldoon (1105, p. 315), Vieira (1762, p. 184), Yram (1897, p. 90).

162. EXTRAPHYSICAL CODE OF ETHICS

Definition. Extraphysical code of ethics: the methodical and systematic study of useful rules and precepts regarding experiences of the human consciousness projected with lucidity from the human body.

Synonymy: collection of extraphysical laws; extraphysical countercode; set of projective rules; statutes of ethical progress; system of projective principles.

Items. In the extraphysical code of ethics, or countercode of the projected projector – analyzed here as a theory of research – in benefit of the practitioner and the development of his/her consciential projections, it is necessary to include practical items, based on facts, similar to at least the following 16 listed below in alphabetical order:

1. **Friendships.** Cultivate personal relationships and friendships without distinction in the intraphysical and extraphysical dimensions. Facts: consciousnesses do not extinguish and destinies cross outside the human body (groupkarma).

2. **Intention.** We can only allow ourselves to make mistakes due to ignorance, never due to bad intention. Fact: the law of cause and effect postulates that no intention of the consciousness remains hidden without consequences, without responses, repercussions such as action and reaction, or *boomerang* effects.

3. **Intercessions.** Intercede in a rational and positive manner, whenever possible, in favor of intraphysical and extraphysical consciousnesses. Facts: the projector helps the intraphysical consciousness in need, who is naturally assisted by his/her personal extraphysical helper. This helper, grateful and in solidarity, eventually becomes the projector's helper.

4. **Mind.** Keep your mind open to the reception of extraphysical events. Fact: the intraphysical consciousness who only wishes to extraphysically see what he/she conceives, ends up only seeing his/her pathosenes and thought forms and will not get out of himself/herself in the ordinary, physical waking state in order to achieve extraphysical self-awareness.

5. **Moral.** Regard cosmoethics as indispensable for consciential and extraphysical evolution. Facts: correct extraphysical assistential practices in favor of terminally-ill intraphysical consciousness, for example, if considered only from a human perspective, clash head-on with the code of human ethics regarding euthanasia in most countries.

6. **Preconceptions.** Avoid negative conditioned reflexes and preconceived ideas as much as possible when projected. Fact: the religious, factional, orthodox and segregationist (or *brainwashed*) intraphysical consciousness, when projected, hinders (with one's *parapsychological* conditioning) the performance of extraphysical assistance administered to believers of other religions at a religious temple. This is because psychological or human conditioning becomes transformed into parapsychological or extraphysical conditioning.

7. **Privacy.** Endeavor to be useful when extraphysically projected and even invade, if necessary in some circumstances, the privacy of intraphysical and extraphysical consciousnesses. Fact: through lucid projection, beneficial energies can be transmitted anonymously to an intraphysical consciousness who would otherwise never allow this fraternal assistance due to his/her sectarian scruples in the ordinary, physical waking state.

8. **Rights.** Respect the rights of other consciousnesses, as minimal as they may be. Fact: most intraphysical consciousnesses live unaware of the extraphysical realities and have open or disguised fear of projecting themselves from the human body (projectiophobia) to other dimensions of life.

9. **Self-coherence.** Maintain self-coherence between acts in the ordinary, physical waking state and extraphysical actions during the projective period. Fact: among invisible witnesses there are perturbing sick extraphysical consciousnesses that are never silent regarding what they *see* and, generally speaking, they see (witness) practically everything.

10. **Self-critiquing.** Live with self-critique in order to act with dignity. Fact: in extraphysical confrontations the consciousness is called on to test its integrity, performance and possibilities.

11. **Serenity.** Maintain continuous serenity, balance and self-control against emotionalism in all extraphysical situations through the control of one's self, without becoming excessively perturbed when acting under pressure or in emergencies outside the human body, rationalizing the emotions until transforming them into elevated sentiments. Fact: the projected intraphysical consciousness, when controlled by strong emotions, diminishes its extraphysical paraperceptions, loses control of the lucid projection, becomes subject to extraphysical traumas, may return abruptly to the dense body, and prematurely and frustratingly interrupt the experience outside the human body.

12. **Sexosomatics.** Understand the functions of sex in terrestrial life and its positive and negative extraphysical consequences. Facts: healthy emotional effusions, in the extraphysical dimensions, go beyond forms, degree of permissiveness and the clichés of human customs. It is therefore evidently impracticable to realize occurrences in the extraphysical dimension, such as ejaculation, fecundation, gestation and others.

13. **Thoughts.** Be aware of the vital importance of mental acts – thosenes *with a predominance in tho* – in the extraphysical dimensions. Fact: unconscious, unexpected and undesirable evocations, occur much more frequently than we imagine.

14. **Unapproachable.** Know how to recognize the consciousnesses that, in critical circumstances, should not be directly contacted by the projector when projected in the extraphysical dimension. The following are 3 facts worth considering, regarding examples of beings that should not be contacted:

A. **Vehicle.** The difficult situation of an intraphysical consciousness who is driving a vehicle at high speed.

B. **Arms.** The person who has the forefinger on the trigger of a firearm.

C. **Intermission.** The intraphysical consciousness who has recently arrived in the intermissive period and is undergoing restorative sleep or parasleep.

15. **Universalism.** Include in universalism the ideology characteristic of the evolved extraphysical communities or those more lucid extraphysical consciousnesses. Facts: everybody has red blood. The psychosoma is not descendent from any race, is not distinguished by the color of the skin, and is not obliged to follow any creed. No extraphysical consciousness has citizenship. The megaschool of earth is, in fact, one of the smallest fragments of cosmic debris in the universe.

16. **Well-being.** Place the well-being of all above the sectarian or factional interests (corporatism, *lobbyism*) of associations, groups and nations (*nationalism, xenophobia*). Facts: extraphysical

cooperation involving issues with bellicose objectives and espionage tactics, with the objective of supplanting future and supposed enemies, causes the negative results of *groupkarmic interprison*, first of all, for the consciential projector.

Avoidances. In summary, being practical, the lucid projector who wishes to evolve according to the principles of cosmoethics should avoid at least 3 negative procedures:

1. **Espionage.** Perform military or industrial espionage.
2. **Detective.** Endeavor to verify – working as a private detective – the infidelity of couples or any other person.
3. **Secrets.** Endeavor to discover secrets that others wish to keep hidden.

Bibliography: Steiger (1602, p. 157), Vieira (1762, p. 184).

163. LUCID PROJECTION AND MATERIALISM

Definition. Materialism: the tendency, attitude or system that thinks that everything is matter and that *immaterial* substances do not exist.

Synonymy: atheism; materialist philosophy; materialistic creed; negativism; physicalism; physicalist philosophy; pure technological philosophy.

Tendencies. There are philosophical tendencies and existential principles that delay life, self-knowledge and the inner evolution of the consciousness. Egoism and materialism are good examples of this, in this current industrial and commercial human society (intrapysical society).

Puerilities. Materialistic ideas are puerile and contradictory in many respects.

Categelophobia. The materialist avoids building up his/her hopes about the ultra-life regarding something that can be shown to be a mere dream. He/she is afraid of being considered foolish or being ridiculed (categelophobia) if, upon the death of his/her human body, there were nothing left. This is a completely obtuse way of thinking, because if this really happened, or nothing really occurred, he/she would not even know.

Justification. Philosophy demonstrates that there is no greater justification for a materialistic philosophy than for a consciential one, a materialistic philosophy not being any more scientific than a consciential one (consciential paradigm).

Subjectivity. Philosophically speaking, the reality of a subjective fact has the same nature as a material fact. A subjective fact can be as real as a material, objective, intense fact.

Lost. The true materialist is that intrapysical consciousness who is completely lost in his/her intrapysical present, who endeavors to eliminate his/her own past and future. Mired in, concentrated upon and fascinated with the hedonistic experience of the here-and-now of his/her animal body, this individual crawls over the planetary crust. In his/her myopic, carnal or cellular vision, the following do not exist: the holosoma, existential seriation, the progressive evolution of the aware being, consciential multidimensionality, universalism, holomaturity and even cosmoethics. Egokarma still absolutely predominates in the context of the individual's self-thosenity.

Impracticability. Isolated, sophisticated efforts are made by individuals – who, incidentally, have not personally produced lucid projection – who are busy with secondary objectives of political domination, in the sense of including lucid projection, in an aprioristic manner, within the scope of phenomena connected to materialism. Nevertheless, the facts demonstrate, so far, only individually speaking, the complete impracticability of this unhappy attempt.

Evidence. It becomes illogical, not to mention irrational or infantile, for projectors to make any attempt to avoid or mask the reality of extraphysical facts related to the psychosoma and silver cord by producing simple lucid projections above their own bed in the privacy of their bedrooms in order not to talk about other bodies or immaterial objects.

Value. One simple real fact is worth more than all conceivable wordplay.

Denunciation. Hence, this book openly denounces and contests the manner of thought and action of the most modern, cultured people in today's world, namely those who speak and live materialistically, who are obstinate in not seriously considering the growing manifestations of so-called "parapsychism;" those who negate the reality of immaterial force fields and, naturally, the mind, or the consciousness; and any other thing that is not matter.

Projection. Lucid projection proves to the interested person that the death of the human body does not put an end to the personality.

Projectors. There are no great materialist projectors, because the first condition rationally excludes the second.

Matter. It would be preferable to call atomic particles "something," as they present such extraordinarily microscopic diameters – if indeed we can call them *diameters* – capable of traversing a distance of many light-years without even colliding with each other within *intra-atomic space*.

Missile. This is analogous to the idea of a missile launched into space that travels for billions of miles without even passing near any other object or celestial body.

Solidity. All material things, including ourselves, are composed of matter which seems very solid to the sensorial perception of any person. Nevertheless, if this is solid, what do we mean by "solid"? Is not solidity a completely egocentric personal point of view with regard to matter?

Conversion. We also know that atomic fission showed that matter can be converted into waves of energy according to Albert Einstein's well-known equation, $E = mc^2$ or, in other words: "the mass of a body is the measure of its content of energy", and that sometimes energy can be converted into matter.

Atoms. Nuclear physics showed that atoms – the units of construction of all material things – are composed of a space full of fields and particles in movement, the particles of which sometimes act more like waves than particles.

Space. In the hardest substance, 2 atoms never touch each other, the space between 2 adjacent atoms being, in fact, much greater than the atoms themselves.

Destruction. Matter and energy can neither be created nor destroyed, and their form can only be altered.

Reality. Besides all this, many scientists and philosophers, both materialist and non-materialist, come to question the "objectivity," "reality" or even the "existence" of matter, energy, space and time.

Ultramaterialism. Unfortunately, even today, within the scope of parapsychology, the researcher and his/her research will become more accepted by the general public to the degree that they make greater concessions in favor of ultramaterialism, which prevails in most areas of human activity.

Half-truths. It will be easier to have one's work recognized and greater financial grants available to sustain scientific research upon restricting oneself only to half-truths of the manifestations in the field of parapsychology.

Isolation. The farther the researcher advances on the extraphysical front in the direction of the more ample leading-edge relative truths, the more isolated he/she will feel in all respects.

Vicious. How long this vicious circle will continue no one knows, although matter itself has been *dematerialized* by physicists and, in light of this, materialism can no longer be presented as a scientific philosophy. Marxist doctrine itself entered into decline in practical international life at the end of the twentieth century.

Note. Based on the material presented thus far, those who deny the existence of the consciousness acting outside the human body will waste their time if they continue reading this book.

Fields. The discovery, in the field of biology, of the organizing electromagnetic or electrodynamic fields of cells, proves that humankind, even physically, is not constituted of simple chemistry, nor is it a consequence of a grouping of proteins, nor is it a result of blind causality, nor does it originate from erratic genes, nor are elevated human sentiments expressed through chemistry alone.

Energy. Modern science currently accepts that matter is concentrated energy. This energy is not tangible, constituting an abstract principle.

Source. We can thus conclude that the material world as well as extraphysical environments have the same origin or, in other words, they arise from some form of energy which unfolds into some parts that compose the physical universe and other parts that serve as bases for parapsychic experiences, thoughts and consciential attributes.

Discontinuous. Projectiology helps the intraphysical consciousness unveil and amplify the universe of his/her philosophical concepts, in a scale that is well-defined through 3 distinct consciential, evolutionary, increasing, logical and rational stages: crustal concepts, provincialist concepts and universalistic concepts:

1. **Crustal.** With lucid paratropospheric projections, even within the space above one's own human bed, the intraphysical consciousness annihilates meager materialistic concepts, atheism, physicalist, telluric, merely technological philosophy, and naturally becomes consciential, shelving the *theta* operation and definitively discarding anxiety regarding acceptance of the fact of survival of the consciousness after the human body's biological death.

Departure. Here, the human-animal leaves the lair, leaves the bedroom and opens his/her door to this planet with a new perspective.

2. **Provincialist.** With lucid projections in the extraphysical dimension, per se, the intraphysical consciousness who admits conscientiality in general promotes his/her own opening, or *open-mindedness*, discovers the law of successive intraphysical lives (existential seriation) and progresses up to the limits of the geocentric or homemade, provincialist and planetary conceptions of Christianity, which still has as a model and maximum example, a personality who was also human, Jesus of Nazareth (4 B.C. – 29 A.D.), the greatest myth, the *intraphysical* taboo personality, or he who still utilizes the psychosoma constantly, judged by many to be the most evolved being in recorded human history (although not yet a *Homo sapiens serenissimus*, or *serenissimus*).

Campus. Here, the human-consciousness departs from the segregationist terrestrial university and extends his/her *campus* to the universe.

3. **Universalistic.** With lucid projections using the mentalsoma in the mentalsomatic dimension, the intraphysical consciousness overcomes small, planetary human conceptions and even the scope of this galaxy, the Milky Way, advancing toward the infinite with universalistic ideas of terrestrial life and even beyond the space-time-form continuum, which maintains the human body restricted, characteristic of human or intraphysical existence.

How. With the condition of cosmoconsciousness, the social being begins to reflect upon the *how* and *why* of understanding the reality of the free consciousness (FC), which no longer uses the psychosoma, nor is it reborn within the current existing conceptions of resomatics, permanently living in the state of continuous self-awareness.

Challenge. Here, the consciousness confronts its greatest challenge: conscious self-evolution jointly with the general evolution of all the innumerable consciousnesses in the universe (populations of demography and *parapopulations* of parademography).

Astronomy. On the other hand, in light of the data evidenced by current astronomic research, 8 modern suppositions accepted by various schools or lines of research deserve mention here:

1. **Galaxies.** The physical universe – which shows profound intelligibility or prescience – probably has 100 billion galaxies.

2. **Stars.** Other galaxies (besides the Milky Way), such as Andromeda, each include between 200 and 400 billion stars.

3. **Life.** Extraterrestrial life and many types of intelligent beings exist.

4. **Civilizations.** It is presumed that thousands of civilizations exist and communicate among themselves.

5. **Intercommunication.** There is a system of intercommunication in our galaxy – the Milky Way – in which we still do not participate.

6. **Astronautics.** A space voyage to the star closest to earth, would take about 40,000 years or 400 centuries.

7. **Signals.** A piece of equipment is currently being used to analyze radio signals. It is basically a spectral analyzer, with an extremely wide bandwidth, over a million channels, used to scan the heavens in search of signals of life on distant planets.

8. **Contact.** Let us wait, then, for the first official, intelligent, physical, interplanetary communication or even an absentee contact, which can arise at any moment.

Mega-intrusion. In conclusion, it is important to ponder the following: materialism, which has existed for centuries in intraphysical society, is the greatest feat achieved by the mega-intruders on this earth. A philosophical and experiential condition that is completely irrational has been maintained through money, social prestige and temporal power for those intraphysical consciousnesses who are predisposed and, above all, self-corrupt. Now, however, in this era of conscienciality, this type of mega-intrusion is coming to an end forever, on a one-way road within the evolution of consciousnesses. Consciencially speaking, this planet will never be the same from this point on.

Bibliography: Flammarion (524, p. 32), Frazer (549, p. 127), Kardec (824, p. 56), Meek (1028, p. 306), Müller (1107, p. 33), Pushkin (1342, p. 300), Russell (1482, p. 42), Targ (1651, p. 156), Vieira (1762, p. 219).

164. UNIVERSALISM

Definitions. Universalism: the set of ideas derived from the universality of the basic laws of nature and the universe which will become, over time or, in other words, from the natural evolution of the consciousness, the dominant philosophy of the human species and of all beings in the cosmos; self-lucid identification of the consciousness with the community, the state, the planet and finally the cosmos or the universe.

Synonymy: cosmic movement; cosmism; cosmological manual; cosmopolitanism; eclecticism; ecumenism; homaranism; philosophy of the canon of the universe; stellarism; statutes of cosmic citizenship; statutes of the universe; unifying perspective; universal conciliation; universal consent; universal context; universal union; uprooted theology.

Botany. The question of universalism does not only involve modern humankind, nor was it born with *Homo sapiens*. *Fetal* universalism started with the first life on this planet, even before the subhumans of zoology, directly through plants (botany).

Monocultures. Let us examine the facts. The extensive monocultures (vegetal egocentrism) do not sustain life.

Exclusivity. Nature does not permit flora to practice monoculture. The predominance of certain species can even occur, but disastrous exclusivity never persists (*first egocentrism*).

Deintrusion. Thus, nature favors the natural control (*first deintrusion*) of plagues, viruses and bacteria (*first intruders*).

Separation. Involvement in a religious belief, whichever it may be, separates human beings from other human beings, their evolutionary colleagues.

Fight. Once separated from his/her contemporaries, and seeking to maintain personal security, this human fights with other humans, his/her evolutionary fellow human beings, or those with whom one coexists, even within the scope of his/her belief.

Politics. This fact occurs because every religious institution of necessity has its politics. All politics is partisan. All partisanship is obviously fractionating.

Megafraternity. The one who understands and practices universalism endeavors to apply the sentiment of cosmic love or that of universal fraternity (megafraternity), and no longer fights with other consciousnesses (*useful pacifism*).

Antennas. Artificial satellites and parabolic antennas are at the forefront of the inevitable universalism of culture, the sciences and the arts.

Earth. Planet earth, besides being *deficiencyland*, a *megaslaughterhouse*, a planetary trash bin or a correctional institution is, above all, a consciential megaschool.

Truth. In human life, many clairvoyants and revealers have already demonstrated aspects of the full, tranquil and self-persuasive truth of the facts that can be achieved to a greater degree directly through the experience of lucid projection, above all in the mentalsomatic dimension.

Perfection. On the other hand, there are no perfect consciousnesses, completely pure beings, perfect works, or perfect revelations on earth.

Initiates. Without examining the merit of each one, it can be affirmed that intraphysical beings, such as Moses (eighteenth century B.C.), Zoroaster (eighth century B.C.), Gautama Buddha (483 B.C.), Laotzu (531 B.C.), Jesus of Nazareth (4 B.C. – 29 A.D.), Mohammed, Francis of Assisi (Giovanni di Francesco di Bernardone (1181-1226), Dante Alighieri (1265-1321), Leonardo da Vinci (1452-1519), Emanuel Swedenborg (1688-1772), Andrew Jackson Davis (1826-1910), Mohandas Karamchand Gandhi (1869-1948), Edgar Cayce (1877-1945) and Eurípedes Barsanulfo (1880-1918), besides many others, were types of initiated personalities or extraphysical adepts, registered by human history, who came from more evolved extraphysical dimensions.

Innocents. Alongside these historical personalities, *operating outside of* or apparently against their specific tasks, countless other extraphysical and intraphysical consciousnesses, in different eras, have been acting as useful-innocents of the evolved extraphysical dimensions, performing, in their time and in their own way, a secondary but important role of coadjutants taking the position of heterocritics, maxidissidents, adversaries and counteragents.

Complexity. The universe is more complex than we can imagine. There are semimaterial stars.

Suns. There are sentient beings in the high temperatures of suns.

Macrobeings. There are macrobeings and microbeings in conditions beyond our current comprehension.

Inaccessibility. A great percentage of reality is radically inaccessible to our present stage of knowledge. The concept of solidity is also relative.

Table. The periodic table of the elements is just starting for planetary humankind.

Histology. Many cell transmutations occur that are beyond the currently understood processes of physics, chemistry and biology.

Unit. Lucid projection facilitates a greater understanding of the universe as a living unit.

Culture. When viewed from a cultural perspective, universalism arises in an ample range of manifestations, spanning from pure erudition to heightened popularization.

Opponents. Based on the aforementioned ideas, the following 8 practical aspects, for example, are or have been diametrically opposed to universalistic policy:

1. Human neuralgic frontiers.
2. The “Berlin Wall.”
3. The “38th Parallel,” which divided and established the two Koreas.
4. Exacerbated nationalism.
5. Cultural parochialism or isolationism.
6. The closing of ports.
7. The “Iron Curtain” or the “Bamboo Curtain” (xenophobia).
8. Any type of dictatorship.

Harmonies. Universalism leads the intraphysical consciousness to emphasize 3 categories of harmonies:

1. **Mentalsomatics.** Elevated sentiments or intellect-emotion harmony (mentalsomatics, psychosomatics).
2. **Theorice.** Direct personal experience or theory-experience harmony or theorice.
3. **Nature.** Profound integration with nature and the cosmos or humankind-nature harmony.

Platform. Besides provincialist blinders, humankind has priority goals, causes, ideas, universalistic or intergalactic banners with philosophical, political, social, economic and practical connotations having profound significance and value for the improvement of the standard of existence and quality of human life which stem from cosmoethics.

Projectability. The veteran projector ends up sharing these priority goals, accepting them as being cumulative, natural or physiological effects of that which he/she experiences, witnesses or participates in within his/her double life during the unfolding of extraphysical events.

Executability. Although, at first sight, it seems utopian to defend these ideas relative to current human life, with numerous and powerful interests and forces in opposition, we can list a platform of behavior that reflects the directives which are in force in the assistential undertakings stemming from evolved extraphysical communities. These directives are fully executable by the minds that long to free themselves from the geocentric, orthodox, sectarian, segregationist, telluric, parochial, domestic limitations of this planet, as this will undoubtedly be the goal of future generations.

Positions. The following are 20 libertarian positions of the intraphysical consciousness motivated by evolutiology:

1. **Rights.** The sincere, lucid defense of human rights in general.
2. **Antidictatorship.** The extinction of ostensive or disguised dictatorships in the governing of people and minorities. A totalitarian nation, or a paternalistic government, does not help the intraphysical consciousness develop its individuality toward an evolved condition of full self-awareness.
3. **Antiwar.** Exaltation of the principles of nonviolence and pacifism on the earth and in cosmic space, with the pursuit of the gradual, unilateral disarmament of all nations.
4. **Globalization.** The way toward the creation of a world state, centralized world government, or a global system composed of intensely correlated units.
5. **Governments.** The establishment of multinational governments in specific areas and conditional spheres of action.
6. **Ecology.** Preservation and recuperation of nature in general (ecology).
7. **Minorities.** Safeguarding of the small number of beings (indigenous people and animal species) on the verge of extinction.
8. **Antihunger.** The battle against hunger and scarcity of food in the world, within a universal, rationalistic consensus.
9. **Families.** Family planning in accordance with terrestrial regions and human customs.
10. **Consumerism.** Protection of the consumer on all fronts of consumerism, avoiding unmeasured or exploitive consumerism, including the prohibition of advertisements for medications, pesticides, alcoholic beverages and tobacco.
11. **Antipollution.** The minimization of noise from all machines, safeguarding us from tragedies, accidents and calamities due to the failure of automatic sensors and computers.
12. **Assistentiality.** Discerning cosmopolitan social assistance, without discrimination based on race, social or age group, guaranteeing health, well-being, education, leisure and longevity (old age) to the billions of inhabitants of this planet.
13. **Antidrug.** Formation of supranational antidrug organizations in international solidarity in the fight against drugs and research in partnership with all pharmaceutical laboratories on human diseases and the most dangerous killer viruses, in order to obtain vaccines and medications which, once obtained, are given international usage status, free of patents and privileges.
14. **Antitobaccoism.** The use of all appropriate resources in the task of liberating intraphysical society from the smoking addiction (tobaccoism).
15. **Polyglotism.** International consecration, for immediate use, of those living languages that are in greater use, in view of the practical harmonization of individuals, in light of conscientese, the universalistic language.
16. **Unification.** The implementation of the greatest possible ecumenism between religions, as well as between multidisciplinary scientific perspectives, in order to achieve the unified perspective of all types of beliefs and all lines of scientific research.

17. **Knowledge.** The popularization of lucid projection, gradually substituting belief with knowledge.

18. **Antiform.** The psychological and parapsychological liberation of the intraphysical consciousness from its prison of human forms, in view of consciential or extraphysical holomaturity.

19. **Coexistology.** The individual unveiling of universalistic coexistology through the extinction of everything that can separate consciousnesses, defending the dissemination of intelligent life throughout that portion of the universe that is within reach.

20. **Conscientiality.** The indefatigable pursuit of the state of continuous self-awareness.

Transcendence. The general universalistic view leads the awakened intraphysical consciousness to discard his/her three-dimensional self, or private, isolated, instinctive egoistic (*mega-ego*) point of view, replacing it with a transcendent, four-dimensional, cosmic and broad approach, in accordance with the principles of pure fraternity.

Diversification. It is worth emphasizing that this awareness of consciential evolution will not reach the point of sterilizing creativity and the natural diversification of the *human being*, who will always be happier knowing how to coexist with the ambiguities of permissible concessions by the ego, without fixed ideas or pre-determined behavior patterns, but with various completely free ways of living, loving, eating, drinking, building, sowing, playing, speaking and thinking.

Independence. Universalism leads the intraphysical consciousness to voluntarily (a work of the will) honor the reality of the extraphysical dimensions (animism-parapsychism) in a rational manner, simultaneously and completely dispensing with a dependence upon social religiosity and the influence of religious professionalism of any type, even that of multinational or supranational religious empires.

Freedom. Freeing the consciousness from excessive repression of its conduct (punctiliousness) and unnecessary restraint (castration) of its creativity, universalism allows it to healthily amplify its *universalized inner freedom* (the most precious of assets) to immeasurable limits, without the prison of dogmatism, obscurantism, *intellectual fossilization* (oxidization or rusting of ideas) and *consciential rancidity* (consciential energy that produces a disagreeable taste and smell) characteristic of unevolved paratropospheric extraphysical environments.

Breadth. Summing up: the concept of universalism permits the more lucid intraphysical consciousness to simultaneously consider all broader aspects of human existence, eliminating basic egoistic divergencies between human beings and beings in general.

Globalization. Therefore, the globalizing notion of life's harmony will, in practice, gradually increase. People will then deal with things and be motivated so as to consolidate at least the following 5 sets of intraphysical collective realizations:

1. **Ecumenism.** The convergence of all religions in an ecumenical union: ecumenism.
2. **Eclecticism.** Conjoined philosophies: eclecticism.
3. **Multidisciplinarity.** Conjoined sciences: multidisciplinarity.
4. **Coalition.** Conjoined policies: coalition.
5. **Holomaturity.** Religions, philosophies, sciences and politics also simultaneously conjoined: cosmism, although respecting their limits and respective distinct areas, moving toward collective or universal extraphysical maturity.

Amplification. The free extraphysical experience inexorably leads to the universalistic amplification and deepening of the consciousness's mentality. Imagine that you visited, with full lucidity, 10 different planets, some less developed, others equal to and others still more evolved than earth. This would result in your planetary or terrestrial mentality inevitably changing and amplifying to a broader level of universalism.

Courses. This is exactly what happens, on a smaller scale, with veteran, intraphysical, lucid projectors, and, to a greater degree, with extraphysical consciousnesses, including those that have recently passed through resoma, when they are conscientially more lucid, having undergone the second desoma during their *intermissive courses*. The importance of the earth's role, then, becomes diluted in the magnitude of the cosmic immensity that is sensed, perceived or experienced.

Interdisciplinary. It is worth observing that there are 4 well established interdisciplinary fields manifesting in humankind's daily life:

1. **Anomalistics.** Anomalistics or the comparative study of anomalies.
2. **Futurology.** Futurology or the forecasting of futurities.
3. **Polymathics.** Polymathics or the integration of scientific disciplines with humanistic and consciential fields.
4. **Conscientiology.** Conscientiology, or the general study of the consciousness (noetics).

Bibliography: Alverga (18, p. 193), Gildea (591, p. 43), Gooch (617, p. 17), Kardec (824, p. 184), Powell (1279, p. 165), Rampa (1351, p. 138), Saraydarian (1507, p. 238), Vieira (1762, p. 29), Yogananda (1894, p. 220).

165. EVIDENCE OF CONSCIENTIAL MATURITY ON EARTH

Prognostics. Through a succinct analysis, it is possible to locate and identify the prognostics of a gradual installation of extraphysical consciential maturity on earth.

Classification. The following are 20 evident signs of greater consciential maturity found on this planet. They are classified here according to the condition of maturity, whether predominantly individual, collective or ambivalent:

Individual maturity:

1. **Self-awareness.** The currently less common execution of deliberate consciential self-analysis, or the self-critical consciousness (conscientiometry, conscientiogram).
2. **Conscientese.** Self-awareness that is indicative of the existence of conscientese (communicology).
3. **Cosmoconsciousness.** The condition of cosmoconsciousness obtained from the individual's will within cosmoconscientiology.
4. **Deintrusion.** Intentional execution of extraphysical deintrusion through deintrusive self-projection or a more ample extraphysical self-awareness (projectiotherapy).
5. **Future.** Intention regarding planning one's next human life while still living out this existence or self-lucidity with regard to the evolutionary future.
6. **Self-freedom.** Exaltation of the condition of practicing conscious self-freedom.
7. **Projectability.** Lucid projectability (LPB) already practiced on a diuturnal basis with full self-awareness and the execution of projection with continuous self-awareness (projectiology).
8. **Sentiment.** Spontaneous self-rationalization of emotions or self-awareness regarding the lucid use of the mentalsoma (mentalsomatics).

Collective maturity:

9. **Astronautics.** The international conquests of astronautics for pacific use or *interstellar awareness*.
10. **Rights.** The defense of human rights that is becoming frequent and generalized, or the juridical awareness, since the Universal Declaration of Human Rights adopted by the United Nations General Assembly, on December 10, 1948.

11. **Ecology.** Emergence of a greater collective ecological awareness (ecological NGOs).

12. **Fraternity.** Gregarious modern life in metropolises (megalopolises, megacities, condominiums, apartments), current sports activities (tournaments, clubs, Olympiads) and group leisure (playgrounds, tourism, charters), or an increase in community awareness; international organizations that demonstrate humankind's concern for humankind (Amnesty International, International Red Cross, Minority Rights, Women's Rights Movements, Human Rights Movements, the Peace Movement; and finally: the possibility of breathing today (1998), in the planet's troposphere, a population that already comprises six billion human beings).

Bioenergy. Ironclad willpower in the conscious application of bioenergy with the most surprising positive results: intergovernmental organizations, such as the International Monetary Fund (IMF), created on December 27, 1945; the installation of the World Health Organization (WHO); the International Labor Organization (ILO); UNESCO (United Nations Educational, Scientific and Cultural Organization); and the fact that the Indian state of Sikkim, in the Himalayas exists, where assassination is practically unknown, are unequivocal demonstrations of consciential maturity: the acquisition of original ideas; the creation of new facts; the identification of acts of consciential immaturity. Consciential maturity leads the intraphysical consciousness to serenity, notably characterized by impartiality and equanimity.

13. **Interdisciplinarity.** The interdisciplinarity sought in a more emphatic manner in contemporary science (invisible school) or scientific awareness.

14. **Union.** The uninterrupted operation, for over 3 decades, of the United Nations (UN) or political cosmoconsciousness.

Ambivalent maturity:

15. **Communicability.** Aware, parapsychic, interplanetary communication (animism; parapsychism; projectiology; UFOlogy).

16. **Clarification task.** The lucid practicing, on an individual and group basis, of the fraternal clarification task or interassistential self-awareness.

17. **Ethics.** Identification and practical application of cosmoethics or ethical self-awareness.

18. **Pacifism.** The pursuit, albeit still hesitant, of the implantation of pacifism as an ideal and definitive norm among human beings (non-violence) or anti-bellucose self-awareness.

19. **Questioning.** The fact of humankind more and more becoming a serene questioner or a self-critiquing and heterocritiquing awareness.

20. **Universalism.** The philosophy of universalism, the application of which is already sought on a daily basis, both individually and in group, or anti-egoistic self-awareness.

Objectivity. It can be deduced from these signs that individual maturity, besides being subjective, is consequently objectively exteriorized through the individual's ordinary acts, thereby characterizing the details of his/her behavior in the intraphysical society of which he/she is a member.

Permanence. There is currently an increase in the percentage of beings who have passed through desoma (extraterrestrial extraphysical consciousnesses) and those having undergone resoma (intraphysical consciousnesses of the planetary superpopulation). These 2 facts create a situation that remains undefined regarding the exact degree of consciential maturity on earth. Nevertheless, through the resources of projectiology, we reach the conclusion that – aside from other possible conditions of consciential maturity – the abovementioned certainly came in order to remain on this planet. In addition to this, all indications are that these conditions will henceforth continue to be improved and become more evolved.

Specific Bibliography: More recent works by the author: *700 Conscientiology Experiments* (in Portuguese); *Conscientiogram* (in Portuguese).

166. HOLOMATURITY

Definition. Holomaturity: the evolutionary state in which the consciential principle acquires maturity on the way toward full development in its evolution or multidimensional, holobiographical and multimillenary progression.

Synonymy: consciential constitution; consciential discernment; consciential maturation; consciential matureness; extraphysical maturation; extraphysical matureness; holistic maturity; innocence of wisdom; integral consciential maturity; projective prophylaxis; serenism; supermaturity.

Neoteny. Humankind, as a human animal, is one of the few mammals that maintains a biological component that is common and natural among amphibians called *neoteny* or, in other words, the tendency of the adults of certain species to retain juvenile characteristics.

Syndrome. Some authors call this condition the “Peter Pan syndrome.” Therefore, even after becoming an adult, and being sexually capable of reproduction, the human being continues to behave childishly, in an irrational or immature manner.

Hyperacuity. The intraphysical consciousness has to overcome neoteny in order to become fully mature (recuperation of cons, hyperacuity).

Learning. In ordinary life, within the didactic directives of educational services, the maturity of the human personality is the capacity characterized by 10 strong-traits:

1. Have money in your pocket without spending it (*material self-control*).
2. Perform a task, whether or not you are monitored (*self-motivation*).
3. Postpone immediate gratification in favor of long term gain (*forecast*).
4. Be able to suffer an injustice and not wish to avenge yourself in a like manner (*cosmoethics*).
5. Control anger (emotional self-control) resolving differences without violence (*discernment*).
6. Make a decision and keep it despite opposition and changes (*personality*).
7. Confront disagreeable situations without complaint or discouragement (*serenity*).
8. Know how to live in peace with that which we cannot change (*ambiguities*).
9. Change that which can be changed, recognizing one’s own faults (*self-critiquing*).
10. Pass safely through existential crises (*consciential self-control*).

Multidimensionality. According to projectiology, however, the greatest indication characteristic of a highly mature personality regarding evolution is the incorporation of the universe (macrocosm) within one’s own consciential micro-universe (microcosm), through the capacity for identifying and establishing an increasingly ample empathy (universalism) with living beings and inanimate things at more and more inner levels (cosmoethics). This is the practice of consciential multidimensionality.

Implications. The intraphysical consciousness often resists personal growth and nourishes a deep fear of maturity because it implies many things, including a certain degree of independence and autonomy, a capacity for self-discipline, certainty in regard to objectives and values, and motivation towards a level of personal realization.

Responsibility. Furthermore, greater maturity implies greater responsibility, which is a frightening possibility for some people.

Success. There are also those who fear success, excellence and knowledge. For example, fear of success and fear of greater maturity are closely related. The more success we have in terms of performance, abilities, knowledge, sense of perspective, leadership, and so on, the more people expect from us.

Existential robotization. Intraphysical consciousnesses who are still immature, discouraged or literally mediocre (existential robotization) find refuge and security in not being either too advanced or too behind the rest of the evolutionary group, but located within the obscure average (mediocrity).

Knowledge. Immaturity also leads the intraphysical consciousness to fear knowledge. There are those who seek knowledge, as well as those who avoid it, in order to reduce anxiety. The

knowledge of a certain fact implies the obligation to action. Immature individuals consider it safer not to know. If they knew, they would have to do something about it, or feel guilty over their cowardice.

Unaware. There are therefore those who still prefer, in this era of modern science, to live as a *blissful ignoramus* instead of being an *unhappy sage*. Such is the case with the inveterate smoker who deliberately ignores any discussion or literature that could clarify the possible connections between cancer and smoking.

Orgasmolatry. The current human evolutionary planetary moment relates to intraphysical consciousnesses whose lives are based on hedonistic principles, uncontrollably seeking pleasure, orgasmolatry and, consequently, an exaggerated worship of the human body and youth, and the associated motivating interests, commerce, industries, communities, media and advertising to this end, not to mention those who still live at a subhuman level, and whose efforts consist solely in obtaining the minimum necessary for the survival of their body, which is understandable, up to a certain point.

Animals. When considered in the condition of human beings, we are all still animals.

Zoology. Our zoological reality (zoology, fauna) indicates 3 facts worthy of study:

1. **Tail.** All human beings still present a caudal appendix (tail) up until the 10th week of intrauterine life.

2. **Canines.** All healthy persons with an intact soma, present 4 canine teeth for tearing meat or food in general.

3. **Chimpanzee.** Our biological or genetic makeup is 96.7% identical to that of the simian, monkey or chimpanzee. Our difference, of a greater conscientiality, is only 3.3% of our genetic make-up.

Instincts. Fortunately or unfortunately, most of the manifestations of our human behavior is based on the instincts of subhumanity.

Beliefs. Archaic beliefs, rooted in emotion (psychosoma) and seeped in taboos, still predominate everywhere in the twenty-first century.

Immaturity. Nevertheless, this also begets the side effect of a yearning to remain forever young, in *eternal youth* or in perpetual infancy, like *immutable minors*, which means remaining extraphysically immature, superficial and uncommitted at all costs.

Illness. There is very intense pressure for people to be young in the current intraphysical consumerist society. The physical human world suffers from the illness of infantilism.

Gerontophobia. The current norm is based on the fear of aging, the avoidance of baldness, the repudiation of white hairs, the taboo of wrinkles, the continued worship of the shape of the human body, namely generalized *gerontophobia* or the precocious senility complex.

Stubbornness. Clearly, if intraphysical consciousnesses insist on maintaining the *status quo* of their own evolutionary infancy, afraid of even reaching ordinary and restricted human, physical, psychic maturity, how are they going to achieve extra-human, extraphysical, parapsychic maturity or holomaturity?

Exploitation. Youth worship, the juvenescence of intraphysical society, or more appropriately, the exploitation of youth or its hypocritical deification, in this perverse relationship of generations, and the individual's common desperate need to appear, think and act youthfully, regardless of chronological age, under the threat of obsolescence and the *stigma of the discardable*, leads the intraphysical consciousness to extraphysical somnambulism. Any projector can easily verify this fact through mild, prosaic or paratropospheric projections.

Fetus. The results of orgasmolatry and gerontophobia – the prevailing binomial being exaltation of youth-shame of aging – has been felt for centuries and is easily encountered in the two dimensions of life: most (89%) of the consciousnesses of the members of terrestrial humanity live in a somnambulant condition while in the human body. After the soma begins to decompose, these consciousnesses arrive in the paratropospheric extraphysical dimension perturbed by various types of

prolonged post-desomatic parapsychoses, manifesting themselves in conditions such as: extraphysical fetuses, consciential embryos or beings that are immature in the presence of reality.

Culture. The mass communication mentality is contrary to the mentality of culture in general. Culture is based on the individual, whereas the means of communication lead people to the stagnation of uniformity or non-inventiveness.

Simplism. Culture illuminates the complexity of the multidimensional life of the intraphysical consciousness and the means of communication simplify it in an infantile, primary and simplistic manner, an attitude characteristic of the lowest common denominator.

Interrogation. Culture signifies endless questioning – an uninterrupted search for leading-edge relative truth – and the means of communication are not aware of anything more than quick, simplistic answers regarding everything.

Amnesia. A world obsessed by materialistic reality is a world obsessed about forgetting (amnesia) previous lessons. This tends to continue the evolutionary stagnation of the intraphysical consciousness.

Solution. How are we going to reach maturity in consciential (parapsychic), multiexistential terms, when most of us (humanity) are still not even able to be mature in cerebral (psychological) terms in just one life, namely the present one? The answer-solution to this question-dilemma is in the personal mastery of bioenergy (holochakrology), in the understanding and use of the holosoma (multicorporal consciential ecosystem) and in the full application of universalism.

Awakening. This is why lucid projection is recommended as a functional practice in order to achieve the awakening of somnambulants, who are adepts of the human body's animal youth, as well as the primary emotionalism of the psychosoma (emotional parabody). This will allow the achievement, besides terrestrial youth, not merely human maturity, but continuing to the discovery of extraphysical maturity or holomaturity, or elevated sentiments (rationalized emotions) by prioritizing the use of the mentalsoma (parabody of discernment).

Logic. Logic, originating from the mentalsoma, does not enrapture. It is a conquest of *Homo sapiens serenissimus* or *serenissimus*.

Persuasion. We can use all available techniques to demonstrate objectively, through logical argumentation, that our opinions are well founded, that our point of view is fair, that our affirmations are true, that our goals are laudable. Even so, after this, by proving the truth of that which we affirm, a person who listens to us will not feel obliged to accept, admit or follow us, and may reply saying: "You did not convince me" or, "Well, it seems to be true, but this doesn't change my point of view" or, "You are right, I now have another opinion, but nevertheless I will not behave differently". That is why, in projectiology, the individual, when really interested or motivated, should personally perform participative projectiological research.

Proof. The most concrete, marked and indisputable proof is not always able to convince or persuade a person, regardless of how solid a cultural background that individual may have. The facts evidence this every day.

Verbaction. The following are 10 disturbing examples of the inappropriate use of verbaction on the part of paradoxical professionals who refute proof when faced with obvious pertinent facts:

1. **Chancellor.** The monoglot chancellor (diplomatic incompetence).
2. **Dietician.** The overweight dietician (obesity).
3. **Tamer.** The lion tamer who runs fearfully from a mouse (murophobia or musophobia).
4. **Engineer.** The fearful engineer who does not travel by plane (phobia).
5. **Nun.** The catholic nun who becomes pregnant (gestation).
6. **Journalist.** The illiterate journalist (professional incompetence).
7. **Pulmonary.** The pulmonary specialist who smokes (smoking).
8. **Psychiatry.** The psychiatrist who bites his/her nails (onychophagy).
9. **Religious.** The religious professional who commits suicide.
10. **Sensitive.** The veteran sensitive who is afraid of first desoma (thanatophobia).

Self-control. Only maturity of the consciousness brings inner renovation, straightforward discernment or true self-control of the ego through the thoughts and actions of the consciousness, coming from the mentalsoma.

Egokarma. One cannot live intraphysical existence for another intraphysical consciousness. Egokarma comes before the measurements of groupkarma and polykarma.

Service. We can affirm that humans are organically, mentally and psychologically mature when their human faculties arrive at full development, such that they are able to adequately react to any circumstance that terrestrial life presents and provide themselves and intraphysical society with the service that is expected.

Process. Lucid consciencial projection, highlighting the fallacies of the worship of eternal immaturity, is an efficient maturative process for the intraphysical consciousness. It integrates the information that is processed, associates a maximum of self-thosenes, amplifies one's perspectives toward a broader and more panoramic visions of beings and issues, in the direction of hyperacuity or lucidity of understood and accepted immortality, thereby achieving a convenient balance between awareness and intuition.

All. Extraphysical maturity allows the intraphysical consciousness to understand its meta-organisms (holosomatics).

Coordination. We are not merely the cellular organism: liver, heart, brain, attractive skin or the perfect plastic features with attractive sexual characteristics. Being more than this, we are the intrinsic coordination of various vehicles of manifestation (unified body), the most ostensive and rudimentary one being the human body, and the most subtle being the mentalsoma, which houses the consciousness or ego and all of its basic attributes.

Environment. Extraphysical maturity also leads the intraphysical consciousness to consider its relationship with its environment. The vehicles of manifestation of the consciousness depend upon its environment.

Relationships. We do not relate only with the human dimension, but we also constantly relate to, control and are always being controlled by 3 other categories of consciencial environments or communities:

1. **Paratroposphere.** To and by the tropospheric extraphysical dimension (paratroposphere), a duplicate of this intraphysical or human dimension.

2. **Extraphysical.** To and by the extraphysical dimension, per se, being extremely different from the intraphysical or human dimension.

3. **Mentalsomatic.** To and by the pure mentalsomatic dimension, with the absence of the psychosoma, and which decidedly does not present any similarities to the human dimension.

Self-support. Maturity leads the consciousness to transfer the environmental, instinctive and emotional support of *human life* to the rational, parapsychic and extraphysical self-support of *multidimensionality*.

Formula. Consciencial maturity can be expressed in a simple formula: the inversion of the conduct of the human being who, in many other journeys through planetary life, remained at the inferior level of *maximal-suffering-with-minimal-learning*, who now moves on to the superior level of *maximal-learning-with-minimal-suffering*.

Conditions. There are two conditions which are quite different and extremely well-defined:

1. *Intraphysical maturity.*

2. *Extraphysical maturity.*

Infantilism. The intraphysical consciousness has still not discarded extraphysical immaturity and also has not discovered the existence and usefulness of extraphysical maturity, as long as he/she remains in human infancy or consciencial infantilism, dazzled by 3 involvements:

1. **Physicalism.** The physical or intrasomatic world, the daily temptations of pathological intraphysical society and existential robotization.

2. **Autobiography.** Solely human, mental maturity, bedazzlement by the development of one's own terrestrial biography, which ends in the grave or the crematorium.

3. **Superficiality.** Consciential infancy, fascination only with surface realities beyond dense matter, without applying them to promote personal intraconsciential recycling.

Premises. Any intraphysical consciousness arrives at a more ample consciential maturity through the following 3 premises or stages of self-discernment:

1. **Happiness.** After the ego (*mega-ego*) naturally overcomes – without missing, without complaining – the psychophysical conditions characteristic of crying out of happiness, or the dispensation of the need to feed multifaceted deficiencies.

2. **Renunciation.** After the personality silently and spontaneously renounces – without grief or rupture (minidissidence) – the more legitimate and just personal rights, in the face of the material arena of this planet.

3. **Justice.** After the motivated person stops combating blatant injustices (“justice”) when this combative approach does not favor others besides him/herself.

Oblationality. It is doubtless intelligent and worthwhile to endeavor to interpret the condition of holomaturity, an attitude which is easily understood. It is, however, difficult to become capable of effortlessly living in harmony with all the intrinsic, underlying details of these premises and priorities that compose a condition of non-pathological oblationality.

Thosenology. Maturity of the consciousness deepens and amplifies discernment, pointing out to the ego how to order its actions or self-thosenes from the mentalsoma, maintaining a balanced ascendancy over the other vehicles of consciential manifestation.

Pathology. However, this does not negatively or *pathologically* signify the following 7 postures:

1. **Stratagem.** The intellectualization of social relations as a defensive means of cutting normal emotional involvement (protective stratagem).

2. **Hermitry.** Solitary self-absorption that seeks social isolation as the best standard of social life (fruitless hermitry).

3. **Alienation.** Transformation of oneself into an uncommitted, robotic being, with no emotional ties to anything or anyone (distanced spectator).

4. **Contradiction.** The metamorphosis of emotion and spontaneity into abstractions, in an attempt to mechanize love and esthetics (contradictory positioning).

5. **Psychosoma.** The judgment that the emotional parabody – the psychosoma – is merely an obtuse, eternally animal instrument, with no other use (radical sophistication).

6. **Criticism.** The belief that emotional involvements will always be infantile, weak or simply idiotic (cynical criticism).

7. **Intellectualism.** Addressing problems and situations, while invariably divorcing them from their emotional aspects (blind intellectualism).

Health. Maturity of the consciousness signifies – in a positive and healthy manner – control, without repression or sacrifice, of the emotions that can enslave the ego, employing, for this purpose, rationalized emotions, or those greater sentiments that come directly from the pointer of the consciousness, which is based in the mentalsoma.

Caution. Consciential maturity leads the individual to live with lucidity, alertness and to be cautious regarding 7 areas of intraphysical knowledge:

1. **Religion.** Religion, when it is a simple professionally imposed package (dogmas) of absolute, definitive, unverifiable and improbable truths.

2. **Art.** Art that is devoid of content and message when it signifies the discovery of a *greater number* of new, experimental methods (styles) for *continually saying less and less*.

3. **Cybernetics.** Cybernetics (automation) wherein the machine robotizes and separates the intraphysical consciousness from coexistence with social beings.

4. **Technology.** Technology, when concentrated only in superindustries (bellicosity) of carnage and genocide.

5. **Science.** Science, when it only creates researchers (dermatologists of the consciousness) who never deepen their own causal reality as self-aware beings.

6. **Politics.** Politics, when it is interested solely in heightened abdominal brainwashing (repression) of the unthinking human masses (existential robotization).

7. **Communication.** Communication, when it exclusively sells the fallacies (lies) of the fulgurant mind manipulators, the violators of intraconsciential micro-universes or the impudent merchants of the consciousness.

Period. The individual who psychologically and conscientially matures earlier has a greater chance of better utilizing his/her period between successive lives or lifetimes.

Mistakes. Without applied extraphysical maturity, the regrettable repetition of errors, mistakes and infantile omissions of perspectives from prior intraphysical existences (retrosomas) – whether they are philosophical, political, religious, mystical, artistic, poetic, idealistic or well-intentioned – becomes almost inevitable.

Difficulty. That is why intraphysical consciousnesses find it so difficult to act with rationality, discernment and common sense, without mysticism and dependency upon rituals (psychological crutches, leashes and yokes), in the face of extraphysical realities.

Repeaters. The contingency made up of those who are repeating multiexistential mistakes – those who are prisoners of dispensable self-mimicry – comprise the majority of *somnambulant humanity*.

Signals. Individual extraphysical maturity or holomaturity, and the recuperation of cons or human hyperacuity, are marked by 10 unmistakable signs:

1. **Self-coexistence.** The intraphysical consciousness feels good coexisting with him/herself, as a personality, dispensing with the need for greater and rigid self-critiques (conscientiometry, conscientiogram).

2. **Self-determination.** The intraphysical consciousness severs his/her dependence upon others, things, and all psychophysiological crutches, although having, as never before, the precise notion of interdependence between all beings or consciential principles that are in continuous evolution.

3. **Self-confidence.** The intraphysical consciousness acquires self-confidence, annihilating the paranoia of timidity (shyness is an illness) on the way toward security, authenticity, sincerity and frankness.

4. **Self-development.** The individual does not keep waiting for dreamt-of help to come from other beings, from *destiny* or from circumstances. He/she endeavors instead to realize the best by him/herself, developing personal potentialities (paragenetics, innate ideas, personal talents) with discernment regarding evolutionary priorities and acting with an increasingly well-defined decision-making ability.

5. **Self-liberation.** The individual dispenses forever with personality cults (idolatry, adoration) and becomes liberated from the megapotency of so-called *public opinion*.

6. **Self-realization.** The intraphysical consciousness assumes a position that is founded upon solid evolutionary and rational bases, pursuing self-realization and conquest through continuous recycling, which enriches his/her human existence with increasing productivity within the existential program (existential programology).

7. **Self-discipline.** The person remains balanced, becomes disciplined, participatory, co-optive and authentic in all manifestations, through self-monitoring, thereby completely eliminating self-corruption and pathothosenes.

8. **Self-sufficiency.** The social being no longer asks on his/her own behalf in his/her intercession and revindication, but only on behalf of other consciential principles.

9. **Self-examination.** The ego no longer fuels personal grief, susceptibility, sensitivity or jealousy in his/her inner world (consciential micro-universe), nor does he/she expect gratitude, recognition, financial return or perfect understanding by others regarding that which he/she does. Thus, he/she does not get disappointed, as a conscious member of the microminority among the minorities of intraphysical society, remaining free of complexes and repression, in the pursuit of pure interconsciential understanding.

10. **Self-awareness.** Both the intraphysical consciousness and the extraphysical consciousness achieve full self-awareness of the mentalsoma and the mentalsomatic dimension and endeavor to live – wherever they may be – predominantly in accordance with the serenity, balance and discernment that the consciousness possesses when it is isolated in the mentalsoma, rationalizing the emotions or, in other words, relegating the ephemeral manifestations of the animal emotionalism that is natural to the psychosoma to a secondary position. This has the effect of gradually using up and atrophying this vehicle up to the point of making it disappear, when there is no longer a reason for it to exist, whereupon the consciousness reaches the condition of free consciousness (third desoma).

Conscientiometry. From a practical standpoint, the level of consciential maturity can be measured, with conscientiometry, through the successive beliefs that are nurtured by the intraphysical consciousness in 4 existential periods:

1. **Infancy.** First, during infancy, a belief in God (religiosity).
2. **Youth.** Second, in youth, for example, until a short while ago, in Karl Marx (socialism).
3. **Adulthood.** Third, in adulthood, in the lotto or lottery (automatic wealth).
4. **Maturity.** Fourth, in the period of integral or holistic conscientiological maturity, in self-confidence or, in other words, in the impulsion of your own will to evolve multidimensionally, thereby maximally dispensing with idolatry, crutches and egoistical supports.

Principles. Stemming from faiths of all types, the intraphysical consciousness acquires direct knowledge; stemming from random, alienating beliefs, the individual defines secure personal principles for living. Identify, if possible, which level is your own. You only stand to gain as a result of this approach.

Types. The true age (maturity) of a person can be classified into 3 distinct types:

1. **Chronological.** The chronological age of the human body or the state of coincidence of the vehicles of manifestation of the intraphysical consciousness, including the holochakra.
2. **Psychological.** The person's psychological age or, in other words, the mind or brain, including the parabrains or the psychosoma.
3. **Consciential.** The consciential age of the consciousness, per se, which is headquartered in the mentalsoma, with the holomemory and the rationalized emotions.

Conduct. Psychological maturity is a rare condition. Not all persons are able to discern between mature behavior and infantile behavior. The mature or infantile solution of problems should be observed by all of us.

Adults. The immaturity of adult humans is common. Not all adults are adults. There are adults who are clearly retarded and yet are not considered to be mentally debilitated. There are those who are grownups on the outside, but are still children within (or are *always* children inside). Adult immaturity explains many lamentable events in human history, which thus far remain inexplicable (certain frivolous wars, absurd escalations of weaponry and other facts).

Mentalities. Strictly speaking, there are those who consider children, who are so dependent, to essentially be criminals and, therefore, to be dangerous. This is due to their irresponsible or infantile animal manifestations. Fortunately, the children's physical capacities are too limited. However, an infantile mentality inside an adult human body is much more dangerous and potentially disastrous. We are not merely referring here to the unhappy exceptional individuals (oligophrenics, the mentally retarded or cases considered to be ostensibly pathological), but instead to the frank immaturity of those average adults who are rarely socially perceived as such (existential robotization).

Trap. Those who pursue extraphysical truth can be drawn into a psychological trap or pressured to remain conscientially immature in the following 2 manners:

1. *Mentally*, in the condition of the accommodating psychological servitude of people who give up their right to question certain vital themes in order to avoid creating a scene.

2. *Emotionally*, upon accepting a basic interconscial dependency on some professional guru, sensitive or orthodox leader (rituals, talismans, amulets, astrological charts, predictions) for the rest of his/her human life. These complacencies become transformed into psychophysical yokes or crutches and the entire scenario consolidates the aspect of group intrusion of intraphysical consciousnesses or group fascination.

Spectacles. The daily exhibitions of human and conscial immaturity are the most readily encountered spectacles in social life, whether on the street (transit neuroses), in newspapers (police columns), television stations (soap operas at the lowest common denominator, the predominantly malevolent character), in homes (domestic tyranny), in office departments (the prepotency of those in command positions: *Those who can give orders, do so; those who are judicious, obey.*). Conscial immaturities occur in the home, at work, in social life, in emotions and in decisions.

Retardation. Planetary humanity still suffers from the worst possible ill: retarded conscial development, one of the most lamentable diseases that affect the mentalsoma, and with a high degree of frequency in the profiles of parapatology of the parabody of discernment. Those who suffer this condition are immutable-anomalous-beings (at an evolutionary standstill) in a universe in constant mutability (the constant progress of the universe). There are a shocking number of conscially retarded consciousnesses.

Cons. The majority of existing adults are mental and conscial children. There are persons who never grew internally or, in other words: did not recover a reasonable number of their cons. For example: it is easy to encounter a 30-year-old woman who is the emotional equivalent of a 15-year-old girl; or the 25-year-old man who has the egocentric perspective of a child of 5.

Evolution. Conscial evolution is the journey of the consciousness from immaturity to maturity. The act of working on behalf of the maturity of the human species is pure universalism, or the greatest clarification task that is available to the social being. It represents cooperation in *bioenergetic weaning* in regard to excessive dependencies and personality cults.

Intruders. The populations of the intraphysical dimension and extraphysical paratropospheric dimension are in desperate need of conscial maturity. There are legions of semiconscious adversaries of conscial maturity or, in other words, intraphysical and extraphysical intruders who are *semi-conscious* of their hetero-intrusion.

History. All persons can grow irrespective of their physical age. Unfortunately, throughout the earth's history, there has never been a sufficient number of mature-model individuals (leaders) in the proper place at the right time. Example: the level of electoral candidates everywhere. This is the profile of the planetary mega-school to date.

Demonstrations. The following can rationally be considered clear demonstrations of conscial immaturity: fear, any type of psychological insecurity and the act of considering oneself to be an exception to the human species.

Projectability. Adult immaturity directly hampers the development of lucid projectability or the capacity of the intraphysical consciousness to project with lucidity to extraphysical dimensions.

Exercise. Conscial maturity is pure rationality, a practical experience in line with the dictates of the mentalsoma. The exercising of maturity is the act of endeavoring to eliminate the psychological obstacles that impede humankind from rationally executing its tasks, as well as being enormously forceful in the sense of reducing the millenary difficulty of ridding ourselves of our irrational beliefs (animal experience).

Fraternity. When acting, while in the state of maturity, the intraphysical consciousness preponderantly, stemming from the mentalsoma, rationalizes the emotions to a point at which common love is transformed into a profound sentiment of pure fraternity. This sentiment allows one to overcome, in one's intraconscial world, the levels of gender definition, besides the influence of human appearances, different physical ages, family positions and the social conditions of each being.

Retrocognitions. This transcendent human attitude helps the intraphysical consciousness have positive retrocognitions and locate and identify other consciousnesses of his/her evolutionary group (groupkarma), when they pass through resoma. This intraphysical consciousness, upon arriving at 50 years of age, at least, in a single human lifetime, may recognize, for example: certain consciousnesses in two short consecutive human lives; and certain extraphysical consciousnesses, first in the extraphysical dimension, and then, subsequently, reborn in the intraphysical dimension, breathing oxygen at his/her side.

Derepression. The first great struggle required for the intraphysical consciousness to achieve a greater maturity in adulthood is the overcoming of his/her own repressions (abdominal brainwashing) generated by education and the inevitable instruction that he/she underwent in infancy, adolescence and the beginning of his/her adulthood. It is important not to forget: this effort must be repeated, indefatigably, in each new intraphysical existence (a new soma and a new holochakra).

Intraphysical consciousnesses. Realistically speaking, humanity can be divided into two categories of intraphysical consciousnesses: very repressed and less repressed. Those intraphysical consciousnesses who are very repressed studied little and reflected even less. In this planetary evolutionary stage, projectiology is directed to those intraphysical consciousnesses who are *less repressed* or, in other words: the only ones capable of understanding and practicing it with indispensable lucidity.

Anti-repentant. The thought, word or, specifically, the mature consciential act is essentially a catalyst for the self-evolutionary process, signifying the maximum that is possible at that consciential moment or that which is ideal for all. Additionally: it is logical, executable, functional and *anti-repentant*.

Impact. The impact of consciential maturity often impresses and traumatizes. This fact is practically inevitable. The consciousness, when operating from the mentalsoma (leading-edge relative truth), is stronger, more effective and decisive than when it operates from the psychosoma (desires, animalism), from the holochakra (bioenergy) or from the human body (musculature). For example, the author, as a result of the minimal leading-edge relative truths which he is able to understand, has been called an *antichrist*, and these intraphysical consciousnesses are not far from the truth. The communicator of these leading-edge relative truths will always be an *antimythical torturer* of intraphysical consciousnesses.

Sadism. Orthodox, sectarian, factional and narrow-minded persons judge the analysts of evolution of the consciousness to be sadistic. *Brainwashing deprogramming* frequently *hurts greatly*, both morally and intraconscientially. In these cases, the ego's self-defense mechanisms are *finely ground* in order for the positive intraconsciential recycling of the life of the intraphysical consciousness to occur. Hence conscientiological mini-dissidents arise. Extremely mutilating *consciential surgeries* occur in the area of leading-edge or vanguard ideas. Is there, perchance, another, more efficient methodology for helping others to understand leading-edge relative truths and self-cures?

Bibliography: Miranda (1050, p. 148), Vieira (1762, p. 220).

167. TECHNIQUE FOR ACQUIRING A UNIVERSALISTIC SENSE

Definitions. Universalistic sense: the inner consciential condition of conciliation and pure conformity with all beings and things of the universe; the state of consciousness already identified with the universal community, total and irreversible awakening to pure universalism.

Synonymy: citizenship of the universe; cosmopolitan sense; eclectic sense; open mind; open-mindedness; self-awareness of the cosmos; understanding of cosmic law; universalistic coexistology.

Fixation. Every time the consciousness has a more lasting and deep fixation in one consciential dimension its attribute of omniperception is restricted, which signifies self-castration, temporary obfuscation and a decrease in its maximum consciential and evolutionary effectiveness. In order to minimize setbacks in its demand for its own evolutionary growth, the consciousness needs to be more self-aware of this fact.

Resoma. The greatest fixation that occurs in the evolutionary scale of the consciousness is the act of its resoma into a human body. The only occurrence worse than this is the pathological condition of post-desomatic parapsychosis.

Zenith. Nevertheless, somewhere along the evolutionary trajectory, one inevitably arrives at a level at which the consciousness spontaneously detaches itself from all of its egoism in order to permanently embrace pure altruism with no constraint, sacrifice or greater difficulty on its own part. Upon arriving at this zenith of greater understanding, all segregations, labels and specific demands of the ego lose their *raison d'être*, regardless of one's cultural background, native language or the intraphysical society in which one lives.

Process. The process of the consciousness' acquisition of the universalistic sense, while still in the intraphysical condition, represents a constant struggle against the conditioning imposed by the indispensable, and always repressive, human education, in the sense of achieving the following 4 objectives:

1. **Reproduction.** The cutting of the egoistic links of animal reproduction (human gestation).
2. **Competitiveness.** Refraining from all types of merely planetary competition in any field or sector of intraphysical manifestation.
3. **Universalism.** Universal interests placed *before* interests that are parochial, provincial or pertain to *one's own little world*.
4. **Vision.** A wide-ranging view that always endeavors to focus *beyond* the confines of the planet where one temporarily resides.

State. Thus, the state of universalistic sense is the final condition that crowns the consciousness and is situated well beyond an increasing scale: the state of a sense of family, profession, community, region, nation, continent and, lastly, planet.

Advance. The universalistic sense prizes universal consent, shifts from the part to the whole, advances beyond and leaves behind all ideas or manifestations of retrograde policies that express egoism, such as: segregation; nationalism; exacerbated patriotism; the radical party; Jacobinism; xenophobia; the clan; the sect; the closed club; orthodoxy; dissidence; isolation; excessive, multiple *leashes of the ego*; and other correlated tendencies or those of an identical nature.

Technique. The acquisition of a more profound applied universalistic sense is accessible to any individual. Therefore, it is worth observing these 10 topics:

1. **Training.** Disciplined training in the control of consciential energy and the production of lucid consciential projections allows the interested individual to have a more ample development of parapsychic perceptions, starting with ordinary clairvoyance or the reading of the energetic aura that surrounds all beings and objects.

2. **Interworlds.** The principles of evolution suggest that all of us, without exception, are predestined to be *gods* at an opportune moment. The more the consciousness evolves, the more it increases the range of its influence towards some type of omnipresence, and deepens its understanding towards some type of omniscience. At this point, the development of clairvoyance opens the perceptive doors of the intraphysical consciousness to other consciential dimensions. This permits him/her to live while thinking, feeling and reacting in many dimensions at the same time, although headquartering the ego, without alienation, in one of them – in this case, the intraphysicality that is characteristic of his/her human body – even when this physical dimension, strictly speaking, is much more pathological (entropy) than healthy.

3. **Unveiling.** The unveiling of other dimensions on the spot – during the development of daily occurrences – shows the intraphysical personality other more evolved parameters of heterocritical judgment: a more accurate vision of universal life; his/her practical integration with the cosmos; the precise understanding of universalism; a greater and uncommon level of consciential maturity (holomaturity); and rationalized emotions (sentiments) in relation to all beings and nature with whom he/she coexists.

4. **Energy.** Upon being awakened to multidimensional life, the consciousness precisely identifies and characterizes the function and action of consciencial energy in all of its manifestations in the manner of the maxim resource, the common denominator, the master key, the instrument which discriminates priorities or, the unit of measure of beings and things in its actions.

5. **Auras.** The auras of these beings and things will be perceived at another level from now on, with a different perspective, more intimately congregating and amalgamating all the objects of universal reality, freeing the clairvoyant consciousness from slavery to the rigid forms of matter. This same consciousness will even locate and identify deceased beings, situating each in its level or dimension of manifestation. In this way, for example, from a human environment, it can begin to simultaneously distinguish 3 extraphysical consciousnesses, each in its own dimension, where the less evolved ones do not perceive the presence of those that are more evolved.

6. **Time.** With the passage of time and an accumulation of experiences, the universalistic sense ends up establishing a sensation of lucid inner peace in the ego that no longer allows anxiety regarding the past, present and future or, in other words: eliminating time, which has now become a simple factor that is constraining and unnecessary for its evolutionary impulse.

7. **Consequences.** As a result of the elimination of the excessive effect of the time factor, the intraphysical consciousness no longer spends time waiting to pass through desoma, or harbors expectations regarding the impulses of the changes in the human calendar, in order to fully live or realize more. The individual pursues the resources for maximal experience from that very moment, in the still physical here and now, because he/she knows that the evolutionary task is a singular one, whether in the intraphysical state, the extraphysical state or the projected state. The consciousness that is still convinced of being able to energetically vibrate in an intense manner through the force of the will, regardless of the vehicle of manifestation which is predominately manifesting in a specific environment at any moment, benefits from this in a positive way.

8. **Co-optation.** This attitude of growth conquers the sympathy of more greatly evolved consciousnesses (evolutiologists, *serenissimus* and even free consciousnesses) that control all existing things. The individual therefore becomes even more engaged as a lucid, active minicog within the evolutionary maximechanism that oversees all living beings. The degree of his/her co-optation increases. He/she will no longer remain in blind opposition to the universe, but will gladly integrate him/herself in an intimate, definitive manner, into the framework of conscious assistants (evolutionary team) and directly join with the pervading situation in this universe. His/her presence (personal holothosene) will be much more impactful and productive in the scenario in which he/she participates, not ostentatiously, but anonymously, working at the core essence of things, addressing that which is important and performing truly lasting work (existential program).

9. **Cosmic.** At this level, the consciousness generally reaches the condition of cosmoconsciousness, receiving *a touch of the infinite* and entering the real state of the universalistic sense – in the blink of an eye and in a wholesale manner – as though through a providential shortcut.

10. **Cosmocrazy.** Lastly, the simultaneous views of different consciencial dimensions, and the conjoined interdisciplinary and multifaceted analyses of the problems and phenomena of multidimensional life, lead the intraphysical consciousness' aspirations toward the consciencial era or, in other words, implantation of the cosmocracy.

Projections. The maintenance of a universalistic sense decisively helps the performance and development of the intraphysical consciousness regarding lucid consciencial projections, notably in his/her periodic extraphysical experiences.

Senselessness. No ordinary, immature or vulgar personality is exempt from senselessness. The maintenance of an open and universalistic consciencial micro-universe offers us the best resource for directly combating the limitations of our mega-weak-traits of senselessness. Hence the opportunity and importance of establishing the technical bases for the acquisition of a universalistic sense, being the best method for overcoming the condition of multimillenary, multiexistential or holobiographical consciencial immaturity, retardation and torpidity.

Considerations. It is far from the author's intention to exhaustively solve, here and now, the ancestral and crucial problem of the immaturity of the human consciousness in a manner that will persuade all intraphysical consciousnesses regarding the usefulness of constantly perceiving and experiencing a universalistic sense. However, the following are 10 considerations – basic rules that are coherent from a logical point of view and are acceptable from an ethical standpoint – that are capable of technically defending us from the specific errors of senselessness, immature opinions, and the narrow-mindedness that sidetracks us from a direct line of reasoning:

1. **Self-awareness.** Carry out rigorous self-critique regarding your own tendencies in all areas of human activity.

2. **Comparison.** Perform a deeper examination of differences in opinion, in a comparison of your parents, colleagues and friends.

3. **Openness.** Become informed on opinions held in social circles other than your own (open-mindedness) through tests of direct personal experience (yours).

4. **Coexistence.** Coexist with other individuals with whom you wholly disagree maintaining a climate of harmony (peaceful coexistence), avoiding anger or misunderstanding due to opinions contrary to your own (admiration-disagreement binomial).

5. **Gathering.** Take the initiative of prudently gathering the ideas of others (inter and multicultural contacts) who have tendencies that are different from yours, aware that neither party has good evidence in more heated controversies.

6. **Depreconception.** Read books, magazines, newspapers and CD-ROMs dedicated to the dissemination of lines of thought that are different from yours, with the certainty that if the individuals who write and publish these works appear crazy or wicked to you, you also appear that way to them.

7. **Dialogue.** Establish an imaginary dialogue with a hypothetical opponent, pursuing – unbiasedly, democratically, and in a comparison of all opinions (inner debate) – the ideal prevailing opinion, or the one with a useful consensus regarding each subject under analysis.

8. **Interdisciplinarity.** Pursue interdisciplinarity in your research, making your own direct observations, knowing how to use modern means of communication, the most efficient physical agents of universalism (parabolic antenna; artificial satellites; the Internet; multimedia; cable TV).

9. **Polyglotism.** Endeavor, if possible, to read, speak and think in languages that are not your native tongue.

10. **Travel.** If possible, travel and live away from your own country for a period of time (cultural excursion; study scholarship), in order to eliminate preconceptions restricted to the space-time *continuum*.

Maturity. These attitudes enable the deepening of our logical perceptive acuity and, consequently, amplify our level of conscial maturity against psychic vacuity (*empty-headedness*), lack of intellectual sharpness, lack of sensitivity, faulty reasoning, defective powers of observation and mental slowness, on the way toward imperturbability, which is characteristic of a fraternal and agile person, who is simultaneously centered and universalistic (*serenissimus*).

Expansion. After employing these logical resources of maturity, or executable universalistic processes – which can inspire the use of many others – you will remain in a state of full conscial immaturity only if you so desire, because the result, for the person who puts them into practice, will be to subjugate the psychosoma, amplify the use of the mentalsoma and, finally, achieve the expansion of your own consciousness (cosmoconsciousness) by using conscial energies and self-thosenes in a far more intelligent manner.

Specific Bibliography: The author's most recent work: *700 Conscientiology Experiments*.

168. THEORY OF CONSCIENTIAL SELF-CONTROL

Definition. Consciential self-control: the condition of the correct use and matured practice of the consciousness' balance in relation to itself, other consciential principles (consciousnesses in evolution), and the universe which shelters it.

Synonymy: self-control of the ego; volitive self-confidence.

Types. The condition of consciential self-control presents 2 well-characterized basic types:

1. **Initial.** Initial or partial self-control, typical of *pre-serenissimi*.
2. **Final.** Final or global self-control, typical of *serenissimi*.

FCs. Ahead of these two types, situated at another level, at the forefront of evolution, free consciousnesses (FCs) are encountered.

Limits. Ordinary, somnambulant, humanly average or evolutionarily mediocre persons have their normal consciential limits of self-control in the coincident state within intraphysical existence upon their vehicles of manifestation: the human body (soma); the energetic parabody (holochakra); the emotional parabody (psychosoma); and the parabody of discernment (mentalsoma).

Sensitives. However, there are those intraphysical consciousnesses who are able to control their mind – self-consciential control – above or beyond the normal limits of the evolutionary performance of average persons. These individuals are called *sensitives, animists, scientists, nobelists, artists, record breakers, medalists, gifted* and other names. Some are considered to be witches or warlocks; others are considered to be *mystics, hierophants* and *saints* (of these 1,848 are registered in Catholic hagiology); still others are called *magicians* or *conjurors*.

Quality. Numbers cannot clearly convey all that exists regarding consciential evolution. The quality level of the effort which the intraphysical consciousness seeks through the maturity of freewill is extremely important.

Objectives. Many immature individuals feel self-realized upon exerting great amounts of effort in consciential self-control toward objectives that are badly chosen, unconstructive, inefficient, negative, pathological or predominantly useless with regard to the acceleration of the evolutionary self-yield of his/her consciousness, in accordance with the principles of cosmoethics.

Immaturity. Immaturities with respect to consciential evolution can be verified in a great number of books of international records as examples of what can be intelligently avoided by more lucid interested persons regarding evolution.

Disparate. There are those who go to great lengths in order to set the most disparate records, such as: balancing golf balls on a piece of furniture; hold up cigar boxes on the chin; eat more than anyone else. Are these beings still too animalized or materialized to concern themselves with the idea of ceasing to undergo resoma? They undoubtedly are.

Partial. Partial or sectorial consciential self-control can be subdivided into 4 categories, according to the control of the consciousness over each of its vehicles of manifestation. We can thus, as examples, come across the actions, when positive, of the contortionist, the sensitive, the artist in general and the genius of proven wisdom.

1. **Somatics.** The contortionist controls the segments of the human body or soma, beyond the average of the population, and transforms him/herself into a *human snake* or a *boneless woman*; the athlete breaks international records in positive acts of strength or Olympic games. Examples: Harry Houdini (1874-1926); Sergei Vassilievitch Rachmaninov (1873-1943), the musician with the greatest finger span; Mark Spitz, the multiple medalist swimmer; Edson Arantes do Nascimento (1940-), Pelé. In these cases it is necessary that the person has a hereditary condition for a specific genetic predisposition (egokarma), with perseverant dedication to self-disciplined training over a long period of time. All subhuman animals (consciential principles) have still not evolutionarily arrived at this level.

2. **Holochakrology.** The sensitive (animist-parapsychic) controls the energetic parabody above the average of the population and helps persons to cure themselves, parapsychically bends metal, promotes telekinesis, transmutes objects, materializes substances, triggers rays of light and energy

around him/herself. Examples: Jesus of Nazareth; Daniel Douglas Home; Eusapia Paladino; Uri Geller (1946-); Thomas Green Morton (1947-); and others. In general, the performance of the ego is based on the emotional parabody, in the state of dis coincidence, in order to act directly upon the energetic body, because it does not transport the consciousness. That is why *physical parapsychic* phenomena depend so much on the emotion of the moment that is predominant in the environment (holothosene); the company or personalities in the surroundings of the sensitives; the predisposition and personality of the parapsychic researcher.

3. **Psychosomatics.** The artist controls the emotional parabody above the average of the population and *electrifies* the cardiochakra and the psychosoma of others, creating immortal works in many artistic areas. Examples: Ludwig van Beethoven (1770-1827); Enrico Caruso (1873-1921); Niccolò Paganini (1782-1840); Vincent Van Gogh (1853-1890); William Shakespeare (1564-1616); Honoré de Balzac (1799-1850); Rita Moreno (1931-), the most versatile international actress. In many cases, the artist controls the emotions excessively during creations aimed at other persons, but ends up being a victim of the relationship with his/her own emotions through implosive excesses (drugs) and sick catharses.

4. **Mentalsomatics.** The genius, with greater wisdom, has an above average control of his/her mental parabody and invents things, discovers laws and presents innovations or discoveries that overshadow everyone else and captivate the world. Examples: Aristotle; Galileo Galilei; Isaac Newton; John Bowring (1792-1872), the greatest polyglot; Albert Einstein. As a rule, these philosophers, scientists, inventors and discoverers are those people who are more capable of making suggestions to others regarding the search for the benefits of consciential maturity. This depends upon the degree of lucidity of his/her own reality or genius.

Specialities. At our current evolutionary level on this planet, the evolutionary talents of the consciousness, obtained through the repetitions of millennia and the string of intraphysical lives, almost always concentrate in a specialized manner in the extremity of a specific single line of activity. They still do not simultaneously present multifaceted capacities in their personality, or multimodal creativity in broad, generalist actions in more than one vehicle of consciential manifestation.

Conscientiometry. When a person controls one or more of the vehicles of manifestation, that intraphysical personality still presents 4 very characteristic traits in his/her evolutionary profile:

1. **Autobiography.** He/she obstinately defends his/her autobiography.
2. **Registers.** He/she is entered in the registers of humanity.
3. **Encyclopedias.** He/she has his/her biography in international encyclopedias.
4. **Records.** He/she is listed among the human record holders of all people.

Insertion. This personality, without exception, regardless of who it is, can be inserted into one of the 4 basic aforementioned types.

Global. The *serenissimus*, however, can be classified as a fifth type regarding the condition of consciential self-control. He/she controls, without pathological repression, and beyond the average of the planetary population, the 4 vehicles of manifestation of the consciousness – the soma, the holochakra, the psychosoma and the mentalsoma – in an intelligent, global, simultaneous, conscious or intentional manner, without significant difficulty, effort or sacrifice on his/her part.

Direction. Being more aware of universal laws, *serenissimus* is better able to anonymously, surreptitiously, multidimensionally and secretly direct other planetary beings in their evolution (evolutionary catalysis). Example: *Monja* (Vieira, 1762, p. 201).

Holosoma. Upon beginning to control the holosoma, the 4 vehicles of consciential manifestation together and at the same time, the intraphysical consciousness becomes anonymous to intraphysical humanity, *exiting the scenes* of the stage of human life. This signifies that holosomatic self-control is necessary and characteristically multidimensional.

Discarding. The preceding observations become logical if we are attentive to the fact that *human life* rationally relates to the consciousness in the animal or *human body*, which is always perishable and discardable in a predetermined and inevitable period of time.

Bibliography: Vieira (1762, p. 201).

169. THEORY OF ESSENTIAL WISDOM

Definition. Essential wisdom: that body of knowledge which deepens further regarding the structure of the consciousness, in its multiple dimensions, with regard to its manifestations or self-thosenes, extending itself in a more lasting way over conscial evolutionary time and, therefore, being qualitatively superior to others.

Synonymy: causal wisdom; essential science; *leading-edge wisdom*; mature wisdom; maximal wisdom; multidimensional instruction; priority science.

Concept. The concept of wisdom is always masked by appearances, superficialities and the general momentary conditions of human life, when addressed in only one intraphysical life, throughout the history of humanity. This masking is intensified still further in the myopic perspectives of universal phenomena, which are broad but developed through the immaturity of materialists or physicalists.

Existential seriation. In view of the above, the following question can be asked: “How much is one human life worth within the context of the complete scheme of the uninterrupted evolution of the consciousness (existential seriation, holobiography)?” A single intraphysical existence does not serve as a parameter measuring the undefined future of the consciousness. It illuminates a few upcoming immediate conscial steps, but nevertheless does not unveil the remote future and integral destiny.

Categories. We can consider wisdom in diverse types or categories according to its consequences, effects, scope, permanence and other variables.

Titles. How can it be contested that the wisdom of a holistic philosopher, addressing many dimensions where the consciousness expresses itself, who already has a deep understanding of cosmoethics, is not qualitatively superior to the wisdom of an eminent scientist, such as a specialist in physics at the zenith of excellence in conventional megascience, but whose knowledge is restricted only to the circumscribed atmosphere of human life, which is of reduced evolutionary validity, regardless of how many titles and extraordinary international laureates he/she possesses?

Self-lucidity. The awarding of titles does not confer a greater self-lucidity upon the recipient than that of other mortals, in any field of conscial investigation.

Prioritization. The quality of option-prioritization shown by the nucleus of knowledge chosen by the sage – free will – defines the degree of his/her initial wisdom or maturity.

Essence. The most essential wisdom is that in which the consciousness applies a maximum of his/her intelligences and potentialities in the establishment of more advanced priorities in his/her research. Therefore, the most essential wisdom expresses the gathering of the knowledge of highest priority, with regard to its importance and productivity relative to personal and collective effort, in line with the interminable evolution of the consciousness.

Sages. Based on these logical premises regarding wisdom in general, it is easy to conclude that there are two categories of sages, independent of personal notoriety:

1. **Essential.** Sages of essential wisdom.
2. **Secondary.** Sages of secondary wisdom.

Brilliance. In other words, without any elitism, there are sages of the first category and sages of the second category, with regard to the quality of their wisdom. The prestige, celebrity, academic titles and awards that they have received in their existence, or their *nobelism*, the brilliance of their human career and their biographical registration in renowned, prestigious international encyclopedias is unimportant because, in this case, these variables become secondary.

Consciousness. The consciousness is a far more important reality, and is of far greater interest than the transitory postulates of human science.

Non-prioritization. The lack of prioritization (non-prioritization) regarding the choice of the individual's interests shows the narrowness of the consciential micro-universe of certain sages.

Characteristics. The following 4 characteristic aspects, among many others, are essential proof and are indispensable for the classification of the consciousness' level of wisdom:

1. **Holomaturity.** The correct use of intellectuality according to cosmoethics or, in other words, intellectuality that is indicative of holomaturity.

2. **Openness.** The openness of the mind simultaneously to culture and counterculture, formal education and self-education, specialities and generalism, orthodoxy and heterodoxy, without preconceptions, academicism and scientism.

3. **Polymathy.** The broad and experienced view of understanding and erudition or polymathy.

4. **Self-education.** The maintenance of a good personal library (holotheca) in view of irreplaceable, continued self-education (autodidact).

Evolution. The multidimensional order and logic of evolution suggests that the consciousness only achieves the level of the first category of wisdom after already having experienced wisdom of the second category, within the logical progression of seriated, successive intraphysical lives (existential seriation).

Paradox. Paradoxically, there are anonymous sages without diplomas who are nevertheless aware of and experience leading-edge relative truths which are essential for the consciousness itself. These scholars are far more important than the greatest sages who have received international acclaim for one or another contribution made in a given sector of human knowledge, but that is limited and more transitory in the endless evolutionary way of the consciousness.

Serenissimus. From the perspective of their evolutionary evaluations, there are anonymous-sage pre-*serenissimi* at better levels of performance (anonymous existential maxi-program) than many notorious-greater-sage pre-*serenissimi* (explicit existential maxi-programs). The first ones find themselves closer to the level of the evolutiologist or of the *serenissimus* and are headed toward the aware anonymous condition of *serenissimus*.

Maturity. Greater and integral consciential maturity leads the intraphysical consciousness to seek more ample development of free will beyond human passions and parochialism. This inevitably leads to the identification and prioritization of essential wisdom.

Arguments. Human arguments are not strong enough to change facts.

Interests. The basic difference between the lucid and young intraphysical consciousness and the lucid and mature intraphysical consciousness lies in the fact that the first still maintains his/her basic interests predominantly bound to the immediatist present, and to the limited and defined future of the current human life that is to be built. The second consciousness centers his/her essential interests beyond ephemeral human life, toward the infinite future of consciential life, without generating any alienation.

Knowledge. The categories of knowledge cannot be merely classified into technical (physical, molecular, material) and human (corporal, cellular, cerebral), but also need to be amplified by multidimensional variables (consciential, essential, cosmoethical).

Projectiology. Conscientiology is one of the most essential of all sciences because it focuses precisely on the research of the rational, integral and maximal awareness of the consciential micro-universe. Projectiology acts exclusively within the scope of essential wisdom, or that of conscientiology, because it concentrates all of its research, without any messianism, in the third basic state of the consciousness, or the projected state, which is important to the intraphysical consciousness and even to the extraphysical consciousness.

Intelligence. The complex module of *evolutionary intelligence* can be considered as the *materthosene* of essential wisdom within an individual holothosene, in relation to the twists and turns of the difficulties through which we pass in intraphysical life, always aiming toward existential completism.

170. CONSCIENTIAL ERA

Definition. *Consciential era*: that era in which average human consciousnesses will encounter themselves sufficiently improved through the impacts, redefinitions, revolutions and evolution created by generalized lucid projection.

Synonymy: *cosmococracy*; life with mega-helpers; new neolithic revolution; physical-extraphysical counter-civilization; projectional era; projective era.

Graduation. In the development of the consciousness, everything evolves in a generalized and irreversible graduation that reaches all areas of thosenic manifestation. The following, for example, are 28 logical progressions of facts, listed here in alphabetical order:

1. From alchemy to chemistry.
2. From astrology to astronomy.
3. From bioethics to cosmoethics.
4. From candles to spotlights.
5. From cave paintings to holography.
6. From caves to megacities.
7. From common sense to mature science.
8. From faith to lucid self-experience.
9. From flora (botany) to fauna (zoology).
10. From good intention to self-discernment.
11. From horses to spaceships.
12. From ignorance to wisdom.
13. From instinct to reason.
14. From kindergarten to the post-graduate course.
15. From medicinal teas to conscientiotherapy.
16. *From mediumship to lucid self-projectability.*
17. From miming to conscientese.
18. *From pre-serenissimus to Homo sapiens serenissimus.*
19. From religion to the practice of penta.
20. From smoke signals to e-mail.
21. From soma to mentalsoma.
22. From subhuman animals to humankind.
23. From the clan to the world state.
24. From the consultation room to the extraphysical clinic.
25. From the feudal system to the world state.
26. From typing (typewriter) to keyboarding (computer).
27. From veterinary science to medicine.
28. From walking to volitation.

Order. The experience of continued human lucid projections gradually establishes a distinct and hidden order by which one lives, that becomes perceptible through the multidimensional comparisons, multifaceted analyses and self-critiquing judgments of the intraphysical consciousness that is in frequent transit between various consciential dimensions. These experiences end up being reflected in the life of the human being.

Extraphysical. The rational direction of human consciousness to a more advanced stage, beyond the following temporary physical conquests to an extraphysical and lasting level in relation to the multiexistential consciousness must be emphasized: beyond the periods or waves of change; beyond the research that sociologists, anthropologists, psychologists, thinkers and futurologists employ in order to arrive at conclusions, think ahead and make forecasts, establishing the evolutionary phases of intraphysical societies and human communities; from the first wave, or the agricultural revolution, the second wave, or the industrial revolution, up to the so-called third wave of current history, the age of

information, electronics, the global village, communication technology; and even beyond the future *waves* that will come more and more rapidly and ephemerally in the coming decades.

Implantation. Logic imposes a living and a clearly discernible standard from which it can be concluded that the generalized conquest of this consciential era – analyzed here as a theory for research – will still take some time to be implanted in the planetary atmosphere (human holothosene).

Experience. Nevertheless, the individual experience of this consciential era can already be sought, pursued and enjoyed now, both individually and in small groups, for those who wish to and are sufficiently motivated towards this.

Priority. Lucid projection, in unveiling the extraphysical world that coexists with this human world, minimizes the problems of the individual's daily life, allowing one to counterbalance the values of sociological conquests, as advanced as they may be, internally exalting a greater certainty and better consequences, which naturally becomes a priority for the more lucid individual.

Multivehicular. With repeated and advanced lucid projections, the intraphysical consciousness begins to establish multi-secular, multi-existential and multi-vehicular plans. In other words, the individual plans while taking into account many vehicles of manifestation or human bodies, thus expanding aspirations beyond planetary limits, at a cosmic, universal and atemporal level, or more precisely, beyond human calendars, ephemerality, conquests, discoveries and inventions, at a level that it is as yet unattainable by even the most brilliant sociology or futurology project.

Helpers. So far, we live on the earth under the protection of the helpers for the execution of any advanced extraphysical undertaking.

Self-sufficiency. The consciential era will be the period of life that naturally dispenses with the resources and incessant interventions of the helpers. Thus, the consciousness will act on its own, directly, with self-sufficiency both inside and outside the human body, dispensing with all *parapsychophysical crutches*. The consciousness will therefore be in close, profound harmony with his/her evolutionary orienter or the evolutiologist of his/her karmic group (*mega-helper*).

Existential seriation. All indications are that when the consciential era is installed on a planet, it marks the beginning of the end of the rigidity that is characteristic of successive lives or existential seriation, for the consciousnesses that inhabit it.

Eras. The scale of evolution of the intraphysical consciousness on earth can be built upon 6 eras established according to *energetic stages*:

1. **Muscular.** The era with a predominance of *muscular energy*, of work performed with the muscles of human and subhuman animals, of biceps and manual labor (hands, arms, soma).

2. **Mechanics.** The era with a predominance of *motor energy*, beyond human articulations or, in other words, the work performed by wheel, the motor and the machine at the beginning of technical-scientific development through the extensions of feet and legs (automobile, truck, tractor, airplane).

3. **Chemistry.** The era with a predominance of *chemical energy*, derived from the pollutional burning of organic fuels (coal, petroleum, gas) and greater industrialization, with the extension of the eyes and the frontochakra, from the microscopes of histology to the telescopes of astronomy.

4. **Atomics.** The era with a predominance of superconcentrated *physical energy*, of the nucleus of atoms of metal (uranium, thorium) operating generators, ships and submarines, not to mention hydroelectric energy (Itaipu) and solar energy, along with their extensions of the nervous system and the laryngochakra (telephone, radio, television, fax).

5. **Electronics.** The era with a predominance of *neuronal energy* with direct extensions of the brain (cerebellum, psychomotor activity, psychomyology) and the coronochakra (computer, transistors, chips, automation).

6. **Volitional.** The era relative to self-awareness of *consciential energy* (holochakra), the impulsion of the will, control of the emotions of the psychosoma through the mentalsoma, discernment, consciential maturity, with the direct extension of the human senses (parapsychic phenomena) and the awakening of multidimensional self-awareness. This era arose with projectiology in the twentieth century.

Bibliography: Vieira (1762, p. 219).

171. HOLOKARMIC ACCOUNTS

Definition. Karma: the law of cosmoethical causation, which neither punishes nor rewards, neither creates nor designates anything, but infallibly directs all other laws that produce certain consequences in the set of actions of the consciousness.

Synonymy: law of action and reaction; law of cause and effect; law of retribution; law of return; theory of behavioral reversion.

Division. In a more instructional approach, it is always better to focus the theory of karma of the consciousness into 3 well-defined segments: egokarma, groupkarma and polykarma.

1. **Egokarma.** The pure, individual, or egokarmic, account refers to the inner life of the person, its consequences (psychosphere or individual holothosene) and the egocentrism or egoism of the instinct for survival.

2. **Groupkarma.** The account of the consciousness in relation to its resomatic group comprises its evolutionary groupkarma, derived from the interpersonal activities or those of the karmic group (community of destiny; group fascination).

3. **Polykarma.** The account related to intra and extraphysical collectivities, and a more ample individual public life, comprises the polykarma of that consciousness and its pure, applied fraternity (multidimensionality).

Holokarma. Holokarma is the karma of the *consolidated balance* of the consciousness' actions, or the sum total of its 3 karmic accounts.

Differences. The fundamental differences between the egoistic actions of the intraphysical consciousness when defending his/her egokarma and groupkarma – when faced with fraternal human actions within the context of polykarma – can be identified by the ideology developed through the creation of well-devised secrets, the withholding of information, subtle involvements, emotional blackmail and, most commonly, the inculcation of behavior.

Leading-edge. The projectiological perspectives of leading-edge truths inevitably lead the consciousness to the source of indispensable concepts or to the support provided by the highest common denominators. They marginalize peripheral aspects, going straight to the useful core facts related to the consciousness. They always value intelligent prioritization. They seek that which is more profitable in terms of the conscious evolution of the consciencial micro-universe.

Philosophy. The individual's life philosophy or political ideology has a great influence upon the karmic accounts of the intraphysical consciousness.

Levels. With respect to karmic accounts, it is observed that the intraphysical consciousness evolves, in the environments of the intraphysical dimension, along an ascending scale within the social context, through at least the following 8 well-defined environmental or geographical levels:

1. **Home.** Still the cornerstone of society, the family unit above all stratifies the first cradle of the egokarma of the intraphysical consciousness and is the instrument of renovation for intraphysical society in general. The family institution, a micro-structure inserted into the social macro-structure, is the group that seeks the union of all its members, stemming from the work of the mother and father, within a society that is divided into classes. The family environment, the cornerstone of intraphysical society, presents many contradictions. Within this environment arise the demands of genetics, the trials and torments of the destitute home, the members of the family unit, the initial formation of the personality, the first examples and impressions, the critical comparisons of contrasting socio-economic situations, the pressures for greater social justice, relatives and, later on, outside the family unit, matrimony or, when the social being is evolutionarily more advanced, the evolutionary duo.

Small world. There are adults, human family members who have never left the well-defended and egoistic scope of their home or nuclear family. They live segregated in the *small world* of their home, that has become transformed into an ivory tower filled with egoism, in defense of the monopoly of their egokarma and, to a lesser degree, stuck to their karmic group (clan).

2. **School.** The school, the second immediate field of influence and interaction of the resonant consciousness, is where collective education is administered and the student class exists, the *sacred cow*, the extension of the family. Within this context the following can be noted: mass dissemination of repressions, authoritarianism, and social conditioning; preparation of children for intraphysical life; inculcation of behavior and the dominant ideology; possible generalized acritical sentiments; *consciential* awakening or intellectual torpor; deformations of human reality; and the first big enticing attractions for the consciousness outside the home.

Discipline. In the educational institution, the concept of discipline should always arise in the performance of an intelligent activity, in order to generate learning and a critical posture. Unfortunately, the authority figures do not always base their actions in dialogue and a common pursuit. An initial group of colleagues (karmic group) appears in the school and *attach* themselves to the branches of the genealogical tree of egoisms of the consciousness.

3. **District.** In the district of the city that has similar functions, aspects or people per se, where offices, clinics, tailor shops, stores or any other workplaces are installed. In low-level districts, one encounters human misery, slums, flood victims and the *embassies* of those contaminating non-evolved extraphysical environments. In these physical environments, work is performed that is not always entertaining, not always dignified and does not always produce wealth, but which constitutes the profession that gives weight and prestige in a social context. From this arises religion and religious mystifications that, unfortunately, seek, through social restraints, the alienation of the dominated class.

Innovations. It is from the workplace, however, that the bothersome forms of behavior arise which nevertheless bring innovations, the ever-present perturbations that exist in any type of transformation for the better, thus enriching the holokarma of the consciousness. The extraphysical consciousness, when reborn, although more multidimensionally aware (evolutiologist, *serenissimus*), paradoxically concludes that the nonstructural individual revolution depends upon the will of each one, exclusively, and at a certain evolutionary level will become more opportune and advantageous for consciential destinies. Without incurring any monopoly of egoism in his/her actions, the consciousness bases itself on the fact that the extraphysical lucid parapopulation is greater in number and evolutionary consequences to the physical, human consciential population (an estimated 9:1 ratio in 1998).

4. **City.** The city is the demographic complex that is socially and economically formed by an important non-agrarian concentration of the population. It can also be the environment, the nature, the reflection of agrarian problems and those of the rural proletariat, who are most exploited by the municipality; the daily life of the urban-industrial environment, the laborers who make up the *reserve army* and above all, the overpopulation, pollution, lack of green areas, the problem of unemployment, residential difficulties, traffic jams, the lack of food, medical assistance and leisure for children. The city is the assemblage of large groups of individuals who differ from each other in classes and coexist with their contemporaries, the social sport club, elitism, sumptuousness, snobbism and all types of segregation.

Interprison. As a general rule, all intraphysical consciousnesses who pertain to the dominant and exploiting class that owns production facilities and sweatshops, without serving others in an ample manner, must necessarily be reborn into the same country due to the obligations that they – more or less consciously – assume with the groupkarmic interprison.

5. **State.** The state, as considered here, is the territorial division of certain countries, the regionalism, foods, folklores and regional dialects, but also the ecological problems, hunters, lumberjacks, water polluters, the state colony of the metropolis and of the capital.

Ecology. Up until now, egokarmic and groupkarmic action incontestably predominate in the destiny of most consciousnesses and many social beings become entangled in their groupkarmic accounts due to the misuse of fauna and flora (anti-ecology).

6. **Country.** The country is the homeland, the native land. The homeland is generally portrayed in the exaltation of its economic and political grandeur, in an infantile, poetic manner, as the generous mother and protector, the ideological conditionings that are full of contradictions.

Democracy. Much is generally said about a democracy and a socialization that is never fully achieved or experienced, but maintains a capitalist-enslaving ideology, generating myopic nationalism, patriotism and patriots, the nationally vainglorious individuals, and ambiguous *unions between brothers*. Here, almost always unconsciously, groupkarma acts upon the majority of consciential destinies.

7. **Earth.** On the third planet of the solar system, the following are still predominantly cultivated to a high degree: unchecked planetary egoism, the rigidity of religions and ideological sectarianism. Therein live planetary humanity, the human species, the consciousness as human-animal. The unforgettable superiority of human beings over subhumans is always omnipresent in physical existence.

Cons. Materialists and egoists think that terrestrial humanity is the only grouping of living conscious beings that exists in the cosmos. Nevertheless, the action of polykarma can already be applied at highly expressive levels. With the notion of the habitability of other planets and internationalism, initial polykarma begins to be clearly defined here for the more apt, lucid intraphysical consciousness or the one with a greater recuperation of cons.

8. **Universe.** The universe is the sum total of everything that exists when taken as a whole. Multidimensionality, beginning with the intraphysical dimension, is endorsed by astronomy and astronautics, by parabolic antennae and parapsychic perceptions, in the physical and extraphysical practice of universalism.

Altruism. Integral, maximal and positive polykarma is consolidated by practicing altruism at a truly universal level.

172. THEORICE OF HUMAN ASSISTENTIAL TASKS

Definition. Human assistential task: service of fraternal aid on the part of a consciousness in favor of another or others.

Synonymy: assistential work; fraternal service; interpersonal help; work of solidarity.

Categories. According to the directives of universalism, there are two categories of libertarian human assistential tasks of consciential emancipation which are different from each other and are very well-defined:

1. **Consolation task.** The consolation task (initial *microlibertarian*).
2. **Clarification task.** The clarification task (advanced *macrolibertarian*).

Complementarity. Both are dignified, useful and indispensable in the evolutionary scale of the consciousness. They present rigid principles but complement each other because they endeavor to express fraternal love, to practice kindness, to teach consciousnesses, to be useful to humanity or fulfill the *raison d'être* of human existence: to help those beings with whom we *co-evolve* or lend incessant mutual assistance.

Crossroads. When the intraphysical consciousness decides to evolve in a rational manner, the natural progress of existence sooner or later leads one to a crossroads, or a growing crisis in human life (existential program). At this point, the two types of tasks can no longer allow a limited course of action.

Choice. When faced with both, each self-aware intraphysical being finds him/herself obliged to choose the essential directives for the basis of his/her own assistential work, listed below in 18 logical comparisons. These comparisons are to be analyzed and critiqued preferably by persons over 21 years of physical age who are already able to think about the quality of the eternal consciousness, despite living in the condition of a human being in a perishable animal body:

1. **Politics.** The *simple* task of consolation is involved in the situation of the majority. It is compliant, *responding with "yes" more often* than "no," *pleases others* and always blesses, offering palliatives for those who still need to ask for themselves. The *complex* task of clarification is involved

in the minority of the opposition. It analyzes realistically, *responds with “no” more often than “yes,”* clarifies the facts, points out mistakes, teaching each person to only ask for others, and no longer for him/herself, in the direction of complete consciential self-sufficiency.

2. **Languages.** Those who console *cover up problems* and, using syrupy postures, shielding themselves in compassion, partially open the minds of others using infantile parables, images, circumlocutions, euphemisms and sugarcoated adjectives, *bordering on* hypocrisy. Those who clarify exalt self-critiquing and, with defined attitudes, shield themselves in justice, fully open the minds of others using constructive frankness in a language that is concise, direct and realistic, *far removed* from hypocrisy.

3. **Performance.** The service of consolation is *easily understood*, is pleasant to execute and soothing to perform. It produces immediate, rewarding, tangible and visible human results. The clarification task is *difficult to understand*, is less agreeable to execute, is not always pleasant to perform and only shows long-term extraphysical results, beyond human life.

4. **Techniques.** Consolation is based on the submission and blind passivity of individuals, functions with parapsychism predominating over animism, speaks solely at the level of consciousnesses that are led, reaches the majority of the *populace* and still submits itself to public opinion, giving special attention to the *quantity* (volume) of its services. Clarification is based on lucid, active performance and on the reaction of individuals. It functions with animism predominating over parapsychism, speaks at the level of consciousnesses that are led and lead, addresses the minority of conscientially mature beings and acts with full independence in the presence of so-called *public opinion*, giving far more attention to the *quality* of its services, including those of penta.

5. **Dimensions.** The still immature consolation task grows in full emotionality, under the direct inspiration of the *paratropospheric dimension*, through the psychosoma (the parable of emotions), using the individual’s desires or the capacity to feel. The clarification task, on the way to holomaturity, grows in full consciousness, under the direct inspiration of the *mentalsomatic dimension*, through the mentalsoma (the parable of *sentiments*), using the individual’s ideas or the capacity to think (reasoning, thosenization). This topic summarizes the essence of the author’s theory on assistential and educational works between consciousnesses.

6. **Objectives.** Upon acting, consolation dedicates itself more to *form* or the ephemeral appearance of beings, things and facts; concentrates its performance in *megahome-earth* and the emergence of consciential first-aid; and employing the practice of empiricism in emergency therapy, it represents the palliative of “quickly removing only the mosquitoes that are attracted by filth.” Upon acting, clarification applies itself more deeply, to *content* or the permanent essence of beings, things and facts; centralizes its performance in *megaschool-earth* and in the campaign of consciential prophylaxis; and practicing scientific theory as a singular vaccination, it acts as a preventive “gradually removing the dirt and the mosquitoes ‘forever’”.

7. **Resources.** Consolation uses *intuition*, requires a mystical climate of revelation in order to exalt emotionalism – its basis for persuasion – thus leaving many people still asleep in their somnambulism, because its relative *truth* of its teaching, which is partial and enslaving, is bound to the religious movement, which retains a monopoly over truth, to unending politics and to human labels. Clarification uses *rationality*, needs the balance of science in order to exalt discernment, the basis of its persuasion, trying to awaken all those *evolutionary slumberers* because the impartial and free relative truth of its teaching restricts itself only to the naked and blunt facts, universal phenomena, conscientiality, philosophy and pure extraphysical reality.

8. **Age.** The consolation task dedicates itself to consciential infancy and adolescence and, appealing to the force of emotivity, manipulates passions. It still makes concessions to the means needed to attain its ends, using dispensable subterfuge and committing the peccadilloes (pathothosenes) characteristic of religious demagogues (sophism and fallacious logic). The clarification task dedicates itself to consciential maturity, appealing to the serenity of reason. It works with reason, concerning itself with the qualification of the means for attaining its ends, desiring the attainment of full consciential authenticity.

9. **Consciousnesses.** The *more maternal* task of consolation acts to promote the gains of successive lives, appealing, above all, to extraphysical consciousnesses – which intraphysically undergo *resoma* – to subsequently reflect upon humankind in its condition as consciousness. The *more paternal* clarification task works toward the freeing of all from the cycle of existential seriation, basing itself first upon humankind, already intraphysical consciousnesses, to subsequently appeal to extraphysical consciousnesses. Within this context, machismo and feminism are secondary, because the consciousness itself does not have gender, although both tasks present characteristics that are still restricted to the subhuman aspects of the intraphysical consciousness.

10. **Existential seriation.** The *repressive* consolation task, as it is still moralistic, seeks to implant the virtues of *sanctity* and empty salvationism, speaks with austerity, is demanding, respects Puritanism and is sensitive to conventionalism. It beckons with the illusory possibility of immediate inner reform and the necessity of only a single physical life to reach liberation from the multiexistential cycle, using all the psychological crutches that it comes across. The *derepressive* clarification task, as it is moralizing, demands nothing, always speaks of the need for many inevitable successive physical lives and intermissive periods in the direction toward the true liberation of the consciousness. With a good humor and leisure, it repudiates convention, eliminating all the psychological dependencies and crutches that it can.

11. **Renovation.** The *repetitive* task of consolation rehashes antiquated formulas, all the while discoursing in a sacramental tone, sometimes accommodating itself in the rearguard “mending used cloths,” and maintaining the human masses in a lamentable unconscious psychological dependency. The *renovative* clarification task applies new formulas and dares to face the *front-line* of the evolutionary battle, “exchanging used cloths for new ones” and leads intraphysical consciousnesses to a conscious psychological interdependence, wherein they are responsible for themselves with a greater lucidity.

12. **Vehicles.** The consolation task endeavors to locate the center of the consciousness in the *psychosoma* – the emotional parabody – acting upon the human-animal, e.g., through the enthusiastic *show* of the orator, creating listeners who applaud profusely and who, distressed and inhibited, do not expose their ideas for fear of failing to please. The clarification task endeavors to locate the core of the consciousness in the *mentalsoma* – the vehicle of balance and maturity – acting upon the human-consciousness, e.g., through the gathering of ideas through discussions promoted by the teacher. This creates uninhibited students who assume their own personality and critically question everything and everyone in a universalistic manner (omniquestioning).

13. **Chronology.** The *primary* phase of consolation spans from the past to the present, manifesting in the space-time continuum in the physical restriction of the intraphysical consciousness, based in the intransigence of orthodoxy and self-defensive purism that leads to the segregation of local, parochial, national and planetary provincialism. The *evolved* phase of clarification spans from the present to the future, providing the consciousness with the means for liberating itself from form, space and chronological time, until it arrives at the universalism of pure fraternity, without elitism or *ivory towers*.

14. **Justice.** The consolation task is rooted in requests for *mercy*, first and foremost, by the consoler and in his/her own favor. The clarification task is rooted in requests for full *justice* by the clarifier, however not only in his/her own favor, but first and foremost for the benefit of his/her evolutionary colleagues.

15. **Polykarma.** In the consolation task, the consoler is still more concerned with the details of the defensive activity and final balance of his/her egokarmic and groupkarmic accounts. In the clarification task, the clarifier is essentially concerned with the details of the activity and final balance of his/her polykarmic account.

16. **Approaches.** The consolation task is strictly dedicated to the religious dimension, e.g., the Gospel and Christ worship, by worshipping the myth of Jesus Christ, the top guru, making people feel more and think less. Through *wordplay*, the consolation task leads people through the lyricism of

poetry, blind romanticism and the exaltation of religion and religiosity, because it requires faith. The clarification task is essentially dedicated to the parameters of logic, good sense and the foundations of science – conscientiology, for example – making each one think for him/herself in order to domesticate instincts and animal sensations and, by *tossing ideas around*, leads him/her to the discernment and experimentation of pure science, substituting belief and unproductive religiosity with knowledge (wisdom or experience). There is a fundamental difference between wordplay and tossing ideas around: content and form (confor).

17. **Religions.** The consolation task still promotes idolatrous personality cults (“-latries”), maintains gurus and untouchable issues as taboos. It concerns itself with proselytism and is sensitive to competition (competitiveness) with other religions and philosophies. The clarification task no longer propagates personality cults, dispenses with gurus, distances itself from systematic indoctrination, and endeavors to harmonize with the best side of the numerous religions, philosophies and lines of knowledge (“-sophies”).

18. **Examples.** Sects and churches generally only have resources for executing the primary phase of the consolation task, because they are captive to human life, temporal power, dogma and the *magister dixit*, not being able to deeply clarify anything if they do not apply open animism and parapsychism. Extraphysical truths, considered from the universalistic point of view, have the power to clarify and, surpassing the consolation task (which can be practiced by others who are newcomers to assistentiality), do not need to repeat it, creating temporal empires, because they have attained the task of self-knowledge through the animism of lucid projection, pure parapsychism, and extraphysical deintrusion, in which the intraphysical consciousness directly goes, researches and concludes for him/herself, without intermediaries or external influences, about human life and the consciential dimensions (consciential multidimensionality).

Beacon. Although both of these assistential instruments are useful, the tendency of the consolation task is to be an evolutionarily numbing instrument, an *anesthetic*. The tendency of the clarification task is to be an illuminating instrument, a *beacon*.

Merits. The intraphysical being who is able to perform the clarification task, today on earth, should consider him/herself lucky. Having great merit is indispensable in order to develop the clarification task in the current human atmosphere or in the terrestrial holothosene.

Sectarianism. All human assistential or educational undertakings – *in any area*, although having a manifest or dissimulated sectarian sense, as inspired or temporally grandiose (pharaonic) as they might be – are still bound to the inceptive consolation task. Only the frank sense of universalism allows achievement of the authentic contextual level of the clarification of consciousnesses and ample polykarmality.

Construction. Generally, the intraphysical consciousness, through the consolation task, first constructs a personal foundation of energetic defense, from which he/she subsequently endeavors to build the clarification task.

Formula. Coldly analyzing the two human assistential tasks under discussion, using a simple arithmetical formula, it can easily be concluded that *1 man-hour* of the new and more difficult work of clarification is qualitatively worth much more than at least *10 man-hours* of work of consolation, a task which we have been repeating (dispensable self-mimicry) over centuries in a series of intraphysical lives and intermissive periods.

Practicality. The reader should not discard this chapter, judging it to be excessively idealistic. This subject, in addition to being very rational and practical, can help you keep your feet firmly planted on the ground of the planet.

Case Study. In near-death experiences, when the “being of light” appears to the projected intraphysical consciousness, at the critical moment in which he/she must decide whether to stay in the extraphysical dimension or return to the human body to continue with an existential mini-moratorium, as a general rule they ask: “What have you done in favor of others in your life on earth?”

173. SELF-CRITIQUE OF THE PROJECTOR

Definition. Self-critique: critique performed by someone upon him/herself or upon his/her own acts and manifestations.

Synonymy: critical self-awareness; self-analysis; self-confrontation; self-confrontational judgment; self-critiquing judgment; self-detection of lies; self-evaluation; *suspectometer*.

Mixing. The projective consciential experience is not an easy subject to present in detail. Above all, our conscious and unconscious desires and passions become quickly mixed into the observation, selection and classification of the extraphysical events that are experienced or witnessed by the projected projector.

Objectivity. If we do not maintain an attitude of permanent scientific impartiality and objectivity, we see only what we want to see, closing the eyes (and para-eyes) to that which we do not want to perceive.

Reality. It is not necessary to have an opinion about everything in the cosmos. Nor need we accept one of two theories, both of which are conflicting or incomprehensible for us. Whenever we encounter something that we do not understand, we need to postpone the acceptance of the reality around us.

Fantasies. Those who read the fantasies of science fiction suspend their disbelief and criticism in order to delight themselves with the *story*. In dealing with reality, the safest attitude is to suspend the acceptance that one has of the facts, unless the intraphysical consciousness prefers to think in the world of fantasy or, in other words: live a pipe dream or a daydream.

Objective. There is only one objective reality. The conventional objective reality is the universe that is studied by physicists, chemists, biologists and other scientists within the space-time continuum, as well as those objects, elementary particles and beings that populate it, which are observed by the physical senses and the instruments which are under the command of the observer. This includes your human body and the signals that circulate through your nervous system. These signals allow the connection between objective reality and the human perception of this same objective reality.

Subjective. Various subjective realities exist that correspond to each consciousness or consciential micro-universe. The electrochemical pulses involved in the registration of the biomemory or cerebral memory carry information between the sensory organs and the brain, allowing the observer to detect the presence of objects and events outside the human body.

Perceptions. The perception of events occurring *outside* the human body or, in other words, the lucidity or awareness of external perceptions, constitutes subjective reality per se. Only the consciousness can know its own subjective reality, in which is included the perceptions of occurrences *inside* one's own human body and in all the other vehicles of manifestation of the consciousness (holosoma).

Repression. The projector has to observe and interpret extraphysical events without taking personal interests and desires into consideration. The individual needs, as far as possible, to liberate him/herself from all scientific preconceptions or dogmas, religious repression and sacralization, and those of education and class conditioning (corporatism, lobbyism, nepotism).

Elaboration. The projective experimenter need not and should not endeavor to remodel the ordinary dream in order to present it in the form of a relatively coherent and comprehensible story (*psychological makeup*) in order to pass it off as a lucid projection, in the same way that secondary elaboration is produced by the patient in psychoanalysis. In this case, the person removes the absurdity and incoherence from the dream, covering its flaws, performing partial or total remodeling of its elements, embellishing those portions which have been selected.

Conspiracy. Lucid projectors should also not resort – as countless philosophical, political, religious or social groups do – to the veil of silence, as though a conspiracy had been mounted by the authorities, government, opposition groups, powerful individuals, or economic forces in order to guarantee that his/her points of view on projectiology are not being heard, and that the final, definitive triumph of their ideas, which are learned in and through their lucid projective experiences, are being postponed.

Devil. It should be kept in mind, for example, that, similar to the conspiracy theory, religious professionals invented the devil (Beelzebub, Diabolus, Lucifer, Mephistopheles, Satan), some centuries ago, in order to explain the human failings of Christianity as a global movement.

Ignorance. The result of this is the interpretation of ignorance, not as a mere absence of understanding, but as the action of a sinister force, the origin of impure and malevolent influences that perverted our mind and imposed the erroneous habit upon us of resisting knowledge and contesting the facts. On the other hand, these facts unfortunately did not and do not impede the development of interconsciential intrusions and self-intrusions or obsessions.

Precipitation. Another sick tendency of human nature is exaggeration or precipitation in the analysis of a fact when someone operates based on the erroneous idea that “if this is not the truth, then it ought to be,” avoiding considering other perspectives and ignoring all evidence that is contrary to your own – which has been established in advance (apriorism) – with regard to the subject.

Exaggeration. Exaggeration sometimes makes a person – when at an intellectual crossroads or when presented with an interpretational dilemma – resort to changing the story, or even applying force upon the theory of an analyzed subject, through a great deal of *squeezing, pulling, pushing, and twisting*, in order for the story to fit better or give the impression of squaring perfectly with the facts under analysis.

Authenticity. Lucid projection constitutes an authentic fact in and of itself. It dispenses with all types of psychological aids. It is not necessary to resort to any types of appeal in order to affirm it as being a real and persuasive phenomenon to anyone else.

Self-sufficiency. The natural fact of lucid projection is self-sufficient, speaks for itself and defends itself. Lucid projection is self-persuasive, thereby being a challenge to all intelligent or more lucid social beings.

Self-critique. Given these considerations, it is worth emphasizing that – in any parapsychic or conscientiological scientific experiment, notably those regarding individual experiments with lucid projection – the practitioner should conduct a rigorous examination of self-critique *after* physical awakening.

Classification. At this point, it is important for the interested individual to ponder the classification of the analyses. Critiquing, in projectiology and conscientimetry, is consciential analysis. Critiquing can generally be placed into two categories: self-critique and heterocritique. Self-critique – the most relevant of all types of critiquing – is the consciousness’ analysis of itself.

Heterocritique. Heterocritique can be divided into two classifications: first – and more relevant, in this particular case – the consciential analysis performed by another or others (consensus) upon ourselves, the author or you, the reader. Second, your consciential analysis of another or others.

Utilization. Heterocritique generated by others in regard to you, even when it is spontaneous or unsolicited, needs to be rationally pondered and utilized by you. What is more: you should always seek out heterocritique in order to improve your consciential awareness and improve your behavior patterns and strategy for consciential self-analysis. You should obviously not confuse the above-cited critique with so-called current *public opinion*, or *kaffeeklatsch* gossip.

Analysis. In this detailed examination you need to analyze whether your extraphysical experiences were not perhaps hallucination, coincidence, daydream, mistake, exaggeration, hypnagogy, hypnopompy, distorted memory, erroneous perceptions, imagination, fantasies, illusions, delirium, nightmare and dream, or a possible combination of these and other explanations. As you know, *to analyze* signifies: to disassemble, dissect, separate, study and interpret.

Projectiocritique. The existence of projectiocritique, or rigorous psychological self-analysis, enumerated below with 10 items for those who wish to evolve with projections and achieve a greater extraphysical maturity, are singled out, before any other practical considerations, in order to highlight its importance and, above all, help the individual who aspires to have impactful lucid projections:

1. **Projection.** Only proceed with the comparison of your own consciential experiences with the data in this book when you are fully convinced that you have had a lucid projection and not any other altered state of consciousness, much less those that are reminiscent of movies, television shows, computer archives, novels, literature, passions or puerile vanity.

2. **Incoherences.** Research all causes and correlations of all *anachronisms, incongruities, incoherences, inconsequences and inconsistencies* of the extraphysical perceptions experienced during the projective experiments.

3. **Distortions.** Do not withhold information under some pretext, do not write your reports under pressure, or deliberately distort the version of the occurrences in order to avoid difficulties in the acceptance of your projective experiments.

4. **Exclusions.** Be authentic, always faithful to the facts, distancing yourself from any propensity to highlight any perspectives to the exclusion of others when analyzing lucid projections.

5. **Frankness.** Be completely frank, using sensible and rational approaches in the registering of your extraphysical experiences.

6. **Imagination.** Eliminate embellishments forged by the imagination, or imagistic processes, during the detailed interpretation of parapsychic occurrences.

7. **Preconceptions.** Jettison possible preconceptions, or taboos of civilization and all types of dogmas upon studying projective experiences.

8. **Doubts.** Abstain from forcibly transforming doubts into certainties when naturally focusing upon projective phenomena.

9. **Fearlessness.** Derepress and unreservedly expose yourself, realistically, without fear of complications, misunderstandings, misinformation or threats regarding your lucid projections.

10. **Confession.** Always confess ignorance, when necessary, upon being faced with any doubtful subjects under analysis.

Self-censure. On the other hand, you, as a practitioner who is interested in lucid projectability (LPB), should be aware that this self-critique cannot be confused or exaggeratedly interpreted to the point of becoming a castrating or sterilizing self-censure that indicates a tendency in your perspective, expressing opinions which are censured by myths, spurious influences, subconscious coercion in the analysis of facts or detours from the forms of scientific procedure.

Excesses. We should not forget that 2 excesses can be lucidly interpreted here:

1. **Masochism.** Excessive *self*-critique can be interpreted by you, the experimenter, as masochism.
2. **Sadism.** Excessive *heterocritique* can still be interpreted, *by* and *for* you, as sadism.

Projectiolatry. The author is, personally, against all stagnating and excessive cults. This is why he is against *projectiolatry*.

Role. The projector who wishes to evolve cannot abdicate from his/her reason, discernment, good sense, permanent state of self-critique and frankness, starting with him/herself, recognizing the precise role of lucid projection in the development of humankind, nevertheless with neither excesses, exaggeration, fantasies nor fabrications.

Hypotheses. Incidentally, the author has seen nothing in the extraphysical dimensions, environments and communities, through lucid projections, that serves to prove the following 4 theories:

1. **Metempsychosis.** Metempsychosis, or the doctrine in which a human consciousness is reborn into the body of a subhuman animal.

2. **Mate.** Soul mates or the supposition wherein two consciousnesses with a great deal of affinity evolve interdependently with one another.

3. **Fusionism.** Fusionism or consensual fusion (*melding*), the hypothesis of two or three consciousnesses merging, thereby forming another more evolved consciousness.

4. **Elementals.** Beings called elementals or the separate creation, with a parallel evolution of consensual principles that are different from the personality and which culminates in the composition of the human consciousness (intrapysical consciousness).

Bibliography: Garret (571, p. 50), Gooch (617, p. 45), Rignonatti (1402, p. 163), Rogo (1444, p. 16), Vieira (1762, p. 62).

174. LUCID PROJECTION AND ABDOMINAL BRAINWASHING

Definition. Abdominal brainwashing: the method – through the systematic production of fatigue, using chemical agents, persuasion, indoctrination and incessant torment – that endeavors to convert persons lacking free determination of their will to a generally political credo that they would not embrace if they were free.

Synonymy: brainwashing (*hsi-nao*); cerebral attack; drug induced abreaction; forced mental intrusion; ideological reconditioning; ideological remodeling; imposition of belief; memory reprogramming; mental stripping; menticide (term created by Joost A. M. Meerloo); mind manipulation; mind modeling; pathological indoctrination; perverse conversion; planned intellectual coercion; psychopolitics; thought control; undesirable persuasion.

Anti-critique. Abdominal brainwashing is the most abject and manifest form of indoctrination. It makes human life with self-critique, universalism, consciential maturity and development of the intraphysical being's lucid projectability impracticable, because it makes it impossible to install self-control in the mental time and space of the unaware intraphysical consciousness. This topic should therefore be analyzed in detail in order to remain inoculated against it (paraprophyllaxis).

Obstacle. Second only to fear (neophobia, projectiophobia), brainwashing (a term coined by Edward Hunter in 1951) is the second greatest obstacle, or practical impediment, to the development of projectiology. In order for it to develop in the individual, lucid projectability requires the application of discernment, which brainwashing or, more precisely, *abdominal brainwashing*, eliminates in the intraphysical consciousness.

History. Historically, abdominal brainwashing is not a new process for the implantation or reinforcement of beliefs. It has always existed in one form or another, in all epochs, either at a more superficial, restricted level (*copycat*; *peer pressure*; *vidiotism*) or, at a deeper, broader level (resomatic forgetfulness; mystical excesses; false confessions).

Automatons. The routine established by culture and created by the formation of habits, through the strength of social rules and environmental myths, turns all persons into partial automatons.

Promoters. In modern life, the promoters of unperceived abdominal brainwashings are those incessant prattlers that never shut up: publicity, advertisements, radio, television, Internet, movies, variety newspapers and magazines.

Pacifier. Strictly speaking, subtle abdominal brainwashing begins in the cradle, when the pacifier is used to stop up the mouth of a newborn.

Protowashing. The so-called *group-soul* of subhuman animals seems to be the first natural, incipient, spontaneous and unconscious abdominal brainwashing process (abdominal protowashing) existing in the universe.

Mold. In certain cases, the adult, through abdominal brainwashing, becomes a child again, fitting into a mold of deliberately prepared thought (ideological remodeling) and impinged behavior (inculcation) for a specific group. These observations suggest that many aspects of human abdominal brainwashing constitute a psychological regression of the ego to the state of primitive animality or the condition of *group-soul*.

Dolphins. It is worth noting that even dolphins, when in captivity resulting from their capture, imprisonment and physical isolation, suffer psychological changes, rarely live for a long time and, in these deprived conditions, do not exhibit any degree of extrasensory perception.

Resoma. On the other hand, the resoma of an extraphysical consciousness is also an abdominal brainwashing process, notably for those egos who do not experience lucid self-retrorecognitions or, in other words, those intraphysical or social beings, most of whom do not remember their experiences prior to physical rebirth (previous intraphysical lives and intermissive periods). In this aspect, every physical life is a new consciousness-washing due to intraphysical restriction and the loss of cons. A new – most recent – multiexistential catharsis occurs when the consciousness is able to remember some experience previous to the current intraphysical life. This is the process used in past life regressions.

Evolution. This approach shows that abdominal brainwashing – in this case consciential, with pluri-existential and multi-secular effects – is a process that is primarily restricted to the actual mechanism of evolution of the consciousness.

Forgetfulness. We forget our previous experiences, living our life without awareness of our integral past in order to dedicate greater attention to our less undesirable side, making the better side of our ego, preferably, come to the fore. We gradually remember our more forgotten or more remote experiences to the degree that we gradually become more apt, understanding and mature, improving our consciential performance with respect to the evolution of all.

Slate. It is common knowledge that intellectual indoctrination (mentalsoma) that lacks emotional exaltation (psychosoma) is notably *inefficient*. This is because modern political abdominal brainwashing techniques, the methods for awakening religious fervor, changing human convictions, gathering and conserving neophytes, preserving political beliefs and making proselytes outside the group with *softening* processes and the careful disturbance of cerebral activity, are always directed toward an assault upon the emotions, and not the intelligence, thereby erasing the *cortical slate* (cerebral hemispheres), jeopardizing discernment and increasing suggestibility.

Mechanism. The basic process for quick conversion is always the total exhaustion of the human body, the bombardment of the brain taken to the point of exhaustion, pressure placed upon the ego beyond its tolerance level, the inhibition of the individual's reasoning capacity and critical faculties, until reaching the point of physical collapse, emotional fatigue, sudden stupor or the total collapse of the nervous system.

Conditioning. Through continued tension, awakening and sufficiently over-stimulating the individual's strong emotions to the point where the perturbed victim becomes angry, afraid or excited, which is deliberately provoked, the person can be conditioned to detest that which was loved and to love that which had been detested, to dissipate beliefs and attitudes and destroy thought and behavior patterns.

Characteristics. Cases of abdominal brainwashing – from the mildest to the strongest ones, whether latent or manifest – can generally be grouped and explained by the following 6 basic characteristics: types; responsible parties; institutions; processes; victims; and consequences.

1. **Types.** Strictly speaking, there are different types of abdominal brainwashing. Some examples are: automatizing; classic; commercial; confessional; contemplative; group; mass; indirect; individual; market oriented; police oriented; political; religious; *resomatic*; ritual; robotizing; sanctifying; somnambulizing or zombifying; spontaneous.

2. **Responsible.** Those persons responsible for abdominal brainwashing – *brainwashers*, human domesticators, ego invaders, specialists in totalitarian menticide, vandals or violators of consciousnesses – receive different names according to different contexts. Examples: advertisers; dictators; indoctrinators; initiators; intraphysical intruders; kidnappers; lawyers; liberal professionals; pastors; politicians; priests; psychiatrists; psychoanalysts; psychotherapists; secret police; superiors; and torturers.

3. **Institutions.** Mental reform techniques applied in many locations or institutions vary according to the target group and circumstances, but the basic approach is the same. Examples: clinic; concentration camp; convent; factory; maternal uterus; military headquarters; police department; political correctional facility; political party; psychiatric hospital; revolutionary school; temple; or wartime hospital.

4. **Processes.** It is interesting to note that the process, the mental collapse and the condition of abdominal brainwashing itself all receive different names in different contexts. Examples: *brainwashing* in the techniques used by the elite forces of modern political war; *contemplation* in the mystical practices of religious sects; *forced confessions* in police interrogations; *forgetfulness* in the general process of resoma; *initiation rites* in orders, mystical fraternities and primitive societies; *marketing* in the competition of commerce and industry; *menticial assault* in the political processes sustained through physical and psychic violence; *rapid sanctification* in diverse religious catechisms; *zombification* in the practices of voodooism.

5. **Victims.** In theory, practically all intraphysical beings can be victims of abdominal brainwashing, although some persons are more predisposed than others. Examples: certain ill persons; conditioned zombies; excessively religious persons; exhausted soldiers; fatigued prisoners; gang members; hetero-suggestible personalities; ignorant or uncultured people; kidnap victims; materially dispossessed individuals; non-religious seekers; opinionative robots; potential proselytes; pusillanimous egos; religious neophytes; the individual who has lost a loved one; tired workers; torture victims; vulnerable ordinary citizens.

6. **Consequences.** The consequences of abdominal brainwashing present variations according to their carefully planned objectives. Examples: the achievement of *sanctification*; attributing a state of *grace to the intervention of the Holy Spirit*; the *freeing of souls*; the achievement of religious cures; conversion to the old militant communism; the creation of mental slaves; the menticide syndrome; the demonstration of the precision of Freud's theories; the perverted use of Pavlovian rules; the breaking of old behavior patterns with the implantation of other new ones; *barbed wire* phobia; the epidemics of religious or political fanaticism throughout time.

Indoctrination. Specific and countless examples of abdominal brainwashing are found with all victims of sectarian, factious or systematic indoctrination, physiological and chemical pressure and group suggestion that aim to dismantle the personality and construct a new personality. Examples: soldiers (*group-soul* of a regiment), in this case in reference to professional killers throughout time (Japanese kamikazes; car bombs in Lebanon and other locations); the orthodox followers of diverse religious orders (the *group-soul* of fanaticism); the historical processes of the Inquisition (thirteenth to seventeenth century) and the imposed abjurations; the movement of religious exaltation of the Crusades; the conversion of Saul on the road to Damascus (Acts 9:1 and 18); the use of concentration camps and forced labor camps with the technique of mental purging of prisoners (Second World War); psychoanalytical methods with catharsis and the reliving of childhood traumas, and the techniques of multiexistential regression (often exceptionally positive); campaigns of religious revivalism of orthodox beliefs (Methodists; those individuals obsessed with the Bible); the techniques of multinational inculcation of the soul (the Moonism cult; the Hare Krishna movement); the totalitarian propaganda of radical assemblies (the *training* of Hitler Youth; the Symbionese Liberation Army; the Brazilian Society for the Defense of Tradition, Family and Propriety); political reeducation programs (the beginnings of Chinese Communism; the prisoners of war in the Korean War); the condition of certain contemporary kidnapping victims, imposed by kidnappers, who suffer from the *Stockholm syndrome*, in which the victims (masochism) surrender emotionally, sympathizing with the kidnappers (sadism).

Franciscans. The following is a historic or classic example of abdominal brainwashing performed with the *best of intentions and the greatest goodwill*, without any self- and heterodiscernment or consciential maturity but fanatically through religion, that was already occurring in the year 1228 in the processes of contemplation or sanctification. Priest, author and biographer, Thomas of Celano, when candidly referring to the Franciscans, of the Catholic religious order of the same name, established by Francis of Assisi, originally left the following pearls in Latin in reference to the *group-soul* of the convent (italics by the author):

“They above all possess the virtue of mutual and constant charity, to the point that it unites their wills, the 40 or 50 living in the same place seeming to have *a single will and a single opinion*” (p. 20). “Some of them have already become so unaccustomed to speaking that, when they need to, they *barely recall how to form words*” (p. 20). “They have finally *arrived at a level of contemplation*, wherein they learn everything that they have to do or not do in order to learn to please God, dedicating day and night to divine glorification and prayer” (p. 21).

Techniques. In summary, it can be affirmed that the abdominal brainwashing process is a new and methodical combination of known techniques, destroying deep-rooted preconceptions through the removal of perceptual and social support, the prohibition of humor, a weakening of the ego, the annihilation of the old self-image and its replacement with another, in a strategy of mental subjection, even changing the social being's legal name, in some cases producing a clear change in the ego during intraphysical life with the loss of the prior identity.

Scale. The scale of the phenomena of abdominal brainwashing, whether spontaneous or unconscious on the part of the victim, can be synthesized into a crescendo of consciential alterations, through 7 levels:

1. Absence of conscious self-critique.
2. Obsession or fixed idea (monoideism).
3. Fanaticism (political, religious).
4. Intrusion (or self-intrusion).
5. Consummate abdominal brainwashing.
6. Profound alterations in the personality.
7. Loss of a portion of intraphysical life and the existential program.

Efficiency. It is always unwise to underestimate the efficiency of the methods of perverse indoctrination. It is an illusion to believe that intellectual knowledge of what is happening can always keep a person from being indoctrinated. The facts show that: the human body cannot resist conditioning; no one is completely safe from the process of mental reprogramming; there is still a generalized ignorance regarding abdominal brainwashing techniques. For example, *all* infantry soldiers, being normal men who are trained to kill or be killed, suffer an eventual neurological reaction – combat fatigue – when submitted to the pressures of combat over a sufficiently long period of time in a continued, severe campaign.

Recruitment. Abdominal brainwashing, promoted by modern religious cults through recruiters of those who are solitary, indecisive, lacking affection, desperate and disappointed individuals, applies at least the following 20 coercive techniques, listed here in alphabetical order:

1. Absolute loyalty.
2. Altered diet.
3. Chants and meditation.
4. Conformity.
5. Doctrinaire confusion.
6. Exclusivity.
7. False sense of camaraderie.
8. Financial involvement.
9. Hypnotic states.
10. Illogical activities.
11. Indoctrinating bombardment with the spoken word.
12. Isolation from the outside world.
13. Lack of privacy.
14. New family relationships.
15. Pavlovian control.
16. Rejection of values.
17. Sense of community affirmation.
18. Sensory deprivation.
19. Total loss of privacy.
20. Unquestioning submission.

Conscientiometry. In light of this detailed presentation of material, it is worthwhile for each one of us to ask the following question with rigorous self-critique: “To what degree does some type of abdominal brainwashing diminish the acuity of my unveiling of the surroundings, impede the development of my reason and reduce the level of my consciential maturity?” The quality of the response to this conscientiometric question defines your projectiological possibilities as an intraphysical being.

Research. If you are still in doubt regarding the exact response, research the theme more deeply, using different approaches, with the following mini-bibliography.

VII – Pre-Projection Physical Waking State

175. CHRONOLOGICAL ANALYSIS OF LUCID PROJECTION

Definition. Chronological analysis: detailed examination of each constituent element or discrete part of a phenomenon, in order to understand its nature, proportions, functions, limits, relationships and consequences with regard to the natural chronology of the phenomenological occurrences.

Synonymy: chronographic analysis; study through chronological time.

Analysis. In the analysis of the entire lucid projection, induced by any process or methodology, it is important to consider the set of factors inherent to the transcendent, animic (intraconsciential) and parapsychic nature of the phenomena, which change in each of the projector's experiences, as well as from one projector to another.

Enumeration. The intraphysical consciousness interested in performing a detailed study can establish a comparison, identifying the similarities and differences of the projection in question with the specifications sequentially arranged in an *illustrative enumeration (flowchart)*, starting from this section 7.

Patterns. This section includes, in chronological order, an extensive and diversified quantity of the typical patterns of the most common experiences, occurring before, during and after the activities of the consciousness when outside the human body. It also includes highly probable eventualities, concurrent phenomena and multiple detailed technical procedures, derivations and consequences, cited as correctly as possible in the chronological order of events (timeline) that develop in an ordinary projection.

Repetitions. The purpose of clarifying the important details as much as possible, establishing bases for the evaluation of the quality of the experiments, generated inevitable repetition due to the interactions of the phenomena and congenerous approaches.

Evidence. In the topics presented, all having intriguing and more or less original perspectives which require further exploration, the items terminate with the providential *and others*. This resource – apparently unscientific – attests to the current ignorance regarding the repercussions and extent of experiments that will only be clarified, confirmed or invalidated in the near future by the scientific criterion of a convergence of evidence, through the universality of reproducible observations of lucid projection practitioners and parapsychic phenomena researchers.

Note. It is important to emphasize the fact that none of the characteristics presented here, listing projective details, can be taken as being general, as they vary from person to person and can even occur in a manner that is contrary to what is affirmed.

Facts. Nevertheless, these characteristics are typical of the difficulties commonly experienced by the majority of lucid projectors and are related to the psychological (intracerebral) and intraconsciential (consciential micro-universe) facts most common to human existence and completion of the existential program.

176. STAGES OF LUCID PROJECTION

Cycle. The *projective cycle* is composed of 5 main, distinct stages or 5 different steps that the intraphysical consciousness has to execute in the intraphysical and extraphysical dimension in order to produce the experience of lucid projection.

Chronology. The 5 projective stages can be differentiated in the following chronological order:

1. **Pre-departure.** Pre-projection physical waking state (preparation for consciential departure).
2. **Takeoff.** Exteriorization of the consciousness (takeoff).
3. **Volitation.** Extraphysical period of the consciousness (extraphysical experience, volitation).
4. **Interiorization.** Interiorization of the consciousness into the human body (consciential reentry or *re-incorporation*).
5. **Outcomes.** Post-projection physical waking state (outcomes of consciential arrival).

Waking state. The ordinary, physical waking state, before as well as after the production of the lucid projection experience, becomes important because the following frequently occurs:

1. **Pre-projective.** Before, the preambulatory or pre-projective phenomena or influences.
2. **Post-projective.** The immediate consequences of the experiment or diverse post-projective manifestations arise soon after the experiment.

Highlight. From this chapter on, each of the 5 stages of the lucid projection experience will be highlighted in various parts, in order to anatomize the projective occurrences of the human consciousness or intraphysical consciousness as far as possible.

Bibliography: Vieira (1762, p. 53).

177. DOORWAYS TO LUCID PROJECTION

Dimensions. All doorways to dimensions that are external to the intraphysical consciousness are predisposing states for the production of lucid consciencial projection.

Types. There are various types of *doorways* to human lucid projection, such as the following 17, listed in alphabetical order:

1. Autoscopy.
2. Daydream.
3. Diverse xenophrenic states.
4. Extracorporeal sleep.
5. Extraphysical catalepsy.
6. Extraphysical somnambulism.
7. Hypnagogic state (alpha waves).
8. Natural sleep.
9. Nightmare.
10. Ordinary dream.
11. Ordinary, physical waking state.
12. Parapsychic trance (specific).
13. Parapsychic.
14. Physical catalepsy.
15. Psychological.
16. Somnolence.
17. Vibrational state (VS).

Ambivalence. These projective doorways are ambivalent, as they can pertain to both the *entrance* to and *exit* from lucid projection. Thus, the consciousness of the projector leaves the state of natural sleep, for example, and returns to it soon thereafter.

Alternation. The common alternation of the states of consciousness, referring mostly to natural sleep, dreams and nightmares, occurs less frequently with the physical waking state, daydreams and the hypnagogic state (hypnagogogy).

Traumas. Various physical traumas can provoke a lucid projection, such as the following 10, listed in alphabetical order:

1. Drugs.
2. Electric shock.
3. Encephalic traumatism.
4. Impact of the sudden acceleration or deceleration of a vehicle (car, for example).
5. Odontological anesthesia.
6. Previous partial projection.
7. Psychic and emotional shock.

8. Serious illness.
9. State of coma.
10. Surgery.

Repetition. Any intraphysical projector can experience all of the consciential states referred to here in order to begin the lucid projection, although 1 or 2 states repeat more frequently according to the process employed to project.

Bibliography: Shay (1546, p. 32).

178. DATE OF THE PROJECTIVE EXPERIMENT

Occurrences. With regard to the date of the projector's experiment, various occurrences, or at least the following 10, can be observed:

1. Consulting the calendar and scheduling.
2. Day of the month.
3. Best day of the week for the projector.
4. Month.
5. Year.
6. Holiday.
7. Atypical day or one involving a disruption in the human body's psychophysiological rhythm (circadian cycle, biological clock, biochronology).
8. Phase of the moon.
9. Personal register.
10. Other references specific to the intraphysical consciousness.

Confirmation. The details of the date, which seem unnecessary at first glance, are actually factors relevant to the intentional or unexpected subsequent confirmation of occurrences of human lucid consciential projection. They are notably important in the case of precognitive projections.

Comparisons. Besides, they serve as valuable elements in the comparative studies between seriated consciential projections and the influences of the human environment (holothosene).

Projector. It is always relevant for a woman to observe her menstrual periods in relation to lucid projections, verifying if there is a notable aspect or interaction between one fact and the other.

Rest. Certain women feel a greater need to rest when their menstrual period is approaching. Besides, pre-menstrual tension (PMT) frequently occurs.

Moon. Some individuals recommend not performing experiments with projection during certain phases of the moon, especially in the last quarter. Nevertheless, the author considers that precaution to be secondary, simple superstition or a harmless preconception.

Bibliography: Butler (227, p. 74), Monroe (1065, p. 235), Vieira (1762, p. 210).

179. METEOROLOGICAL CONDITIONS PRIOR TO LUCID PROJECTION

Characteristics. Among the characteristics of meteorological conditions that bear some relation to lucid consciential projection, the following 10 can be singled out:

1. Good weather.
2. Rainy weather.
3. Storm.
4. Windstorm.

5. Lightning.
6. Thunder.
7. Nearby noises.
8. Relative air humidity.
9. Cold.
10. Heat.

Cosmic. The so-called cosmic, meteorological factors, climatic influences and changes in the seasons should not, in fact, exercise any influence over the lucid projection experience. It above all depends upon the decided will, psychological motivation and performance of the practitioner, who can overcome all inconvenient or apparently adverse conditions to the experiment.

Novice. It will always be easy to write this, but in practice the theory (theorice) is not all that simple due to psychological factors, conditionings of all kinds, that are specific to each person, preconceptions and deeply rooted superstitions that stratify the complexities which are part of each human personality.

Optimization. Hence, it will always be better for the novice to choose a favorable, ideal or typical day with good weather to begin the projective exercises, optimizing the circumstances for initial attempts as far as possible.

Bibliography: Butler (227, p. 74), Vieira (1762, p. 165).

180. PHYSICAL BASE OF THE PROJECTOR

Definition. Physical base: selected safe location where the human body of the intraphysical consciousness remains while projecting from it.

Synonymy: *astralport*; bedroom; domicile of the human body; *duodrome*; energetically shielded chamber; garage of the soma; human base; landing field; parking lot of the human body; private retreat; projective base; spinning top for successive projections; support base; volitional station.

Internal. Strictly speaking, the first internal physical base of the intraphysical consciousness is the human body or soma.

Battery. The extraphysical sphere of energy or psychosphere of the intraphysical consciousness makes the projector's physical base its battery of consciential energy (CE), which can be charged or uncharged (unbalanced) on the occasion of the lucid consciential projection.

Categories. There are various categories of physical base for the projector, such as the following 21:

1. The internal physical base, the human body.
2. The external physical bases: the bedroom, as well as the others listed below.
3. Living room.
4. Large room.
5. Office.
6. A walled location.
7. Laboratory.
8. Apartment.
9. House.
10. Farm.
11. Institution.
12. Temple.
13. Monastery (convent, seminary).
14. In the open air or outdoors.
15. Yard.

16. Balcony.
17. A stationary vehicle.
18. A moving vehicle.
19. A customary or familiar base.
20. An occasional or emergency base.
21. A floating base (boat, ship, submarine, balloon).

Best. The best and most common physical base is a silent bedroom where the projector can keep the door locked and the windows closed.

Blue. The color blue, used in the decoration of the bedroom or room, has a positive or sedative effect toward sleep and lucid projection.

Location. In the physical base, at least the following 7 essential factors should be borne in mind:

1. Environmental conditions.
2. Equipment for sleeping that sometimes functions for simple physical reasons and other times for purely psychological reasons.
3. Complete equipment for annotations.
4. Local altitude.
5. Acoustic isolation, as well as isolated surroundings.
6. Everything that distracts the physical mind detracts from lucid projection.
7. Closed or opened doors and windows.

Rest. In theory, at least, one can sleep on anything: bed, armchair, sofa, bed frame, lawn, carpet, on a truck and other objects or vehicles, even when they are moving.

Rigidity. There are those who rest lying on very rigid surfaces, such as floors which, according to specialists, do not afford restful sleep.

Headboard. Others sleep with the headboard of the bed slightly elevated.

Hammocks. There others still who spend the night in hammocks.

Astronauts. Astronauts sleep well floating in zero gravity.

Privilege. The inside of an orbiting spaceship cabin can be considered a privileged physical base for lucid consensual projections, despite all the physiological problems it can cause for the astronauts.

Bed. Using a single bed avoids spontaneous movements and unconscious contacts by one's mate, a very common act when both sleep in a double bed.

Twin. If sleeping with one's mate is disturbing, the individual should try using twin beds or separate rooms. This may seem less romantic, but in certain cases it is even better for a good matrimonial relationship. Nevertheless, this is never the ideal for the self-aware evolutionary duo.

Length. In principle, your bed should be at least 6" (15 cm) longer than you.

Obstacles. All obstacles to *freedom* of the human body represent an obstacle to *sleep*.

Extra. Those who prefer and have sufficient space can, for example, use an extra large or king-size bed that is sufficiently ample, being 86.75" (2.2 m) long and 63" (1.60 m) wide.

Kicks. The king-size bed allows each partner to use separate blankets on the same mattress, thus sleeping together (double occupancy) and yet separate from each other. This nullifies the effects of *random kicks*.

Distance. The distance between the floor and the projector's human body upon projecting does not matter and does not seriously interfere with the production of lucid projections.

Bunk. It has been observed that many veteran lucid projectors exteriorize the consciousness, leaving the physical body lying on the higher level of a bunk bed or, in other words, on the second or even the third superimposed narrow bed, being part of a special attachment of a set of beds inside the house, or even in the compartment of a ship's cabin.

Mattress. The mattress should not have springs. Besides making noises that can be heard when lying on your front, they become magnetized (electromagnetism) and there are those who think this interferes in the experiment, in certain cases.

Width. The mattress must be sufficiently wide in order to allow freedom of movement.

Flotation. A springless mattress, aside from being more relaxing, does not make noise, nullifies the reciprocal disturbances made while sleeping and gives the sensation of floating on air, thus providing a more tranquil sleep.

Subhuman. Mattresses without animal fibers have been recommended by some ecologist projectors, as the subhuman animal that provided the fibers died while terrified. Some persons are sensitive to these negative energies

Objects. Besides the usual mattresses, there are those who sleep on at least 4 other types of objects:

1. Lumpy, broken-down mats, as hard as bricks.
2. Water-beds.
3. Inflatable mattresses.
4. Pads.

Sheets. The sheets in the physical base should be clean, cool and soft. Cotton sheets are most highly recommended, as their natural texture generates less static electricity, thus favoring natural sleep.

Pillows. There are pillows with different degrees of hardness and softness, thinness and thickness. They can be made of synthetic material, continuous multi-filament fiber or foam, for those who suffer from allergies. A very thick or bulky pillow can create problems in the cervical column (neck).

Position. Pillows need to be thick enough to keep the head in the same horizontal position as the shoulders and spinal column. This can be verified by standing up with the shoulder against a wall. The space between the head and wall, corresponds to the thickness of the pillow, for the average person who sleeps while lying on the side.

Laboratory. In laboratory experiments the sensitive, placed in the dorsal position, uses a *U-shaped* foam rubber pillow in order to be immobilized and limit auditive perception.

Bag. There are those who produce lucid projections while leaving the inactive human body inside a large zippered sleeping bag, used for camping, placed directly on the bare ground, in the open air with only the sky above them.

Cocoon. The sleeping bag – a type of a temporary cocoon for the adult’s human body – is the most simplified, external, portable physical base that a lucid projector can have.

Ropes. There are mountain climbers who have already lucidly projected, in a spontaneous manner, while the human body is inactive, fastened by two ropes from the protrusions of high rocks. Many of these intraphysical consciousnesses live intraconscientially *on the verge of suicide* while practicing their radical sports.

Furniture. Aside from the bed, other pieces of furniture may occupy the bedroom-laboratory of the lucid projector, such as the following 4:

1. Chair
2. Armchair.
3. Inset closet.
4. Bedside table.

Instruments. Many instruments are optional and end up being used in the physical base, such as the following 11:

1. Silent digital clock with a display that can be consulted in the penumbra.
2. Chronometer.
3. Thermometer.
4. Hygrometer.
5. A barometer hung on the wall.
6. An easy-to-use flashlight.
7. Direct or indirect air-conditioning.

8. A portable tape recorder.
9. A nearby light switch.
10. Various monitors and polygraphs.
11. An electroencephalograph and other instruments for physiological measurement, if needed.

Avoidances. One should avoid electric wires, telephone, radio, television, stereo equipment, VCR and other electronic devices that are unnecessary for consensual projection being switched on in the bedroom.

Mask. You can use a comfortable sleeping mask and ear plugs when lying down, but they can interfere in the physical and psychological states of the lucid projection practitioner. In other words, they solve one problem while creating another.

Resources. Aside from the instruments already listed, there are other resources for writing and reading that can be used in the physical base, such as the following 4:

1. Pencil or ballpoint pen.
2. Blank sheets of paper.
3. Calendar.
4. A book of selected and mentally pacifying readings, for those who do not suffer from insomnia.

Blankets. One should use a minimum of blankets on the human body in order to avoid the inconvenient weight that produces negative impressions in the psychosoma and even inopportune nightmares.

Family. The *intrapysical assistant*, as well as the presence of family members and their illnesses have a bearing on consensual projections.

Interference. It is recommendable to avoid creating concern in family members or interference in the normal course of their existences with the occurrences of experiments with lucid projection, e.g., someone wanting to enter the bedroom during the projective experiment, as they can only co-operate when they are able to understand what the projector is experiencing, thereby remaining sympathetic toward the experiments.

Vehicles. Experiences in which the consciousness projects from the human body that has been left in a mobile physical base, e.g., a vehicle such as a car, bus, train or airplane, are frequently of short duration and generally uninteresting. The same occurs when the projector projects while listening to the radio or watching television.

Forced. In forced projections, the physical base varies a lot and can be one of the following 9:

1. A surgery table.
2. A hospital bed.
3. A dentist's chair.
4. An ambulance stretcher.
5. Highway asphalt.
6. A battlefield.
7. A sidewalk.
8. A prison cot.
9. A body of water: the sea or a river.

Cubicle. Irrespective of the physical base, even a small closed cubicle, the consciousness should not have any baseless fear about getting stuck there, since the psychosoma's permeability gives ample freedom of extraphysical action.

Theory. There are those who, at bed time, are concerned about aligning the human body along the north-south magnetic axis or, in other words, pointing the head northward and the feet southward, in order to be in harmony with the earth's magnetic field, which would supposedly help induce sleep. Nevertheless, there is no scientific justification for this north-south magnetic wave theory (electromagnetism), the repose of sleep and its influence on lucid projections.

Blockage. The sporadic changing of one's physical base, as with the projector's departure from the city to another location, e.g., the beach, the mountains or the countryside (farm), and a prolonged and different projection occurring in one of these new places during this period can provoke *mnemonic blockage*. This especially occurs if the projected projector extraphysically returns to the original, habitual base to perform extraphysical assistance from there.

Dislocation. The above-cited fact stems from the *parapsychological* dislocation of the intraphysical consciousness, in view of the new location of the human body away from its routine environment, now inactive in a strange room. In this case, upon physically awakening, the projector tries to put him/herself – from a mental point of view – in the new temporary physical base and the inadaptability to the environment blocks his/her recollection.

Extremes. There are two extreme physical bases:

1. **Uterus.** The uterus is the *first*, external and initial physical base used by the fetal body of the resomant consciousness in its *initial projection*, its first semi-physical projection, in use soon after human conception (resomatics).

2. **Cemetery.** The cemetery (grave, tomb, sepulcher) is the *last*, external and definitive physical base of the intraphysical consciousness (when the soma is buried and not cremated), in his/her *final projection*, his/her last semi-physical projection or biological death (desomatics).

Exoprojection. When the consciousness is projected in the psychosoma in outer space – lucid exoprojection – it can return with lucidity to the terrestrial physical base passing through a maximum of 10 stages of visualization, or dimensions, listed here in a decreasing scale of geographical size, ranging from space to the 2 cerebral hemispheres:

1. Earth (troposphere).
2. Continent.
3. Country.
4. Regional area (state, province).
5. City (village, megalopolis, capital).
6. District (borough).
7. Residence (house, farm, apartment).
8. Bedroom (energetically shielded chamber).
9. Human body or soma.
10. Human head or encephalon.

Head. Thus, it can be observed that the physical base, in its simplest form, is precisely the human head, namely the 2 cerebral hemispheres.

Mentalsoma. When projected in the isolated mentalsoma, the consciousness can radically eliminate the intermediate stages of visualization, returning from outer space directly to the cerebral hemispheres or, better still, to the act of physically awakening.

Macrocosm. In the macrocosmic extreme of outer space, the projected intraphysical consciousness can receive impressions of occurrences similar to the following 6:

1. The condition of darkness.
2. Seeing stars.
3. Colors.
4. Lights.
5. Extraphysical consciousnesses or projected intraphysical consciousnesses.
6. Extraphysical intuitions.

Microcosm. In the microcosmic extreme of the physical head, the intraphysical consciousness can, upon interiorizing, have experiences along the lines of the following 5:

1. Conscial blackout.
2. Intracranial sounds.

3. The condition of darkness.
4. Brief cataleptic state.
5. Abrupt physical awakening.

Caverns. The caverns and grottos carved out by humankind or nature in the petrous structure of mountains constitute excellent external physical bases for the intraphysical consciousness who endeavors to produce lucid consciential projections.

Rule. There is a steadfast rule: tell me your physical base and I will tell you how your consciential projections are.

Climate. The inner climate of the physical base influences and defines the employment of the vehicle of manifestation of the consciousness and, consequently, the average type of the human projector's lucid consciential projection experiences. The following are 2 examples:

1. **Psychosoma.** The physical base with very human characteristics – geo-energetic (telluric), emotional or passionate (“emotiogenic”) – predisposes the intraphysical consciousness to have lucid consciential projections in the psychosoma (emotional parable) in the environments of the intraphysical tropospheric dimension.

2. **Mentalsoma.** The physical base with an elevated atmosphere of rationalized or intellectual (“rationogenic”) emotions inclines the intraphysical consciousness to have lucid projections in the mentalsoma, in the mentalsomatic dimension.

Incense. The use of perfume, incense, strong deodorizers or antiseptics should be avoided in the intimacy of the physical base. Besides not contributing to the production of immediate lucid projection, they can, in certain situations, depending on the consciential projector, interfere with or mask the complex extraphysical olfactory perceptions of the consciousness projected in the psychosoma.

Extraphysical clinic. The physical base of the veteran, active or hard-working projector who is already engaged in a physical-extraphysical assistential team (intraphysical minicog consciential epicenter of a multidimensional assistential maximechanism), can be transformed into a clinic for extraphysical work (extraphysical clinic) by the helpers who are attuned to the projector, his/her family members and his/her assistential works.

Penta. The daily personal energetic task, or penta, is the ideal process for maintaining the energetic equilibrium and homogeneity of the extraphysical clinic.

Personalities. In this extraphysical clinic, the 4 following basic types (profiles) of extraphysical personalities (extraphysical consciousnesses) can be found:

1. **Somnambulants.** *Somnambulants*, unconscious extraphysical consciousnesses (sometimes projected intraphysical beings as well) who are temporarily in the extraphysical clinic, but unaware of the environment and indifferent to human beings.

2. **Sick.** *Sick individuals*, including parapsychotic post-desomatics, energivorous extraphysical consciousnesses or intruders, who are attracted by the process of extraphysical bait and who may or may not interfere in the human atmosphere, albeit under the zealous supervision of the helpers.

3. **Convalescents.** Extraphysical *convalescents*, including *extraphysical blind guides* (old relatives or family acquaintances that have already gone through desoma) which interact with the physical and extraphysical environments. They even *sit* on available chairs, observe what the human beings do, listen to their open conversations and often wish to talk with the projected projector.

4. **Helpers.** *Helpers* of all types and nature who supervise the extraphysical clinic, always executing defined tasks in short or long shifts, with temporary tasks or more long-term obligations.

Bibliography. Brunton (217, p. 267), Castaneda (258, p. 199), Crookall (331, p. 42), Frost (560, p. 52), Greenhouse (636, p. 154), Mittl (1061, p. 9), Monroe (1065, p. 211), Muldoon (1105, p. 182), Powell (1278, p. 83), St. Clair (1593, p. 149), Swedenborg (1635, p. 105), Vieira (1752, p. 4).

181. PROJECTARIUM

Definition. *Projectarium*: the physical base scientifically prepared to facilitate the development of lucid projections.

Synonymy: extraphysical observatory; interdimensional chamber; location of extraphysical retreat; lucid projection laboratory; physical-base-laboratory; projective anechoic chamber; projective chamber; projective ecosystem; projective mute room; projective soundless chamber; projective soundproof chamber; projective soundproof room; projective station; *projectorium*.

Reasons. In view of the fact that the ambient conditions of the physical dimension, or the space-time continuum, even when against one's will, always exercise a reasonable amount of psychophysical influence on the human body and the consciousness of the projector, the ideal would be to create, just as a hypothesis, a special, optimizing physical base where all the propitious conditions for having a completely lucid consciential projection are brought together, namely a *projective ecosystem*.

Vibrations. Among the conditions for installation of the *projectarium*, the following 10 can be singled out:

1. **Painting.** The room painted blue with a non-glossy paint, in order to reduce light reflection as much as possible.

2. **Soundproof.** Highly isolating lining and masonry or soundproofed (soundproof chamber, anechoic chamber) or acoustically highly isolated.

3. **Antivibratory.** The construction built or lined for reasonable isolation against external sounds should also provide isolation from significant mechanical shocks and have characteristics that are absorptive (no transmission to the interior) of external vibrations (antivibratory), shock absorbers.

4. **Conditions.** The internal space of the *projectarium* should extend beyond the perimeter of the more intense action of the silver cord, or a radius of at least 13' (4 m) from the human head of the projector in repose in the dorsal position.

5. **Air conditioning.** Use of indirect, silent air conditioning.

6. **Ozone.** Application of ozone in the environment in order to aid the physiology and paraphysiology of the projector's vehicles (holothosene).

7. **Furniture.** Use of practical furniture inside the *projectarium*.

8. **Instruments.** Use of non-intrusive instruments for registering physiological processes and making measurements of all types.

9. **Room.** Isolated annexed support room.

10. **Notice.** A written notice in the external area to refrain from disturbing the location for any reason during the experiments.

Hypotheses. The following are 4 working hypotheses pertinent to the *projectarium*:

1. **Gravitation.** Could nullification of the gravitational force or the installation of a state of imponderability inside the *projectarium* help in the production of lucid consciential projections?

2. **Field.** Would the installation of a special force field help?

3. **Cage.** Would the use of a Faraday Cage be appropriate?

4. **Energetic dimension.** What relationships could be created between the *projectarium*, the extraphysical sphere of energy (personal psychosphere) and the energetic dimension?

Bibliography: Puharich (1338, p. 111).

182. AMBIENT LIGHT

Para-eyes. The mechanism of the human body's physical eyeballs is practically not used in the development of conscial projections. In these experiences the para-eyes of the psychosoma are almost always used by the projected consciousness.

Extremes. As a rule, the two extremes of ambient luminous intensity, maximal illumination (natural or artificial) or complete darkness, although not being impediments or antiprojective factors, disturb rather than help in the experiments of inducing lucid conscial projections, for the majority of projectors.

Stimulus. The presence of light, being a stimulus, impedes sleep.

Penumbra. The conscial projector should only let a few rays of light enter the bedroom from which he/she projects or, in other words, should maintain the bedroom at a low level of illumination. The semi-dark or penumbra, achieved with the use of a small, weak lamp or some discrete light source that enters the room is the ideal illuminative condition of the location where the projector's inactive human body rests in the physical base.

Objects. All polished reflective surfaces, sharp-edged equipment, sharp, pointed objects and other dangerous objects or those that can predispose accidents in the home, should be removed from the bedroom.

Points. Semi-illumination allows the projector to maintain visual points of reference, to lie down and get up from the bed, immediately discerning the actual position of the human body in relation to the objects and furniture in the room, without losing sense of direction upon waking up, in case the lights of the environment are turned off.

Avoidances. All these measures aim to avoid the following 4 occurrences:

1. **Awakening.** Confused physical awakening.
2. **Walking.** The need to walk while feeling your way in the dark.
3. **Furniture.** The act of bumping up against and tripping over furniture in the physical base.
4. **Accidents.** Potential minor accidents in the home.

Cloth. A penumbra can be maintained in the chamber of the physical base with a dark cloth used as a window curtain (*blackout curtain*) or in between the ordinary curtains and the window panes, if present.

Bibliography: Monroe (1065, p. 211), Muldoon (1105, p. 204), Vieira (1762, p. 17).

183. AMBIENT TEMPERATURE

Definition. Ambient dysthermia: the condition of more extreme ambient temperature – whether intense cold or excessive heat – that goes beyond the possibilities of acclimation on the part of the human organism (soma).

Synonymy: ambient hyperthermia; ambient hypothermia; extreme ambient temperature.

Importance. An adequate ambient temperature of 68° F (Fahrenheit) (20° C, Celsius or centigrade) and the quality of air breathed during sleep are of extreme importance for lucid projection experiments induced by the will.

Summer. In summer, maintaining the air inside the house (indoors) cooler than that outside the house (outdoors) induces sleep.

Relaxation. Low temperature as well as high temperature trigger mental inquietude, discomfort and restlessness, impairing muscular relaxation, intensifying blood circulation and heart beat, thus impeding the human body from being inactive and liberating the psychosoma with the consciousness to have an excursion in another conscial dimension.

Ideal. Given that the *human body's thermostat* and sensitivity to cold vary, there is no ideal temperature that works for all persons. Nevertheless, as already mentioned, the best temperature for projecting is around 68° F (20° C). It is always preferable to feel a little cold than to feel a little hot.

Restlessness. With the temperature inside the bedroom above 75.02° F (23.9° C), the person does not sleep well, is restless and sleeps more lightly.

Nightmares. Above this temperature, disagreeable dreams and nightmares arise, according to recent research on sleep and insomnia performed in specialized laboratories.

Air conditioner. In hot climates, the use of central, silent air conditioning is recommended, where possible. Otherwise, use an air conditioner installed in an adjoining room in order to provide indirect cooling and diminish the effects of the apparatus' noise on the individual.

Change. During the period in which the consciousness finds itself projected, a sudden change in ambient temperature, either an increase or a decrease, can provoke an extraphysical repercussion with the ensuing return of the projected intraphysical consciousness, interiorization and abrupt physical awakening.

Analysis. The analysis of ambient dysthermia requires a multidisciplinary approach, in at least the following 9 areas of research:

1. **Medicine.** In the field of medicine, the state of suspended animation and the consequent projection of the intraphysical consciousness occur provoked by hypothermia, in *hypothermic surgeries*, *cerebral cryosurgery*, artificial hibernation, *accidental hypothermia* and in the hypothermia of submersion.

2. **Metapsychics.** In the old metapsychic experiments, there was an immediate *drop in temperature* of the human environment in the materialization room when ectoplasm was materialized in materialization phenomena.

3. **Parapsychology.** In modern parapsychology experiments, there is a condition of cooling in the manifestations of physical effects, telekinesis, the icy currents of air in poltergeist cases and other occurrences. Just as with interstellar space, *extremely low temperatures* exist in all that pertains to the extraphysical paratropospheric dimension.

4. **Projectiology.** In projectiology practices, when the projected consciousness re-encounters the human body, upon interiorizing, it almost always feels the organism to be cold, at a *lower temperature*, often contrary to the warmer environment of the physical base where it finds itself.

5. **History.** According to the teachings of human history, the industrial revolution developed in areas of *lower temperatures*.

6. **Geography.** According to geography, the same industrial revolution enjoys greater growth precisely in the areas of *cold temperature*, north of the Tropic of Cancer, as well as south of the Tropic of Capricorn.

7. **Economy.** The economy progressed as a consequence of the transition of agriculture to the industrial era, precisely in the *colder countries*.

8. **Sociology.** Sociology has still not tackled, in a broad manner, as is needed, the problem of civilizations in *cold environments*, due to the taboo of the racial issue.

9. **Politics.** Politics places the so-called Third World predominately in the warmer, tropical areas, while the First World remains in the *colder areas*.

Map. For the reader interested in further details on the subject, analysis of the map published by the World Bank on the distribution of "Industrialized Countries and Regions" is recommended, as it clearly shows the location of human progress as being dependent upon colder areas.

Industrialization. Upon studying this world map, Llerena considers that the new industrial stage today comprises no more than a quarter of the world population, situated in the temperate zones of the planet (gray areas on the map). The more industrialized area in Brazil is highlighted.

Compensation. It can be seen that ambient dysthermia acts vigorously upon the parapsychic conditions of humankind. Obviously, projectiology could not be exempt from this action. Just as the Inca civilization compensated latitude with altitude, projectiology compensates climate, temperature and humidity with air conditioning.

Projectiological Bibliography: Butler (228, p. 149), Muldoon (1105, p. 197), Vieira (1762, p. 98).

Specific Bibliography: Llerena, Carlos Moyano; *El Futuro Posible*; Buenos Aires, Argentina; Sudamericana; 1989.

184. AMBIENT NOISE

Definitions. Acoustics: that part of physics that studies the oscillations and waves occurring in elastic mediums, the frequencies of which range from 20 to 20,000 Hz and are perceived by the ears as sonorous waves; the physical science of matrix analysis that studies sounds and noises.

Synonymy: science of noises; *decibelogy*.

Adversary. Noise, or undesirable sound, due to its effects upon the human being, is the great ambient adversary of sleep and also of the lucid consciencial projection experience for the majority of projectors. Therefore, we should observe and control the level of ambient noise in the physical base of the consciencial projector.

Aggression. The noxiousness of a noise – or the aggressive action that a noise exercises upon the organism and also, consequently, upon the intraphysical consciousness – can logically be characterized by the disturbances or alterations that it produces.

Sensitivity. Sensitivity to sound varies from person to person and according to the stage of sleep in which one finds oneself, as well as one's sex, physical age and the place where one is located.

Women. Women are more susceptible to waking up due to noise than men.

Volume. The degree of disturbance caused by a noise depends on one's familiarity with the sound, its intensity, its duration and the person's sensitivity to that noise.

Unit. The unit of noise intensity is the decibel (dB).

Decibels. The following is a scale (ranking, table) of noises (racket, sonorous pollution), according to the pressure of sound in decibels, with 30 values:

- 0 = Silence; acoustic laboratory, whispering (tending toward zero is a *safe zone*).
- 15 = Leaves blown by the wind (very low sound, whispering).
- 20 = Ticking of a clock; radio broadcasting booth; tranquil garden.
- 30 = Murmurs from 1' (30 cm) away; conversation in a low tone of voice (proxemics).
- 35 = A library; a quiet room.
- 40 = Ordinary conversation from 20" (50 cm) away; calm office (low sound, ideal).
- 45 = Ordinary apartment; tranquil street; first class lounge on a transatlantic cruise.
- 50 = Common typewriter; tranquil restaurant; silent car (common noise).
- 60 = Ordinary conversation; singing bird (still within the safety zone).
- 65 = Noisy house; tour bus (a person can suffer from stress).
- 70 = Traffic on a relatively quiet city street.
- 72 = Subway train (loud voice).
- 75 = Thunder; a busy street (loss of sleep; irritability; depression; fatigue).
- 80 = Cinelândia (downtown area), Rio de Janeiro, RJ, Brazil, at rush hour.
- 81 = Electric drill.
- 82 = 50' (15 m) away from heavy traffic (the *risk zone* starts here).
- 84 = Vacuum cleaner operating outside the physical base.
- 85 = Powerful radio at maximum volume in a room; car horn.
- 89 = Certain samba schools; a crowded *Latin* restaurant.
- 90 = Blender (discomfort); action film.
- 92 = Worship services at certain churches.
- 95 = Sports car in motion (increase in tension; intestinal disturbances).
- 100 = Motorcycle without a muffler; jackhammer at less than 16' (5 m); rock concert; subway.
- 107 = Powerful lawn mower in operation.
- 108 = Anhangabaú tunnel, São Paulo, SP, Brazil.
- 110 = Car horn at a distance of 3' (1 m).
- 120 = Chainsaw (impossible to have a conversation).
- 125 = Pile driver in operation (already in the lesion zone).
- 130 = Jet taking off at 100' (30 m) (airplane turbine).
- 150 = Firing revolver.

Sleep. Above 60 decibels (60 dB), approximately the noise of a truck passing on the street, the majority of persons wake up or at least suffer a disturbance in their natural sleep.

Stimuli. Any sound above 70 decibels (70 dB) begins to stimulate signals from the nervous system to the rest of the human body.

Circulation. If the sound is sudden, uninterrupted and meaningless, the arterial pressure will increase and the supply of blood to the heart will diminish (cardiorespiratory circulation).

Tachycardia. When the intensity increases, the pupils dilate, the muscles of the abdomen and thorax contract and the heart beats faster (tachycardia). This occurs with any sleeping person.

Scale. The following are 4 abovementioned occurrences, according to their decibel level for certain sounds in outdoor environments, that can wake you up in the physical base or interrupt your lucid projection through extraphysical traumas: a vacuum cleaner operating outside the physical base; a sports car in movement; a powerful lawnmower in operation; a jet plane taking off.

Threshold. The noise level of 120 decibels (120 dB) makes conversation impossible, marks the beginning of the normal pain threshold and is also a noxious condition for the ears, being the starting point for possible acoustic traumas and traumatic deafness.

Locations. Locations of the projector's human body that do not favor the production of lucid projection are illustrated by the following 5 examples:

1. **Airport.** Physical base near the sonic boom of jet airplanes in the vicinity of an airport, or the strong sonic explosion (sonic clap or sonic boom) that occasionally occurs due to variations in pressure coming from the passage of an aircraft that flies at (or above) the speed of sound (or breaking the sound barrier, clap).

2. **Street.** Physical base on a busy street or highway.

3. **Building.** Physical base in an apartment building with thin walls or little acoustic isolation.

4. **Market.** Physical base located near an urban street market.

5. **Club.** Physical base located near a club featuring noisy social or athletic activities.

Interruptive. The series of specific interruptive undesirable ambient noises that, when near the inactive human body of the projected projector, can impair the development of the production of lucid projection, can be classified into 2 basic types:

1. Indoor.

2. Outdoor.

Indoor. Among the indoor interruptive noises, at least the following 10 can be singled out:

1. Doorbells, telephones and intercoms.

2. Pendulums and the ticking of noisy clocks.

3. The creaking of spring mattresses.

4. Noisy windows.

5. Door slams.

6. Jackhammers or the sounds of flushing toilets.

7. Ascending and descending of elevators, especially when badly adjusted.

8. Sound appliances operating at high volume.

9. Crackling fire in the fireplace.

10. Loud dog barks.

Outdoor. Among outdoor interruptive noises, the following 18 can be singled out:

1. An exploding air balloon.

2. A next door neighbor's air conditioner that is loud, loose or badly regulated.

3. Pigeons cooing out on the window ledge.

4. Outside noises from the street, a train, a reception hall or a neighboring staircase.

5. Nocturnal caterwauling.

6. Singing of a swift or a bellbird in the vicinity.

7. Emptying of trash containers in the street (community service).
8. Nocturnal street repair using jackhammers (sewer, water, gas, telephone, cable TV systems).
9. Vehicles driving over metal plates.
10. People walking, objects falling or being dragged over the ceramic or wood floor in the apartment above.
11. Neighborhood party (weekend).
12. Vibration of the floor in the physical base.
13. Storms, thunder, howling winds and other acts of nature.
14. Fire engine, police car and ambulance sirens (as in New York City).
15. The horn or alarm of a car parked in the street going off.
16. Construction noises, such as saws and mechanical hammering.
17. Construction or remodeling of buildings in the neighborhood.
18. Chinese wind chimes hung near the physical base (calming 1 resident and disturbing the sleep of 10 neighbors).

Earplugs. Some individuals solve the problem of noise when going to bed by using earplugs (small plastic cylinders or cones), or even anti-noise balls (big disposable pieces of cotton that can be either dry or soaked in water, olive oil or vaseline). They are all able to block out only about 20 decibels. The balls of wax, molded by hand, are difficult to insert and fall out easily.

Protection. The following are 8 resources currently used for the acoustic protection of environments that help to isolate the projector's bedroom (shielded chamber):

1. Double windows.
2. Installation of an air conditioner.
3. Sealing of the slits around the bedroom window, which reduces the noise level by about 10 decibels, because where air enters, sound waves also come in.
4. Installation of thick curtains, since they are porous, act as sound sponges, absorbing the sounds.
5. Double curtains or, in other words, curtains with a velvet or synthetic fabric lining.
6. Decorative wall carpets hung in the noisy area.
7. Installation of 1" (2.5 cm) thick soundproofing cork on the walls. This absorbs 57% of the sound that infiltrates through the walls.
8. Lowering of the ceiling with suspended acoustic tiles.

Cold. In cold climates, double-thick doors and double-pane windows maintain a reasonable level of acoustic isolation in the projector's bedroom.

Air conditioner. In order to reduce the acoustic impact in the bedroom of a physical base located in an area of high sound pollution, it is recommended that one turn on an air conditioner placed a short distance away. Its continuous operation produces a *white noise*, or a low-frequency noise, that blends with the noises of the environment and favors sleep through the creation of positively conditioned reflexes.

Blockages. If you try to mentally block or cover up the negative noises, this can also inadvertently block the inspirations and suggestions of the helper who tries to assist you in the production of lucid projection. In this case, your consciousness closes in on itself and, instead of going outwards (centrifugal direction) in a projection, can end up interiorizing even more, inside yourself (centripetal direction), in the intimacy of your coincident vehicles of manifestation.

Causes. Physical noises have diverse effects upon human lucid projection. Just as physical noise can, on the one hand, abruptly interrupt an extraphysical experience, even finalizing the lucid projection with physical repercussions (there is a projective technique using precisely this characteristic), it can also, on the other hand, generate a spontaneous and instantaneous lucid projection. For example, this situation has already been registered many times with a person in a deep, heavy sleep using an alarm clock to awaken him/her.

Alarm clock. In the semilucid state in which one finds oneself when hearing the strident sound of the alarm clock, the consciousness tries to turn it off, as it has done daily. But instead, now projected, the parahand – to the individual’s amazement – goes through the “off” button and the ringing apparatus.

Awakening. Instead of the consciousness *physically* awakening as a result of the ambient noise, an *extraphysical* awakening occurs in this specific case.

Intraphysical consciousness. Hence, we may conclude that the intraphysical consciousness is frequently found to be in an ambiguous or versatile condition, predisposed and ready to enter into different consciential dimensions, according to the injunctions of the moment.

Bibliography: Crookall (331, p. 32), Frost (560, p. 53), Vieira (1762, p. 55).

185. INTRAPHYSICAL ASSISTANT

Definition. Intraphysical assistant: the intraphysical guardian of the human body of the projector which is inactive and emptied of the consciousness during lucid projection.

Synonymy: ground crew; human guardian; intraphysical guardian angel; intraphysical vigilante; projection adviser.

Categories. Among the many categories of intraphysical assistant, at least the following 8 can be singled out:

1. Husband or wife (partner of an evolutionary duo).
2. Family member.
3. Leader of a research meeting.
4. Researcher (projectiologist, conscientiologist).
5. Hypnotist.
6. Physician.
7. Sensitive.
8. Friend.

Duo. The partner of the evolutionary duo is the ideal assistant for the projector.

Projection. The projector can project with or without the assistance of another individual, as well as being able to dispense with certain factors such as a technique, parapsychism and others. The individual can even project spontaneously, by accident.

Protection. Nevertheless, the more a projector endeavors to make the experiments physiological, rational and protected using the resources that are available and adaptable to the environment, the better will be the individual’s performance in high-quality lucid consciential projections.

Assistant. The role of the intraphysical assistant is the same as the person on aircraft landing strips who assists the takeoff and landing of aircraft with occasional aircraft-related services; as well as the so-called *extraphysical guardian angel*.

Tendency. The natural tendency of projectiological facts is to gradually transform the intraphysical assistant into the projector’s extraphysical assistant as well or, in other words, they end up projecting together.

Circle. Certain parapsychic, occultist, esoteric, spiritist and syncretic organizations gather many intraphysical assistants, forming a circle of vigilance and irradiation, or an energetic or parapsychic human chain in order to protect and guard the inactive soma that is with them – emptied of the projector’s consciousness, which is temporarily absent in extraphysical and intensive assistential service – against any harm.

Bibliography: Butler (227, p. 71), Fortune (540, p. 154), Vieira (1762, p. 18).

186. PHYSIOLOGICAL STATES PRIOR TO LUCID PROJECTION

Occurrences. Among the preconditions of the human body that influence the physiological state prior to the lucid projection, the following 20 can be singled out:

1. Physical age.
2. Normal health.
3. Occasional illness.
4. Chronic illness.
5. Wound.
6. Convalescence.
7. Rest.
8. Physical fatigue.
9. Mental fatigue.
10. Sleepiness.
11. Heart rate.
12. Hypomnesia.
13. Use of medication.
14. Body weight.
15. Diet.
16. Fasting.
17. Gastric repletion.
18. Intestinal constipation.
19. Sports: power walking, swimming.
20. Biorhythms and paraborhythms.

Projector. Besides that which has been presented, the female projector can particularly be influenced prior to the consensual projection experience by menarche, pre-menstrual tension (PMT), menstruation, gestation, breastfeeding and menopause, for example.

Sleep. To start with, it is preferable that the practitioner be rested, having had enough sleep, in order to attend to the physiological needs of the individual's organism before trying to produce a lucid consensual projection. Countless factors that predispose the person to sleep normally, or to combat insomnia, favor the production of lucid projection.

Bath. Some favor taking a lukewarm bath before going to bed in order to relax, but the water temperature should be between 89.6 and 95 degrees Fahrenheit (between 32 and 35 degrees Celsius) in order to induce sleep. The person can remain immersed in the water for approximately 20 minutes. If the bathtub is sufficiently spacious, there is no problem in turning the lights off, closing the eyes and floating.

Towel. After the bath, the individual should dry the body gently with a fluffy towel without rubbing, as the friction is stimulating and predisposes the intraphysical consciousness toward the waking state and not sleep.

Nose. Before lying down to project, it is advisable to create the simple habit of clearing the nose thoroughly with warm water, unblocking the nasal cavities, and thus allowing unencumbered respiration.

Avoidances. Before lying down to produce a lucid projection, the practitioner should also avoid ingesting more diuretic beverages and food – e.g., tea, beer, white wine, soft drinks, mineral water, asparagus, melon, watermelon, cherries – in order not to have to get up to go to the bathroom, thus creating difficulty in getting to sleep and predisposing the production of consensual projection.

Bibliography: Frost (560, p. 46), Vieira (1762, p. 130).

187. CONSCIENTIAL STATES PRIOR TO LUCID PROJECTION

Categories. The psychological or *consciential preconditions* to consciential projection can vary greatly, as the projection practitioner may be in a mood characterized by one of the following 13 personal conditions:

1. Serene (tranquility).
2. Unstable (anxious, tense).
3. Motivated (eager).
4. Defiant.
5. Fearful (insecure).
6. In a parapsychic trance.
7. Confident about the imminent projection.
8. Informed about lucid projection.
9. Expectant.
10. Ignorant about the subject.
11. Away from the subject for some time.
12. Indifferent.
13. In a mood contrary (hostile) to lucid projection.

States. There are 7 psychological states that classify the entire period in an increasing scale that ranges from the condition of full alertness of the wakeful consciousness to the immediacy of natural sleep:

1. **Activity.** You feel active.
2. **Level.** Your consciousness operates at a high level, although without complete strength.
3. **Relaxation.** In the condition of relaxation, your consciousness is aware, although not fully alert.
4. **Dizziness.** You feel quite dizzy.
5. **Slowness.** Aside from feeling dizzy, you are somewhat slow.
6. **Sleepiness.** Your consciential condition is very characteristic of psychological sleepiness and detachment (alienation).
7. **Incapacity.** You find yourself in a quasi-asleep condition, unable to stay awake.

Avoidances. The following 6 examples are personal predispositions that act as psychological factors that are negative toward lucid projection immediately *before the experiments* and should therefore be avoided:

1. **Films.** Watch heavy or violent films.
2. **Shows.** Attend exciting shows.
3. **Reading.** Stop reading an absorbing book or CD-ROM at a dramatic part, which may create the desire to continue with the storyline.
4. **Contact.** Enter into contact with people you disagree with.
5. **Concerns.** Harbor thoughts of concern and disgust.
6. **Thosenization.** Other thoughts or thosenes that are easy to identify and avoid.

Bibliography: Frost (560, p. 46), Vieira (1762, p. 27).

188. ORDINARY PHYSICAL WAKING STATE

Definition. Physical waking state: the awake or conscious state of the intraphysical consciousness maintained by the center of vigilance of the mind (pointer of the consciousness).

Synonymy: alert state; diurnal consciousness; first attention; intracorporeal experience; ordinary lucidity; ordinary waking state; physical vigilance.

Activity. Erratic mental activity, with no specific objective, is sometimes referred to by expressions such as the following 4:

1. Undirected thought.
2. Train of thought (mental flow).
3. Ordinary awareness of the waking state.
4. Internal monologues.

Classification. The ordinary, physical waking state can be classified into 2 modes:

1. **Coincidence.** The state of *intracorporeal* experience or coincidence of the vehicles of manifestation of the intraphysical consciousness.

2. **Discoincidence.** The state (contraposition) of human lucid projection, *extracorporeal* experience or discoincidence of the vehicles of manifestation of the intraphysical consciousness.

Conditions. According to detailed experiments with lucid projection during the period prior to the loss of ordinary physical wakefulness, at least the following 4 conditions should be observed:

1. **Order.** Order of sleep: first, second, third, or last sleep.
2. **Sleepiness.** Sleepiness or a state of unexpected sleep.
3. **Sleep.** Sleep without loss of physical wakefulness.
4. **Insomnia.** Insomnia that has been overcome.

RAS. The state of cerebral cortical activity or, in other words, the ordinary waking period of the human consciousness is maintained by impulses that pass through the RAS or *reticular activating system*, a bundle of nerve fibers that ascend through the mesencephalon, from the vertebral column to the areas of the cerebral cortex.

Obstruction. The obstruction or inhibition of the impulses that pass through the RAS would explain the states of natural sleep and hypnosis.

Foresee. High quality human lucid projection has its roots, or foretokens, in the ordinary, physical waking state or, in other words, in the psychophysiological condition that prevails over the consciousness before projecting from the human body.

Emotionalism. If emotions already prevail over the practitioner's reasoning prior to projecting, they will naturally also prevail during the extraphysical period, and will also submit the consciousness to inevitable traumas and diminish the purity of perceptions.

Reactions. From this psychosomatic fact, one of two categories of reaction may result in the projector's consensual micro-universe regarding the quality of the projection:

1. **Vegetative.** This emotional reaction will only allow the production of mere animalized or *vegetative projection*.
2. **Evolved.** Contrarily, if emotional equilibrium and full serenity proceed with the consciousness without hiatus from one dimension of life to another, the projector will achieve a consensually more advanced or evolved projection.

Bibliography: Castaneda (258, p. 20), D'arbó (365, p. 239), Ebon (453, p. 31), Vieira (1762, p. 70).

189. PHYSICAL POSITION PRIOR TO LUCID PROJECTION

Importance. Lucid projection is the only serious activity that the intraphysical consciousness executes in which he/she leaves the human body behind. This is why the position in which he/she remains resting, temporarily inactive, acquires enormous importance.

Rest. The following are 7 motionless or resting physical positions that can characterize the physical conditions of the intraphysical consciousness prior to lucid projection:

1. Dorsal position.
2. In line with the head.
3. Lateral position, on the right or left side.
4. Prone position.
5. Reclined position.
6. Seated position.
7. Erect or standing position.

Circulation. The projection practitioner should avoid lying at the edge of the mattress in order to prevent putting pressure on some parts of the soma and consequently creating a circulation problem in the outstretched arm or leg.

Stomach. Lying on your front, *on the stomach* or on one side of the stomach, customarily not only makes takeoff difficult, but sometimes even interiorization. Therefore, this is the least recommended position for *novice* lucid projectors.

Activities. The following are 10 activities or physical positions of the person in movement that are most common prior to lucid projection:

1. **Holochakra.** The person speaking (on the phone, for example).
2. **Walking.** The person walking (normally, or in a hurry).
3. **Race.** The person (marathon runner) running (aerobic race).
4. **Swimming.** The person (athlete) swimming (any style or stroke).
5. **Editing.** The person (writer, transcriber) writing manually (manuscript).
6. **Dance.** The person dancing (dancer) alone or with a dance partner.
7. **Typing.** The person (typist or computer operator) keyboarding (typing).
8. **Music.** The person (musician) playing piano or another musical instrument.
9. **Driving.** The person inside a vehicle (even driving) whether a car (driver, chauffeur), bus, train, racing car (driver), airplane (even flying the plane), bicycle (cyclist), motorcycle (motorcyclist), launch or boat.
10. **Equestrian.** A person (horseman) riding a horse.

Effects. Among the effects of physical positions prior to a conscial projection, at least the following 4 should be observed:

1. Comfortable physical position.
2. Uncomfortable physical position.
3. Voluntary physical position.
4. Forced physical position.

Ritual. Almost everyone has a favorite position for sleeping, which is part of the ritual of sleep.

Choreography. There is also a certain choreography in the way in which we position ourselves in bed during the night.

Accommodation. An intraphysical consciousness can employ different means for settling into the bed for sleep. The following 7 are examples:

1. Sleep with the body stretched out.
2. Sleep with the body twisted.
3. Sleep in the prone position.

4. Sleep in the fetal position.
5. Sleep hugging a pillow or a *stuffed animal*.
6. Sleep with one foot outside the blankets.
7. Sleep with the human body more fully stretched.

Classification. People generally have two positions for sleeping:

1. **Alpha.** The *alpha position*, which one assumes when awake but relaxed, ready to dive into the first stages of sleep.
2. **Beta** (omega). As the individual feels sleep approaching, the *omega position* is assumed, which will be maintained for the greater part of deep sleep.

Comfort. Each person should let the human body settle itself in the position in which it naturally feels comfortable.

Cross. One of the most comfortable positions is the swastika, wherein the body imitates a broken cross, with the intraphysical consciousness laying on the front, with one of the arms over the head, the other bent and placed under the body, and the legs bent as though the person were running.

Arms. The arms should preferably be placed alongside the human body, without touching any part of the soma, in order for the consciousness to project with lucidity.

Coziness. A cozy environment is better for sleeping than an ample room.

Uterus. People generally sleep better when in an indoor environment where they can be found in a situation similar to the fetus inside the maternal womb or, in other words, in a *uterine environment*.

Alignment. Although still not scientifically proven, popular empiricism indicates that the alignment of the human body in the north-south direction – with the head facing northward and feet southward – has some positive relationship with the telluric, geoelectric or magnetic currents and helps in the attainment of tranquil sleep. It is a hypothesis for consideration.

Rotation. It is worth registering that the influence of the earth's rotation and its magnetic field is sufficient to move the magnetic needle of a compass and also to slightly effect the human body's nervous system.

Hypoxia. The following are hypotheses that still need to be tested:

1. **Head.** Would the use of a high pillow, putting the head at a level higher than the body, foster the production of lucid projection, as it predisposes cortical hypoxia?
2. **Armchair.** Would sitting in an armchair, for example, which also predisposes cortical hypoxia, facilitate lucid projection?
3. **Front.** Is it more *difficult* to consciously project when lying on your front in bed, as mentioned above, due to the absence of cortical hypoxia?

Recall. Although in certain cases cerebral hypoxia impairs recall after projective experiences, it is a recommendable condition because it facilitates departure from the soma, a practice that is much more difficult than the other (recall). We should opt for the lesser of 2 evils.

Memories. A great extraphysical experience always reinforces the practitioner's memories – holomemory and biomemory – of projection. Leaving the soma with lucidity is a much more problematic activity and one that, rationally, should always be prioritized.

Bibliography: Huson (768, p. 109), Mittl (1061, p. 8), Monroe (1065, p. 211), Schiff (1515, p. 180), Vieira (1762, p. 210).

190. DORSAL POSITION

Definition. Dorsal position: the horizontal physical position of one who is lying on the back. (see fig. 190, p. 1,129).

Synonymy: favorite position of lucid projectors; projective posture; reclined position; supination; supine position; terrestrial posture.

Ideal. The position of the projector lying on the back (supine or dorsal position) on the bed, floor, grass or in other locations – although being the most difficult position for most lucid projection practitioners to remain in – is the ideal and physiologically the best, as it naturally predisposes the consciousness to leave the human body in a natural manner.

Explanation. This favorable condition of the dorsal position can be explained in 2 ways: according to the extraphysical aspect, as well as the physical aspect, per se:

1. **Extraphysical.** The positive extraphysical effect of the dorsal position upon the production of lucid projection is explained by the fact that the psychosoma, upon leaving the human body, in almost all common lucid projections and even in the disincidence of natural sleep every night, remains in the dorsal position, longitudinally, floating from 2-20" (5-50 cm), on average, above the human body, before standing up or becoming erect and the consciousness of the projected projector acquiring greater extraphysical self-awareness.

2. **Physical.** In a manner similar to that occurring when a person is under a general anesthetic and remains in the dorsal position, the very position of laying on one's back – with the human body stretched out on either a bed or a surgery table – physically favors the production of the lucid projection phenomenon, because it predisposes a reduction in or lack of oxygen in the cerebral hemispheres (cortical hypoxia).

Anesthesia. Under a general anesthesia, this occurs after the anesthetic has increased psychophysiological relaxation and diminished the respiratory frequency.

Technique. It should be kept in mind that mild or inoffensive cortical hypoxia can even constitute an efficient projective technique.

Maintenance. It is worth further pointing out that remaining in the dorsal position immediately after a lucid projection, produced shortly before, facilitates the production of spontaneous lucid projections in series soon thereafter, in a single night of voluntary projective experimentations.

Habit. In line with what has been presented, for the individual interested in producing high quality lucid projections, it is worth making all possible effort, with neither laziness nor feverishness, to acquire the good projective habit of always sleeping on the back, in spite of the physical and psychological difficulties that will initially be faced, struggling with oneself in order to reach this objective.

Projector. The dorsal position – with legs spread apart, the human body on the bed in total muscular relaxation and the use of loose clothing – favors the male projector, because it avoids the predisposition toward an inappropriate penile erection, which interferes in the projective process.

Erection. Nevertheless, that corporal position works in this respect only in some cases, because physiological erection during natural sleep occurs irrespective of the physical position of the sexual organ.

Projector. The dorsal position, with the legs spread apart, does not particularly favor some young women who are affectionately or sexually deprived. It is recommended that these young projectors, if necessary, when preparing to practice lucid projection, draw the legs and feet (*pre-kundalini*) together in order to avoid inappropriate and undesirable dispersive, mental connotations regarding the sex act.

Pillow. Certain people, upon reaching a deep relaxation of the human body, have the tendency to naturally and unwittingly open their mouth when they assume the dorsal position in order to project with lucidity. It is recommended that these persons place a light, somewhat hard, pillow lengthwise under the chin in order to keep the mouth closed. In this way they avoid: snoring loudly, physically waking themselves up due to extraphysical repercussions or provoking tonsillitis (dry mouth, hypophonation).

Similarities. The projector being in the dorsal position on the bed allows the spontaneous projection of the consciousness in the psychosoma to occur, similar to 3 natural factors:

1. **Perspiration.** The phenomenon of the unconscious perspiring of the human body.
2. **Evaporation.** The imperceptible evaporation of a tree's moisture.
3. **Emanation.** The subtle emanation of a flower's perfume.

Mildness. The projective process of the intraphysical consciousness in the dorsal position develops in a gentle, natural or unsuspected manner by the consciousness that finds itself to already be in the extraphysical dimension, manifesting through a consciential vehicle other than the human body.

Bibliography: Crookall (331, p. 98), Denning (391, p. 84), Garfield (569, p. 121), Greenhouse (636, p. 43), Mittl (1061, p. 8), Muldoon (1105, p. 200), Vieira (1762, p. 17).

191. CONDITIONS OF THE HUMAN BODY PRIOR TO LUCID PROJECTION

Touch. In pure lucid consciential projections, or those generated through the impulsion of will, without the interference of pathological factors, or those which are essentially artificial, any circumstance or occurrence that involves touching the human body, which has been left temporarily inactive, can bring the consciousness back to the somatic form.

Factors. It is always advisable to observe the preconditions of the human body prior to the lucid consciential projection experiment, removing all factors that can disturb the natural development of the occurrences. The following 3 are examples:

1. **Soma.** The clothes of the projector's human body (soma).
2. **Bed.** Bed linen.
3. **Objects.** The objects in contact with the projector's human body.

Impure. In *impure* or prolonged artificial consciential projections stemming from pathological processes, accidents and near-death phenomena (NDE), as opposed to *pure* lucid consciential projections, it has been observed that the human body that is at rest can be touched – while its clothes are being changed or it is bound with rope, as occurs in some indigenous tribes, for example – without these movements provoking an abrupt return, with extraphysical repercussions, of the consciousness projected in the psychosoma.

Laboratorial. In lucid consciential projection experiments performed in the laboratory, the projector also submits him/herself to a condition that depends upon wires and direct connections to monitors and diverse apparatuses. This is one of the initial obstacles that scientific experimentation always has to overcome.

Bibliography: Crookall (331, p. 26), Monroe (1065, p. 211), Vieira (1762, p. 143).

192. OBJECTS OF THE PROJECTOR

Types. The projector, regardless of whether lying down sleeping, seated, or even moving, wearing clothes, shoes, hat, glasses, contact lenses, rings, jewelry, wristwatch, carrying objects in the pockets, holding a cigar in-between the fingers (polluted tobacco addict), can still produce a lucid projection.

Agility. In fact, these conditions and material objects do not hamper the agility of the exteriorized psychosoma or the isolated projected mentalsoma.

Simplification. In spite of what has been presented, it is recommended that one simplifies the human body's conditions in voluntary experiments, with a view toward reducing the negative psychological factors that act upon the projector's consciousness.

Removal. Among the objects, whether metallic or not, in contact with the projector's human body that should be removed, the following 9 can be singled out:

1. Wedding ring.
2. Rings.
3. Wrist, pocket, mechanical, electrical, electronic, or digital watches.
4. Bracelet or belt.

5. Earrings.
6. Chain around the neck or on an arm.
7. Necklace.
8. Hair band or tiara.
9. Eyeglasses or contact lenses: as a rule, the removal of these is recommendable in certain cases, except for lenses that are made to be worn for a week or longer without being removed.

Exceptions. Obviously, there are objects that should not or cannot be removed, as is the case with an ill person with bandages, a cast, a pacemaker, or a projector who is currently using an internal absorbent, and others of a similar nature.

Bibliography: Frost (560, p. 52), Monroe (1065, p. 211), Vieira (1762, p. 172).

193. CLOTHES OF THE PROJECTOR

Types. Two types of clothing influence projective practices because they are in direct contact with the projector's human body:

1. **Soma.** The clothing enveloping your soma on that occasion.
2. **Bed.** The sheets on the bed where your human body is at rest, in certain cases.

Common. The projector's clothing can be of at least the following 5 types:

1. The nightly pajamas, the attire most used by night projectors.
2. Underwear, even T-shirts and light nightgowns, for example.
3. Athletic clothing.
4. Dress or suit.
5. Ordinary clothing.

Recommendations. Nevertheless, clothing that is light and very loose is always recommended, in order to avoid blood stasis, as well as removing shoes and socks. During the projective practices you should not wear belt, eyeglasses or wristwatch.

Looseness. The knees, back of the neck and fingers should be unrestrained and should not have anything constricting them.

Weight. Regarding bed linen, it is advisable to use a minimum of blankets that are as light as possible, to avoid extra weight on the human body. This extra weight provokes negative psychological effects during natural sleep and lucid projection itself, including nightmares, inconvenient sensations of weight and suffocation, extraphysical semi-lucidity, extraphysical traumas and physical repercussions.

Pressure. One should allow the light sheets to drape gently over the human body, including the feet, without creating the least amount of pressure.

Avoidances. Covers and blankets made of synthetic fabric are not recommended. Some studious individuals recommend avoiding all types of colored clothing, that can energetically intoxicate the person's aura. This subject still requires more in-depth research.

Nudity. There are those who prefer to sleep, and to even prepare for lucid projection, entirely undressed which, due care being paid to the ambient temperature in order not to catch a cold, will always be a practical process, as this creates the positive psychological effects of freedom, agility and lightness. It is worth mentioning that the act of the projection practitioner lying in the nude can lead the consciousness, when projected in the psychosoma, to also feel naked in the extraphysical dimension.

Cleanliness. There are individuals who particularly emphasize the aspect of personal hygiene and the cleanliness of the person's clothes and bed linen as important requirements for predisposing lucid projection, in view of personal comfort as well as the circulation of consciencial energies, being preferable for the person to take a shower before beginning the experience.

Shower. After showering one should not create friction on the body when drying in order to avoid keeping the consciousness excessively alert.

Bibliography: Mittl (1061, p. 8), Monroe (1065, p. 211), Muldoon (1105, p. 199), Vieira (1762, p. 188).

194. CAUSES OF LUCID PROJECTION

Types. The causes, or the etiology of the lucid consciencial projection phenomenon can be classified into 2 basic types: subjective and objective.

A. Subjective. The following 13 items, at least, are the most common subjective causes of lucid projection, or those originating *inside* the consciousness (intraconscientially):

1. Absorption of cosmic energy.
2. Break in routine.
3. Dream (xenophrenic state).
4. Extreme pain.
5. Great mental concentration.
6. Hypnagogic state.
7. Physiological dis coincidence every night during sleep, the most common.
8. Production of the vibrational state (VS).
9. Self-determination.
10. Sensory deprivation.
11. Spontaneous cause.
12. Strong desire.
13. Voluntary induction.

B. Objectives. Among the objective causes of lucid projection, or those originating *outside* the consciousness (extraconscientially), at least the following 13 can be singled out:

1. Anesthesia.
2. Catalytic factor.
3. Critical life-threatening situation (desoma).
4. Drugs (pharmacology, psychopathology).
5. Electric or emotional shock.
6. Indeterminate cause.
7. Laboratorial factor.
8. Near-death experience (NDE).
9. Physical accident.
10. Physical lesion.
11. Special coadjutant.
12. Surgery.
13. Trance state (xenophrenic state).

Impure. Impure consciencial projections can be provoked by people who suffer from abnormal or ill conditions (pathology). The following 7 variables are examples:

1. Chronic alcoholism.
2. Migraine attacks.
3. Intense common cold.
4. Typhoid fever crisis.
5. Epilepsy.
6. Medication.
7. Encephalic trauma.

Bibliography: Champlin (272, p. 210), Crookall (338, p. 118), Shay (1546, p. 32).

195. LUCID PROJECTION AND DISTANCE

Space. The *space factor* interferes with the projected consciousness in 3 ways:

1. **Strong.** Strong or vigorous effect when the consciousness is projected in the psychosoma in the paratropospheric extraphysical dimension.
2. **Weak.** Weak effect in the extraphysical districts not directly related to the human dimension.
3. **None.** No effect, in other words: does not act upon the consciousness when projected in the mentalsomatic dimension, or in lucid projections experienced in the isolated mentalsoma.

Voluntary. From what has been presented above, we can easily conclude that intentionally produced, voluntary, ordinary projection which, in the majority of cases, occurs within the projector's physical base, or in the environment of the projector's existence, is strongly related to the space factor.

Scale. The facts related to physical distance allow the elaboration of a scale with 3 progressive stages of discoincidence or 3 well-defined distances that occur between the vehicles of the manifestation of the consciousness:

1. **Inch.** The first stage, which is physiological and common to all persons, constitutes a minimal, partial exit of the psychosoma, only about an inch (a few centimeters) out of coincidence, or *minidiscoincidence*, as occurs in natural *sleep*, every night, or in a condition of extreme physical *fatigue*.

2. **Feet.** The second stage, which is traumatic and less common for the majority of individuals, indicates the complete exit of the psychosoma from the human body, less than 3 feet (1 meter), or some yards (meters) away, within the physical base. This stage frequently occurs in physical accidents that involve *trauma*, and scenarios that unfold in surgery rooms, dental clinics and hospitals where patients are under anesthesia.

3. **Miles.** The third stage, born of motivation, is rarer and is characterized by a great separation of the vehicles of manifestation, *maxidiscoincidence*. The consciousness, projected in the psychosoma, or the body of desires, reaches distances of miles (kilometers), traversing oceans and continents, almost always carried by a strong wish to be in a specific place, or together with a specific person (consensual target).

Spatial. Without a doubt, spatial projections are also included in this scale, as in these two basic categories, for example:

1. **Microcosm.** The projections of the consciousness in the microcosm (psychosphere, personal holothosene) of one's own human body are classified in the first stage of the scale.

2. **Macrocosm.** Exoprojections, or those that occur in the macrocosm, in heavenly bodies distant from the earth, in cosmic space, are classified in the abovementioned third stage.

Relaxation. The greater the practitioner's capacity for psychophysical self-relaxation, the greater will be the possibility for his/her consciousness to lucidly project itself further from the human body and physical base, thus imposing a more intense neutralization upon the action of the silver cord.

Bibliography: Baumann (93, p. 23), Martin (1002, p. 49).

196. STARTING TIME OF THE PROJECTIVE EXPERIMENT

Characteristics. Among the characteristics of the starting time that the lucid consensual projection practitioner should consider, at least the following 10 variables should be observed:

1. Time planned according to the experimenter's daily work routine, which does not interfere with normal, professional tasks, or with the practice of any type of parapsychic trance.
2. Punctuality, in view of the assistance provided by the helpers.

3. Consultation of the clock and specialized instruments.
4. As exact a time as possible (including minutes) of the beginning of the projective preparation.
5. The moments before going to bed to sleep.
6. The first half of the night.
7. The morning period.
8. The afternoon period.
9. Other subsequent data.
10. Detailed record of the experiment.

Ideal. Lucid projection can be produced at any time of the day or night. Nevertheless, the intraphysical consciousness benefits from choosing a better time for lucidly projecting from the human body: during daybreak, in the second half of the night (precisely between midnight and 3 o'clock in the morning, local time), a period in which the majority of people are sleeping within or near the physical base. Thus, their attention or general mental concentration is deviated and focused on other mental targets aside from the projector's personality and existence.

Melatonin. According to observations made by the author, the space of time between midnight and 3 o'clock in the morning is precisely (or coincidentally) the same time period of peak melatonin hormone production by the internal pineal secretion gland (the so-called *third eye*).

Sleep. It is currently accepted that melatonin controls reactions to stress and changes in environment. It helps to conduce the human body toward the condition of relaxation, to calm it and to predispose sleep. These are precisely the conditions necessary for psychophysical preparation for the production of lucid consciential projection.

Light. Melatonin produces effects similar to those typical of the old drug "Valium[®]". The production of this hormone is governed by the quantity of light that the human eyes receive.

Questions. On the other hand, is it the condition of the vegetative life of the human body without the consciousness, or the consciousness' *empty brain* state, that also predisposes the production of melatonin through the pineal gland? In other words: does the pineal gland carry out its *organic* functions better when it does not suffer the direct influence of the consciousness' *presence*?

Hypothesis. At any rate, this original observation, based on the facts registered here about the unquestionable *lucid projection-melatonin* relationship deserves more in-depth research (work hypothesis) in the areas of the physiology of the human body and the paraphysiology of the psychosoma.

Assistential. The best time for lucid projectors who intend to perform extraphysical assistance – either alone or assisted by a helper – is between 6:00 and 11:00 PM (local time). This is characterized by psychotherapists as the period of "human anguish," the more adequate time to endeavor to minimize depression, despair, sadness, neediness, doubt, grief, great loneliness and the imbalanced relationships of intraphysical beings, especially the inhabitants of the great urban conglomerations, megacities or megalopolises.

Incubation. The lucid projection phenomenon provoked by the impulsion of will, through perseverant exercises and training, sometimes presents a latent period or a type of incubation phase of some days or weeks.

Moon. Some authors recommend that the practitioner begin his/her projective exercises during the new moon. Nevertheless, repeating what has already been affirmed: there is no scientific evidence that a specific phase of the moon, or specific manifestations of any other heavenly body, negatively or positively influence the intraphysical consciousness in the act of the individual's induction of a lucid consciential projection.

VIII – Lucid Projection Techniques

197. PREPARATION FOR LUCID PROJECTION

Definition. Technique: the set of precepts or processes that a science makes use of, as well as the ability to use these norms or the practical part.

Synonymy: scientific norms; scientific processes.

Preparations. We will first consider here (in the next 9 chapters) the preparatory techniques for lucid projection and the basic projective techniques. We will then address the derived techniques of lucid projection, per se.

Predominance. In the elaboration of all the listed projective techniques, the following 6 variables always predominate, where possible:

1. **Didactic.** The manifest intention of the didactic or normative presentation.
2. **Methods.** Well-organized methods with formal plans.
3. **Suggestions.** Detailed systems with direct suggestions.
4. **Concordance.** The codification of concordant aspects.
5. **Avoidances.** Notices regarding useful avoidances in the procedure.
6. **Users.** Indications according to specific personalities (technique users).

Reactions. The consensual reactions that occur in the preparatory processes for lucid projection can be classified as physical actions and psychological reactions.

A. Physical. Among the physical *actions* in preparation for lucid projection at least the following 11 procedures can be singled out:

1. Personal and environmental hygiene (cleanliness).
2. Attending to physiological needs, such as emptying the bladder, clearing the nostrils with warm water.
3. The practitioner remaining in intraphysical isolation.
4. Specialized reading.
5. Stretches, sighs, shivers and yawns (energetic detoxification).
6. Hydromagnetic *shower* or aeromagnetic *refrigeration*.
7. Vibrational state (VS) or exteriorization of energies (self-passes).
8. Psychophonic monolog.
9. Recorded suggestions.
10. Reduction in the heterogeneity of the physical-extraphysical environment (holothosene).
11. Avoidance of ingesting excessive amounts of heavy, solid and liquid foods.

B. Psychological. Among the psychological *reactions* involved in preparing for lucid projection, the following 10, among others, can be pointed out:

1. An inner fearless and worry-free state.
2. Mental concentration.
3. Self-determination.
4. Healthy autosuggestions.
5. Saturation of the mind with the intention of projecting from the soma.
6. Energetic shower.
7. Energetic and parapsychic signage.
8. Personal lack of preparation.
9. Healthy or pathological mental perspectives.
10. Parapsychic phenomena such as: inspiration, clairvoyance, psychophony and physical effects.

Data. It will always be better if your consciousness acquires the greatest possible amount of clarifying data on projectiology before endeavoring to exit the human body with lucidity.

Sleep. The preparatory process for your consciousness to project from the human body is just like the process of preparing for sleep every night.

Habits. As a lucid projection practitioner you should primarily avoid abrupt, radical changes in the patterns of your habits or human lifestyle.

Shower. The hydromagnetic shower is a type of energetic detoxification executed through the exteriorization of energy. It is commanded by the will while taking a shower and works like an individual, localized hydromagnetic storm, in a type of hydrotherapeutic prophylaxis.

Water. The water should be set at a comfortable temperature. It removes the heavy fluids and thought-forms or dense morphothosenes, rinsing the organic form, reaching the holochakra, including the aura, silver cord and psychosoma.

Refrigeration. Aeromagnetic refrigeration is also a type of energetic detoxification that can be performed by those who are accustomed to using air conditioners in hot climates and who do not have any type of allergy to cold air, which can provoke a cold.

Conditioner. Aeromagnetic refrigeration consists of the emission of consciential energy at a distance of 3' (1 m) in front of a 1 HP air conditioner that is installed at a lower elevation and set on "low."

Efficiency. Although providing distinctively positive effects, this method is not as efficient as the physical and energetic action of the jets of shower water acting on the aligned bodies (androsoma or gynosoma).

Effects. Both the above-mentioned shower and cooling procedures produce positive and distinct physical-extraphysical effects, such as the following 7:

1. **Perceptions.** They preserve the quality of the projector's perceptions when practiced before an anticipated or imminent projection.
2. **Coronochakra.** They dilate the pulsation and the luminous rhythm of the nucleus or vortex, as well as the rays, shoots, petals, sections or lotus of the coronochakra, from whence they originate.
3. **Emitter.** They transform the lucid projector into an authentic emitter or transmitter of energy.
4. **Healthiness.** They serve to maintain the practitioner's *aura of health*.
5. **Self-defense.** They create and maintain the so-called *protective shell* (energetic self-defense) for the lucid projector.
6. **Mentalsoma.** They gradually and continuously expand and increase the size of the mentalsoma, which greatly helps in advanced mental projections.
7. **Projectability.** They help in the amplification of the awakening of the coronochakra and, consequently, in the activation of the other chakras. This permits lucid projections in series, leading toward continuous self-awareness day and night.

Bibliography: Frost (560, p. 45), Rogo (1444, p. XI), Steiger (1601, p. 122), Vieira (1762, p. 51).

198. GENERALITIES ON PROJECTIVE TECHNIQUES

Rule. Every intraphysical consciousness – even when undergoing the agony of biological death (first desoma) of the soma – can temporarily project the lucid consciousness from the human body.

Exception. In theory, there are no known exceptions to this rule. That is, there is no known extremely personal condition which can definitively impede an intraphysical consciousness from temporarily leaving the inactive – albeit vitalized by a vegetative existence – human body and, thereafter, return to it.

Difficulties. Those who are totally ignorant of the subject of lucid projection and novice projectors face 4 basic difficulties in order to voluntarily project with lucidity:

1. **Projection.** The actual process of the consciousness projecting from the human body.
2. **Lucidity.** The temporary attainment and maintenance of extraphysical lucidity.
3. **Recall.** The posterior recollection of extraphysical facts that one experienced or participated in.
4. **Report.** The accurate translation into words of the pure psychophysical and extraphysical sensations during the different events of a lucid projection.

Holochakra. The mechanism of the functioning of several methods herein can be explained by the alteration of the holochakra's structure or its relations between the human body and psychosoma.

Case study. One day, the author, when retyping these chapters, was sought out by a young musician from a distant capital. The young woman explained what she was researching and asked a favor. Would it be possible for the author to teach her to attain lucid projections? She clearly expected that my reply would be succinct. Furthermore, she seemed to think that once she had half-a-dozen guidelines she would achieve immediate results.

Athleticism. The author sought to explain that it was not quite as simple as that. He informed her that the subject had currently demanded almost two decades of research and occupied dozens of pages in this book, discussing the methods for producing lucid projection and showing how they should be followed.

Tennis. The author explained that it was like a book on tennis, her favorite sport. In tennis, one studies the science and the art that presuppose rules for each of the shots, the *modus operandi* of the *why* and the *know-how* involved in applying them, describing the organization of these parts in the general strategy of a winning game. The science and art of projecting from the human body with lucidity must be studied in a similar manner.

Athlete. There are guidelines for each of the steps that are to be taken in order to achieve a full lucid projection. Thus, the lucid conscial projector is nothing less than a transcendent athlete.

Music. The youth appeared distrustful. Although realizing that she did not know how to conscially project with lucidity, she seemed to think that there is not much to teach regarding the subject. The author asked her if it was sufficient to listen to sounds in order to listen to a symphony, such as Beethoven's "Ninth," which had been playing when she arrived. She responded, "Of course not." This is what would happen with lucid projection and the author asked her to explain her technique for listening to music properly. She said that, yes, she could do this, but not in a few words.

Symphony. Listening to a symphony is complicated. It is not sufficient to remain attentive, there are so many different things to consider, so many parts to distinguish and classify. One cannot instantly and simply teach everything that the listener has to know. Besides, it would take a good amount of time listening to music before someone becomes a good listener.

Conditions. It was explained to her that producing lucid projections was also like that. If someone could learn to listen to erudite music, he/she could learn to conscially project with lucidity, as long as the conditions were the same. There would be norms to know and follow. It is with practice that one creates good habits. There are no insurmountable difficulties. It only requires the will to learn, motivation and patience.

Changes. The production of lucid conscial projection aims precisely to change stratified habits in the entire physical existence of the intraphysical consciousness, regardless of age and peculiar characteristics (strong traits and weak traits) of the individual's personality.

Notion. If she did not find the response completely satisfactory, it would be difficult for her to learn to conscially project with lucidity. She had no idea about what actually constitutes a lucid projection. Since she considered lucid projection to be something that anyone can do, something that we bring with us in the functioning of our organism, she refused to admit that learning to project with lucidity was the same as learning to listen to music, play tennis or to train oneself in the complex use of the human senses and the attributes of the ego.

Help. The author's help cannot surpass the help that the interested readers give themselves. Many often say they think it would be good to learn to project with lucidity, if they knew how to do it. Firstly, they can be certain of success *if they exert themselves*. Secondly, if they wish it, they *will know how to exert themselves*.

Individuality. Lucid projection practitioners do not develop equally, as there are many differences between individuals and all projective results depend exclusively, above all, upon the person or his/her individual characteristics.

Sections. The interested reader should look in the specialized sections of this book for the techniques related to the 4 acts that are difficult in terms of lucid projection. One should select those with which one feels a greater affinity and is motivated to use, in order to begin perseverant training.

Style. Remember that regardless of which technique is chosen it should become a personal, nontransferable practice that is in harmony with your personality, temperament, style, conscial micro-universe and personal performance.

Hygiene. Certain suggestive resources or factors that trigger projective processes can be extremely useful for the novice. Every resource, even the most exotic ones, as long as they are inoffensive for the consciousness, contributing toward the aims in view, within physical, mental and conscial hygiene, can and should be used in order to produce lucid projections.

Effort. All effort or sacrifice made toward this goal is worth one's personal dedication.

Crutches. The projector gradually, upon gaining more experience, will always end up reaching a stage in which he/she will dispense with all dependencies or psychophysical crutches that he/she uses to overcome deficiencies in the process of lucid projection.

Identification. Taking this into consideration, the interested reader should identify the process, methodology or procedure, among the dozens of existing methods and coadjutants for projecting with lucidity, to which he/she best adapts.

Artifice. If you need a word, symbol, image or even a strange artifice in order to feel secure in the act of projecting, you should use it and later, upon gaining more experience, simplify where possible, dispensing with all superfluous resources.

Habits. What is most important, nonetheless, is not merely to leave the human body, but to create the simplest physiological personal habits for projecting that you can in order to gradually achieve high quality experiments with a complete mastery of the processes.

Learning. Remember that extraphysical learning is arduous and infinite, as it does not even cease upon biological death of the human body (first desoma).

Concentration. Projective exercises, regardless of which one you have chosen to use, should be practiced in a moment or period of calm, in a peaceful environment, slowly, with a good amount of attention and available time, and in an atmosphere (holothosene) that is adequately isolated.

Automatism. Avoid executing the techniques in an automatic and unfocused manner. The regular practice of projective exercises at a specific time, preferably in the early morning, produces positive results in less time.

Age. All the projective techniques that are analyzed here are indicated only for persons 15 years of age and older. Individuals of both sexes below this age should wait to arrive at this existential period – when they, as human beings, have consolidated the foundations of the central nervous system – in order to begin practicing lucid conscial projection induced through the impulsion of their own will.

Science. Nevertheless, we cannot forget the classic question, “At what age should we teach science to a child?” The response is simple, “From the moment the child asks, ‘Why?’”

Spontaneity. On the other hand, when lucid projection arises spontaneously before the youth reaches this age, it is inoffensive and, in this case, inevitable and imperative.

Ignorance. Nevertheless, many youths suffer disastrous consequences due to the ignorance of many people on this subject, including liberal professionals, in terms of incorrect approaches, unnecessary therapies and incorrect medications administered in a great number of cases.

Attempts. If you are really interested in producing lucid consciential projections you should not try only once or a few times over a period of time using a single technique and give up the subject forever if, perchance, you do not succeed.

Routines. The production of lucid projection depends upon innumerable factors, including those of an individual physiological nature. This is why, even if you change projective techniques, you should make further attempts from time to time, especially after changing basic habits or existential routines, no matter how insignificant you find them to be at first glance. Such modifications can predispose you to the onset of a consciential phenomenon, notably so when you have never had a previous lucid consciential experience.

Spontaneous. In any case, if you are really interested in producing lucid consciential projections or have tried to provoke such experiences, prepare yourself psychologically to accept spontaneous lucid projections because they might occur during any favorable opportunity from now on. The projective phenomenon is physiological or parapsychological and, besides, can be sponsored by helpers, evolutiologists and *serenissimi*.

Holochakrology. As we will see in the following chapters, with the presentation of the projective techniques, the studies on holochakrology and the application of consciential energies, in accordance with the basic chakra, are of undeniable relevance in the development of the lucid projectability (LPB) of the intraphysical consciousness.

199. PROJECTIVE PSYCHOPHYSIOLOGICAL CRUTCHES

Definition. Psychophysical crutch: the inducing resource or triggering factor used by yourself, a novice projector, prior to the beginning of the experience, with the objective of obtaining the technique for lucidly projecting or at least dynamizing the projection.

Synonymy: catalyst of lucid projection; parapsychic artifice; parapsychic crutch; potentiater of lucid projection; psychological artifice; psychophysical inductor; psychophysical stratagem; psychophysiological dependence; ritualistic support; somatopsychic support; symbolic representative.

Types. Psychophysical crutches can generally be classified into 3 types:

1. **Physical.** Two psychophysical crutches, which are more physical than psychological:

A. **Massages.** Massaging of the ankles and forehead to induce psychophysical relaxation.

B. **Dance.** Dancing with the spinning of the human body and head.

2. **Physiological.** Four psychophysical crutches of physiological origin:

A. **Fasting.** The use of fasting to weaken the human body and predispose the psychosoma to takeoff.

B. **Thirst.** The use of thirst for the same objective.

C. **Transmissions.** Reception of transmissions and self-transmissions of energies (consciential energies).

D. **Psychomotor.** The practicing of physical exercises in order to become tired and sleepy.

3. **Psychological.** Nine psychophysical crutches, which are more psychological than physical:

A. **Hypnosis.** Hypnotic induction in order to project.

B. **Rituals.** Diverse rituals, some presenting excessively mystic connotations.

C. **Music.** Listening to soft relaxation and sleep-inducing music on tape or disc.

D. Visualizations. Visual projections of the ocean, rivers, waterfalls, sky, clouds or meadows.

E. Inductions. Vocal inductions performed by the leader upon a group of candidates to lucid projection.

F. Mantras. Mantras: special words or expressions.

G. Oration. Special oration (prayer), either unspoken or verbalized, performed by the projector or by another in order to solicit extraphysical help.

H. Evocations. Conscious and realistic evocations.

I. Faith. One's own religion or individual faith.

Laboratories. Currently, even in the scientific laboratorial research of lucid projection, audiovisual apparatuses, inventions and other resources – such as the vibrating chair, colored spiral discs and others – are used and can be undeniably interpreted and classified, in one way or another, as psychophysical crutches or *electronic rituals* (technical procedures).

Obstacles. Nevertheless, all rituals are, generally speaking, psychophysical crutches which, when excessive, can become conditioning factors that keep us from getting directly in contact with physical reality and with extraphysical reality. This fact must not be forgotten in any considerations regarding projective psychophysical crutches.

Meditation. It is also worth mentioning that conventional physical meditation, whether the common or transcendental type, can even permit a first lucid projection for the practitioner who has a projective predisposition. But it does not always help everyone, from the standpoint of projectiology. On the contrary, it can be a hindrance in relation to the efforts and attempts made by the intraphysical consciousness to project with lucidity, because one person's consciencial performance is very different or, better still, opposite to that of another individual.

Comparison. The following is a succinct comparison of 2 basic differential factors between the state of meditation and the phenomenon of lucid projection:

1. **Direction.** In the condition of meditation, the consciousness goes *into itself*, centripetally, in the interior of the consciencial micro-universe or the ego, balances the dense organism, calms the mind, often interiorizing itself still further into the physical body. In the phenomenon of lucid projection, the consciousness, when in the physical dimension, goes *out of itself*, centrifugally, leaving the human body, exteriorizing itself toward one or more existential dimensions, with the possibility of establishing direct extraphysical contacts with other consciousnesses, balancing the energies of the psychosoma, expanding itself beyond the physical mind (brain, biomemory) and the inner world of the ego.

2. **Extraphysical.** After takeoff of the psychosoma, or the departure of the consciousness from the human body – during the extraphysical period of the projected consciousness – the consciousness can, according to extraphysical circumstances, perform extraphysical (extracorporeal) meditation directly in that consciencial dimension. This resource is quite different from conventional meditation and permits the consciousness to obtain original ideas, while it is temporarily outside the human brain.

Dispense. Successive projective experiences, bringing greater extraphysical maturity, projective experience and agility, makes it such that the intraphysical consciousness ends up dispensing with physical, physiological and psychological dependence or crutches – whether stars, shells, maps, cards, pendulums, pyramids, sensitives and gurus; or the personal use of amulets, mystical rings, bracelets, necklaces, crosses, magical defenses, herbs, metals, perfumed objects, stones, head, foot or hand protectors, blessed saints and talismans – in order to rely solely on his/her steadfast will to leave the human body naturally. This, of course, without disregarding the common physiological resources of both mental and physical hygiene, basic animic-parapsychical aids and the cooperation of the helpers.

Scaffolding. All diverse types of rituals and crutches should be considered scaffolding that is destined to disappear when the edifice of the projective technique has been constructed or, in other words: when the projector has perfectly mastered the process of lucidly projecting through the impulsion of his/her own will.

Superstition. It is important to warn the knowledgeable reader that, strictly speaking, the following 4 procedures, sometimes included in techniques to produce lucid projections, are perfectly dispensable resources which only exist or are used out of psychological conditioning or human superstition. They are:

1. **Stars.** Influence of the phase of the moon or other heavenly bodies.
2. **Head.** Positioning the human head in a particular direction in accordance with geographical factors.
3. **Diet.** Special diet, whether vegetarian, fruitarian or carnivorous.
4. **Amulets.** Any kind of amulet designed to protect the intraphysical consciousness while in the ordinary, physical waking state or when projected in the extraphysical dimension.

Last. At our present level of consciencial evolution, the 4 most useful psychophysiological crutches and the last to be naturally discarded by the consciousness are: evocation with discernment and serenity, parapsychism, helpers and laboratorial equipment.

Minicrutches. The person who develops consciencial energy resources, who has already refined his/her own parapsychic or animic sensitivities and who fluently employs the functioning of his/her chakras has no plausible reason for being concerned with minicrutches that are used so much by worried novices and unsatisfied seekers, such as: horoscopes, biorhythms, predictions, amulets, talismans, pendants, bracelets, crystals, pyramidology and others of a like nature.

Affirmations. These superficial and less effective crutches (of the retailer) are apparently useful only for those beginners who do not as yet have other more potent, evolved and efficient resources for their consciencial affirmations and parapsychic realizations (that are characteristic of the “wholesaling” intraphysical consciousness with greater self-discernment).

Reflection. Unfortunately, psychophysiological crutches can be used in like manner for *well-intentioned* practices of extraphysical assistance or the *malevolent* practice of extraphysical attacks upon intraphysical consciousnesses. Sadder still, both of these practices can also be developed without the use of any psychophysiological crutches, by using only the vigorous, iron-clad, obstinate will of the practitioner. It is always useful to reflect upon these facts.

Withholding. In light of these phenomena, on the other hand, we cannot withhold information regarding the realities of the extraphysical dimensions, creating an “occult science” and maintaining the obscurantism, occultism and esoterism that predominated everywhere until quite recently.

Procedure. Scientific research and diffusion of the collected findings, including their implications in light of cosmoethics, are the best conduct or the ideal technical procedure for all social beings.

Conditions. Generally speaking, psychophysiological crutches can lead the intraphysical consciousness to negative conditions that need to be remembered, in the sense of avoiding them in projective techniques. They include the following set of 12 anachronistic variables:

1. **Conditioning.** Paralyzing bureaucratization or unproductive conditioning.
2. **Fissures.** Deformations of the consciousness or fissures in one’s personality.
3. **Pathothosenes.** Sterilizing degradation, self-corruption or pathothosenes.
4. **Stereotypes.** Fossilizing stereotypes and stratifications.
5. **Monoideism.** Obsession, fixed ideas or monoideism.
6. **Censure.** Castrating prohibitions or censures.
7. **Rules.** Rigid, but useless, rules.

8. **Delirium.** Tyrannical or obtrusive rituals (delirium).
9. **Routines.** Senseless routines.
10. **Symbols.** Empty symbols and senseless formulas.
11. **Taboos.** Superstitions and taboos.
12. **Traditions.** Outmoded or fossilizing ancestral traditions.

Goal. Physical-extraphysical life demonstrates that each extraphysical consciousness goes through the resoma process alone – except the more pathological cases of Siamese twins – in a naked human body, without ever bringing extraphysical crutches with them. Everyone also passes through the desoma process alone without ever taking along physical crutches, even during group, collective desomas or those that occur en masse.

Irrationality. These facts evidence the wisdom of living without crutches and rituals of any type, as most of them are folly, absurd, irrational, nonsensical and evasive. The condition of being free from all these things is the ultimate, inescapable, definitive, mature and rational goal in the natural evolution of consciousnesses.

Inducers. The continuity of projective work permits one to dispense with all psychophysical inducers according to the following 2-element formula:

1. **Physical.** The physically healthy person does not need physical crutches.
2. **Parapsychic.** The parapsychically healthy person does not require parapsychic crutches.

200. PSYCHOPHYSIOLOGICAL SELF-RELAXATION TECHNIQUE

Definition. Psychophysiological self-relaxation: the voluntary action of relaxing the entire human body and, finally, one's own mind, thus permitting the freeing of the holochakra and then the psychosoma, carrying with it the intraphysical consciousness.

Synonymy: alphasation; liberation of the holochakra; muscular and mental relaxation; physical relaxation; *pratyhara*; progressive muscular relaxation (PMR).

Sleep. When tense, one probably feels tired but, at the same time, finds oneself so awake inside that it becomes difficult to calm down and undo the *inner knots*. This is why a reduction in muscular tonus characterizes the state of natural sleep.

Condition. Progressive, deep muscular relaxation of the human body allows you to achieve complete immobility, semi-lethargy or induce a state of anesthesia in every area of the human body, thus overcoming psychic and muscular tension, anxiety and insomnia at the same time that you empty your mind of everything except the desire to lucidly leave the dense body.

Step. This procedure is the first, almost indispensable, step needed for you to voluntarily produce a lucid consensual projection.

Initiative. In many projective processes, the consciousness takes the initiative to leave the human body. In the psychophysiological self-relaxation technique the contrary occurs, in that the human body creates the condition wherein the intraphysical consciousness departs from within itself.

Alpha. The perfect progressive and controlled, concentrative corporal self-relaxation predisposes your mind to a self-induced hypnagogic state – corresponding to the alpha rhythm captured by the electroencephalograph – being an essential component of the mental control or meditative techniques used in yoga, Zen, transcendental meditation and autogenous training.

Recordings. The psychophysiological self-relaxation technique can even be practiced by using instructions recorded on discs or tapes, as well as listening to recordings of special sounds, such as the relaxing sound of ocean waves crashing on the beach.

Immobility. Above all, psychophysiological self-relaxation (of the nerves and muscles) must lead you to total immobility, namely a state of general relaxation, in a comfortable position, lying down, motionless, with muscular hypotonicity and mental passivity.

Tension. Tension – the condition contrary to relaxation – is responsible for inopportune movements on the part of the practitioner.

Inconvenience. Once you have initiated your state of self-relaxation, you cannot give in to the inconvenient and extemporaneous desires to scratch, swallow dryly, clear your throat, cough or move your fingers and joints.

Progressive. One of the most greatly utilized procedures is progressive self-relaxation, through which you convince your human body to stretch itself, mentally going over all the organic areas and, indirectly, removing tension by contracting and relaxing the muscles in a set order for a period of 30 minutes, before beginning the projective experiment, following these 8 steps:

1. **Isolation.** Isolate yourself in a closed room where you will not be disturbed while practicing the exercise. Remain in the nude or wear only light, loose clothes. Loosen your belt and remove your glasses and watch. Make sure that nothing is pressing or binding your knees, nape of the neck and fingers.

2. **Position.** Lay down on a bed or sit in a comfortable chair or armchair. The seated position predisposes the production of lucid projection for many people. Close your eyes.

3. **Contraction.** Do not contract your muscles with all your strength. Just keep them firm, counting slowly from 1 to 5 and then relax them for about 20 seconds before working with another group of muscles.

4. **Respiration.** Contract and relax each group of muscles 2 or 3 times, endeavoring to inhale while contracting them, hold your breath while counting and exhale when relaxing. The bedroom or room should be well-ventilated.

5. **Attention.** Focus your attention on the sensation of specific muscle areas alternately contracting and relaxing, keeping the rest of your body calm and still.

6. **Imagination.** Pretend that your entire being constitutes only that part of your body upon which you are working. The process must be simultaneously a mental (consciousness) and physical (soma) exercise.

7. **Sequence.** Contract and suddenly relax the muscles starting with the fingers, hand, forearm or the arm (biceps, triceps), first on one side, then on the other. Then, do the same with the muscles of the head, starting with the top of your cranium. Then work with the muscles of the face, that is: forehead, eyes, eyelids, cheeks, chin and mouth; neck; back; shoulders, in the back and front; chest; abdomen; and, finally, buttocks, legs, feet, toes, first on one side then the other.

8. **Time.** Do not expect immediate results the first time you exercise self-relaxation. Endeavor to gradually learn the procedure that suits you best, performing the exercises daily for two weeks.

Night. Many practitioners avoid performing self-relaxation exercises at night because they induce sleep and the individual ends up calmly sleeping without projecting lucidly.

Flotation. If you are a good swimmer, it will be very easy to create the conditioned reflexes of the physical and mental self-relaxation techniques necessary to produce lucid consciential projection. All you have to do is, in summer, enter the sea and go a little beyond the surf (where there are no sharks), float on your back on the water's surface with the top of your head toward the sun (in order to avoid glare in the eyes), stretch the arms and legs and let the movement of the waves move your body at will, buoying or floating entirely relaxed.

201. MENTAL CONCENTRATION TECHNIQUE

Definition. Mental concentration: the direct focalization of your senses and conscious mental faculties upon a single subject, without distractions.

Synonymy: capacity of mental concentration; centralization of thought; *dharana*; dynamic will; mental focalization; unidirectional concentration; unidirectional will; willful control.

Will. Strictly speaking, all the articles necessary for supplying a lucid projector can be boiled down to a singular piece of equipment: your ironclad will.

Intelligence. Your ironclad will becomes inevitable, and practically irreplaceable, in the intelligent actions of your consciousness.

Ambiguity. Meditation, both *with* and *without* mental concentration, can just as easily help or hinder you in lucid projection processes.

Molecules. There is laboratorial evidence that the “concentration of the consciousness” can influence the molecular structure of water, metals, mercury in particular and cells of the human body.

Change. Knowing the exact time to *shift mental gears*, when you should or should not concentrate, is the key to voluntary lucid projection including, in this case, the lucid takeoff in the psychosoma and projection with continuous self-awareness.

Mind. On the one hand, for your consciousness to take off from the human body in the psychosoma using any kind of takeoff, it is always best to leave the *mind empty* and not concentrate. On the other hand, dynamic concentration aids the predominance of activity in the right cerebral hemisphere, which predisposes the consciousness to fantasies, interfering with the purity and quality of your extraphysical perceptions, attracting oneiric interferences after your consciousness has projected.

Complexity. The projector has to choose the condition that potentiates lucid projection the most for him/her. Once again, we observe the degree to which the consciousness is an extremely complex reality.

Focalization. When your eyes lose their capacity to focalize directly and correctly, your subconscious or unconscious mind (or your unconscious will) enters into action, impelling your psychosoma to exteriorize from the human body, taking with it your consciousness attached to the parabrains.

Attitudes. It is still worth emphasizing that voluntary lucid projection is, above all, the product of 3 conjugated intraconsciential attitudes:

1. **Determination.** A question of simple determination (intentionality).
2. **Conscious.** A conscious act of will (deliberation).
3. **Dynamization.** A process of consciously dynamizing the human will (self-lucid thosenization).

Contemplation. Based on the abovementioned concepts, an action that can lead your consciousness to project itself from the human body with lucidity is to contemplate an object placed a certain distance from your eyes fixedly.

Technique. The following is a mental concentration technique that induces you to project yourself lucidly from your human body in 7 steps:

1. **Isolation.** Isolate yourself in a closed room where you will not be disturbed while practicing the exercises. Remain in the nude or use only light, loose clothing.
2. **Candle.** Place a lighted candle on a wide plate (to avoid fires) in a distant part of the room.
3. **Armchair.** Keeping your trunk erect and hands on thighs, sit on a comfortable chair or armchair about 9' 10" (3 m) away from the candle, at the other end of the room.
4. **Darkness.** Darken the room entirely, leaving only the light of the candle.
5. **Stare.** Stare attentively at the lighted candle in front of you and concentrate on it until you are unaware of the rest of the physical world around you.
6. **Extension.** At this point, only you and the candle exist. The candle is an extension of yourself, of your human body.
7. **Visualization.** When you, near and facing the lighted candle, feel your normal awareness become *suspended*, first imagine or visualize your psychosoma moving out of the human body and going toward the lighted candle. Then, *feel* your departure and yourself going toward the candle.

Chakras. These exercises should be practiced with the maximal impulsion of your hyperdynamized, ironclad will. Some practitioners focalize on the frontochakra or umbilicochakra to energetically hyperdynamize or intensify the exhaustive, obstinate effort of the impulsion of the will.

Classification. *Mental concentration* represents the second stage in deep meditation techniques, the first stage being *attention* and the third, *contemplation*.

Distractibility. The contrary state, or the consciential condition antipodal to the ability of mental concentration is distractibility or, in other words: the ease with which the consciousness changes the course of thought under the influence of external stimuli. This is a subject that is much researched within the world of psychopathology.

202. RHYTHMIC RESPIRATION TECHNIQUE

Definition. Rhythmic respiration: the respiration exercise based upon a specific rhythm of breathing, or one with an exhalation that is slower than normal.

Synonymy: metered respiration; pneumoprojection; retention of breath; retention of respiration; rhythmical respiration; voluntary respiring.

Respiration. Respiration is the process through which the human body inhales, uses oxygen and liberates carbon dioxide.

Capacity. The total capacity of the 2 lungs is not correctly and fully utilized by human beings. On average, only about 70% is used.

Instruction. Breath control has been continually taught to instrumentalists, singers and athletes. It has also been used for a long time to put the intraphysical consciousness into a trance state and permit the departure of the psychosoma from the human body, taking the consciousness with it.

Antigravity. The control of respiration explains such phenomena as induced levitation based on the antigravity, or countergravity, of the marathoner monks and lamas of Tibet, who can cover tremendous distances at surprising speeds.

Biodynamics. The biodynamics of breathing evidences 4 categories of vital physiological involvement:

1. **Areas.** Involvement of the lips, nose, throat, stomach, diaphragm, lungs, brain and heart (specific areas).
2. **Soma.** Involvement of the entire human body (soma) from head to toe.
3. **Occurrences.** Involvement of many other occurrences, such as: yawning, eructation (belching), sneezing, snoring, hiccups and coughs.
4. **Alternation.** The obvious involvement of continuous, alternating inhalation and exhalation. Oxygen is the vital foundation of intraphysical existence.

Slavery. You, an intraphysical being, are a mental slave of air or, in this case, oxygen.

Retention. The apparently simple act of holding your breath may cause a slight discoincidence of the vehicles of manifestation of the consciousness. Thus, appropriate respiration constitutes an effective process for you to project due to the action of carbon dioxide.

Oxygen. This aerial vitalizing substance, oxygen, is more important for human survival than any solid or liquid nourishment ingested through the mouth.

Detoxification. The system of inhalation and exhalation, as well as simple acts, such as sneezing, eructation (belching), hiccupping and yawning can act as psychophysical detoxification agents for you as a lucid projection practitioner.

Muscles. It is necessary to warn you from the beginning that exercises that involve the retention of the breath should be executed by a decrease in the action of your abdominal muscles and not through constriction of the throat.

Excess. Any excessive effort during these exercises indicates that you are proceeding incorrectly.

Inhalations. Normally, a healthy person inhales and exhales air approximately 17 to 25 times per minute, or makes approximately 24,480 respiratory exchanges per day.

Sufficiency. To calm the mind during animic-parapsychic experiences, for example, 10 inhalations per minute are normally sufficient.

Ideal. Nevertheless, if you can restrict yourself to a mere 5 respiratory exchanges it will be better or the ideal.

Meditation. In meditation exercises, only 4 respiratory exchanges occur per minute, but when the process becomes deeper, the meditator's respiration is not even perceived.

Diving. The best and quickest way for you to become fully aware of the breathing process, as well as of your own human body – which helps greatly in the practice of lucid projection – is for you (if you are a swimmer) to cross the limpid waters of a full swimming pool, deep underwater, in a tranquil environment.

Physiology. The following is the correct physiological technique of human respiration that aims to induce you to lucidly project from your human body, through 8 steps:

1. **Isolation.** On an empty stomach, isolate yourself in a closed room where you will not be disturbed while practicing the exercise. Remain in the nude or use only light and loose clothing. It is always good to clean both nostrils with lukewarm water so that your respiration will be unimpeded.

2. **Back.** Sit straight-backed on a comfortable chair or armchair. Keep the arms extended alongside the body, muscles relaxed, without moving the shoulders. This is an ideal position to apply in some projective techniques.

3. **Nostrils.** Breathe slowly and regularly through the nostrils. Do not breathe through the mouth or with the chest. Let your abdomen distend. The room or bedroom should be well-ventilated.

4. **Diaphragm.** Using the diaphragm to breathe, you gradually distend the lower part of the chest and push the lower ribs outward.

5. **Lungs.** Continue filling the lungs with air and start to fill the upper extremities of the lungs, the pulmonary apexes, pushing the lower ribs further outward. This will renew the residual air in the lungs.

6. **Exhalation.** Hold your breath for some seconds and then slowly exhale through the nose, forcing the exit of all air, emptying the lungs completely and contracting your abdomen as much as possible, as if to have it touch the spine.

7. **Repetition.** Repeat the complete sequence above consecutively 6 times or, in other words, 6 consecutive inhalations and 6 consecutive exhalations. Then rest, holding your breath for some seconds or for as long as you can without feeling uncomfortable.

8. **Sleep.** Continue the exercise until you fall asleep or, in other words, breathe as slowly as you can until your respiration is hardly perceptible.

Cardiochakra. According to holochakrology, it should be remembered that the effectiveness of the rhythmic respiration technique greatly depends upon the quality of energies of the cardiochakra of the intraphysical consciousness practitioner.

203. IMAGINATIVE ESCAPES TECHNIQUE

Definition. Imaginative escape: the voluntary action of your creative imagination which permits the separation of your consciousness and your brain, or the freeing of the psychosoma, taking the consciousness with it to manifest in another dimension (see fig. 203, p. 1,130).

Synonymy: directed daydream; imaginary journey; moving dream; self-programmed daydream; waking dream.

Desire. In using creative imagination – through the use of imagery – you apply a strong desire and visualization of images to suggest, in a form of autosuggestion or self-hypnosis, the separation of the consciousness from the physical brain or, in other words: the departure of the psychosoma transporting the consciousness out from the human body in an escape from a physical environment (intrapysicality) to another that is well-characterized (extrapysicality).

Association. The most appropriate images for your imaginative escape will be those which emerge from your unconscious mind, or those closely associated with your personal life.

Resources. The following is the imaginative escape technique using 3 different resources:

1. **Sea.** The most common creative imagination process is to imagine yourself anchored to the bottom of the sea, desperately needing to go upward, forcing your way to the surface.

2. **Wall.** Another method is to visualize yourself on one side of a high wall, in a deserted area, and try to jump or scale the wall to reach the pleasant, green scenery on the other side.

3. **Staircase.** A third method is to concentrate on climbing an imaginary staircase all the way to the top, from where another district can be reached, at which point your psychosoma will detach itself from the human body.

Instructor. These projection proceedings can also be induced by an instructor or guide, or even by a previously prepared recording that will lead you through the various stages of the experiment. It is somewhat similar to massage and projective visualization techniques, and to modern techniques employed in psychotherapy.

Group. The imaginative escape technique can be induced by an instructor who speaks softly, slowly, in a calm tone of voice to a group of highly imaginative people gathered at the same time and in the same place, or collectively programmed, as if their minds were embarking on a group *tour*.

Bibliography: Boswell (174, p. 140), Martin (1002, p. 51), Muldoon (1105, p. 161), Rogo (1444, p. 151), Shay (1546, p. 40).

204. PROJECTIVE VISUALIZATION TECHNIQUE

Definition. Projective visualization: the process by which you seek to mentally see the inducing images of lucid projection which are deliberately created by your own imagination.

Synonymy: projective self-visualization; projective visibilization; projective *yantra*.

Systems. Throughout time, diverse systems have been using *visualization* to attain projection of the consciousness from the human body, especially: cabalism; tantric yoga; Tibetan yoga; hermetic magic; contemporary parapsychologists; ancient Egyptian practices; and shamanism.

Coadjutants. Visualization exercises are powerful coadjutants for you to project, in light of the following 4 factors:

1. **Projectiology.** They actually help in the processes of voluntary lucid projection.
2. **Discoincidence.** They predispose the discoincidence of the vehicles of manifestation of your consciousness.
3. **Analysis.** They intensify the capacity to observe and analyze extraphysical events with clarity and precision.
4. **Mnemosomatics.** They act to improve your memory and, consequently, in the technique of recall subsequent to projective experiences.

Technique. The following is the 14-step logical visualization technique that can predispose you to leave the human body:

1. **Isolation.** Isolate yourself in a closed room where you will not be disturbed while practicing the exercise. Remain nude or use only light, loose clothing.
2. **Armchair.** Sit in a comfortable armchair at a distance of 4' 11" (1.5 m) from a uniformly colored wall – white, for instance – which serves as a background. There must not be any furniture or decorative piece nearby which could divert your attention.
3. **Vase.** Place a simple object, such as a vase, directly in front of your visual field (see fig. 204, p. 1,131).
4. **Stare.** Stare attentively at the vase until you have memorized everything about it in detail, including the form, color, shape, base, opening and its use.
5. **Visualization.** With your eyes closed, visualize and mentally recreate, outside of your head at a distance, the vase and the bedroom, with all of the perspectives, shapes and exact proportions.
6. **Confirmation.** As soon as the visualized images fade, open your eyes and confirm how the room actually looks.
7. **Repetition.** Repeat the process for 20 minutes daily and uninterruptedly, without missing a single day.
8. **Alarm clock.** As soon as you have mastered the process described so far, having clear visualizations, place 1 reliable alarm clock in front of you and memorize the time. Close your eyes and visualize the alarm clock, including its shape, colors, contours and hands.
9. **Mental.** Next, visualize your mental alarm clock ticking far from you, at a distance.

10. **Power.** After a few minutes, open your eyes and check the exact time on the alarm clock to see if it is approximately the same time you visualized. If it is, your powers of visualization, or capacity to project part of your consciousness, is reaching its highest peak and you will be able to reach the extraphysical dimension lucidly.

11. **Details.** At this point, first visualize yourself, with all the action details, leaving the human body using the psychosoma.

12. **Self-visualization.** The exercise of self-visualization in the psychosoma does not mean that you should only think you are leaving the dense body, but you need to visualize your own extraphysical duplicate in minute detail rising and freeing itself in the extraphysical dimension.

13. **Soma.** On the other hand, the visualization process makes you forget about the existence of your soma or human body and you can project yourself using the mental body, wherein you will feel bodiless. For many practitioners, this visualization process is easier for projecting lucidly.

14. **Tunnel.** Another visualization resource used for you to project lucidly is creation of the mental image of a dark tunnel with a distant exit. At the precise moment you visualize the fact that you are reaching the tunnel's exit, your psychosoma exteriorizes from the human body.

Step. Visualization using the remote viewing method, as it is easier, can serve as a first step toward developing lucid projection. Many people have experienced actual remote viewing even without any kind of training or inducement to lucid projection.

Remote. Here is a simple remote viewing technique in 10 steps:

1. **Photos.** Arrange to have someone take a series of large photos of diverse areas in the city or neighborhood where you reside.

2. **Choice.** Choose one photo of an area unknown to you, look at it attentively and then seat yourself in an armchair or comfortable chair in an isolated room and visualize the location reproduced in the photograph.

3. **Imagination.** Maintain the visualized images in your mind as long as possible. Imagine yourself leaving your human body, going to this place and floating above it.

4. **Details.** Observe all details, shapes, colors and possible structures of the visualized area, without censure, judgment or analysis.

5. **Register.** If possible, register what you have visualized and experienced on tape or draw the most relevant details you were able to see.

6. **Comparison.** Next, meticulously compare what you saw with the photo.

7. **Extras.** Make special note of anything extra or different that you saw and that is not in the picture. It can be scenery behind a building, a peculiar cloud formation in the sky (always ephemeral but suggestive, e.g., a tornado characteristic of the region), a new construction to one side, a parked old or abandoned vehicle, or any other detail that calls your attention.

8. **Location.** Write down these extra details and immediately go by car to the location itself.

9. **Correction.** Once there, see if any of your additional observations are correct.

10. **Functioning.** If you had actually never visited that location before and your supplemental individual observations were correct, it is clear that your remote viewing functioned.

Unconscious. In certain cases, the visualization technique – and the author has written reports to this respect – has been employed in an unconscious manner by novice projectors. This proves its physiological or natural character.

Case study. A young man was longing for his girlfriend and, one afternoon before resting in Brasilia, intensely visualized the beach in Rio de Janeiro where she might be with her group of friends. He saw himself on a certain beach (Arpoador beach in Ipanema, Rio de Janeiro, Brazil) at that time.

Frustration. This same lucid projector, *while projected*, tried to speak to his girlfriend and her friends, but they all ignored him. This caused him a great deal of frustration.

Frontochakra. According to holochakrology, we should keep in mind that the effectiveness of the projective visualization technique greatly depends upon the quality of the energy of the frontochakra of the intraphysical consciousness practitioner.

Bibliography: Blackmore (139, p. 94), Butler (227, p. 70), Greene (635, p. 19), Huson (768, p. 111), King (844, p. 33), Martin (1002, p. 54), Richards (1394, p. 77), Rogo (1444, p. 107), Samuels (1500, p. 120), Saraydarian (1507, p. 134), Shay (1546, p. 65), Walker (1781, p. 106).

205. PROJECTIVE POSTURES TECHNIQUE

Definition. Projective postures: the set of psychological and physical positions you assume in order to lucidly project your consciousness from the human body or soma.

Synonymy: projective attitudes; psychophysical projective positions.

Rule. In everything you are willing to do, you find yourself obliged to assume certain positions, whether they are psychological attitudes, physical postures or physiological dispositions, which are more effective for your performance and more adequate for your undertaking. Lucid projections are no exception to this rule.

Techniques. Today, there are techniques for everything that we decide to do in intraphysical life.

Sequence. Here is a sequence of 15 technical psychophysical or physiological postures that facilitate lucid projection, which are also physiological or induced by the will of the individual:

1. **Location.** Lie on your back on the bed in a comfortable position. There are those who prefer to lie directly on the floor in order to achieve greater relaxation. The result will be the same in either case.

2. **Clothes.** Loosen your clothes, which should be minimal, only those that are really indispensable. You can be in the nude if you wish. Loosen your belt, remove your glasses (or contact lenses, if that is the case) and your wristwatch. Remember to keep your knees, neck and fingers free from any restriction.

3. **Pillows.** Place 1 pillow under your head and 2 others under your knees or popliteal (hamstring) area, in order to accommodate yourself and facilitate the blood circulation of the lower extremities, if convenient.

4. **Legs.** Stretch the legs without tension or stiffness.

5. **Feet.** Place the feet approximately 1' (30 cm) apart.

6. **Arms.** Rest the arms extended alongside your human body.

7. **Hands.** Open the hands, palms down, on the pillows that were placed under your legs.

8. **Head.** Rest your head in a position that will not strain your neck.

9. **Muscles.** Relax all muscles, without forgetting the jaw, face and neck muscles.

10. **Eyelids.** Close the eyelids naturally, as if you were going to sleep.

11. **Mouth.** Close the mouth without compressing the lips.

12. **Saliva.** Avoid the successive swallowing of saliva, which is generally provoked by the practitioner's nervousness.

13. **Respiration.** Let your respiration flow naturally. The room or bedroom should be well ventilated.

14. **Relaxation.** Relax totally, including your fingers, reaching the state of complete immobility or semi-lethargy.

15. **Torpidity.** Calmly wait for the complete torpidity of your human body, which will occur little by little.

Adaptation. Through the suggestions indicated, you should gradually seek the physical and psychological conditions that are best adapted to your personal tendencies.

Female projector. Particularly for the reader who is a female aspirant to lucid projection, it is recommended, if necessary, to draw the legs and feet together in order to avoid distracting, inopportune mental connotations with regard to sex (*sexosoma versus soma*).

Bibliography: Denning (391, p. 68), Frost (560, p. 52), Vieira (1762, p. 79).

206. CLASSIFICATION OF LUCID PROJECTION TECHNIQUES

Preparations. Up to this point or, in other words, the last 9 chapters, the techniques presented were related more to the preparation of the future projector and the basic techniques for producing lucid projection.

Classification. As for the techniques derived for lucid projection, per se, or the formal systems for inducing projection, one must start with their classification.

Hundreds. Hundreds of the most diverse ancient, new and perfected techniques, and their variations, are available in order for consciences to project themselves from the human body with lucidity in experiences induced by their own will.

Ideal. The ideal method, a single, safe, simple, entirely effective formula, that has received universal approval or viability and is adequate for everyone, a veritable common denominator, still does not exist. We also do not expect it to be developed very soon.

Personalities. This fact is due to the diversification of personalities, physical constitutions, human character, individual behavior and the existence of 3 highly complex ultraphysical vehicles – the holochakra, psychosoma and mentalsoma – that are unequally developed and are evolutionarily organized as individual instruments of each intraphysical consciousness.

Inadequacies. Although the current alternative methods are incomparably superior to those employed half-a-century ago, for example, they still are inadequate to meet the practical needs of all individuals with disparate sex, age, biotype, temperament and conduct.

Patrimony. If a universal method existed, totally lucid projection would already be the patrimony of all individuals in many intraphysical societies, on various levels of civilization, from time immemorial.

Knowledge. We presently have to be content with the fragmented knowledge that is currently available to us, because our ignorance in many areas of projectiology is still significant and we are defiantly continuing in this field of research which is still affected by obscurities, mysteries, enigmas, unknowns or questions.

Reasons. There are many correct ways of predisposing the projective process in a good human environment (holothosene). You therefore should not use only a single technique to produce lucid projection, but take advantage of everything that will permit you to healthily attain the objective of projecting with lucidity and good recall, according to the physical and extraphysical conditions of the moment.

Attributes. The techniques for one to project oneself are based on 1 or several attributes of one's own consciousness, such as: imagination, visualization and mental concentration.

Mega-strong-trait. You, an aspirant to lucid projection, should verify, with extreme self-critique, which is your best consciential attribute or your mentalsomatic mega-strong-trait or that in which you are most versatile, in order to use it as a fundamental resource.

Abilities. The acts of relaxing both mentally and physically, clearing the mind with ease and redirecting attention outward from the human body are the most necessary and promising abilities you can present as an aspirant to having major lucid projections.

Self-confidence. On the other hand, if you admit or are confident that a certain technique will work for you, this will probably occur.

Combinations. Sometimes, it is more valuable to combine different methods in order to leave the human body, individually adapting them to your temperament, inclinations and circumstances. However, to be truly effective, any projection process tests your willpower in terms of being a fearless (projectiophilic), disciplined and perseverant person.

Chance. Assuming there is no universal method for voluntarily projecting that works for all intraphysical consciousnesses in an indistinct and generalized manner, a set of greatly varied, although select, techniques are presented here.

Suitability. It is worth your knowing all possible projective techniques in order to ensure the greatest possible chance of encountering at least one that will work for you or is better suited to your temperament and personal conditions. This technique should at least inspire you to attempt *to improvise your own specific, individually ideal method.*

Compensation. Practice all indirect, supplementary means and do so on a long-term basis, because lucid projection compensates for all your persistent efforts and performance.

Suitability. As you will see, there are processes for projecting that can help a certain microminority of individuals, as they better adapt to the conditions of a specific projector. This technique would be suitable in terms of highly personalized prerequisites, such as the following 9:

1. **Lungs.** The individual with good lungs: carbon dioxide technique.
2. **Suggestion.** The person who is impressionable: hetero-hypnosis technique.
3. **Art.** The individual with an artistic temperament: projectiogenic images technique.
4. **Duo.** The partner in an evolutionary duo: the sex act technique.
5. **Will.** The person with a strong will: physiological resources technique.
6. **Music.** The music lover: the musical pieces or melodies technique.
7. **Paraperceptiology.** The sufficiently developed and active sensitive: the technique of projection assisted by a helper.
8. **Dreamer.** The constant dreamer: the projectiogenic dream technique.
9. **Intellectuality.** The intellectual individual: the technique of projection in the mentalsoma.

Sleep. Some techniques can only be used by those who sleep alone, otherwise the practitioner will disturb the individual who is sleeping beside him/her (e.g.: the partner in an evolutionary duo).

Company. There are techniques for the aided projector, that is, one who is in the company of someone else, such as: sex act, hetero-hypnosis, massage and visualizations, music and visualizations, assisted projection, transmissibility.

Veterans. There are also techniques for the veteran projector: mentalsoma, repetition and rolling over backward.

Movement. Other projective techniques require movement, e.g.: the sex act, carbon dioxide, mantras, massage, pineal, break-in-routine and rotation.

Preferred. Of all the techniques herein described for voluntary projection or projection provoked by your consciousness or your will, two stand out as being preferred or advantageous because they are easier and spontaneous: self-hypnosis and projectiogenic dream.

Better. In spite of what has already been said, researchers have still not proven that there is one method that is better than the others for producing lucid consciencial projection.

Motivation. All projective methods can work if you master the techniques that help to induce progressive, deep neurological and muscular relaxation, and simultaneously maintain sufficient motivation to temporarily leave the human body.

Others. Besides those mentioned, which are considered to be the most functional, hundreds of other processes exist for conscientially projecting with lucidity, in accordance with the tendencies of your

personality as an aspirant to being a lucid consciential projector or even as a veteran experimenter. The following 6 categories are examples:

1. **Extraphysical:** a direct and realistic request for assistance made to a known helper, an extraphysical consciousness which inspires confidence in you to project with lucidity.
2. **Paraperceptive:** application of energetic touches (consciential chakroprojection) in order to intensify the personal vibrational state (VS) and produce the departure of the psychosoma.
3. **Psychological:** monoideism regarding a certain chosen form that one endeavors to see in a dream, or even the process of emotional shock (consciential traumatoprojection).
4. **Chemical:** the use of several special drugs, including anesthetics (consciential narcoprojection).
5. **Physiological:** a back-and-forth nodding movement of the head which has been flung backward (consciential cephaloprojection).
6. **Physical:** placing oneself in the rhythmically flashing light of a stroboscopic lamp (consciential stroboprojection); electric shock (consciential electroprojection); sensory deprivation; restricted environment; decrease in personal vitality; flotation with total solitary confinement, in total darkness and complete silence, in a tank of water that has been chemically prepared; wearing a jacket so tight that you can hardly move; and breathing through a tube (consciential hydroprojection).

Deprivation. *Sensory deprivation*, or perceptual isolation, is the name given to the prolonged, and practically complete, deprivation of sensory stimulation obtained in a laboratory or experimental chamber – in a rigidly monotonous environment, or a situation in which absolutely nothing occurs, as all standardized or perceptual stimulation has been removed – following this technical orientation involving 5 variables:

1. **Room.** Use a soundproof room in which a monotonous masking sound is transmitted through headphones, which blocks out other noises that might still be able to penetrate the air-conditioned room.
2. **Bed.** Lie down on a comfortable bed.
3. **Pillow.** Place your head on a U-shaped pillow that covers your ears.
4. **Glasses.** Put on glasses with frosted glass (or ping pong ball halves over the eyes) that do not permit any visual perception.
5. **Cardboard.** Put on cotton gloves and wrap your arms in long cardboard tubes that extend past your fingers, in order to block tactile perceptions.

Rigidity. These arduous and rigid conditions can clearly help any intraphysical consciousness produce lucid consciential projection.

Phenomena. In the application of any of the projective techniques, your consciousness may experience common phenomena, such as: the vibrational state; lucid dream or semilucid consciential projection; harmless physical catalepsy; and others.

Ointment. The following is a medieval recipe – among many existing recipes – of “astral projection ointments” to be applied to the entire human body prior to a projective experiment. These are very popular in certain parapsychic study circles. Contents: 5 ounces of lanolin; 1 ounce of hashish; 1 handful of hemp flowers; 1 handful of poppy flowers; ½ handful of hellebore.

Placebo. The greater function of these ointments as resources for the production of lucid projection is only psychological or autosuggestive (placebo).

Attempts. It is evidently unnecessary for you to practice all the methods, but you have nothing to lose by making some attempts at conscientially projecting with a certain degree of lucidity using any method that is harmless to your physical or mental health, since no specific minimum standardization for the control of the basic technical parameters for projective methods has been established yet.

Order. In the following chapters, the author has taken the responsibility of distinguishing the best techniques for you to lucidly project. They are currently those most widely known and used, and are the most adaptable to each practitioner, according to his/her projective capacity, psychophysical predispositions and individual motivation.

207. OPENING DOOR TECHNIQUE

Steps. This is the opening door technique, which induces you to lucidly project from your human body. It is given here in 8 steps:

1. **Isolation.** Isolate yourself in a closed room where you will not be disturbed while practicing the exercises. Remain in the nude or use only light, loose clothes.
2. **Armchair.** Sit straight-backed in a comfortable chair, or armchair, with hands on thighs.
3. **Imagination.** Close the eyes and imagine, using the obstinate force of your ironclad will, a closed door set in a white wall.
4. **Inscription.** On the closed door, mentally inscribe a characteristic symbol, such as the infinity symbol (∞).
5. **Meditation.** Meditate on the inscription on the closed door for a few minutes.
6. **Opening.** Intensely visualize the door opening slowly and endeavor to see yourself going through the open door to the other side of the white wall.
7. **Repetition.** Repeat all steps of the exercise, in the correct order, intensifying the visualization more and more each time.
8. **Exteriorization.** The exteriorization of your psychosoma will occur suddenly with a sensation of extreme lightness and ample freedom of extraphysical movement in the paramembers of the psychosoma.

Bibliography: Fortune (540, p. 154), Grant-Veillard (623, p. 93), King (846, p. 114), Martin (1002, p. 57), Rogo (1444, p. 54), Walker (1781, p. 112).

208. PROJECTIVE SEX ACT TECHNIQUE

Definition. Projective sex act: procedure through which a man and a woman release the libido and simultaneously, or due to this, produce a lucid projection experience.

Synonymy: joint projective orgasm; libidoprojection; projectiogenic orgasm; projectiogenic sexual union; projective sexual intercourse.

Predisposition. According to public opinion polls, one of the existing and verified conditions for the deliberate or spontaneous production of the human lucid projection experience is precisely when the individual is having a sexual orgasm.

Impact. This is why certain people can produce the lucid projection experience far more easily during the sex act or soon after a joint orgasm. This happens due to the emotional impact of orgasm

and the extreme degree of relaxation and the predisposition of the human body and mind to undergo natural sleep after the sex act.

Relaxant. It is known that sexual hormones exert a certain relaxing effect upon both men and women.

Sexology. In the study of sexology without taboos – relative to lucid projection experiences – it becomes imperative to start from the fact that the sex act is not ugly, dirty, sordid, prohibited, painful or disagreeable.

Physiology. On the contrary, the sex act is a gift of biology, an active part of the natural physiology of the human creature, that can also be used simply for the pleasure that it gives one, without any medical reason or sense of guilt.

Repressions. What has made the understanding of sex more difficult is the absence of advanced sexosomatics education due to ignorance (excessive repressions, preconceptions) regarding sexual techniques, attitudes or norms considered to be correct.

Reduction. Sex is the world's most popular revitalizing agent or stress reduction technique.

Benefits. Practiced correctly, the sex act combines the benefits of active aerobic exercise, aside from its vibrant impact, with the fundamental high point of the individual's thoughts and emotion.

Reactions. The benefits of the sex act are reflected throughout the human body through the following 4 basic reactions:

1. **Circulation.** An intensification in blood circulation.
2. **Heart.** An acceleration in heartbeat.
3. **Respiration.** An elevation in respiratory capacity.
4. **Relaxation.** The triggering of deep muscular relaxation.

Tranquility. This process for projecting with lucidity is only recommended for partners in an evolutionary duo, couples who are married or of any other condition as long as they have an active sexlife that is also tranquil, devoid of anxieties, guilt or any other concerns in the phase subsequent to the sexual union.

Time. The most adequate time for this practice is in the second half of the night or, more precisely, between 2 and 4 o'clock in the morning, when neither partner has any kind of concern or duty to perform immediately after the sex act.

Unconcern. The lucid projection candidate, during or immediately after the sex act, should remain completely unconcerned about surrounding human life, during and after the orgasm, allowing the impact of his/her emotions to dislocate his/her consciousness from the human body and the sleep state to come over the physical body without loss of lucidity, only thinking about projecting to the extraphysical dimension, removing all other ideas from his/her intraconsciential world.

Bathroom. Ideally, when possible, both partners will always wait to go to the bathroom until later, after the projective experience.

Men. Men usually benefit more from the sex act technique because, according to verifications of modern sexology, they tend to sleep more soundly than women after sexual union.

Advantages. The use of the projective sex act technique presents 5 indisputable advantages:

1. **Habit.** It naturally creates the habit – for the partner in an evolutionary duo who has a disciplined mind and consolidated habits – of projecting with lucidity soon thereafter.
2. **Deintrusion.** It avoids extraphysical traumas and strengthens the lucid projectors when faced with troublesome approaches by ill or energivorous extraphysical consciousnesses pursuing animal emotions or consciential energies of sexual origin.
3. **Erections.** It eliminates many occurrences of penile as well as clitoral erections, which are more frequent in sexually-deprived persons.

4. **Joint.** It permits a greater agility for the evolutionary duo to obtain joint lucid projections.
5. **Union.** It facilitates a deeper and fuller extraphysical union for both sexual partners, which will be reflected in their shared life in the ordinary, physical waking state.

Restriction. During the sex act performed in the “missionary” position (with the man on top of the woman), the woman is frequently not able to experience full pleasure due to the force of the man’s weight restricting her movements. This restraining condition, or sensory deprivation, sometimes generates a sudden lucid projection, according to reports made by some women who are physically more fragile than their partner.

Karezza. The projective sex act technique should not be confused with *Karezza*, also called *magical masturbation*, or sexual union without orgasm, frequently prolonged over various hours. It is a magical practice vehemently disapproved of by the majority of psychologists and sexologists, and one of which the author also disapproves. The aim of this practice is the achievement of a hallucinatory trance, or hypnagogic state, wherein both partners have contact with extraphysical consciousnesses.

Sexochakra. According to holochakrology, we should bear in mind that the effectiveness of the projective sex act technique greatly depends upon the quality of the energy of the sexochakra of the male (androchakra) or female (gynochakra) intraphysical consciousness practitioner.

Bibliography: Denning (391, p. 203), Frost (560, p. 65), King (846, p. 128), Rampa (1361, p. 20), Twemlow (1710, p. 452), Vieira (1752, p. 21).

209. PROJECTIVE SELF-IMAGE TECHNIQUE

Definition. Projective self-image: the image, in this case strictly physical or human, that you mentally have of yourself and which helps you to lucidly project from the soma or cellular body (see fig. 209, p. 1,132).

Synonymy: narcissistic technique; projective mirror technique; projective self-reflection; self-awareness of the human form.

Reflection. This method for the consciousness to project from the human body with lucidity is ideal for those who are able to sleep while seated in an armchair and is based on a detailed narcissistic study of awareness of oneself, self-knowledge or of the self-image reflected on a smooth surface, preferably a mirror. However, other surfaces can also be used to good effect, such as still, clean water, polished metal, glass or a crystal ball.

Transference. Through the self-image technique, the consciousness of the observer passes *into* the completely flat mirror or, in other words, to one’s reflected image, in a process similar to that in which the human consciousness leaves the human body and goes inside a nearby, motionless, physical object. In this case, one feels and perceives from the perspective of the object, as if the human body – a physical object – was temporarily substituted by another physical object.

Technique. The following is the projective self-image technique, that induces you to lucidly project from your human body, through the following 7 steps:

1. **Isolation.** At bedtime, isolate yourself in a closed room where you will not be disturbed while practicing the exercises. Go to the bathroom and attend to any physiological needs prior to the technique, then put on a loose pair of pajamas.
2. **Armchair.** Sit in a comfortable armchair placed in front of a big mirror that reflects your entire human body when you stand. The armchair must be placed near the light switch of the artificial light source that illuminates the room.
3. **Inspection.** Then carefully inspect every detail of your own reflection in the mirror, as though you had never analyzed yourself before, discovering aspects that you had never noticed.

Note each expression, shape, color and contour of every physical component of your face, hair, forehead, eyebrows, eyes, nose, mouth, chin and ears in a reflexive, circumstantiated self-examination.

4. **Name.** Stand and examine your entire body and finally fix your attentive observation on your eyes or directly into the pupils. In this position, repeat your own name several times clearly and audibly, as if it were a mantra.

5. **Visualization.** Visualize yourself, alive, in the place of the reflected image. Make it move as though it were your real form, just like your consciousness acting while outside the human body.

6. **Sleep.** Keep this visualization intense. Forget the mirror and the present physical circumstances until you are overcome by sleep or physical fatigue.

7. **Saturation.** In the most intense phase of the visualization, give in to the urge to sleep, turn off the light and sleep in the armchair, preferably, or in a nearby bed (as a last resort), with the mind saturated with your vital image.

Television. The image of your mirrored figure, created in your mind, is similar to the luminous image retained in your vision as a television viewer when you go to sleep at night immediately after switching off the TV in your bedroom.

Impression. If the transference of your consciousness to the reflected image was very intense and deep, it impresses your subconscious will to such an extent that the psychosoma is projected with your consciousness, thus occurring your immediate extraphysical awakening and the beginning of your lucid consciential projection, per se.

Bibliography: Bord (170, p. 56), Carrington (245, p. 259), Farrar (496, p. 193), Greene (635, p. 32), Huson (768, p. 113), King (845, p. 118), Muldoon (1105, p. 217), Rogo (1444, p. 54), Shay (1546, p. 62).

210. SELF-VISUALIZATION WITH OPEN EYES TECHNIQUE

Base. This exercise is based on visualization of the separation of your psychosoma with your eyes *open*, which is not easy. However, the difficulty diminishes with practice and when you have already mastered the self-visualization with *closed* eyes technique.

Indications. The process of visualization with open eyes is indicated only for the individual who has a predominance of visual memory in visualizations, general perceptions and common observations, and who is endowed with a powerful imagination.

Technique. The following is the self-visualization with open eyes technique that induces you to lucidly project from your human body in 4 steps:

1. **Isolation.** Isolate yourself in a closed room where you will not be disturbed while practicing the exercises. Remain in the nude or use only light, loose clothing.

2. **Bed.** Lie on your back and extend the arms alongside the body.

3. **Visualization.** While keeping the eyes open, visualize, just like someone watching a film, the separation of your psychosoma gradually leaving your entire human body.

4. **Progression.** Visualize the formation of your extraphysical feet (parafeet), then paralegs, paratrunk, para-arms and parahead, slowly and in minute detail, until you can distinctly see your entire double (psychosoma) distinctly formed outside your human body.

Illumination. You should choose whether to leave the room illuminated or in a penumbra, according to the influence of light on your pupils (photophobia).

Bibliography: Martin (1002, p. 55), Walker (1781, p. 106).

211. STEP COUNTING TECHNIQUE

Trip. This technique is based on the detailed visualization of a specific trip, used to visit a loved one, with a precise number of steps to complete the journey.

Return. You imagine yourself leaving your house, taking the necessary number of steps and then reaching the house you want to visit. You knock at the door and it is opened by the person you want to visit. Your empathy with this person can potentiate the effects of the technique. You should return to your own house taking the same number of steps.

Demands. The step counting method demands considerable concentration, vivid visualization and the precise number of steps and details regarding the route (itinerary, trajectory).

Variation. The most common and practical variation of this method is for the projector to leave the bedroom and go to the kitchen of his/her house or apartment, observing and visualizing the smallest details of the physical particularities along this domestic route that has been visited and examined in detail many, many times while in the ordinary, physical waking state.

Blueprint. It is always better to carefully repeat the exercises, without getting discouraged, even using a blueprint of the location and drawings of every possible detail of all existing furniture and interior decoration in the building, indicating at least 6 main points chosen along the route, such as:

1. Picture frame on the wall.
2. Point of illumination.
3. Flower vase.
4. Hallway corner.
5. Coffee table.
6. Television.

Impression. The exact impression of the details of the objects and the angles of the route in the individual's memory ends up leading the experimenter to have a projection, extraphysical awareness and the unimpeded travel of the domestic route in the psychosoma.

Bibliography: Crawford (313, p. 68), Martin (1002, p. 59), Muldoon (1105, p. 221), Ophiel (1150, p. 27), Walker (1781, p. 112).

212. CARBON DIOXIDE TECHNIQUE

Definition. Carbon dioxide technique: this well-known gas, when at elevated levels in the pulmonary alveoli (hypercapnia) and circulatory system, generally in an atoxic mixture or without any serious side effects, of 7 parts (70%) oxygen and 3 parts (30%) carbon gas, diminishes the efficiency of the functioning of the brain and permits the freeing of the consciousness manifesting in the psychosoma.

Synonymy: carbon anhydride technique; carbonprojection; CO₂ technique; hypercarbonic technique; intentional asphyxia; lack of air; oxygen starvation; premeditated suffocation; voluntary agony.

Atmosphere. Carbon dioxide (formula CO₂) is an incombustible, colorless, odorless, heavy gas. It is nontoxic, although an asphyxiant. It makes up 0.02% of the atmosphere at sea level.

Liquid. Carbon dioxide is soluble in water and alcohol. It liquefies at a pressure of 5 atmospheres and a temperature of -68.8°F, degrees Fahrenheit (-56°C, degrees Celsius or centigrade).

Evaporation. At normal pressure, part evaporates and part solidifies, forming dry ice (solid carbonic anhydride or carbonic snow), used to maintain low temperatures: -128.2°F, degrees Fahrenheit (-89°C, degrees Celsius).

Meteorology. This gas is employed in the preparation of carbonated beverages, in medicine, in fire extinguishers and, in solid form, in the seeding of clouds, with the aim of modifying the structure of the cloud and provoking its precipitation or dissipation.

Botany. Carbon dioxide is an indispensable food for plants, being eliminated by living beings as a result of cellular respiration.

Psychiatry. Carbon gas, as mentioned above, has already been therapeutically administered to psychoneurotic patients via mask. This generated an ample variety of subjective sensory phenomena that were extremely similar to the near-death experience (NDE), including the exact sensation of the separation of the consciousness from the human body and consensual self-bilocation.

NDE. This proves that the retention of carbon dioxide in the brain – when the individual is exposed to extreme hypercarbic conditions – can trigger the near-death experience, which ends up being inoffensive or, more precisely, becomes a forced lucid projection.

Alterations. Changes in the velocity and intensity of respiration influence the heartbeat and blood pressure, altering the levels of oxygen, carbon dioxide, acids, alkali, lactates and calcium in the circulatory system. This also affects the normal functioning (neurophysiology) of the cerebral hemispheres, in either a serious or inoffensive manner.

Symptoms. Hypoxia, privation provoked by a low or inadequate level of oxygen in the tissues, and hypoxemia, a lack of oxygen in the circulatory system – a consequence, for example, of a reduction in atmospheric pressure – constitute forms of *oxygen starvation* producing symptoms of asphyxia, suffocation, ringing in the head, lack of muscular coordination, visual alterations, dizziness, psychic absence, perspiration, emotional instability, loss of critical judgment, hallucinations and other xenophrenic states.

Hypobaropathy. Each organ of the human body has a very different tolerance to hypoxia.

Disturbances. A lack of oxygen in breathed air causes disturbances that receive various denominations, such as: hypobaropathy; altitude sickness; mountain sickness; airsickness; *soroche*; *apunamiento*.

Mountain climbing. This phenomenon occurs with human beings (e.g.: mountain climbers) when they are at high altitudes, above 3.73 mi. (6,000 m), on mountains or in airplanes.

Chamber. The normal air in the consensual projector's bedroom (energetically shielded chamber) contains 21% oxygen and can be considered to have 0% carbon dioxide.

Desoma. It is important to mention that if carbon dioxide (CO₂, anhydrous carbon) is inhaled in its 100% pure state, it immediately causes the deactivation (desoma) or *death of the human body* through asphyxia or suffocation. In this case, the person inhales without oxygenating the blood.

Appendectomy. In Brazil, in 1986, a case of medical error occurred, with international repercussions for the professional involved when – during an appendectomy – carbon gas, being mistaken for oxygen, was applied to a young patient.

Ecology. In 1989, at the international meeting in Paris known as *Planet Earth*, carbon gas was unanimously chosen as *The Earth's Number 1 Enemy* by 180 experts from 40 different countries, assembled with the proposal of reducing the escalating levels of pollution.

Combustion. It has been shown that 80% of carbon gas emissions into the atmosphere are caused by the burning of carbon, petroleum and gas, and only 20% is due to deforestation.

Harmlessness. It is interesting to emphasize the pacific, harmless and positive use of carbonic gas within projectiology.

Occurrences. Six occurrences arise in the field of projectiology due to the decrease of oxygen in the lungs with a consequent increase of carbon dioxide in the tissues: the rhythmic respiration technique; near-death experiences; accidents with asphyxiation; lucid projections in prisons; the existence of inadequate sleeping habits; voluntary mini-deaths.

1. **Respiration.** Hypercapnia, excessive carbon dioxide in the blood and, consequently, an elevated level of carbon dioxide in the brain, explains the mechanism by which the rhythmic respiration technique operates. This is used in the respiratory exercises of yoga which, when practiced systematically, induce prolonged suspensions in respiration or, in other words, a retention of expiration or reduction in respiratory rhythm, interrupted by pauses and leaves the experimenter slightly oxygen starved or in a condition of voluntary agony.

2. **Near-death.** Carbon dioxide is normally formed in the brain as an end product of cerebral cellular metabolism. The incoming, pure or oxygen-rich blood supply that takes oxygen to the brain is also responsible for the return transport – impure blood or that mixed with carbon dioxide – of carbon dioxide out of the brain in order for the CO₂ to finally be expelled by the lungs. A stoppage in the flow of pure blood provokes a heart attack (infarct, myocardial infarction), a hypercarbonized brain (hypercarbia), as well as a great number of near-death experiences (NDE), and, in certain cases, departures of the consciousness from the human body.

3. **Accidents.** The increase in carbon dioxide in order to produce lucid projection even occurs with a certain frequency, in a spontaneous manner, without the deliberate intention of the intraphysical consciousness, in serious accidents that generate suffocation or asphyxiation.

4. **Solitary.** The same process of increasing carbon dioxide unconsciously produces involuntary lucid projection in confined individuals in restrictive total institutions, such as prison inmates in cells and solitary confinement cells with reduced cubage where the air is polluted and has reduced oxygen content.

Solitude. Incidentally, ordinary clairvoyance gives a new meaning to multidimensional life and makes the scorn insignificant that the external social and human world may heap upon the intraphysical consciousness, for any reason.

Relationships. One's circle of consciential relationships amplifies without limits. The intraphysical consciousness will never again feel alone, solitary or completely isolated.

5. **Covers.** The condemned habit of a person covering the head with the blankets while sleeping, thus diminishing his/her capacity for inhaling oxygen and increasing the level of carbon dioxide in the space around the face, or nostrils, in certain cases facilitates lucid projection of the consciousness in the psychosoma.

Migraine. It is worth remembering that the person who likes to sleep after daybreak and pulls the covers over the head to block out the sunlight entering the window can end up suffering from headaches or migraines.

6. **Mini-death.** The use of carbon dioxide evidences the similarity between the phenomenon of lucid projection – also called a *preview* of death – and the experience of biological and definitive first desoma. If inhaled in its pure form, carbon dioxide provokes the death of the human body; if inhaled in small amounts or volumes (30%), it predisposes lucid projection in the psychosoma. The carbon dioxide technique therefore endeavors to produce the deliberate mini-death phenomenon.

Technique. In spite of what has been said so far and as long as you have good lungs and a trouble-free heart and cardiorespiratory system, you can produce simple, harmless and voluntary intoxication following physiological processes by increasing carbonic-acid gas levels in the tissues of your own human body.

Slow. By breathing slowly or, in other words, by inhaling a smaller volume of *air* and, therefore, a smaller amount of *oxygen* and a greater volume of leftover *carbon dioxide*, you hold or reduce the exchange of gases. In this way, the human body is predisposed to free the psychosoma, with a slight dis coincidence of the psychosoma in relation to the dense body.

Effects. The abovementioned process, upon decreasing the activity of your two cerebral hemispheres, will provoke sleep, reduce your heart rate, generally deaden your physiology and dislodge your psychosoma from dense matter.

Duration. Your inhalation or the act of inhaling air (with oxygen) into your lungs is normally equal to the duration of your exhalation, or the act of expelling air from the lungs.

Time. Following this process, the retention of air in your lungs, and therefore of carbon dioxide, should be half of your inhalation or more, up to 3 or 4 times its duration. You need to execute this little by little, through repeated respiratory exercises.

Beginning. Initially, the time relationship between inhalation, the act of retaining air in the lungs and exhalation should be, 12 seconds to inhale, 48 seconds to retain the air, and 24 seconds to exhale.

Maintenance. With a chronometer in front of you, slowly increase the period of retention of the air in your lungs, until reaching the maintenance phase of inhaling for 16 seconds, retaining the air for 64 seconds, and exhaling for 32 seconds.

Totals. Always on an empty stomach, perform 20 complete cycles in each session in order to obtain compensatory results.

Repetitions. Some practitioners repeat the exercises 4 times a day.

Greenhouse. A greenhouse filled with plants can serve as an excellent physical base during the day, with the person lying down inside, in a peaceful environment.

Photosynthesis. Through the mechanism of photosynthesis, plants exteriorize carbon dioxide during the day, thus increasing the level of CO₂ in the practitioner's organism or, in other words, diminishing the oxygen level in the environment and its inhalation into your lungs.

Deprivation. This important process installs a condition of light gaseous intoxication, predisposes the takeoff of the psychosoma (sensory deprivation), composing, in a reverse manner, the mechanism of the projective technique through carbon dioxide. Instead of retaining CO₂ in the organism, one inhales a greater amount of this gas, in this case.

Cubage. It is very important to observe the cubage and sealing of the greenhouse, the quantity of plants, quality of the internal air and the duration of the experimenter's stay inside the greenhouse, so that the gas does not end up generating a serious intoxication for the individual remaining there. There are intraphysical consciousnesses who have gone through desoma due to intoxication inside a greenhouse.

Caverns. Throughout time, ancient initiates, seers and prophets, such as founders of religions, Moses (seventh century, B.C.) and Zoroaster (eighth century, B.C.), as well as meditators, hermits, yogis, Indians, Tibetan yogis and others, have chosen grottos or caverns that have been carved by humans, sculpted out of the stone portion of mountains by nature, or those which are existent in the desert, as their residences, isolated self-imprisonments, or favorite retreats for the improvement of their animic-parapsychic performance.

Factors. The use of natural stone caverns develops consciously or even unconsciously, or perhaps it is more accurate to say instinctively, due to the following 6 factors:

1. **Stones.** The stones of a cavern, including stalactites and stalagmites, offer natural protection against bad weather, winds and brusque changes in the ambient temperature between day and night.

2. **Isolation.** Caves, as natural sources of shelter, offer shade, penumbra and the silence necessary for complete isolation or solitary consciential confinement.

3. **Physiology.** The rarefied air inside a cave, a lack of exposure to bad weather and minimal physical movement significantly reduce the practitioner's physiological needs, reducing to a minimum the hygiene habits indispensable for maintaining one's human body.

4. **Humidity.** The humidity in a cavern helps to lower the temperature and maintain it there, which predisposes all types of parapsychic categories.

5. **Pineal.** A cave can offer complete isolation from light sources. This is very important, as it is known that the pineal gland – which is presumed to be closely connected to clairvoyance, parapsychic phenomena in general and the encephalic chakras (coronochakra, frontochakra, nuchal chakra) – is highly photosensitive. The activity of the pineal gland is activated by darkness and inhibited by light. In humans, this influence occurs through the sympathetic nervous system.

6. Dioxide. A decrease in the oxygen level of air circulating in a cave generates projection of the consciousness through a natural dis coincidence of the vehicles of manifestation under the action of an increasingly high concentration of carbon dioxide in the cave upon the human organism or, in other words, in the pulmonary alveoli and circulatory system. This doubtlessly constitutes the most important and decisive factor in producing consciencial projection.

Hypercapnia. It is worth clarifying that hypercapnia is the excess of carbon dioxide gas in the blood that first provokes neuropsychic effects, including torpor and somnolence. At a more elevated level, the accumulation of CO₂ in the blood triggers pathological conditions until arriving at periodic respiration, or Cheyne-Stokes respiration, which is observed in comatose states or sometimes in deep sleep and, in the absence of a superior regulation, stems from a bulbar reflex.

Base. It is easy to infer from these facts that, aside from the primitive nature of the process of its use, the cave undoubtedly constitutes an excellent physical base for the production of lucid projections of the intraphysical consciousness, especially using the carbon dioxide technique in a restricted environment with sensory deprivation.

Cardiochakra. According to holochakrology, it should not be forgotten that the effectiveness of the carbon dioxide technique greatly depends upon the quality of the cardiochakra energies of the intraphysical consciousness practitioner.

Bibliography: Brennan (199, p. 97), Brunton (217, p. 267), Charrière (274, p. 338), Huxley (771, p. 95), Lefebure (909, p. 208), Moore (1079, p. 58), Sabom (1486, p. 241), Vieira (1772, p. 8), Walker (1782, p. 342).

213. PROJECTIVE FACTOR TECHNIQUE

Definition. Projective factor: mental target, be it a target-object or specific target-place, that you use as a psychophysiological support for your lucid projection.

Synonymy: projective crutch; projective fixation factor; projective support.

Target-object. An intentionally-chosen target-object, as well as a target-place, can be used as a projective factor, element or point of focus outside your human body, in a paratropospheric extraphysical district.

Types. You can choose innumerable *target-objects*, however, only one must be used as a fixation factor, such as:

1. **Internal.** Inside the home (indoors) or in a closed area: an object of personal use; a book; a closed music box; a small decorative piece; a sculpture; a painting; and others.

2. **External.** Outside the home (outdoors) or in the open air: a bush; stone; sand dune; wall; and others.

Person. Obviously, a target-person can also be used.

Affinity. The location where the target-object is located is extremely important for you. As an aspirant to producing a lucid projection, you need to have an affinity or establish a rapport with the environment, like it, know it in great detail and even frequent the place, if necessary.

Target-places. You can choose one of these examples of target-places and use it as a fixation factor: a room or an internal area in a house or apartment; a portion of the garden or backyard of your physical base.

Spontaneous. Certain objects with which you identify, in locations that psychologically predispose you to the production of lucid projection, operate as natural projective factors, triggering non-programmed, spontaneous and surprising projections, sometimes even without your even being aware of the existence of a projective factor.

Bibliography: Castaneda (258, p. 149), Vieira (1762, p. 111).

214. PROJECTIVE HETERO-HYPNOSIS TECHNIQUE

Definition. Hetero-hypnosis: procedure through which a person (the hypnotist, who has strong will-power and a certain psychism or congenital magnetism (paragenetics)) influences another (the hypnotized subject), nullifying the subject's awareness and will, placing him/her into a specific psychic state, with or without trance, that releases the subject's subconscious powers. The subject will do what the hypnotist suggests by concentrating on a thought, idea, place or person, with post-hypnotic suggestions even possibly occurring.

Synonymy: bradyism; druidic sleep; hetero-suggestion; hypnoprojection; hypnotic lucid projection; hypnotic state; hypnotic suggestion; hypnotism; intellectual vivisection; mechanical suggestion; mesmerism; moral vivisection; nervous sleep; objective hypnosis; persuasive suggestion; *sofronization*; third-party suggestion.

Hypnotist. In order to avoid wasting time in the lobby of parapsychic phenomena, as well as useless efforts, frustrated attempts and wrong approaches, the ideal hypnotist (moral vivisectionist) for cooperating in participatory investigations of projectiology in general will always be a projectionist-physician-hypnotist.

Self-persuasion. This is because it is presumed that this person has already experienced the lucid projection phenomenon on his/her own in a spontaneous or voluntary manner and is convinced that the altered consciencial state of lucid projection is, in fact, unique and extremely individual, and is not simply a suggested consciencial condition, a mere inconsequential fabrication or morbid personification.

Conditions. The projective hetero-hypnosis technique, or the hypnotic lucid projection, is the same as projective self-hypnosis although, in this case, it is induced by someone else. It is indicated, as much as the other technique, only for those who are sensitive to deep hypnosis or who have the special conditions for this process.

Suggestion. In the ordinary, physical waking state, *suggestion* is every idea that is awakened in the human brain and accepted by it. Suggestion is the process wherein a person, without arguing, giving orders or coercing, directly induces another person to act in a certain manner or accept a certain opinion.

Hypersuggestibility. Hypnosis is a xenophrenic or supranormal state of hypersuggestibility that can be artificially provoked by various means.

Subhuman. It is worth clarifying that the process of magnetization (a type of hypnosis) of subhuman animals excludes or annihilates the hypothesis or *idea of suggestion* and the act of acceptance by the brain.

Resources. Different coadjutant resources are used in hetero-suggestion, in the sense of intensifying the *rapport* between the sensitive and the hypnotist, notably the following 16:

1. Blowing warm air at the patient.
2. Holding up the thumbs.
3. Hypnotic lights.
4. Inductive melodies.
5. Inhalation of subterraneous smoke, vapors or gases.
6. Magnetic passes, with or without contact.
7. Monotone speech.
8. Narcotics.
9. Relaxation lamps.
10. Rhythmic sounds.
11. Staring at a point of light.
12. Staring at shiny or polished surfaces.
13. Strong and brusque (gong) or light prolonged and repeated auditory or visual sensory stimulation.

14. Suggestions or verbal orders (hetero-suggestions).
15. Touching hypnogenic zones or points.
16. Use of aromas.

Mentally. In spite of this exemplificative enumeration, it is possible to hypnotize a person merely mentally and without the use of any ostensive crutch or external resource.

First. Currently, hetero-hypnosis has gained a well-defined scientific status, although many of its mechanisms are completely obscure. Apply this method, requesting that someone who is a competent hypnotist and in whom you trust implicitly to proceed, as a first step, to give you a hypnotic suggestion, resulting from an induced state of auric coupling.

Isolation. On an empty stomach, go to the bathroom and attend to all your physiological needs. Then, isolate yourself in a closed room together with the hypnotist, where neither of you will be disturbed while proceeding with the experiment.

Recorder. You can be accompanied by a third person who will monitor a silently functioning recorder.

Clothes. Wear light, loose clothing, remain barefoot or wear only socks.

Predisposition. Sit in a comfortable armchair where you can lean your head back. Inwardly predispose yourself receptively, with complete trust and passivity, to the suggestions that will be made.

Second. Once the hypnotic suggestion has been made, the hypnotist, in a second phase, stimulating your capacity to project (projectability), which all of us, intraphysical consciousnesses, naturally possess, induces you to have a lucid projection or, in other words, a departure of your consciousness from the human body in the psychosoma, and your indispensable recollection subsequent to the extraphysical experiences which will occur, stemming from 1 of 3 hypnotic states:

1. Somnolence.
2. Hypotaxia.
3. Hypnotic somnambulism.

Place. At this point, the hypnotist will induce your consciousness to extraphysically go to a certain place, the target-place, such as a house or apartment, the place and inhabitants of which neither you nor the hypnotist are familiar with, in order to avoid any kind of telepathic interference with the experiment.

Para-experiences. Once there, you will verify (para-experiences) what is occurring both intra and extraphysically, the persons present and other details of the environment and events that are of interest, later remembering the events witnessed or in which you participated.

Occurrences. In hetero-hypnotic suggestive induction, 3 intraconscial conditions frequently occur:

1. **VS.** The vibrational state (VS).
2. **Trendelenburg.** The conscial condition of extraphysical Trendelenburg.
3. **Clairvoyance.** The phenomenon of traveling clairvoyance.

Sensations. Having a greater energetic sensibility on your part, as a person who is predisposed toward lucid projection, you will clearly feel the waves of conscial energy that flow from the hypnotist during the trance process, which potentiate, transport or accompany the suggestions that he/she makes.

Bi-controlled. The bi-controlled projection, or one that is controlled in two existential dimensions, is a more complex and sophisticated conscial experience that stems firstly from a projection of yours, that is controlled by the hypnotist, until your consciousness, projected in the psychosoma, encounters a helper – a beneficent extraphysical consciousness – which, after encountering you in a projected state, will start to give you continuous extraphysical assistance from that point on, thereby assuming command of the experiment.

Dehypnosis. In this case, an alteration of *dehypnosis* or, in other words, the final stage of the hypnotic state occurs.

Percentage. Unfortunately, the hypnotic technique does not function equally for all intraphysical beings to project themselves with lucidity, since only a small percentage of the population is able to reach a sufficiently deep hypnotic trance.

Depth. It has been possible to objectively measure the depth of the hypnotic state in the laboratory using a voltmeter.

Efficiency. Despite everything, hetero-hypnosis is one of the most efficient techniques used to produce the experience of human lucid projection.

Controlled. It would be unwise to confuse assisted lucid projection, in which a consciousness is assisted from the takeoff of the psychosoma and receives assistance outside the human body during the entire experiment from a visible or intangible helper, with lucid projection controlled by a human hypnotist who places your consciousness in a deep hypnotic sleep and monitors your extraphysical activities through appropriate suggestions (hypnotic consensual projection).

Traveling. Incidentally, it would not be honest for the hypnotist, regardless of the best of intentions that may be nurtured, to wish to only trigger the production of the traveling clairvoyance (emotional body) of the sensitives and stop there, letting them remain dependent upon or at the mercy of the hypnotist's consensual energies.

Independence. The hypnotist needs to insist that the sensitives make an effort to extraphysically evolve on their own, producing major lucid consensual projections, including those in the isolated mentalsoma, using their personal ironclad will.

Crutch. The hypnotist plays the role of a parapsychophysiological crutch for the traveling clairvoyant (dependent). Nevertheless, the hypnotist should also not continue being a crutch for the parapsychically lucid or self-sufficient lucid projector forever.

Slaveocrats. The hypnotist should strive for effective consensual maturity, on his/her part, and cannot stagnate the consensual development of other intraphysical consciousnesses, indefinitely sustaining groups of dependents or interconsensual slaves in the manner of the following 3 professional slaveocrats of this still pathological intraphysical society:

1. **Clinician.** The bygone clinician who would keep a patient's leg ulcer from healing.
2. **Clergyman.** The clergyman whose church construction never gets completed.
3. **Seducers.** Certain religious professionals, leader-mediums, gurus, psychoanalysts and bioenergetic seducers/seductresses who take advantage of incautious or parapsychically susceptible intraphysical consciousnesses through use of the consolation task, as they are motivated only by tropospheric financial-economic interests.

Satellites. According to evolutiology, consciousnesses should grow freely, like their own stars and not be reflective satellites (satellites of *intrapysical intruders*). They need to exist without psychological dependences, on their own, dispensing with "...latrises", with real discernment and consensual maturity.

215. PROJECTIVE SELF-HYPNOSIS TECHNIQUE

Definition. Self-hypnosis (OE: *self*, self; Greek: *hypnos*, dream): the hypnotic state induced through the practitioner’s will.

Synonymy: autosuggestion; *estatuvolência*; hypnotic self-conditioning; hypnotic self-reaction; physiological projective method; progressive lucid projection; self-hypnoprojection; self-hypnotic projection; self-hypnotic suggestion; self-induced trance; self-mesmerism; statuvolence; subjective hypnosis; suggestion by oneself.

Pain. Self-hypnosis is currently employed as an effective technique for controlling cases of fear (phobias of various natures and origins), shock and even the most atrocious pain felt by soldiers in the line of battle, including the treatment of battle wounds.

Reactions. In this case, the individual, with the help of a tape recording of brief instructions from a specialist, substitutes the action of the hypnotist, thus producing the hypnotic reactions within him/herself.

Yoga. The cultivation of samadhi in yoga practices is a self-hypnotic process.

Easy. There are 2 processes whereby you can induce self-hypnosis in general:

1. Hetero-induction.
2. Autosuggestion.

Trance. The first process, hetero-induction, is easier, faster and more efficient. It is the act of permitting a capable, non-neophyte hypnotist, who is responsible and whom you trust completely, to put you into a hypnotic trance.

Word. Then, the hypnotist will give you a keyword that you can use from that point on to self-induce the projective trance again by saying the word out loud. This selected word functions as a post-hypnotic suggestion.

Bigdream. The hypnotist’s suggestion might be similar to the following: “You are now in a deep sleep. In a moment I will awaken you, but before this I want you to know that every time you say the word *bigdream* in a loud voice, you will immediately fall into a deep sleep, just as you are sleeping now. The word is *bigdream*. Another person can say this word, but it will have no effect on you. However, when you say it in a loud voice, you will fall into a deep sleep like the one you are in now. While asleep, you will remain in control. You will be able to direct your mind where you wish it to go. You will be able to control your body and emotions when you are in this deep sleep”.

Uncommon. The post-hypnotic suggestion, that is, the chosen keyword must be uncommon, not used in regular speech in order to avoid it being said by a friend or someone in a TV show, since this could cause some embarrassment (if a mistaken suggestion occurs) or, what is much worse, if you heard it on the radio while driving, for example. This could cause an accident if it actually induced you into a trance. Here are 5 examples of short, oxytone, invented words that can serve as keywords: *bantaz*, *chamum*, *nantur*, *parcol*, *transtal*.

Difficult. The second method for inducing self-hypnosis, and certainly a difficult one, is for you to produce it on your own. The technique should be the same as when the hypnotist puts the sensitive into a trance, the difference being that you will simultaneously be the hypnotist and the sensitive.

Hetero-hypnosis. The technique for self-hypnosis is the same as that for hetero-hypnosis, however being induced by yourself. It is indicated, as is the other, only for those persons who are sensitive to deep hypnosis, or who possess the special conditions for this process.

Self-determination. Still using the simple, spontaneous and less technical autosuggestion method, you must fearlessly decide to allow the human body to be commanded by your will that has been influenced by mental saturation with the idea of lucid projection. This should be done before you sleep, lying on your back on the bed, in a totally relaxed condition, imagining the departure of your psychosoma upward from the human body, until achieving the hypnagogic state, losing consciousness, awakening from an ordinary dream and floating above the bed.

Departure. Visualize yourself as a body leaving from within another body.

Flotation. Feel yourself abandoning the dense body as if you were floating on water.

Repetitions. You should repeat the above indicated procedure, neither lazily nor feverishly, but perseveringly, night after night, for at least 15 days in a row, gradually improving your psychophysiological performance.

Unconsciousness. After a while, the wish to leave the human body will become unconscious. You will then have the perfect impression that you are an *immaterial* being. You will, in fact, lose the notion of a crude and heavy human body and can often even feel yourself to be on a cloud, bodiless, massless and without any contact with the ground, floating and completely dematerialized (mentalsoma).

Emphasis. Whoever wishes to place greater emphasis on his/her own suggestion for lucidly projecting outside the human body can say out loud to him/herself: “I will leave this body, maintaining awareness and will see it on the bed!” Repeat this suggestion firmly at least 10 times.

Intercurrences. Meanwhile, you should not fail to observe frequent animic-parapsychic interurrences, such as:

1. **VS.** The vibrational state (VS).
2. **Chakras.** The sensations of the chakras.
3. **Signage.** Parapsychic signals (personal signage).
4. **Clairvoyance.** The phenomena of clairvoyance.
5. **Clairaudience.** The phenomena of clairaudience.

Stimulants. These occurrences act as powerful stimulants, motivating you to proceed perseveringly in a deeply motivated manner and without discouragement, with the projective experiments.

Bibliography: Boswell (174, p. 138), Brennan (199, p. 43), Fox (544, p. 64), Goldberg (606, p. 19), Kettelkamp (841, p. 39), Knight (853, p. 56), Monroe (1065, p. 207), Nebel (1118, p. 113), Rampa (1366, p. 205), Rogo (1444, p. 168), Steiger (1601, p. 195), Vieira (1762, p. 205), Wang (1794, p. 161).

216. PROJECTIOGENIC IMAGES TECHNIQUE

Definition. Projectiogenic images: objective mental figurations that stimulate your consciousness to leave the human body using the psychosoma.

Synonymy: images stimulative of projection; projectiogenic figurations; projective visualization strategies.

Types. There are useful psychological techniques that act as triggering factors of your lucid projection. They are based in the creation, which is maintained in your mind, of 6 diverse types of objective mental images that stimulate the takeoff of the psychosoma, transporting the consciousness:

1. **Cone.** Visualize a conical form, whether an hourglass, successively smaller or larger circles, or a cone inside which your body contracts itself somewhat, in order to then expand, twisting yourself from the inside gradually outward until leaving the cone and obtaining, due to this compression, the exteriorization of your consciousness in the psychosoma.

2. **Rope.** Imagine climbing a rope, thereby giving movement to the psychosoma and thus dislodging it from the state of coincidence with the human body.

3. **Wave.** Imagine yourself being carried on the crest of a wave until you reach another environment, in this case the paratropospheric extraphysical dimension. An adequate suggestion for surfers.

4. **Evaporation.** Imagine the departure of your consciousness from the human body, as though the extraphysical body (psychosoma) were evaporating through all the pores of your dense organism.

5. **Tornado.** Concentrate intensely on the spiraling movement of a tornado (whirlwind, cyclone, twister), that is, a column of spiraling air or sand, wherein your consciousness is sucked up into the top of the column of air, contracting until it becomes a simple point of consciousness, when it will then leave the column of air moving upward. At this point, you will expand, reaching another existential dimension.

6. **Tank.** Elaborate the mental figure of a tank that gradually fills with water, on the surface of which you, as a point of light, float until finding a small opening at one side of the tank, through which you transfer yourself to the extraphysical paratropospheric dimension.

Bibliography: Huson (768, p. 112), Muldoon (1105, p. 314), Rogo (1444, p. 53), Shay (1546, p. 62).

217. LUCID PROJECTION THROUGH FASTING TECHNIQUE

Definition. Projective fasting: the partial and temporary abstinence from food with the objective of producing lucid projection of the consciousness outside the human body (soma).

Synonymy: diet control technique; projectiogenic fast; projectiogenic privation of food; projectiogenic suspension of food; projection through fasting; projection through hunger; projective nutritional abstinence; self-conservational projection; third day projection.

State. From a medical point of view, the human body is fasting when all previously ingested nourishment has already passed through the digestive process and been assimilated by the cells.

Antiquity. There have been few civilizations throughout human history – if indeed any have existed – whose religious and ethical systems did not at one time or another institutionalize the practice of regularly suspending alimentation.

Tribes. Ever since the tribal eras of the most primitive civilizations, there was always someone who affirmed that prolonged fasting, or the deliberate abstinence from food, helps free the extraphysical body of the consciousness or, in other words, the psychosoma from the soma.

Applications. Currently, at the close of the twentieth century, fasting is used for at least the following 4 rational reasons:

1. **Physiology.** A period of rest for the animal or human physiology.
2. **Antitoxic.** An efficient, natural means for reversing the toxemia of the human organism.
3. **Restoration.** Restoration of the individual's physical and mental health.
4. **Survival.** A Russian technique of periodic fasting for prolonging animal life (veterinary) and human life (medicine).

Starving. On the other hand, statistics show that approximately 3 million underprivileged persons on the earth fast daily against their will, as they have nothing to eat. Unfortunately.

Mechanism. The mechanism of voluntary or involuntary fasting, used in this case since antiquity, is explained through the alteration of the organic metabolism's dietetic regulation or, in other words, through a lack of vitamins and a deficiency of glucose (sugar) in the circulatory system. This tends to act firstly upon the central nervous system, the most vulnerable of all the human body's tissues.

Optimization. This creates psychological states which are favorable – optimization – to a reduction in the efficiency of the cerebral hemispheres, and separation of the consciousness and the mind, or the consequent freeing of the consciousness in the psychosoma.

Symptoms. Nevertheless, it is appropriate to point out that the regular practice of any type of mortification of the human body should be well-oriented under efficient, specialized, technical supervision in order to avoid innumerable undesirable mental symptoms.

Exclusions. At least the following 9 categories of intraphysical consciousnesses are excluded from this projective technique and, obviously, from the majority of lucid projection methods:

1. **Children.** Children, in general.
2. **Adolescents.** Adolescents, in general.
3. **Anemic.** The anemic individual.
4. **Weight.** Those presenting insufficient body weight (*weight deficit*).
5. **Hepatopathy.** The carrier of a hepatic affection.
6. **Convalescent.** The individual who has recently suffered an organic disturbance.
7. **Smoker.** The inveterate smoker (tobacco addict).
8. **Addict.** The individual who constantly uses light or heavy, licit or illicit drugs, narcotics or numbing agents.
9. **Alcoholic.** One who ingests alcoholic beverages in excess (alcoholic).

Recommendation. In light of the facts presented here, a brief fast is recommended in order to produce lucid projection for the person in good health who has a good appetite and for whom the abstinence from food will already be beneficial at any rate, serving as an efficient form of detoxification, rest and cellular rejuvenation of the organs. This person should remain alert in order to not harm him/herself with improper diet, malnutrition or illness due to deprivation.

Insensitivity. The projective fast is also a good technical indicator for those who display a cold, extremely analytical temperament, are fully self-centered from a material or physical perspective, and have no evident or manifest parapsychic-animic-energetic sensitivity up until this time.

Break. Fasting, in this case, breaks down the thick psychological “crust” of the materiality of the *resomant extraphysical consciousness*, opening weak spots in his/her excessive defenses, self-critiques, censures, conditionings, repressions and insensitivities, somehow predisposing him/her to new sensations and unpredictable discoveries.

Adaptation. Each person adapts to fasting in a different manner and to a different degree.

Duration. There are those who can safely fast for a month or more.

Alterations. Profound biological alterations occur in your human organism after only 24 hours of abstinence from food.

Loss. Most individuals who fast lose from 1.1 to 3.3 lb (½ to 1½ kg) of corporal weight in the first 24 hours.

Period. The best period of the year for you to perform an experimental fast would be on a weekend or during your summer vacation, for example.

Winter. In winter time, your organism needs more nourishment to maintain body temperature, keep the metabolism balanced and avoid infections, even the common cold. It is not advisable for you to drain your organic reserves uselessly at this stage of your technical apprenticeship in projectiology.

Physician. An intelligent course of action would be to consult your *trusted physician* first to ascertain if you are in a fit condition to submit yourself to moderate fasting for 3 days under his/her competent medical supervision.

Period. Fasting for a shorter period will offer you all the unpleasant part of the process without bringing any of the benefits.

Seclusion. During this short period of fasting, it is best to remain in seclusion, preferably staying at home, abstaining from any kind of work or, at least, heavy work that requires intense physical effort. You should not operate machinery or drive because you could faint behind the wheel.

Mentalsoma. All mental work, or that related to the *mentalsoma*, which is considered important, should be postponed.

Sensations. The practice of fasting is not as uncomfortable an experience as those who are well-fed or live constantly intoxicated by medication might imagine. The effort required to experience it is worthwhile.

Water. During the entire fast you, as someone undergoing a fast, should breathe fresh air and drink clean water at room temperature, and only when you feel thirsty or, when in doubt, at your regular mealtimes.

Specification. Partial fasting can consist of only ingesting specific foods, such as the following 3 categories:

1. Succulent fruits.
2. Citric juices.
3. Dairy products.

Occurrences. Here are the occurrences that are generated by the lucid projection through fasting technique, according to each of the 3 days of the personal experience:

1. **First day.** During the first day, easier for you to bear, you will be somewhat obsessed with food, your *stomach* will *grumble* repeatedly and you might have difficulty sleeping.

False hunger. About 12 hours into the fast, you might have the sensation of false hunger or psychological hunger.

Avoidances. Avoid mental and emotional stimuli, noises, tension, anxiety and fear.

2. **Second day.** In the second day of the fast, the most difficult one, headaches and a surprising feeling of weakness can occur, but both symptoms should disappear quickly, partly because they are of a psychological nature, due to the break in your *dietary routine*.

Hunger. Do not forget: hunger is the main component of a set of needs connected to the essential functions that maintain your human life.

3. **Third day.** The third and last day of the fast begins to produce benefits to the degree that your unconscious tires of protesting. Headaches, weakness and any other side effects will disappear inconsequentially, and your energy and thought processes will become clear. You may experience inoffensive *fleeting visions*.

Refrigerator. At this point, you will go to bed feeling hungry, so that your frustrated appetite, the intense desire to eat, will rise to the surface of your subconscious mind. This will lead your consciousness, projected in the psychosoma, to go to the refrigerator, freezer or kitchen cabinet, or to a familiar restaurant, snack bar or bakery in the vicinity of your physical base, in an attempt to break the enforced fast.

Return. The return to a normal diet, on the fourth day, should be gradual so as not to damage the organism's functions.

Warning. If, soon after the fasting period, you stuff yourself with food for another 3 days, eating excessively, you will intoxicate your body again – both the human body and the psychosoma – and you will leave these bodies in a worse condition than they were before the fast.

Coadjutants. If you prefer, you can enhance the projective fasting technique with the application of at least 4 useful coadjutant resources:

1. **Respiration.** Rhythmic respiration exercises.
2. **Visualization.** Visualization exercises.
3. **Immobility.** The waking physical immobility technique.
4. **Alimentation.** Alimentation reduced to only pro-projection foods.

Food. The foods referred to below should be considered as simple superstitions, or autosuggestive resources, because their action in favor of or against the production of lucid projection has not as yet been proven in laboratories or empirically (consensus), as is the case with various proposals in this book.

Hypothesis. This is a projectiological working hypothesis that requires more in-depth research: antiprojective and projective foods (somatics and umbilicochakra).

1. **Antiprojective.** At least the following 6 types of foodstuffs are considered to be *antiprojective foodstuffs*:

- A. Any foods ingested immediately before the projective experiment.
- B. Heavy meals or the ingestion of excessive amounts of food at any time on the day of the experiment.

- C. Any type of meat during the 3 days of fasting.
- D. Nuts: chestnuts, cashews, Brazil nuts, almonds, hazelnuts, coconuts and peanuts.
- E. Any type of smoking (some persons prefer smoking to food).
- F. Alcoholic beverages, as well as licit and illicit drugs in general.

2. **Projective.** At least the following 4 types of nutriments are considered *pro-projective nutriments*:

- A. Carrots.
- B. Fruits.
- C. Vegetables and greens.
- D. Raw eggs, as long as they are ingested in moderation, observing the issue of the personal level of less desirable cholesterol.

Factors. Two factors simultaneously act to free your psychosoma with the fasting technique:

1. **Soma.** Your human body, being more inactive from the lack of food, that generates the psychophysiological symptoms of fatigue besides the purifying effects of the organism.
2. **Suggestion.** The suggestion of food, your intense and constant desire to satiate the provoked hunger.

Involuntary. It is important to inform interested individuals that the author has received many reports of spontaneous, or involuntarily generated, first lucid projections experienced by persons with excess corporal weight and who, while attempting to be on a diet, endeavored to go to sleep without eating anything, thus being extremely hungry or, in other words, in a state of sensory deprivation, in this case. Later, they found themselves in the kitchen trying to turn on the light switch to brighten the room, take the milk out of the refrigerator and put it in a glass. When they were not able to do as they wished, they concluded that they were “in spirit, outside the human body”. One of these individuals even looked through the window at the moonlight before consciously entering (interiorizing into) the physical body.

Umbilicochakra. According to holochakrology, it should not be forgotten that the effectiveness of the lucid projection through fasting technique depends greatly upon the quality of the energies of the umbilicochakra of the intraphysical consciousness practitioner.

218. PROJECTIVE MANTRAS TECHNIQUE

Definition. Mantra: verbal formula used by Hindu, Buddhist, Moslem, Jewish and Christian rituals, in mantra yoga, cabalism and meditation techniques, usually being very short, one or a few words, in order to provoke a parapsychic condition, relaxation or consciencial projection.

Synonymy: cryptic verse; *jappa*; litany; magic syllable; mantric recitation; monology; monosyllabic prayer; monotone chant; mystical verse; occult sound; personal morphothosene; private thought-form; psalmody; ritual recitation; seed-sound; special phoneme; spoken affirmation; syllabic sound; words of power; yoga-mantra.

Christian. Popular prayers, such as “The Lord’s Prayer,” “Hail Mary,” and phrases like: “Jesus Christ, Son of God, have mercy on this sinner,” are genuinely Christian mantras.

Popular. The most well-known, popular mantra used everywhere is “OM,” which signifies “key of the universe;” others are: “Ram;” “God;” “Shanti;” “Jay”.

Resolutions. The affirmations are spoken resolutions that, when used correctly, align the physical, mental and consciential energies.

Trance. The ritualistic method of the mantras, through continuous monotonal chanting of the same syllables over very long periods of time, in the manner of a self-hypnotic effect, promotes the induction of the consciousness into a trance state, whereupon the psychosoma exteriorizes itself from the human body.

Mechanisms. The physiological production of spoken words simply consists of triggering certain vibrations: the external agent, the sound, provokes an impression in the listener's ear. This causes other vibrations in the auditory canal and tympanic membranes, which are connected to the *auditory nerves*. These, in turn, communicate with the cortical *auditory centers* in the brain. Upon reaching the brain, the initial *excitation* is perceived as *sensation*.

Explanation. Therefore, trances obtained by verbal expedients or mantras can be explained by the effect or power of the verbally repeated words which create a kind of psycho-chemical-physiological rhythm in the human body.

Rhythm. This rhythm, together with the breathing during speech, contributes to a reduction in oxygen volume and an increase in the amount of carbon dioxide in the pulmonary alveoli and blood stream. This alters adrenaline levels, which affects the oxygenation of the cerebral cortex, predisposing the dis coincidence of the vehicles of the consciousness.

Effects. Some people presume that mantras have a powerful effect on the soma-holochakra-psychosoma energetic complex, given that, in this case, its effect would be more energetic or psychological than physiological, in biochemical terms.

Sexochakra. In yoga, mantras are used to awaken chakras or the sexochakra (*kundalini*).

Name. You can use the formula of special phonemes to dissociate the vehicles of your consciousness (mantric projection), induced merely by the cadenced repetition, in a low tone of voice, of your own *first name*, or nickname, removing any erratic idea or concern.

Beads. Some people additionally potentiate the mantra method by fingering a long string of beads or a rosary, while repeating a verse or characteristic sound. They may also simultaneously perform breathing exercises.

Repetition. Mantras are enriched, potentiated and activated through repetition.

Efficiency. In fact, rhythmic respiration is more efficient and works better than mantras for producing lucid projection. On the other hand, the technique involving the mixture of oxygen and carbon dioxide, or direct chemical action, works even better than the rhythmic respiration technique for provoking lucid projection.

Oxygen. The 3 projective methods – mantras, rhythmic respiration and carbon dioxide – present 1 basic objective: attain an inoffensive reduction in oxygen or a nontoxic concentration of carbon dioxide in the cerebral hemispheres that permits the release of the psychosoma.

Contrathosene. In spite of everything that has been presented, it should be kept in mind that mantras also function, in their own way, through the *mental word*, which is not audibly spoken, being a contrathosene. Hence the name *occult sound*.

Laryngochakra. According to holochakrology, we should not forget that the effectiveness of the projective mantras technique depends greatly upon the quality of energies of the laryngochakra of the intraphysical consciousness practitioner.

219. PROJECTIVE MASSAGE AND VISUALIZATION TECHNIQUE

Definition. Christos experiment: technique of inducing an altered state of consciousness with the eventual occurrence of the hypnagogic state, vibrational state, lucid projection, traveling clairvoyance, retrocognition, precognition or simple daydream, fantasy and oneiric images, by submitting a person to massage and autosuggestions, with external help, but without undergoing direct hypnosis and without losing ordinary wakefulness.

Synonymy: Christos technique; Glaskin technique; retrocognitive projective technique; stimulation of the third eye; William Swygard method.

First. The first phase is to lie on the floor, on your back, barefoot and with a pillow under your head. Another pillow can be placed under the feet or back in order to better accommodate you and make you feel very comfortable.

Ankles. An assistant vigorously massages your ankles for 3 minutes in order to induce you into deep relaxation.

Eyes. Keep your eyes firmly closed the entire time from this point on.

Forehead. At the same time, the assistant who is controlling the experience makes suggestions to you, asks questions and massages the lower center part of your forehead, the glabellar area or *third eye* location or, in other words, between the frontal lobes of the brain, in a circular movement with the side of the hand curved, as if holding the fist in that position.

Relaxation. You must be entirely relaxed. If you are still somewhat tense, breathe deeply a few times and let your body loosen up.

Compression. The massage of the forehead must be vigorous and brief so that you will feel actual vibrations or *humming* inside your head.

Friction. However, the compression should not be extreme to the point of causing unexpected and undesirable skin *abrasion* due to friction in the glabellar area, especially if you are a woman with sensitive skin or you are sunburned.

Oil. An oily substance can be used to facilitate the compression and massaging of the forehead.

Second. In the second phase, you begin mental exercises, when sufficiently relaxed, to make you expand the consciousness beyond the normal limits of your human body, using these 7 procedures:

1. Keeping your eyes closed, visualize and feel yourself *growing* 2" (5 cm) out through the soles of the feet or the ankles, through extraphysical elongation.
2. Return to normal size and repeat the exercise several times until you feel you can do it easily.
3. Then, concentrate your attention on your head. Grow 2" (5 cm) until you are taller. Return to normal height and repeat the exercise several times. The instructor should encourage you to talk as much as possible, so that you will become accustomed to the idea, for later use, when you are asked to describe the experience.
4. Now *grow* about 1' (30 cm) out from your feet. Return to normal.
5. Do the same with your head.
6. Now *stretch your body* 23½" (60 cm) beyond your feet, maintaining this length while you do the same with the head. Repeat as many times as necessary in order to do it correctly.
7. Finally, while you are still *stretched* in both directions, imagine yourself expanding like a balloon, or the production of *ballonnement*, until you feel free from your human body.

Third. In the third phase, or in the state of expansion, extraphysically go to a familiar place, such as the front door of your house or apartment building, and describe it in minute detail.

Observations. Seek out different angles of observation, moving forward and then backward, to one side and then another, and finally, slightly upwards, describing the whole time what you see with the consciousness expanded through traveling clairvoyance.

Description. Now, *raise yourself up into the air* about 1,640' (500 m) and describe what you see.

Time. See what time it is, as well as the weather conditions, which do not necessarily need to be the same as when you began the experience.

Differences. As a voluntary act, change from day to night, then go back again, changing night to day, always describing the differences observed.

Control. Remember that you maintain full control over that which you are experiencing, this being the most important detail and that which deserves most attention.

Landing. Finally, under a clear blue sky, raise yourself far above the earth, as far as you can, until the scenery below you is no more than an indistinct blur, and then slowly return to earth, landing feet-first until you feel yourself on the ground.

Alterations. In this stage, if the technique has produced results in your specific case, you will perceive the alterations that took place in your environment.

Scenes. The scenes that you will see now might later even be interpreted as possible experiences of another previous human existence.

Awakening. It is not important if you are conscientially aware or not, the massage and visualization technique works anyway. The greater your consciential awareness (conscientiality), however, the greater will be your ability to see and understand the experience.

Frontochakra. According to holochakrology, we should not forget that the effectiveness of the projective massage and visualization technique depends greatly upon the quality of the energies of the frontochakra of the intraphysical consciousness practitioner.

220. PROJECTIVE MUSIC AND VISUALIZATION TECHNIQUE

Definition. Variation of the Christos experiment: technique of inducing an altered state of consciousness based on massage, music and visualizations.

Synonymy: musical stimulation; musicogenic projection; musicoprojection; variant of the Christos experiment; variation of the Glaskin technique.

Alternative. If the technique described above did not produce results, the reason might lie in the fact that you have a normal but unique personality or, in other words: your perceptions are not essentially based on vision but on general perceptions, such as the haptic type, or those acting through the synesthetic fusion of the following 4 senses:

1. Touch (haptics).
2. Audition (acoustics).
3. Olfaction (olfactology).
4. Taste.

Procedure. In this case, adopt an alternative procedure in 5 steps:

1. **Relaxation.** Follow the relaxation technique, the massages and the visualized expansion exercises exactly as recommended in the previous chapter.

2. **Music.** When you have completed the final “expand like a balloon” (*ballonnement*) stage, remain relaxed and keep your eyes closed while listening to a varied selection of musical themes. Listen only to instrumental music, avoiding those pieces with lyrics, and include instrumental folk music from as many countries as possible.

3. **Images.** Describe to your instructor the emotions, sentiments and images that each of the musical pieces evokes in you. The important detail lies in the images (visualizations). When these begin to arise, describe them in as much detail as possible.

4. **Control.** When you perceive the images very clearly, generally accompanied by rapid synchronic involuntary eye movements, your instructor will turn off the musical recording. If this act interferes with the images you see, the music can be played again. It is important to remind you that you fully control everything in your surroundings.

5. **Imprint.** When the images are firmly etched in your mind, continue as in the previous technique. To imprint the experience, it is preferable to gradually remove the background music.

Audition. Music has served as a generating factor for innumerable parapsychic experiences, when it is being played or simply listened to. Although not recommended for the experienced consciential projector, there are those who use it as a simple initial process for projecting, as well as for blocking out or masking noises in a noisy physical base.

Cooperation. For certain people, music, and in some cases even repetitive music, presents emotional implications that end up aiding in the success of the lucid consciential projection.

Organ. Everyone is familiar with the suggestive force of organ music and the human voice (the most evolved musical instrument) in a chorus, widely used in temple atmospheres.

Harmonies. In a simple form of this technique, you can, if you are a music aficionado, play a favorite recording on CD or tape – generally a gentle, uplifting or romantic melody without lyrics – and become involved in the harmonies, thinking about leaving the human body and, after a short while, your lucid consciential projection will occur.

Turn off. In this case, as a rule, you will use only one melody, or a set of half-hour long recorded melodies. The recording will thus silently and automatically turn itself off immediately upon the distancing of your consciousness which, in this way, will not be disturbed during the period of the development of extraphysical actions.

Bibliography: Brennan (200, p. 81), Frost (560, p. 53), Glaskin (599, p. 220), Greenhouse (636, p. 180), Knight (853, p. 57), Shay (1546, p. 39).

221. TRIGGERING OBJECT-FACTOR TECHNIQUE

Motivation. Certain motivating physical objects that temporarily carry an intense emotional charge for the intraphysical consciousness can be employed as agents for triggering lucid projection within one’s own physical base.

Items. The motivating object-factors can be recently acquired simple objects of personal use, rare collectible items for the collector, something that has been stored for years and one wishes to see and remember or a present that has been received.

Eagerness. The most important thing, in this case, is for the experimenter to do everything possible to intensify the eagerness to hold, see, discover and examine, firsthand, the object that is stored at a distance, in another room of the physical base.

Tension. The object needs to be at a distance from the human body of the practitioner, yet within the physical base, in order to increase the tension of knowing it is so near and yet so far, so *accessible* and simultaneously *inaccessible*, thus deepening the desire to have it within one’s grasp.

Elements. The following are the 4 elements that come together to make the intraphysical consciousness project itself, at night, to the object:

1. Curiosity.
2. Eagerness.
3. Satisfaction.
4. Surprise.

Types. The following are 6 practical types of objects that trigger a lucid projection:

1. **Letter.** An anxiously awaited, but innocuous, letter of no serious consequence and which, upon arrival, must not be opened but placed on a piece of furniture a certain distance from the bedroom (energetically shielded chamber) of the conscial projection practitioner.

2. **Book.** A book that you have wanted to read for some time, but of which you have not even seen the cover.

3. **CD.** A CD or *compact disc* that you want to hear, but you leave the wrapping on.

4. **Present.** An unidentified present received from a dear friend, but that can remain wrapped until the following morning.

5. **Video.** A movie on videotape that you received recently and have been wanting to see for a long time.

6. **Collection.** A collector's item sent from abroad: an objet d'art, a shell, a quantity of postage stamps, antique coins, antiques and other similar objects (holotheca).

Birthday. This projective method can be applied with greater ease on the night of the (especially a young) practitioner's birthday, as long as the individual receives presents that have remained wrapped for some time, when possible.

Stimulus. Spinning objects, such as rotating stars and colored disks placed in the projector's visual field, can be employed to stimulate the separation of or reduce the cohesion between the psychosoma and human body. This procedure is used to a great extent in the parapsychic practices of the East.

Process. The colored disk, for example, is placed at a point between and a short distance away from the eyebrows, and the practitioner looks at it fixedly without blinking, allowing the effects of the movement, the lights and the colors to act upon your mind, altering your state of consciousness.

Bibliography: Steiger (1601, p. 117).

222. MUSICAL PHYSICAL AWAKENING TECHNIQUE

Definition. Musical physical awakening: the act of waking up the intraphysical sleeper at a predetermined time, precisely when his/her consciousness is projected outside the human body, in order to call it back with the complete recollection of the extraphysical experiences.

Synonymy: programmed physical awakening.

Periods. Each night, normal or natural sleep clearly presents 2 distinct periods already scientifically identified. They form a standard pattern that is repeated in an alternating manner during the entire night:

1. **Deep.** Deep sleep, devoid of dreams, that occurs soon after the hypnagogic state and is repeated every 90 minutes.

2. **REM.** Sleep with symbolic dreams, wherein rapid synchronous eye movements (REM) arise.

Middle. Those who awaken in the middle of a REM (rapid synchronous eye movement) period, remember vivid imaginative creations and can give detailed reports of many oneiric situations or those of ordinary symbolic dreams.

End. Upon waking up, however, at the end of the sleep period without eye movements, the sleeper may report having experiences of the consciousness projected outside the human body.

Foundations. These 2 principles regarding the moment of awakening establish the foundations of the musical physical awakening technique: to physically awaken the consciousness while engaged in the first projection, generally not remembered, of the night, after the common phenomenon of jerks (myoclonus) occurs. They serve, physiologically speaking, as a sign of an imminent projection, at the end of the period of dreamless sleep.

Time. Before going to bed, set an alarm clock to wake you up 90 minutes after the time you will probably fall asleep that night. This is the time at which your consciousness is most likely to be spontaneously projected, in the middle of an experience outside the human body, which commonly occurs every night.

Music. The alarm clock should preferably be of the musical kind that awakens the sleeper with soft music. Using this equipment will serve to avoid greater extraphysical traumas and will minimize the undesirable effects of an abrupt physical awakening.

Processes. The following are 4 processes for awakening the consciousness at a precise moment:

1. **Shakes.** Ask someone to shake your inactive physical body.
2. **Bell.** Entrust your *intrapysical* assistant to set off a bell next to your human body at a certain time.
3. **Radio alarm clock.** Set a radio alarm clock before going to bed.
4. **Alarm clock.** Set an ordinary alarm clock for a specific time.

Results. These methods also work, but do not produce results that are as positive as those obtained with the use of a *musical alarm clock* that awakens one with soft music. This reduces the negative consequences that violent awakening has on the recollection of the extraphysical events of an abruptly interrupted projection.

Principle. As can be seen, this method is rationally based on the principle – already tested in thousands of laboratory tests – that every intraphysical consciousness projects spontaneously every night during certain phases of natural sleep, although the extraphysical experiences are not recalled in the ordinary, physical waking state.

Average. The period of 90 minutes after the beginning of natural sleep was initially chosen as it represents an average, or the most common fact, according to the physiological sleep chronology of the sleep of sleepers in general. This permits the achievement of positive results for half of all practitioners.

Ideal. Despite what has been said so far, the best time for musical awakening in your personal case is always that which you research, identify and prefer, namely the exact, very individual time when your consciousness is projected. This is the time that works best for you exclusively and can be, for example, 120, 180 or 210 minutes after the beginning of your natural sleep every night.

Surprise. This means surprising the consciousness in the second or third period of dreamless sleep, or during the second or third non-remembered lucid projection of the night.

Statistics. These are not random times, as they adhere to statistics obtained from research performed in *sleep laboratories*, currently a common practice in diverse cultural centers.

Effects. Gently breaking the silence with soft music provokes the physical awakening of your consciousness, brought back by surprise precisely when it is extraphysically experiencing one of its non-recalled spontaneous projections.

Benefit. This type of awakening, although interrupting your extraphysical experience, has the greater benefit of making your consciousness compulsorily return to the human body, which is inactive

in the physical base, with a complete and exact recollection of the extraphysical experiences of that moment.

Proof. This procedure will prove 2 facts to you:

1. **Physiology.** You project every night, although spontaneously, in a physiological manner.
2. **Retrocognitions.** This process offers you the possibility of having complete recollection of experiences, the nature and category of which you might never have otherwise remembered or experienced lucidly in your entire human existence.

Suggestions. Both facts referred to here outline the conditions for you to motivate yourself to induce lucid projection through the resolute force of your will, as well as the initial means available to you for remembering extraphysical experiences.

Recall. This technique does not constitute a method for you to produce lucid projection, *per se*. It is, however, a specific, secure, scientific process for proving to yourself that you can and should remember the experiences that you have throughout your life and which you do not ordinarily remember.

Self-awareness. This method, therefore, signifies not only the ordinary physical awakening of your consciousness, but the greater awakening of your self-awareness in regard to the phenomena of human lucid projection.

Bibliography: Frost (560, p. 44).

223. ASSISTED PROJECTION TECHNIQUE

Definition. Assisted lucid projection: the essentially animic-parapsychic projection technique in which you, as a lucid projector, are directly assisted or commanded during the experiment by a helper who is almost always a projection expert, being a special modality of projection for all sensitives with a certain degree of development.

Synonymy: commanded projection; directed consciential projection; hitchhike-projection; easy projection.

Indication. Assisted human consciential projection is a specially suited phenomenic modality which generally only occurs to the active, well-intentioned sensitive who has a reasonable level of unorthodox parapsychic development, and is a universalistic (open minded) consciousness capable of facing all types of consciousnesses or extraphysical consciousnesses without becoming traumatized, in any extraphysical plane or dimension (see fig. 223, p. 1,133).

Proof. Assisted projection proves that parapsychic components (together with other extraphysical or intraphysical consciousnesses) generally interact in the animic processes (developed only by the consciousness of the practitioner) of the lucid projections of the intraphysical consciousness in the psychosoma.

Occurrences. In assisted lucid projection, certain occurrences, arising from the exercising of parapsychism, are common in the preparatory stage of the experiment, such as the following 9:

1. **Notice.** A notice regarding the upcoming lucid projection.
2. **Energies.** Consciential energy exteriorization exercises.
3. **Monologue.** The psychophonic monologue.
4. **Showers.** Energetic showers upon the projector.
5. **Hetero-transmissions.** Prolonged extraphysical transmissions (along the practitioner's entire soma).
6. **Self-transmissions.** Self-transmissions of energy.
7. **Frontochakra.** Transcendent sensations stemming from the movement of the frontochakra.
8. **Xenothosenes.** Mental suggestions (healthy xenothosenes).
9. **Torpor.** Torpor of hypnotic origin.

Passivity. You should be confidently predisposed toward lucid projection with the psychological and physical passivity with which you submit to the common parapsychic process, as in the case of psychophony. This is why the assisted process does not constitute a purely animic phenomenon, namely one that is produced only with your decided will.

Evocation. You can employ sincerely-felt, rationalized, mental, spontaneous evocation as a basic resource for achieving the objective of your consciousness leaving the human body. This predisposes your deep affinity, empathy or rapport with your closest helper, if you are accustomed to this *psychophysiological crutch* modality.

Awakening. The most common phenomenon to occur in assisted lucid projection is for your consciousness to suffer a brief hiatus in lucidity and later extraphysically awaken somewhere in the paratropospheric or crustal (tropospheric) dimension.

Clairaudience. Your *auditory parapsychism*, if it exists, can be utilized by the helper to suggest or candidly order certain actions during the development of the exteriorization of your consciousness, in the stages of muscular relaxation, mental concentration, absolute serenity, rolling takeoff, re-exteriorizations and re-interiorizations.

Alternate. Often, clairaudience may alternate with transmental or telepathic dialogue in the psychosphere of the projector-sensitive.

Assistance. In assisted consciential projection, the extraphysical assistance of the helper frequently continues for the entire period of exteriorization of your consciousness from the human body, even when at a distance from the physical base or in extraphysical districts and communities, per se.

Intangibility. However, the presence of the helper is almost always sensed in an unquestionable manner, although it is not visible or tangible to you.

Advantages. The assisted-parapsychic-animic projection presents unquestionable advantages over other techniques used for your consciousness to project in the psychosoma, bearing in mind the following 6 variables:

1. **Takeoff.** It permits your lucid takeoff in many cases.
2. **Parapsychism.** It dynamizes the development of all types of parapsychic phenomena.
3. **Self-confidence.** It deepens your confidence and your openness toward projecting consciously.
4. **Security.** It deepens your sense of security in performing projections.
5. **Sensations.** It provides more agreeable sensations during the unfolding of the projection.
6. **Preparation.** It serves as a projection that precedes other extraphysical assistential tasks in which you will participate.

Sleep. It is worth pointing out that the helper will most often approach you during your natural sleep period, while your vehicles of manifestation are in spontaneous discoincidence. The helper will provoke your extraphysical awakening through an intensification in your awareness, as you are already outside the dense body.

Recall. In these cases, the recall following the events of the projection does not always have the same high quality as that of a projection with continuous self-awareness, wherein lucidity is maintained without hiatus, or without any unconsciousness, from the beginning to the end of the experiment.

Helpers. The helpers that provide assistance in lucid projections are technical extraphysical consciousnesses who are accustomed to the phenomena of energy exteriorization, ectoplasmy and assistance to ill humans and extraphysicals.

Together. Instead of 1 helper, 2 or more helpers can operate at the same time, brought together for the tasks, helping you to produce your lucid consciential projection as a projector-sensitive.

Nurses. Sometimes it seems that one helper supports the shoulders of the psychosoma and another lifts up the feet, transporting your psychosoma from the physical bed to the extraphysical dimension, similar to 2 nurses transferring an ill person from the stretcher to the bed.

Merit. As a basic rule regarding the phenomenon, we should bear in mind that the major assisted projection – that is agreeable in all senses, clarifying, of long duration and enriching to the intraphysical consciousness – obviously does not occur without the sensitive-projector having some merit.

By-product. The assistential projection frequently constitutes an evident by-product of extraphysical assistential tasks (conscientiotherapy, penta, extraphysical clinic).

Phases. In this case, the intraphysical consciousness functions in 2 very distinct phases:

1. **Donation.** In a semilucid mode in the first phase, serving as a donor of consciential energy during extraphysical assistential tasks.

2. **Action.** Soon afterward, in a well-defined second phase, the helper energetically intensifies the projector's self-awareness and gives projective free rein to the projector.

Gratification. The extraphysical assistential service performed by the projector through the donation of the dense consciential energies of the human being, that are suitable for the consciential awakening of energivorous extraphysical consciousnesses or parapsychotic *post-desomatics*, can offer you a profound sense of inner gratification.

Recess. A lack of inner balance, an absence of confidence in the helpers, your surrender to fear, frank consciential immaturity, hesitations in your physical and extraphysical decisions relative to the projective work, can all produce a hiatus in the extraphysical assistential services of the lucid projector (“those who stay out of the way help greatly”) and unfortunate subsequent periods of recess from your consciential projections.

Merit. This proves, often ostensibly, that *assisted* consciential projections exist and clearly are always developed with a clear dependence upon meritorious services of extraphysical *assistential* projections.

Joint. The most common joint projections of intraphysical consciousnesses are those sponsored by the helpers. This greatly facilitates extraphysical encounters that are usually difficult for the projected consciousness to achieve in terms of correctly pinpointing the predetermined mental targets, times, communities, and extraphysical districts that are to be reached.

Bibliography: Andrade (27, p. 136), Crookall (331, p. 36), Davis (371, p. 61), Espérance (485, p. 263), Hives (728, p. 7), Müller (1107, p. 252), Pereira (1230, p. 119), Sculthorp (1531, p. 22), Steiger (1601, p. 12), Swedenborg (1639, p. 1), Turvey (1707, p. 93), Twigg (1711, p. 56), Vieira (1769, p. 5).

224. LUCID PROJECTION THROUGH DREAM TECHNIQUE

Definition. Dream control: the lucid consciential projection produced from an ordinary natural dream wherein your consciousness somehow becomes lucid, thus provoking transition from a passive to an active condition, undoing the oneiric images and actually controlling or directing, as much as possible, what are actually extraphysical events and experiences.

Synonymy: controlled extraphysical awareness; conversion of the dreamer into a projector; dream conversion; dream prolongation; oneirogenic projection; oneiroprojection; pre-programmed dream; pre-projection dream; projectiogenic dream; projectiogenous dream; pro-projection dream.

Suitability. This method is only suitable for the individual presenting – in his/her profile as a pre-serenissimus intraphysical consciousness – some or all of these 5 distinct personality characteristics or traits:

1. **Value.** The individual who gives value and significance to ordinary dreams.
2. **Memory.** The individual who remembers many dreams, without forgetting any details.

3. **Messages.** The individual who accepts that dreams bring messages with some positive quality through their reflection of his/her subconscious material.

4. **Fissures.** The individual who admits that dreams highlight obscure aspects of or fissures in his/her personality.

5. **Learning.** The individual who recognizes that through dreams he/she can learn something that is useful for his/her personal and group evolution.

Gravitation. The psychological conditioning stemming from the action of gravity on the intraphysical consciousness alerts the dreamer to the incongruence and unreality of dreams, and the fact that he/she is dreaming. From this are born the majority of lucid dreams or semilucid consciential projections.

Flying. Dreamers of lucid dreams, or semilucid consciential projectors, have a greater number of dreams of flying than the average dreamer.

Will. Based on the phenomena presented here, you should always endeavor to recognize incongruence in and the unreality of your dreams, clarify your consciousness and undo the simple oneiric scenarios through the force of your awakened will (consciential energy).

Frequency. Many people have no idea how often dreams are, in fact, semilucid consciential projections.

Prolongation. You will be capable of lucidly projecting through the simple resource of extending or prolonging the sequences of your natural dream and programming them.

Predisposition. The technique will evidently be easier if you have already dreamt and sensed, as the dream unfolded, that you were dreaming, because in this way you find yourself predisposed to acquiring active extraphysical awareness with greater ease.

Saturation. The most usual process recommends that, while in the ordinary, physical waking state, you saturate your mind with the will to extraphysically awaken from a natural dream of any kind.

Types. The dreams that typically facilitate lucid projection the most are those involving extraphysical flights, or volitation, whether they are spontaneous or previously planned by your decided will.

Activities. You should endeavor to maintain lucidity of the consciousness as much as possible while in the hypnagogic state and build your own dream, selecting some intense motor activity, sport or favorite pastime that gives you a most agreeable sensation and that approximates or imitates the maneuvers of levitation or free flight outside the human body.

Sensation. From the very beginning, you should avoid selecting an oneiric activity with a habitual sensation that is disagreeable because, in this way, instead of a lucid projection, it will provoke extraphysical trauma, with your subsequent abrupt interiorization, physical repercussion or, at least, a nightmare, but it is unlikely that you will achieve a pro-projective dream.

Nightmares. Nevertheless, in spite of all the preceding arguments, many persons, although infrequently, project from nightmares induced by their ironclad will.

Examples. You should observe each 1 of the following examples of preferred motor activities and get a sense of the 3 categories of actions that are thoroughly programmed for pro-projection dreams: ascending actions, lateral actions and descending actions.

1. **Ascending.** Actions that take you in a directly ascensional direction make dreams easier to induce and best predispose your lucid projection, because they follow the trajectory that the psychosoma most often takes in a classic takeoff, leaving the human body in an upward departure. The following are 3 examples:

A. **Elevator.** Ascend in a rapid elevator.

B. **Ferris wheel.** Be carried upward in a Ferris wheel.

C. **Airplane.** Ascend in a rocket, spaceship, airplane, helicopter, glider, hang glider or balloon.

2. **Lateral.** Actions that impel you forward produce a lateral takeoff of the psychosoma, either to the right or the left of the human body. The following 5 are examples:

D. **Swimming.** Swim energetically in a sports competition.

- E. **Speedboat.** Ride in a speedboat.
- F. **Run.** Participate in a marathon.
- G. **Water-ski.** Water-ski at high speeds.
- H. **Surf.** Surf high waves.

3. **Descending.** Actions that impel one downward with the sensation of free-fall are more difficult, as they are contrary to the *natural*, spontaneous movements of the psychosoma, although they are also capable of being executed. The following are 5 examples:

- I. **Diving board.** Dive from an elevated diving board into a full swimming pool.
- J. **Descent.** Descend in a rapid elevator.
- K. **Loop-the-loop.** Descend riding a roller coaster or doing loop-the-loops in an amusement park ride.
- L. **Dive.** Dive into the sea from an overhanging cliff.
- M. **Parachute.** Go parachuting.

Repetition. You need to choose only one type of dream. It should be personal and as adequate as possible to your temperament and daily life existence. Construct it vividly in your imagination, thinking about it every night, repeating it insistently until you saturate your mind, and suggestively impress your subconscious with the will to experience the agreeable sensations and the desire to remember the dream, in detail, after physically awakening.

Easy. If the dream you chose is one of the easy ones, such as taking off in an airplane, you will convert the dream into a projection when you feel yourself heading toward the clouds, visualizing the projection and taking control of the extraphysical events that are almost always occurring near the human body.

Difficult. If you chose one of the more difficult dreams, such as diving from a diving board into a swimming pool, you will enter into the projection upon seeing yourself heading for the water. This is because you will remember the subject, your wish, the idea you have nurtured for a long time. The fall will disappear as your consciousness emerges in the extraphysical environment, within the physical base or next to your body that is inactive and emptied of the consciousness (domestic holothosene).

Flotation. The first really extraphysical sensation that arises is floating, or the act of gliding in space. This can begin with or without the psychosoma oscillating from one side to the other. It will then begin to slide.

Precautions. Before, during the dream and in the conversion to a projection, and even during the subsequent extraphysical condition, you should not think about the existence of the physical base, the human body, the silver cord, or any other factor or idea that might intervene in the natural development of your lucid projection.

Induction. The following is a technique for the induction of an ordinary dream that permits you, as a swimmer, to lucidly project in 6 steps:

1. **Isolation.** At night, near dawn, isolate yourself in a closed bedroom, where you will not be disturbed while conducting the exercise. The room or bedroom should be well-ventilated. Remain in the nude, or use only a pair of light, loose swimming trunks.
2. **Position.** Lie on the bed, in a comfortable position and close your eyes.
3. **Surf.** Imagine that you are going to surf high waves on a beautiful, sunny afternoon.
4. **Images.** Sleep with your mind filled with images of the sea, waves and wind passing before you. Observe the movements of your body and watch the seagulls (birds) and Portuguese men-of-war.
5. **Recall.** Upon awakening, remain in bed without moving and try to remember the entirety of your early morning dream. If you are unable to remember anything, change your position, as this might help your recall.
6. **Register.** As soon as the memories of the dream come to mind, endeavor to register them by writing them down, typing them onto a laptop, or dictating them into a tape recorder. The best occasion for registering any experience, notably the parapsychic ones (including the waking physical

immobility experiment) is the place where the event or experience took place. This reduces selective tendencies, distortion through *re-evocation* and interference from ambient noise and *static*.

Note. It is a well-known fact that anyone can influence the content of his/her dreams by focalizing the mind on a specific subject shortly before going to sleep. This common fact serves to alert you – as a practitioner of lucid projection – to avoid confusing a dream about lucid projection with the experience of an actual lucid projection induced by a dream. They are 2 altered states of consciousness which are quite distinct from each other.

Suggestion. In general, one can suggest a dream before going to sleep, nevertheless one is unable to influence the development of the oneiric images after they have begun.

Ideoplasty. In the transition period between the 2 altered states of consciousness – from dream to lucid projection – the unconscious ideoplastic modeling of consistent morphothosenes or thought-forms can occur before the projected intraphysical consciousness has achieved full extraphysical lucidity.

Case study. On one occasion the author dreamt that he would receive a news magazine and extraphysically awakened on top of a hill in Rio de Janeiro, already dressed in normal attire and with the morphothosene (thought-form) of the magazine in the parahands of the psychosoma. At this point, he hurled the para-magazine over the top of the hill and took off, lucidly and freely volitating through the skies of Rio de Janeiro.

Phenomena. We should not forget that the simple and elementary phenomena of ideoplasty are involved in the appearance of diverse phenomena. The following are 2 examples:

1. **Stigmatization.** In stigmatization or trophic cutaneous modifications that are provoked through suggestion.

2. **Mimetism.** In an entirely unconscious manner in the phenomena of mimetism that are still so mysterious to us and occur frequently in subhuman animals.

225. FRAGMENTED LUCID PROJECTION TECHNIQUE

Definition. Fragmented lucid projection: the projection produced through gradual exteriorization, part by part, of each one of the specific areas of your humanoid form of the psychosoma.

Synonymy: fractionated projection; gradual projection; gradual unfolding; half-unfolding; incipient projection; partial discoincidence; *partial projection*; partial unfolding; peripheric projection; segmented projection; semi-detachment; semiprojection; semi-unfolding.

Types. The semiprojection of a counterpart of your human body can be of an arm, leg, arms and legs at the same time, the trunk and head and, more rarely, the head (parahead) only. Shortly after a complete projection, the phenomena of extraphysical elongation, or sudden interiorization, even with physical repercussion, can also occur.

Third. Partial projection gives the intraphysical consciousness a sensation of possessing a third hand (parahand); a third arm (para-arm); a third leg (paraleg) (see fig. 225, p. 1,134); or 4 arms.

Lucidity. Semi-projection can be lucid or, in other words, provoked through a determined act of will. It can also be nonlucid, when occurring spontaneously.

Perception. It is almost always the veteran projector who can clearly identify or perceive a spontaneous nonlucid projection, obviously after it has been produced.

Minicord. The main motor agent of the semiprojection is the silver cord. This suggests that this appendix of the human body can also exit from diverse areas or segments, there being a mini-silver cord for an arm or a leg.

Technique. After you go through the projective preliminaries, especially physical and mental self-relaxation, close your eyes and concentrate your attention on a segment or part of your human body, your left leg, for example.

Left. While you are thinking about your left leg, *wish* decisively that it leave slightly in an upward direction from its condition of coincidence with your bodies or vehicles of manifestation.

Legs. Concentrate on your left extraphysical leg until you feel that it has dislocated upward. Next, concentrate on your right extraphysical leg, wishing to move it out of coincidence with the vehicles as well.

Body. Little by little, exercise the whole body in this way, *wishing*, in a determined manner, that the extraphysical segments slightly leave the state of coincidence with their physical forms or locations, under your imperious willful command.

Persistence. Do not try to rush the process. Use patience and persistence. This may require various attempts before you obtain discoincidence of even the first segment.

Success. If you are successful with *fractionated* projection, you are prepared to project your consciousness in the *entire* psychosoma in the extraphysical dimension.

Head. The semiprojection of only the head of the psychosoma presents characteristic signals, especially of a mental nature, which permits one to clearly distinguish it from projection of the consciousness in the isolated mentalsoma.

Last. For a great number of projectors, the extraphysical head of the psychosoma (parahead) is the last part to leave the coincidence of the consensual bodies or vehicles.

Sensitives. Developed sensitives show the greatest predisposition toward semiprojections, possibly due to looseness of the holochakra and the natural predisposition toward the precursory signals of projectability, including physical torpidity, alienation, disappearance, *ballonnement*, and dizziness.

Intoxication. Sometimes, semi-detachment occurs spontaneously due to the natural energetic obstruction, or *pranic blockage* of an organic area, e.g.: in the abdomen, when the umbilicochakra and splenochakra are blocked due to the effects of intoxication caused by intestinal constipation (excess of waste matter).

Seated. The partial lucid projection, semiprojection, or hemiprojection (half of the physical body) of only the para-arms, the trunk from the waist up, and the parahead of the human body constitutes a seated consensual projection. This extraphysical position often imposes the immediate return of the projected consciousness to the condition of complete recoincedence of the vehicles of manifestation.

Psychopathology. Besides partial projection – which constitutes a natural and frequent parapsychophysiological phenomenon in the experiences of veteran lucid consensual projectors – hallucinations also occur, as in the case of phantom, extra or supernumerary arms, as it is referred to in psychopathology. This especially happens with epileptic or migraine patients, which is a very different condition.

Syncope. We should not omit a reference to the pathological or unhealthy context in which partial projections occur or, in other words, in the initial manifestations of syncope, weakness, fainting or loss of consciousness.

Torpidity. In fact, at the onset, in cases of arterial hypotension, the person is sometimes surprised by fragmented projections of his/her physical terminations – hands and arms, feet and legs – with the physical torpidity of these corporal segments, before experiencing dizziness or fainting, through a temporary loss of consciousness.

Discrimination. As a rule, it becomes difficult for the consciousness – in circumstances that are generally very stressful and generative of syncope – to remain lucid and clearly discriminate, in

a detailed manner, step-by-step, the organic or physical-psychic occurrences in a self-analysis of the symptoms and signs in which the syncope develops prior to the person losing consciousness.

Thwarted. In thwarted fainting, however, the intraphysical consciousness who underwent the initial stages of fainting without losing consciousness or, in other words, without achieving the complete condition of fainting, is able to compare the pathological experience with a fragmented lucid projection, sponsored by his/her will, which is a healthy condition.

Hypotension. A less common example of thwarted syncope is the person with arterial hypertension (blood pressure: 140 by 100 mm Hg) who, upon inadvertently taking an excessive amount of a diuretic is, hours later, weakened and overcome by a drop in arterial pressure (blood pressure: 90 by 60 mm Hg), but does not get to the point of fainting.

Self-analysis. This condition often permits a person to better perform self-analysis because excessive psychic or emotional factors do not occur so intensely, whereas triggering physical-chemical factors predominate more in this case.

Clarity. In these cases of frustrated syncope, the fragmented projection of the arms is generally clearer and more dramatic than when sponsored only through the deliberate impulsion of the will, in an entirely healthy context.

Note. *Semiprojection*, which represents a partial exteriorization of the psychosoma, should not be confused with *semilucid projection*, which is based on a discontinuity in the lucidity of the projected consciousness; nor should it be confused with the condition of waking dis coincidence.

226. PROJECTION IN THE ISOLATED MENTALSOMA TECHNIQUE

Definition. Projection in the mentalsoma: the state of maximal expansion of your consciousness at a supra-rational and supra-sensory level of concentration.

Synonymy: asomatic experience (without a body); cosmic consciousness (Richard Maurice Bucke: 1837-1902); cosmoprojection; ecstasy (mystics); exaltation (mediumship); *kairos* (existentialism); *khou* (Ancient Egypt); mental projection (projectiology); nirvana (Buddhism); profound projectability; samadhi (Yoga); *satori* (Zen); *slema* (Cabalism); superprojection; ultraconsciousness; *unio mystica* (Catholicism).

Phase. As a lucid projector, you should only endeavor to produce a projection voluntarily in the mentalsoma after you have achieved some control with voluntary projection techniques – even if the results are not continuous over chronological time – in the psychosoma alone, and in the psychosoma laden with the energies of the holochakra (denser) within the physical base in the paratropospheric extraphysical dimension, as well as in extraphysical districts not having any direct relation to physical life.

Self-knowledge. At this point, you should be aware that you will now endeavor to reach an advanced stage of your inner illumination, integral self-knowledge and the condition of cosmic consciousness or cosmoconsciousness.

Target-idea. You need to reflect upon the extremely important fact that, according to the theorice of the mentalsoma, the target-idea predominates and works better in consciential projections in the isolated mentalsoma, in the mentalsomatic dimension, which is common to the entire universe.

Target-person. The target-person or even the target-place tends to attract his/her consciousness together with the psychosoma, which is projected from the human body.

Difficulty. When projected in the mentalsoma, either spontaneously or voluntarily, you might be surprised to find yourself together with a target-person or in a target-place, but it will be much more difficult to deliberately produce a mental projection using these targets.

Processes. While in the ordinary, physical waking state, you should reflect on the details and fundamental steps of the processes your consciousness goes through to achieve a projection in the mentalsoma: the mentalsoma detaches itself from the parabrains of the psychosoma which is almost always partially or totally disincarnate from the human body and holochakra, being very close to the human body or at a certain distance from it.

Position. Use the physical position that is most comfortable for you, the same one you use most often to project in the psychosoma, preferably the dorsal position, performing progressive muscular relaxation until the entire human body is torpid.

Forget. Forget, at this time, 3 categories or facets of *personal world*:

1. **Forms.** The world of forms: length, width and height (lines, curves, spheres, the *light cone*, geometry).
2. **Space.** The world of spaces: the physical, the paratropospheric extraphysical and the extraphysical, per se, which is more ample (proxemics, *domicentrism*, physics).
3. **Time.** The world of chronological time: the past, the present and the future (minutes, hours, days, chronology, chronobiology).

Restriction. These elements are negative, in this case, because they further restrict your mind, human brain, biomemory and, consequently, your intraphysical consciousness, which is doubly constrained in the conditioned situation between two realities:

1. **Funnel.** The *funneling (the funnel of restriction)* of existence.
2. **Bellows.** The *human bellows* of intraphysical life, the soma (lungs, uninterrupted respiration).

Zero. Keep your consciousness as open as possible, predisposed to the reception of new ideas or creative, original, new facts (neophilia). Remove all preconceptions and the reflexes of human conditioning, as though you had begun to reflect now, for the first time, about everything regarding life and the universe, starting from *zero*. Suppose yourself, without pre-judgment, to be in an absolute vacuum or in a possible *nothingness*.

Recourse. As a last recourse, you may concentrate your undivided attention on an elevated or universalistic concept or, in other words, a constructive idea, an enigmatic question suitable for being developed into new angles and parameters that go beyond the boundaries of your consciential maturity and knowledge in the ordinary, physical waking state. It must, however, be similar to your most sophisticated *fourth world*: the individual mental world (consciential micro-universe, personal holothosene).

Examples. The following are 5 ideas suitable for you to induce your consciousness to project in the isolated mentalsoma, according to your personal cultural background:

1. **Mathematics.** If you are a mathematician, you should think about the precise notion of the *infinite*.
2. **Physics.** If you are a physicist, think about the deepest inner structure of the *black hole*.
3. **Medicine.** If you are a physician, think about the nature of *therapeutic psychophysical energy*.
4. **Parapsychism.** If you are a sensitive, think about your own *parapsychic manifestation* in the mentalsoma.
5. **Spiritism.** If you are a spiritist, think about understanding the manifestation of an evolutionarily pure spirit (an FC or *free consciousness*).

Overlook. Most often, your consciousness perceives neither the exteriorization nor the interiorization of your mentalsoma *from* and *in* the parabrains of the psychosoma.

Awareness. Your awareness of being in the mentalsoma almost always arises when you are already in the mentalsomatic dimension. This is due to your indirect observations, or by a process of elimination, in light of the exceptional magnitude of self-lucidity, the apparent absence of a vehicle of manifestation of your consciousness – like a simple point of awareness, an incorporeal point in space or a ball of vitalized energy – as well as your ego's unmistakable inner state of unequalled and unprecedented equilibrium.

Differential. If you are a novice projector, you should remember these differential clarifying characteristics in order to obtain correct analysis of the experiments: whenever you are projected and feel or see yourself as having a partbody, parahands, extremities and strong emotions, you are, without a doubt, manifesting in the psychosoma (the body of desires) and not in the mentalsoma, regardless of how grandiose the sensation of exaltation, euphoria, freedom, lightness or size of your consciousness.

Reflection. As a lucid projector, it becomes useful for you to reflect upon the experiences that you have produced, on the same day as the occurrence – especially if they were mental projections – because this opportune reflection upon a *fresh*, recent experience can provoke much deeper conclusions regarding the apprehension and comprehension of intracosciential phenomena and extraphysical events. This brings elucidation about obscure points and original ideas in other fields of knowledge, enriching your *cultural background*, the recuperation of cons and frank access to your holomemory.

Will. Obviously, anyone can project in the mentalsoma. This only depends upon the impulsion of one's decided will and effective motivation. It can even allow the consciousness to break through the *contact quarantine* with other intelligent civilizations existent in the universe (lucid exoprojections).

Difficulties. Nevertheless, when your consciousness is projected directly in the mentalsoma, certain manifestations become difficult or, better still, impracticable. The following are examples of 11 interdicted, extemporaneous or temporarily inaccessible thosenic manifestations:

1. Coarse emotionalism (serenity can occur, serenology).
2. Extraphysical self-anamnesis (para-semiology).
3. Humanoid speech (*conscientese* can occur, communicology).
4. Invisible intercosciential unions (*congressus subtilis*).
5. Phenomenon of apparition of the intraphysical projector (*inter vivos* apparition).
6. Phenomenon of visible bilocation of the consciousness (paraphenomenology).
7. Physical self-bilocation.
8. Production of direct physical effects (macro-PK, ectoplasmy).
9. Self-telekinesis.
10. Self-transfiguration.
11. Viewing of the silver cord (holochakrology).

Bibliography: Bucke (218, p. 60), Castaneda (258, p. 177), Fodor (528, p. 65), Greene (635, p. 41), Greenhouse (636, p. 25), Lilly (927, p. 71), Marinho (997, p. 83), Miranda (1048, p. 285), Muldoon (1105, p. 225), Powell (1279, p. 89), Rogo (1446, p. 320), Sculthorp (1531, p. 144), Shepard (1548, p. 596), Toben (1688, p. 73), Vieira (1771, p. 13), Walker (1781, p. 27).

227. PINEAL PROJECTION TECHNIQUE

Definition. Pineal projection: the process whereby you, as an intraphysical consciousness, project from your human body through *excitation* of the pineal gland.

Synonymy: adenoprojection; pineal activation; pineal *excitation*; pineal exercise; pineal *eye* technique.

Focalizing. One of the processes used for producing lucid projection is based upon the state of physical relaxation coupled with mental focalization upon the pineal gland, or in the direction of its location (more-or-less at the center of the brain, taken as a point of reference) and fixation of autosuggestion through deep mental self-awareness.

Ophthalmology. This projective process is only indicated for those with no ocular or ophthalmological problems.

Glabella. To focalize the mind at the center of the cranium, thus awakening the pineal gland, considered here as the controller of consciential projection, you mentally concentrate at the base of

the nose, the point between your eyebrows or on the glabellar area. This action requires that your eyes direct themselves upward to a point that does not produce discomfort or, obviously, permanent strabismus.

Axes. The method most often used for locating the pineal gland is to imagine 2 axes or straight lines passing through your head:

1. **First.** The first axis, running from front to back, begins at the point between your eyebrows and ends at the prominent area of the occipital bone at the nape of your neck.

2. **Second.** The second (transversal) axis runs from one temple to the other or, in other words, from the left side of your head (or cranium) to the right side.

Location. The gland is located precisely at the point where the 2 axes intersect.

Techniques. You can employ the pineal gland *excitation* technique by converging the two eyeballs upward and toward the center of the forehead, maintaining them in this position for about 10 seconds. Next, return your eyeballs to their normal positions, relax the ocular muscles and the optical nerve.

Execution. You need to repeat the exercise a few times and execute it with the muscles of the forehead and face completely relaxed.

Index. You can also use the technique involving the slow, successive approximating and distancing of your index finger, following it with your eyes. You will move the finger back and forth from the glabellar area (between the eyebrows) to a distance of 1' (30 cm), always above your eyes, several times.

Coordination. As various people have already done, after a certain time, and with some practice, you learn to coordinate the eye muscles and improve the process without feeling any discomfort or causing any damage to your eyesight.

Takeoff. The projection of your consciousness occurs with the sudden takeoff of the extraphysical head (parahead) of the psychosoma through the cranium. This occurs in a surprising but inoffensive manner, also producing intracranial sounds.

Hypothesis. Based on the fact that the pineal gland begins to *devolve* after puberty and in the period of adulthood, is the pineal projection technique easier for adolescents to apply?

Coronochakra. According to holochakrology, we should keep in mind that the effectiveness of the pineal projection technique depends greatly upon the quality of the energies of the coronochakra of the intraphysical consciousness practitioner.

Bibliography: Bayless (98, p. 158), Bord (170, p. 58), Fox (544, p. 142), Reis (1384, p. 42), Shay (1546, p. 55), Yogananda (1894, p. 167).

228. CHANGE IN ROUTINE TECHNIQUE

Definitions. Routine: the habitual action realized day after day; the sequence of acts that you observe out of habit or, in other words, through frequent repetition.

Synonymy: action of the subconscious mind; action of the subconscious will; tenacious habit.

Trauma. Any old habit, a normal or commonplace action but one which is sufficiently ingrained to be strong, when it is interrupted, or broken, interrupts a routine and tends to create a small trauma (stress) in the consciousness which is upset because it is attached to this routine.

Strength. This is why the pressure of habit, or the force of routine, is a power that can be advantageously applied as a process for projecting with lucidity, because the projected consciousness, moved by the subconscious will, tends to follow routine patterns, thereby occurring frequent cases of spontaneous lucid projection.

Place. Thus, for example, you choose a certain place where you are used to going, either inside or outside your physical base.

Dissatisfaction. If you stop going to this place, thus depriving yourself of this desire or forcing the suppression of this habit that is a part of your life, thinking about it intensely and insistently, and continuing with this unsatisfied wish, your subconscious will, upon sleeping and under suggestion, will take your lucid consciousness in the psychosoma to this precise place, repeating the routine motor (mechanical or automatic) action.

Base. A common example of a change in routine is the sudden move from the projector's physical base. In this instance, the individual sleeps in a new domicile and awakens thinking that he/she is in the previous place. The projector's consciousness takes off from the new physical base and extraphysically returns to the old one.

Warning. It is worth warning you here not to use negative habits or routines – e.g.: imbibing alcohol or overeating – with the intention of projecting with lucidity.

Others. There are two other methods described in this section that are based on the change in routine technique: lucid projection through fasting and lucid projection through the provocation of thirst.

Bibliography: Lancelin (879, p. 313), Muldoon (1105, p. 226), Shay (1546, p. 70), Vieira (1762, p. 111).

229. PROJECTIVE REPETITION TECHNIQUE

Repetition. If you have already consciously projected from the human body on any occasion, either spontaneously or deliberately, you can often project again.

Conditions. Through the projective repetition technique, you, as the protagonist of at least one lucid extraphysical projection, should endeavor to repeat the conditions and postures which predisposed your human body to physiologically permit the takeoff of your psychosoma.

Coadjutants. Particularly in this method, you should bear the following 2 healthy coadjutants in mind:

1. **Fatigue.** Fatigue after prolonged physical activity during the day.
2. **Concentration.** Mental concentration fixed on the desire to project, before going to bed to sleep.

Projectiography. Projectiography, as well as the projector's personal diary, when analyzed discerningly, generally helps the development of veteran projectors' lucid projections and can unquestionably aid in the execution of the projective repetition technique.

Bibliography: Frost (560, p. 225), Vieira (1762, p. 210).

230. ROTATION OF THE PSYCHOSOMA TECHNIQUE

Definition. Rotation of the psychosoma: method through which you produce projection of your consciousness in the psychosoma through rotational movements with this consciencial vehicle.

Synonymy: the turning over onto the back technique.

Drowsiness. Among the projective psychosoma rolling techniques, one most used by the author is turning over onto the back, which is more indicated when you feel physically tired (exhausted) or very drowsy.

Time. It becomes easier to execute the rotation of the psychosoma technique at daybreak or when the day is beginning, after you have had 4 or 5 hours of normal sleep and have left the bed to study or do any other thing, having returned to bed still fairly drowsy.

Takeoff. As difficult as it may seem at first sight, this process, substantially paraphysiological and devoid of symbolic or ritualistic resource, works perfectly well and permits your consciousness to follow, with full lucidity, the most difficult part of the projection, namely the lucid takeoff or abrupt departure of the psychosoma.

Position. Among the possible variations, for example, you can lie face down (prone position) or against the left side of the face, at the edge of the bed. If you wish, you can even cross one leg over the other, placing the right foot over the calf of the left leg, allowing you to relax completely. You can also use a pillow for the head, close to the nape of the neck, and another under the right arm.

Nostrils. Prior cleansing of your nostrils with warm water obviously becomes of particular importance in the utilization of the prone position, or lying on your stomach, on the bed.

Reaction. It is currently believed that the individual who lies on his/her front is almost always psychologically, through the force of an infantile reaction, endeavoring to forget the tribulations of material life, escaping the realities of the physical world by somehow *sinking himself/herself* into the cushion or, in other words: *into the earth*.

Suitability. Although the prone position is generally less recommended for projections, you can use it in these specific conditions with considerable convenience and suitability in order to achieve the hypnagogic state or the alpha brain wave condition.

Escape. In the prone position, your consciousness endeavors to mentally *escape* from the physical world and, upon attaining the hypnagogic state, you should think of blindly flinging yourself backward and upward, far away from yourself and out of the bed, e.g.: to the left, where you know there is no furniture or other object, thus minimizing or eliminating as much as possible the psychological reflexes of your daily conditioning with regard to the environment of your physical base.

Characteristics. We repeat here, for the sake of clarity, the conscial operations that should occur, based on the following 7 basic characteristics:

1. **Objective.** The objective of resolutely flinging yourself from the bed.
2. **Extrication.** The rapid, voluntary extrication of the consciousness in the psychosoma.
3. **Paraback.** A backwards posture (paraback of the psychosoma) in the extrication of the consciousness in the psychosoma.
4. **Perceptions.** The perceptive condition of blindness of the consciousness.
5. **Direction.** An upward direction over the human body.
6. **Intentionality.** The conscial intention to place yourself far from your own human body.
7. **Choice.** The choice of leaving through the left side of the human body, which was at rest or motionless in the prone position.

Musculature. You obviously do not move the human body and do not even tense the muscles when attempting to fling yourself backwards in the psychosoma out of the human body.

Collision. When following the indicated method, your consciousness should not be apprehensive, although it is more frequent than you might think – even for veteran projectors – to *run into* a closet, table or object, or *collide* with a wall, closed window or other material factor in the intraphysical base when manifesting in the psychosoma.

Cord. Your willpower must function and control the force of retraction of the silver cord. It is for this reason that the backward fling is extremely valid.

Reverse. You will probably notice, in this case, that your silver cord will be connected at the nape of your physical body and at the *paraforehead* of your psychosoma. This is the reverse of other methods.

Psychosoma. During the development of this process, your psychosoma rolls over in the air next to the bed one or two times, finally remaining upright, with your extraphysical head (parahead) further from the human body, which is lying on the bed.

Face. Your extraphysical face, in this case, usually faces the bed.

Attempts. You must not become discouraged or give up, but try the extraction one, two, three times or more, stubbornly persisting with immediate consecutive trials.

Half-turn. A half-turn of the psychosoma can also occur, instead of it rolling over once or twice.

Target. With some training – at most by the third attempt, sometimes with successive takeoffs and interiorizations – your consciousness will already feel free and see itself at a distance from your human body. Once this happens, you should immediately forget all the factors and signs of the physical base and focus on a well-defined mental target, if you want to leave the place.

Interiorization. The interiorization of the psychosoma in the prone position can be easily accomplished with its return directly through the back of your human body, and with full awareness, in most cases.

Exercises. Physical exercise in general greatly helps in the experiments with the psychosoma.

Pool. If you are accustomed to swimming, it is highly recommend that you endeavor to become used to jumping backwards into a swimming pool full of water, while in the ordinary, physical waking state.

Derepression. This practice will annul any negative psychological connotation you may harbor toward it in a hidden, undefined or unperceived manner. It will remove your repression and conditioning connected with the uncustomary action of flinging yourself back and upwards in the psychosoma, far from yourself and the bed, in the dark, during lucid and voluntary takeoff.

Observation. Obviously, for those readers unaccustomed to parapsychic phenomena and animic-parapsychic practices, that which is written here will appear to be pure fantasy or science fiction. If you are one of these persons, the author recommends that you not waste time with any projective training for now.

Self-critique. The most intelligent course of action would be to study a little more about the subject, gathering ideas with some veteran lucid projector and only returning to the indicated projective technique – either this one or *any other healthy method* proven to be effective – maintaining a maximum of self-critique, heterocritique and discernment in everything you do.

Bibliography: Blackmore (139, p. 102), Vieira (1762, p. 144).

231. ROTATION OF THE HUMAN BODY TECHNIQUE

Definition. Rotation of the human body: method for you to produce projection of the consciousness in the psychosoma by employing rotative movements with your physical body.

Synonymy: abstract dance; gyration; gyroprojection; lucid projection rotative technique; projective rotation; rotation; rotational method.

Mechanism. The act of gyrating your human body, especially the head, provokes dizziness through an alteration of the regular functioning of the labyrinth or the center of equilibrium of your human body. Also, this act predisposes the departure of your psychosoma from its natural state of coincidence with the entire human body (unified body), including the head, and your consequent departure from the condition of ordinary wakefulness through a forced takeoff or, in other words, through the abrupt projection of the consciousness.

Uses. The gyratory method is mostly used to produce an altered state of consciousness, parapsychic trance, religious ecstasy and even lucid consciencial projection through the dances of Middle Eastern dervishes, the shamans' trances of controlled possession, the modern European practices of witchcraft and the well-known mediumistic gyration or the spinning dances of violent possession in Umbanda or Candomble in Brazil, with an African origin (religious syncretism).

Frenzy. In the abovementioned cases, the gyratory movements are synchronized to traditional chanting or dance and become progressively more frenetic as the individual goes into trance.

Dervishes. Whirling dervishes or spinning witches, begging ascetics, Muslims or Arabs, Turks, Persians and Egyptians are adepts of Sufism. Their repeating gyrational dance is executed through gyrations in circles for extended periods of time. These prolonged dances symbolize the movement of the planets in relation to the sun. They present individual rhythmic expression, can be practiced in groups and lead the dancer to a state of exhaustion and self-induced trance. Some dervishes also use mantras while they dance.

Trance. In the cases of gyrating dances – rhythmic drumming and dances lasting until exhaustion – dizziness and fatigue rapidly lead the consciousness to collapse in a parapsychic trance with consequent visions. The human body can remain under the command of an extraphysical consciousness (possession) during the period of exteriorization of the consciousness, with or without the occurrence of the phenomenon of psychophony.

Chair. A similar technique is applied in order to voluntarily and consciously produce consciencial projection using a common revolving chair, such as an office chair. This permits the continued rotation at a certain velocity with the experimenter's entire body weight seated. The rotation of the chair can be suddenly interrupted. The best type of chair for rotating the body is the type used in *flight simulators*, currently employed in the treatment of a common type of labyrinthitis.

Contraindications. This method is obviously not recommended for those who have had labyrinthitis, disturbances in equilibrium or audition, as well as problems in the cervical spine (neck). It is especially important not to use an old chair, as this can lead to falls and accidents.

Nystagmus. Incidentally, it is worth mentioning that a specific chair is being used for consecutive nystagmus examinations wherein the individual is submitted to a certain number of rotations at a constant velocity, which are suddenly interrupted. In this way, one can determine the labyrinth's sensitivity threshold to rotational acceleration.

Takeoffs. The departure of the psychosoma from dis coincidence of the unified body can be produced through the following 3 basic procedures, among others:

1. **Line.** In a straight line.
2. **Spins.** Spinning to one side.
3. **Whirling.** Whirling or in an upward spiral.

Direction. The most diverse and bizarre consciencial exteriorizations or takeoffs can occur through the rotational method because your consciousness never knows in which of the 3 procedures it will leave, or its destination (direction) upon temporarily leaving the human body in the psychosoma.

Violence. One must be prepared regarding the violent aspect of the gyrating chair practice, which can bring about a negative aspect in the form of creating an extraphysical trauma and thus impairing the quality of the perceptions of the intraphysical consciousness when projected.

Bibliography: Brennan (199, p. 96), Day (376, p. 35), Lewis (923, p. 167), Martin (1002, p. 41), Shepard (1548, p. 231), Spence (1588, p. 121), Zaniah (1899, p. 150).

232. PROJECTIVE MENTAL SATURATION TECHNIQUE

Definition. Projective mental saturation: pressuring the mind with the idea of lucid projection, exercised through all healthy physical, mental and psychological means possible, over a set period of time.

Synonymy: direct projective method; program of total projective immersion; projective psychic saturation; rapid projective system; state of projective quasi-obsession; subconscious impregnation technique; total immersion technique.

Marathons. The study method of psychic saturation gives decidedly rapid results. It is much used as an effective process in intensive training seminars for obtaining consciential illumination through study marathons and debate roundtables.

Languages. It is also employed in the intensive learning of languages, in rapid courses, with a single student, without regular teachers, calling on all the educational resources possible. It can also be used with a resident student, together with other students in a program of full-time total isolation with an actual internment for fifteen days, wherein one is bombarded with the idiom in all imaginable manners.

Mistakes. No one should judge him/herself incapable of projecting from the human body with full lucidity. In this sense, fear (projectiophobia) is the greatest mistake of all and underestimation of one's own potential and personal worth is a close second. Fear and underestimation annihilate the spontaneity and motivation of the consciousness.

Deficiencies. One must combat these deficiencies on the way of psychic and parapsychic development, in all sectors and practical applications.

Atmosphere. Mental saturation fostered with the idea of lucid projection represents the creation of a healthy (non-pathological) fixed idea or monoideism with the deliberate will of projecting yourself, installing the adequate mental atmosphere for this and impressing the subconscious mind in the home, namely the physical base (holothosene) of the projective aspirant.

Saturating. Among the saturating elements adequate for you to promote mental impregnation with the idea of lucid projection, the following 10 should be singled out:

1. **Ambition.** Nurture a productive and ardent ambition to project yourself with a high degree of lucidity, in the manner of a materhosene of your holothosene.
2. **Concentration.** Think intensely or, better still, concentrate your thoughts on the phenomenon of lucid projection at appropriate times and places, on a daily basis.
3. **Understanding.** Understand projectiological phenomena in detail, with naturality, establishing relationships between lucid projections and your preoccupations, human interests and natural cogitations, such as your profession, cultural research and hobbies.
4. **Reading.** Read about the bodies of manifestation of the consciousness and the multiple existing reports from projectors that are easy to consult, whether in books, magazines, e-mails, web sites or journals. Any investment of this type that is made will be worthwhile.
5. **Studies.** Always study perseveringly, analyzing deeply, if possible, the events related to lucid projections.
6. **File.** Also, if it is appropriate, make a collection of file cards on projective themes, compiling your own research files. These cards can be distributed throughout your house, whether on the bedside table, the bathroom mirror, your reading desk or hung on the walls.
7. **Recorder.** Use a tape recorder to register the projective techniques you use or the words of projectors, and listen to these tapes incessantly.
8. **Gathering.** Talk with other persons interested in the theme of lucid projection, be they veteran or novice projectors, projectiology students, or aspirants to lucid projection. Endeavor to achieve the greatest possible gathering of relevant ideas.

9. **Practice.** From the first day of your saturation effort, practice projective exercises intensively, without any interruptions in a series of disciplined attempts.

10. **Implant.** Let the subject “lucid projection” develop for some hours every day, 7 times a week until it becomes firmly implanted or deeply rooted in your mental life and the diurnal routines of your existence, thus creating and fixating specific related neosynapses.

Dreams. Through this system, conscial processes undergo subtle modifications. Within a maximum of 3 to 4 weeks, when the concentrated effort is relaxed, as a first result of mental saturation, natural dreams about lucid projection will occur, if not a small exteriorization of your lucid consciousness in the psychosoma in the physical base. This is an excellent indication of psychic saturation and an effective opening in the way to lucid projection per se.

Principle. There is a basic principle: whoever dreams with projections, even if it is only a nightmare or *bad dream*, is well on the way to producing lucid projection.

Heterocritiques. The direct method, however, is not free of critiques. It is not simply anyone who can withstand an immersion program that greatly emphasizes personal effort on the part of an intraphysical consciousness who is inexperienced regarding the subject, which provokes aimless lucid projections or the erraticism of lucid projection. However, let us be realistic and practical: this evidently becomes secondary.

Corrections. What is important is to break down the taboo, the conditioning or the obstacle to the lucid departure of your consciousness from the human body. Later, you yourself will correct the initial technical imperfections, improve your mental targets, enrich your extraphysical agenda and you will naturally develop yourself with the repetition of the experiments.

Work. Obtaining lucid projection requires work and demands perseverance. However, few emotions can be compared to the moment when you perceive, for the first time, that you are lucid outside your own human body, free of the connections of dense matter or, in other words: victorious over yourself.

Bibliography: Muldoon (1105, p. 219), Schiff (1515, p. 29), Vieira (1762, p. 189).

233. PROJECTION THROUGH THIRST TECHNIQUE

Definition. Thirst: common, physiological, human, internal sensation of necessity produced by a need for (lack of) water (H₂O) or the will to drink.

Synonymy: privation of water; sensation of dryness.

Suggestion. In the same way that the sensation of hunger or the fasting technique is used the sensation of thirst is also employed as a suggestion for impressing the subconscious mind and forcing the departure of the intraphysical consciousness from the human body in the psychosoma in order to satiate an intensely repressed desire.

Domicile. In this manner, you endeavor to transfer the consciousness from its domicile, based on the principle that no one wants to live in a house without water.

Day. From early in the morning on, endeavor to remain thirsty all day, avoiding the ingestion of any liquids: water; juice; soft drinks; tea; any kind of alcoholic beverages; very succulent fruits; soups; or broths.

Night. At night, you go to bed feeling continuously dry, maintaining the intense wish to drink water, thinking about the place where you could satiate your thirst, e.g., 1 of the following 5 possibilities:

1. **Glass.** A glass of cold water strategically placed in position as a mental target or, in other words, a target-object.

2. **Refrigerator.** The refrigerator in the kitchen filled with bottles of mineral water.
3. **Filter.** A pitcher of cold water placed in a nearby place.
4. **Source.** A natural source of clean water (fountain).
5. **River.** A nearby river of unpolluted water.

Potentialiation. There are those who further aggravate the condition of dryness and anxiety for water, intensifying or potentiating the accumulated desire. You can use 4 resources for this purpose:

1. **Imagination.** Imagine that you are drinking.
2. **Contemplation.** Look at a glass full of water in front of you, without drinking.
3. **Salt.** Place a small amount of salt in your mouth.
4. **Hyperdipsia.** Take a few swallows of salty water before going to bed. This will even further intensify the sensation of dryness (hyperdipsia).

Warning. This process of sensory deprivation should not be applied with the concept or the consumption of salt if the intraphysical consciousness suffers from arterial hypertension and neither should it be utilized in an exaggerated manner. If it is, this can cause nightmares *before*, instead of lucid consensual projections *afterward*.

Climate. The technique of employing thirst for the intraphysical consciousness to lucidly project from the human body should be applied during only one day, by a person in good health, especially in a warm climate, during summer, maintaining due care in order to avoid undesirable dehydration. For safety reasons, the supervision of a trusted physician is recommended.

Umbilicochakra. According to holochakrology, it should be borne in mind that the effectiveness of the projection through thirst technique depends greatly upon the quality of the energies of the umbilicochakra (as well as the laryngochakra) of the intraphysical consciousness practitioner.

Bibliography: Crookall (343, p. 111), Muldoon (1105, p. 227), Smith (1572, p. 23), Vieira (1762, p. 39), Walker (1781, p. 113).

234. TRANSFERENCE OF THE CONSCIOUSNESS TECHNIQUE

Leap. In this method, the practitioner with a fertile mind and great determination endeavors to leap from fictitious imagination to a real experience.

Imagination. Remember that imagination is one of the most important means by which we organize, systematize and classify the processed information in our biomemory.

Effort. After visualizing the psychosoma floating over the human body, the consciousness makes a maximal effort to transfer itself to the psychosoma.

Self-bilocation. This process requires the complete dedication of the experimenter and can be developed to such a degree of perfection that it allows the consciousness to contemplate its own resting, motionless human body (self-bilocation) as though it were a *lifeless shell* on the bed or the floor.

Movements. There are those who add (reinforcement, potentialiation or optimization) intense movement of the psychosoma to this imaginative practice, with it turning and moving about, full of consensual energy, and with complete extraphysical agility.

Form. This method, much used in so-called magical practices, is the same as the body of light, body of illusion or ball of light, in which the individual applies respiration, the exteriorization of energies and the transference of an intentionally visualized personal form through a *connection of force*, which is also imagined, between the human body and the idealized form.

Mirror. The projective self-image technique employs precisely the same method of transferring the consciousness of the observer to the individual's image reflected in a large mirror.

Bibliography: Butler (227, p. 67), Martin (1002, p. 54).

235. PROJECTIVE TRANSMISSIBILITY TECHNIQUE

Benefit. Just as the consciousness of the projector, upon projecting, can act upon the consciousness of a sleeping or dreaming person, the lucid projection, as an altered state of consciousness, can, under propitious circumstances of physical and psychological predisposition, be transmitted or predispose other persons, or can have the beneficial capacity of parapsychically inciting other individuals to produce it.

Person. Projective contagion operates more intensely with the partner in an evolutionary duo or a person who is very close to (empathic with) the veteran projector.

Mechanism. The mechanism of psychophysical reaction of transmissibility is based on the exteriorization of consciencial energies and the determined force of the transmitter practitioner's ironclad will.

Causes. Facts indicate that projective transmissibility parapsychologically exists and works due to 3 factors:

1. **Coexistence.** Day-to-day coexistence with the phenomenon of lucid projection.
2. **Saturation.** Mental saturation regarding the subject of lucid projectability.
3. **Report.** Enthusiasm upon hearing someone report their projective experience.

Periapsis. Similar to periapsis in astronomy or, in other words, the nearest point to the center of attraction in the orbit of any satellite, there exists the *consciencial periapsis*, wherein the center of attraction is the parabrains – the seat of the mentalsoma – in the psychosoma.

Applications. Recognizing the existence of the consciencial periapsis permits the energy mobilization practitioner to understand and better apply 4 technical procedures:

1. **Contagion.** Positive or healthy animic-parapsychic contagion.
2. **Psychosphere.** The individual extraphysical sphere of energy (psychosphere, personal holothosene).
3. **Coupling.** Auric coupling between two intraphysical consciousnesses.
4. **Exteriorization.** Exteriorization of consciencial energies.

Case study. For example, the person with a greater capacity for energy exteriorization can put another person who does not have the conscious capacity for energy exteriorization – and who is even completely blocked regarding animic-parapsychic sensitivity – “under his/her wing,” or together with him/herself continuously for a period of time, within the extraphysical sphere of energy. This, along with the aid of the helpers, will increase the individual's parapsychic perceptions.

Tests. The author has observed this fact repeatedly with innumerable extraphysically developed or assisted sensitives. He has also personally tested this many times with friends and acquaintances, starting with auric coupling.

Period. The average period of close association needed with the test-person is 3 days. At this point, the animic-parapsychic phenomena, including facial clairvoyance, occur without interference from any hypnotic factors or explicit suggestions.

236. PROJECTIVE DIAGNOSIS TECHNIQUE

Definition. Projective diagnosis: that which has the objective of identifying a disease, based upon extraphysical examination (para-semiology) of the patient or *evolutive*, being physically performed at a distance, but directly by the projected or semi-projected projector under hypnotic trance and through the phenomenon of traveling clairvoyance.

Synonymy: clairvoyant diagnosis; diagnostic clairvoyance; diagnostic sympathetic assimilation; extraphysical diagnosis; extraphysical-hypnophysical exam; paracatheterization; paralaparoscopy;

parathoracoscopy; projective diagnosis; projective diagnostic exam; projective paradiagnosis; projective self-diagnosis; projective telediagnosis.

Technique. In the technique for performing projective diagnosis, the hypnotist, who is experienced in projectiology, puts the sensitive into a trance, using hetero-hypnosis methods, and instructs the person to extraphysically translocate to the specific target-person. In this case, the identification of the target-patient, unknown to both parties, should be supplied by a third person (double-blind test), preferably a physician who indicates a patient from his/her own clinic who has a complex disturbance or one with an unclear diagnosis.

Verification. First, the traveling clairvoyant describes the target-patient's physical appearance (looks, physiognomy) to the physician who is present in order for him/her to verify the authenticity and precision of the traveling clairvoyance phenomenon on the spot.

Examination. Next, the traveling clairvoyant will endeavor to perform extraphysical examination of the target-patient using the resource of heteroscopy or, in other words, as if perceiving with an x-ray machine (sweeping) over the ill person's entire human body, describing the specific physical disturbances as they are perceived while in the hypnotic trance state.

Warning. The doctor who is not familiar with parapsychic phenomena, especially those of traveling clairvoyance, must be prepared to understand the vague, very general manner or the inadequate terms with which the hypnotized clairvoyant (when this is a person who is not accustomed to the vocabulary, jargon or terminology of the anatomist, the physiologist or the clinician) describes the various signals of the target-patient's illness.

Knowledge. The matter should be received with naturalness as it is perfectly understandable, since the clairvoyant does not have to be a technician, trained in any area of medicine or human health, have a basic knowledge of anatomy or an adequate clinical vocabulary (terminology, nomenclature), in order to correctly perform his/her parapsychic functions.

Academic. In order to make a projective diagnosis, the demanding physician can choose a trusted experienced medical student to act as the hypnotic test-sensitive or, in other words, use the student as a traveling clairvoyant in the analysis of clinical cases.

Qualification. This provision will eliminate all deficiencies in descriptions involving precise medical terms (nomenclature), as they will be made by a qualified person, thus generally improving telediagnostic techniques in general.

Acupuncture. If the interested physician and medical student possess some knowledge of acupuncture or Chinese medicine, this will further help in the understanding of the descriptions made using traveling clairvoyance. This is because the semi-projected consciousness sees the 3 vehicles of manifestation – the human body, holochakra and psychosoma – coincident at the same time, locating light and dark luminous, colored spots, as though performing an acupuncture examination without needles or instruments through the verification of the condition of the target-patient's energetic points.

Prognosis. The execution of a projective diagnosis frequently not only permits one to determine a correct and final diagnosis, but also to suggest a prognosis.

Indications. Projective telediagnosis, going beyond clinical, physical or laboratorial diagnosis can, in many cases, be employed with for the following 4 basic goals in mind, among others:

1. **Doubts.** Eliminate doubts in medical evaluation.
2. **False.** Avoid false judgment of symptoms, signs and etiology in the identification of diseases.
3. **Divergences.** Eliminate diagnostic and prognostic divergences or errors.
4. **Surgeries.** Avoid exploratory surgeries and questionable, unnecessary or erroneous surgical operations.

Advantages. Projective paradiagnosis presents the following 4 advantages worth considering, among others:

1. **Unconsciousness.** Confidentiality, as it can be determined without bothering the patient who is unaware of the measure taken.

2. **Simplification.** It dispenses with the physical examination and even eliminates, in certain cases, the discomfort of catheters and invasive procedures, which reduces surgical aggression upon the organism.

3. **Instantaneity.** The positive instantaneous aspect of the process.

4. **Economy.** The evident economy of the method.

Self-diagnosis. The diagnosis performed by the semi-projected clairvoyant while in trance relative to his/her own human body constitutes a *projective self-diagnosis*.

Veterinary. The diagnosis made by the semi-projected clairvoyant while in trance relative to the physical body of a subhuman or irrational animal constitutes a *veterinary projective diagnosis*.

Coadjutant. Extraphysical diagnosis, while constituting a significant evolution in the practice of diagnosis, must be employed prudently and only as a coadjutant or complement to conventional medical practice, which is indispensable in all instances.

Bibliography: Fodor (528, p. 25), Freixedo (553, p. 49), Frost (560, p. 178), Steiger (1601, p. 209).

237. PROJECTIOTHERAPY

Definition. Projectiotherapy: the treatment, alleviation or remission of diseases of organic, psychic or parapsychic origin of the projector or another person, through the production of lucid consciential projection.

Synonymy: extraphysical teletherapy; lifesaver projection; projective self-cure; projective self-remission; projective therapy; projective treatment; remissive projection; self-curative-therapeutic projection; self-remissive projection; therapy without crutches.

Specialty. Projectiotherapy is an area or technical specialty of conscientiology (evolutiology, experimentology, conscientiotherapy).

Therapist. The projected intraphysical being who endeavors to apply this projective therapy receives the name of *projector-therapist*.

Mentalsoma. Projective therapeutics is classified as one of the cure-at-a-distance techniques although it is applied directly in the extraphysical dimension through the application of energetic pulses – or consciential energy – focused on the holochakra and psychosoma of the patient, or through the action of the will directly from the mentalsoma (mentalsomatics).

Vehicles. Projectiotherapy occurs based on the vehicles of manifestation of the intraphysical consciousness (holosoma) – the human body, holochakra (energetic body), psychosoma (emotional body) and mentalsoma (mental body, holosomatics).

Citadel. Strictly speaking, conventional medicine addresses the human body; acupuncture, do-in, homeopathy and all bioenergy therapeutics act intensively upon the holochakra or the energetic body; extraphysical deintrusion, irradiations at a distance and other techniques particularly utilize the psychosoma. Projectiotherapy, besides utilizing all these means, notably also employs the last recourse, the therapeutic attack on the citadel of the consciousness – the mentalsoma – at our current evolutionary level, in search of the definitive remission of its maladies.

Prophylaxis. Lucid projection, while not performing miraculous cures, in and of itself, constitutes an invaluable prophylactic process, preventing innumerable illnesses and disturbances of the psychophysical systems of human beings, especially when it acts through the effective implantation of extraphysical maturity in the consciential life of the projector and all beings in general.

Holomaturity. Integral consciential maturity or holomaturity is synonymous with projective prophylaxis.

Psychosomatics. It becomes easy to evaluate the immense animic-parapsychic therapeutic possibilities, for oneself or others, of the lucid departure of the intraphysical consciousness from his/her cellular body, if we reflect upon the fact that countless illnesses are the result of pathological

conditions that arise in the psychosoma (psychosomatic illnesses). In these cases, the best therapeutic process will always be to act directly upon the energetic system of the holochakra together with the psychosoma of the patient.

Types. There are basic techniques for the application of projective therapy, through the following 3 provisions, e.g.:

1. **Self-sufficiency.** The projector can produce a lucid projection by him/herself: self-hypnosis, autosuggestion or self-induction.
2. **Helper.** The projector can avail him/herself of the assistance of a helper: assisted lucid projection.
3. **Hypnotist.** The projector can utilize the services of a trusted hypnotist: hetero-hypnosis.

Provisions. Countless curative provisions can be achieved through projectionotherapy, including the following 8, e.g.:

1. **Energies.** Absorption and exteriorization of cosmic energies or extraphysically absorbed energies.
2. **Fields.** Formation or installation of prophylactic or therapeutic consensual energy fields.
3. **Holomemory.** Accurate investigations into the archives of the integral memory or holomemory of consciousnesses.
4. **Projections.** Lucid projections of the consciousness in space and time, with incalculably positive results.
5. **Interviews.** Positive rapport with extraphysical consciousnesses (extraphysical personalities), awake intraphysical beings or projected intraphysical consciousnesses, through direct interviews.
6. **Transfusions.** Energetic transfusions to the holochakra and psychosoma of intraphysical beings and needy or energivorous extraphysical consciousnesses.
7. **Psychosoma.** Instantaneous positive alterations in the psychosoma of an intraphysical consciousness which has passed through desoma.
8. **Holosoma.** Analysis, as a whole, of the holosoma of the ill being.

Energy. The projector, projected in the psychosoma, in any of the techniques indicated, can utilize the exteriorization of consensual energy, whether executed strictly by oneself, or with the aid of a helper.

Holosomatic. This energy is sent directly to your own human body; to the coincident human body, holochakra, psychosoma and mentalsoma (holosoma) of another intraphysical consciousness; or to the psychosoma and mentalsoma of an extraphysical consciousness (and the remnants of the holochakra, when that extraphysical consciousness has still not passed through second desoma).

Lucidity. In the direct application of this therapeutic energy, the projected consciousness of the projector-therapist has to be prepared with good intention, sufficient lucidity regarding what to do, including an awareness of the patient's affected organs and the organic areas in relation to the basic chakras, especially if one is performing projective therapeutics on one's own.

Agent. When there is an intervention of assistance on the part of a helper (an extraphysical consciousness) or a human hypnotist, the lucidity of the projected projector can, in certain cases, be less accentuated and the projected projector will thus function more as a *teleguided* physical-extraphysical agent.

Disturbances. Innumerable disturbances, syndromes or diseases can be treated and even self-cured through projective therapy, such as the following 8:

1. Cases of organic pathologies due to or triggered by disturbances characteristic of the parapatology of the holochakra and psychosoma.
2. Consensual energetic imbalances and blockages in general.
3. Egokarmic stigmas.
4. Interconsensual intrusions in general.

5. Post-desomatic parapsychoses.
6. Interconscial energetic parasitisms or possessions.
7. Psychoses in general.
8. Repressed parapsychism syndromes.

Mentalsomatic. The direct action upon the mentalsoma of the patient, as with the curing of dipsomania (alcoholism), for example, can be performed through a conscial projection wherein the projector-therapist takes possession of the patient's soma (*inter vivos* incorporation), in a temporary, benign possession. The projector then suggests to the patient's consciousness, directly from mentalsoma to mentalsoma, that the patient naturally give up the addiction to drink (chemical or pharmacological dependency) or the use of drugs. In certain resistant cases, this practice, always assisted by a helper, needs to be applied more than once during the projectiotherapy process.

Deintrusion. In cases of direct interference by intruding extraphysical personalities or intrusions by extraphysical consciousnesses, the clarifier-projector, projected in the psychosoma, promotes a direct confrontation (*extraphysical face-off*) with the participating extraphysical consciousnesses in a service of direct or personal extraphysical deintrusion.

Apometria. One of the animic (intrapysical consciousnesses) therapeutic techniques utilizing lucid projection used in Brazil is *apometria*, a term created by José Lacerda de Azevedo to designate Luiz Rodrigues' *hypnometria*, wherein the patient's consciousness is projected in the psychosoma directly to the extraphysical therapists (extraphysical consciousnesses).

Dynamization. Together with the patient, sensitives who are also projected in the psychosoma, assist in the extraphysical care, dynamizing the groupal therapeutic process. In these cases, the patient generally does not see, sense or register anything regarding the therapeutic processes, but noticeably improves in the cases of interconscial intrusion.

Self-help. There are many registered cases in which an intrapysical consciousness projects in the psychosoma in search of human resources of first-aid for his/her own injured human body, or in conditions of extreme danger regarding the life of the soma. These registered cases actually do not only constitute *self-cures*, but also ensure the maintenance of one's intrapysical existence, or the continuation of material survival on earth (lifetime).

Coadjutant. Although projective therapy constitutes a remarkable evolution and an enlargement of therapeutic areas, it must be applied prudently, whether in isolated cases, using only the resources of the animic potentiality of the intrapysical consciousness, or together with parapsychism, but always as a coadjutant resource, alternative therapy or valuable complement to conventional, orthodox medical practice, which is indispensable in any case, not forgetting acupuncture and homeopathy.

Bibliography: Costa (308, p. 4), Greenhouse (636, p. 200), Hermógenes (715, p. 259), Krippner (865, p. 299), Moore (1081, p. 176), Netto (1125, p. 77), Steiger (1601, p. 210), Walker (1781, p. 59).

238. PSYCHOLOGICAL CONDITIONING TECHNIQUES

Pre-takeoff. The psychological conditionings in the pre-takeoff stage that predispose your consciousness to lucid projection are based on technical visualizations that must be carried out when you are in the previously mentioned physical postures. The following 10 are examples:

1. **Thosenization.** Concentrate your thoughts on the objective of lucid projection, avoiding scattered thoughts and daydreams.
2. **Somatics.** Mentally, gradually stop feeling the human body, with the firm thought that your dense body no longer exists.
3. **Universes.** Make your consciousness enter the realms of absolute silence, as if the known universe (cosmos) had disappeared for you.
4. **Forms.** Think intensely upon the idea that material forms no longer exist for you.

5. **Alienation.** Seek the condition of inner alienation toward everything that is physical or material.
6. **Imagination.** Imagine the upward takeoff of your consciousness in the psychosoma or the mentalsoma.
7. **Floating.** Intensely desire to float further above where you feel yourself to be.
8. **Rolling.** Roll the psychosoma to one side, to either the right or the left, the side that you prefer at the moment.
9. **Sounds.** Prepare yourself to hear the shrill sounds (extraphysical sounds) characteristic of the takeoff of the psychosoma, a fact that occurs with relative frequency.
10. **Autosuggestion.** If, by chance, your consciousness loses lucidity in various consecutive experiments, use an autosuggestion before the experience and you will awaken in the extraphysical dimension.

Bibliography: Monroe (1065, p. 207), Muldoon (1105, p. 188), Vieira (1762, p. 53).

IX - Exteriorization of the Consciousness Stage

239. SIGNALS PRECURSORY TO LUCID PROJECTION

Definition. Projective signal: the ostensive occurrence that characterizes the improvement of the processes that produce lucid projection.

Synonymy: indicator of projectability; precursory signal of lucid projection.

Qualities. Among the basic qualities that act to enhance the performance of the aspirant to lucid projection, at least the following 5 can be singled out:

1. **Desire.** The sincere desire to project.
2. **Disposition.** Absence of fear (projectiophilia) or blocks generated by autosuggestion.
3. **Self-discipline.** Incessant and regular experimentation.
4. **Constancy.** Constancy and tenacity of the proposals.
5. **Saturation.** Mental saturation with respect to the subject (creation of specific neosynapses).

Attitudes. These attitudes and procedures permit the appearance of characteristic signals in order to achieve greater success in the production of lucid projections.

Types. The following are 13 basic indications that the experimenter is on the way to achieving the objective of lucidly projecting him/herself:

1. Torpidity of the human body.
2. Sensation of alienation with regard to the physical world (human dimension).
3. Swooning.
4. Vibrational state.
5. *Ballonnement* (ballooning).
6. Projective catalepsy.
7. Vivid natural dreams (recurrence).
8. Continuous dreams of flying.
9. Dreams on the theme of lucid projection (mental saturation).
10. *Quasi-projections*, namely semilucid or badly recalled projective experiences.
11. Lucid projections aborted by some kind of trauma or repercussion, whether intraphysical or extraphysical.
12. Sensation of taking off in the psychosoma.
13. The occurrence of intraphysical repercussions with some lucidity.

Certainty. If some of these signals occur, the aspirant to lucid projection can be absolutely sure that he/she will soon be able to project with ample lucidity. It is simply a matter of insisting with the use of preestablished methods and disciplines.

Stimulus. The precursory signs of lucid projection serve as powerful stimuli to motivate the practitioner to continue with his/her experimentations.

Bibliography: Armond (53, p. 126), Shay (1546, p. 91).

240. PROJECTIVE AURA

Definition. Projective aura: the sensation or particular phenomenon that precedes the beginning of the projection of the consciousness from the human body or soma.

Synonymy: notice of projection; phenomenon of signs; presaging of extraphysical action; primary extraphysical signs; projective disposition.

Personal. The projective aura represents the initial subjective or objective signs of the projective trance. Upon gaining experience, the projector ends up perfectly identifying and characterizing all aspects of his/her extremely individual projective aura. He/she can thus forecast an imminent conscial projection and accelerate personal projective development.

Causes. Among the causes of projective aura, at least the following 9 should be singled out:

1. **Looseness.** Holochakral looseness.
2. **Predisposition.** Animic or intraconsocial predisposition.
3. **Physiology.** The physiology of the human body.
4. **Paraphysiology.** The paraphysiology of the psychosoma.
5. **Bait.** The phenomenon of interconscial bait.
6. **Projection.** Partial conscial projection.
7. **Notice.** Notice of a conscial projection.
8. **Prior.** A prior conscial projection.
9. **Clairvoyance.** Traveling clairvoyance.

Character. According to projectors in general, there are hundreds of types of signs that are characteristic of the projective aura. These signs can be characterized as motor, sensitive, sensorial, psychic or parapsychic (extra-sensory).

Types. The following are the 5 most frequent types of signs specific to the projective aura:

1. **Air.** Perception of a flow of air in the environment.
2. **Whistle.** Hearing a whistling or hissing noise around the practitioner.
3. **Frontochakra.** Subjective manifestations of the chakras, especially the frontochakra.
4. **Vibration.** Small vibration in the head or in the upper part of the thorax.
5. **Light.** Sensation of an abrupt increase in the brightness of the light in the room of the physical base.

Effects. Besides the abovementioned generic signs, there are at least 9 more effects that sometimes comprise the projective aura:

1. **Digestion.** *Acceleration of digestion* and the elimination of gastric repletion, both occurrences having an extraphysical origin.
2. **Visual.** Transform physiognomic alterations.
3. **Hallucinations.** Olfactory hallucinations.
4. **Impressive.** Parapsychic perception of extraphysical presences (extraphysical consciousnesses or, very rarely, projected intraphysical consciousnesses) due to *impressive parapsychism* (impressions of the sensitive intraphysical consciousness).
5. **Parapsychism.** Parapsychic phenomena in general.
6. **Approach.** Sensations of a mental approach or an interconscial attack of an extraphysical or invisible origin.
7. **Signage.** Signals that are typical of parapsychism.
8. **Somnolence.** Somnolence or hypnagogy.
9. **Clairvoyance.** Facial clairvoyance.

Traveling. The practitioner can experience traveling clairvoyance prior to the integral projection of the consciousness in the psychosoma. This can serve as a prior projection, a notice of an upcoming projection or a *preview* of an impending conscial projection, per se. In this case, it can also act as a factor supplying *rapport* or intensifying the necessary empathy with the target-beings in mind who are in another intraphysical or extraphysical environment.

Helpers. Traveling clairvoyance, especially in the conditions referred to, but also in the majority of circumstances, can be promoted by helpers as they are interested in the development of projections, the development of the projector's parapsychic capacities, the resulting performance of fraternal assistance and other factors still unknown to projectors and *surrounding intraphysical consciousnesses* (*occasional bystanders*).

Recognition. After having some lucid projections, the intraphysical projector, attentive to his/her own sensations, ends up recognizing the signals of his/her projective aura and, predisposing him/herself with plenty of relaxation and motivation to help, will be able to leave the human body with much greater ease, in a manner that is constant, uniform, standardized and with greater lucidity.

Duration. The projective aura normally occurs for only a few brief minutes, immediately before the intraphysical consciousness projects. Nevertheless, it can exceptionally last for one or two hours, until the human and/or extraphysical circumstances allow the production of the projection as it should be, or according to the necessities and specific implications of the *physical-extraphysical moment* of the existence of the intraphysical consciousness (existential program).

Pathologies. The projective aura is an extremely positive, simple paraphysiological manifestation. Although it actually represents a very well-defined *aura* it has no direct connection with pathological causes and manifestations, nor is it linked to the epileptic aura, asthmatic aura, the renal colic (lithiasis) aura, the hysterical aura, or that of a migraine (headache), also called visual, sensorial or *psychic auras*.

Bibliography: Frost (560, p. 55), Guirdham (664, p. 15), Monroe (1065, p. 216), Vieira (1762, p. 87).

241. PHYSICAL TORPIDITY

Definition. Physical torpidity: the temporary absence of the sensitivity and, therefore, the action of the human body when the senses enter into torpor, constituting the first personal sign of disincidence of the vehicles of manifestation of the intraphysical consciousness.

Synonymy: deadening of the organism; organic torpidity; organic insensitivity; yoganidra; sensation of organic anesthesia; physical torpor; organic torpor.

Frequency. A reduction in cardiac frequency or, in other words, a reduction in the rhythm of the heartbeat, constitutes the basic factor predisposing the human organism to the state of physical torpidity, stemming from the impulsion of the will.

Cause. The essential cause of physical torpidity is the deactivation of the nervous system through the inhibition of nerve endings. It is for this reason that it generally begins in the extremities, feet, legs, hands and arms.

Signal. Therefore, the appearance of physical torpidity is the first local, characteristic signal of the partial exteriorization of the psychosoma, precisely in the area of the human body that is numb.

Inertia. The partial or complete exit of the psychosoma simultaneously provokes physical torpidity. Therefore, this condition always indicates the occurrence of a partial or complete disincidence of the vehicles of manifestation of the consciousness, thereby arising the temporary inertia of the human body and the freeing of the psychosoma.

Anesthetics. If we consider the deadening effects of anesthetic substances, used in medical and odontological local anesthesia of the patient, we can better understand the phenomenon of physical pre-projective torpidity.

Local. The anesthetic inhibits the transmission of nerve impulses from the neural net of the organic area that has been anesthetized, thereby removing its sensitivity. This fact leads us to think that local anesthesia, in fact, results in an artificial or chemical partial projection of a *portion* of the psychosoma from the human body, through the action of the anesthetic.

General. Likewise, general anesthesia represents a complete artificial and chemical projection of the *entire* psychosoma from the human body, through the action of the anesthetic.

Surgeries. In endorsement of this last occurrence, there are dozens of known cases of lucid projection, registered over many decades, that have occurred in medical surgery rooms and dental offices.

Conclusions. The following 6 inferences can be drawn from these facts:

1. **Will.** The human body's intense physical torpidity of parapsychic origin is the result of a natural self-anesthesia, consciously or unconsciously executed by the will of the practitioner.

2. **Anesthesia.** Evidence abounds of the commonplace cases of anesthesia, under analysis here, which are induced through hypnotic suggestion. They are, nonetheless, instances of actual anesthesia produced through the willful force of the hypnotized individual under the command of the hypnotist.

3. **Discoincidence.** Any type of anesthesia or suppression of local or general neurological activity presupposes the localized or generalized exit of the psychosoma from the condition of coincidence of the bodies or vehicles of manifestation of the intraphysical consciousness.

4. **Holochakra.** Anesthesia acts directly upon the nervous system and, indirectly, upon the holochakra, the energetic body of the intraphysical consciousness. It also evidently acts upon the silver cord, the essential intercorporeal connection between the human body and psychosoma. The silver cord is an *essential part* of the selfsame holochakra.

5. **Cord.** The silver cord – in this case, the element of intercorporeal soma-psychosoma connection – is inserted, connected or, better still, derives from the entire organism, from all of its cells, but essentially from the nerves, the nerve endings, the entire nervous system and, finally, the brain itself or, in other words, the 2 cerebral hemispheres.

6. **Equivalence.** In the condition of the manifestations of parapsychobiophysical phenomena, the following 4 occurrences are equivalent:

A. **Hypnosis.** Psychological anesthesia executed through hypnosis (parabrain).

B. **Analgesic.** Chemical anesthesia (analgesia) obtained through an anesthetic (somatics).

C. **Parapsychism.** The state of organic insensitivity exhibited by fakirs and sensitives.

D. **Will.** The condition of physical torpidity, installed consciously or unconsciously through the force and action of the will of the intraphysical consciousness.

Bibliography: Armond (53, p. 126), Muldoon (1105, p. 215), Rossi (1476, p. 5), Vieira (1762, p. 143).

242. *BALLONNEMENT*

Definition. *Ballonnement*: the sensation of physical expansion – although, in fact, of extraphysical origin or deriving from the holochakra – of any part of the human body, whether the face, members, trunk or even the entire cellular organism that seems to grow, swell, dilate, expand and inflate like a balloon.

Synonymy: “balloonment”; extraphysical sensation of inflating; sensation of an expanded body; sensation of corporal expansion; sensation of corporal swelling.

Frequency. The most common sensation of *ballonnement* is the apparent dilatation, expansion, swelling or thickening of the hands, feet and solar plexus (umbilicochakra) in all directions, and the supposed swelling of the lips, cheeks and chin, which are frequent in parapsychic activities, mainly those with energy transmitting and psychophonic sensitives.

Takeoff. The phenomenon of *ballonnement* sometimes arises for the projector in the moments prior to the takeoff of the psychosoma, or in the pre-takeoff period, either before or simultaneous with the vibrational state. It constitutes an effect of the exteriorization of the psychosoma, generally together with a greater amount of the holochakra.

Sensation. The *ballonnement* effect should provoke happiness in the practitioner rather than apprehension or fear, since it represents one of the first personal indications of discoincidence of the vehicles of manifestation, or the fact that your intraphysical consciousness is starting to leave dense matter with some lucidity.

Incorporation. Besides the sensations stemming from expansion of the animist-sensitive's holochakra and psychosoma during the *ballonnement* phenomenon, incorporation (psychophony) of an extraphysical consciousness also occurs. In this case, the animist-sensitive feels the psychosoma of the extraphysical consciousness, just as the latter feels the psychosoma, holochakra and human body of the sensitive.

Intensification. *Ballonnement* is obviously more pronounced and intense when a slender sensitive with physical effect (ectoplast) capacities incorporates a former intraphysical consciousness which lived in an obese soma. Physical self-transfigurations can even occur in this situation.

Bubble. The *ballonnement* phenomenon demonstrates, in a non-sophistical manner for the experiencer, that the psychosoma is actually a *bubble-body*, and that the parapsychic sensations experienced have a direct relationship with the holochakra.

Tympanites. We must not confuse *ballonnement* of extraphysical origin, analyzed here, with *ballonnement*, a sensation of physical, abdominal origin, due to the pathological distension of the intestine by gas, for example, addressed in medical pathology using the expressions: “meteorism,” “tympanites,” or “pneumatosis”.

Bibliography: Armond (53, p. 127), Greenhouse (636, p. 224), Paula (1208, p. 79), Reis (1384, p. 53), Tourinho (1692, p. 100), Vieira (1762, p. 19).

243. PRE-TAKEOFF

Definition. Pre-takeoff: the preliminary state of the intraphysical consciousness immediately prior to the takeoff of the psychosoma from the human body, or the direct projection of the intraphysical consciousness in the isolated mentalsoma.

Synonymy: introductory state of projection; preliminaries of projection.

Psychosoma. The pre-takeoff characteristics analyzed here relate more to the departure of the intraphysical consciousness from the human body using the mentalsoma and psychosoma – which are more frequent and rich in parapsychic occurrences – and not the direct projection of the intraphysical consciousness only in the isolated mentalsoma, which is rarer and more difficult to analyze.

Characteristics. Among the aspects that characterize the projective pre-takeoff stage, at least the following 17 factors can be singled out:

1. Organic torpidity.
2. Alienation in regard to the human body.
3. Vibrational state (VS).
4. *Ballonnement*, sometimes of the entire body.
5. Sensations of the chakras or centers of force (holochakrology).
6. Specific pulsation of the frontochakra.
7. Hypnagogic state.
8. Fugacious visions.
9. Pre-projective sleep.
10. Pre-projective physical catalepsy.
11. Sensation of the *extraphysical hand*.
12. Semidisconnection.
13. Half-exteriorization.
14. Stretching of an extraphysical member (elongation).
15. Extraphysical Trendelenburg.
16. Self-telekinesis.
17. Loss of physical wakefulness.

Contacts. During the pre-takeoff period, it is just as common for the developing as well as the developed sensitive-projector to have healthy or vigorous mental or parapsychic contacts from the helpers as it is to receive pathological or sick contacts from unbalanced (energivorous) extraphysical consciousnesses. It is from these processes that pre-projective parapsychic phenomena arise.

Bibliography: Vieira (1762, p. 53).

244. VIBRATIONAL STATE

Definition. Vibrational state: the condition wherein the holochakra and psychosoma accelerate their vibrations in order to escape from the slow vibrations of the human body, which can produce a projection of the intraphysical consciousness in the psychosoma (fig. 244, p. 1,135).

Synonymy: energetic state; extraphysical electric state; extraphysical *prickling*; internal motor activity; vibrational effects; vibrational sensations; VS.

Looseness. The vibrational state appears, above all, to be promoted by a greater and benign paraphysiological freedom or looseness of the holochakra.

Causes. The following 4 physical factors also act to trigger the vibrational state:

1. Physical vibrations of the entire human body.
2. Cold winds.
3. A substantial drop in ambient temperature.
4. A condition of emotional exaltation.

Characteristics. The vibrational state stems from the intensification of the release or freeing of consciencial energies. It may be perceptible or imperceptible to the consciousness and occurs more frequently in consciencial projections in the psychosoma with greater density. This is due to the fact that this vehicle carries a greater portion of the holochakra, or energetic body, with it. With the isolated psychosoma or mentalsoma, expansions of the consciousness occur more frequently.

VS. It is important to clarify that the “sensations of vibrations” experienced by the consciousness are not the same as “consciencial energies”, however the latter is responsible for (causes) the generation of the former (effects). Therefore, VS or the vibrational state actually ends up being an *energetic state*, although “vibrations” and “energies” are intrinsically very different realities.

Effects. Among the sensations of the vibrational state, at least the following 3 effects can be singled out:

1. **Waves.** Movement of internal and equal waves of pulsating, painless vibrations, the frequency – or number of vibrations per second – and intensity of which can be controlled by the will, their frequency being rhythmically increased or decreased.
2. **Sweeping.** A stronger or weaker intensity of vibrations *sweeping* the inactive human body from head to hands and feet, and returning to the brain, in a constant circuit of brief seconds.
3. **Resonance.** This occurs until reaching the natural vibratory frequency or resonant frequency of each vehicle of manifestation separately.

Continuity. Often, the vibrational state is characterized only by the sensation of intense continuous vibration.

Sounds. At other times, noises or intracranial sounds, as well as stimuli or visual effects, appear.

Images. The following are 8 images, metaphors or comparisons that consciencial projectors use in order to characterize the sensations of the vibrational state:

1. A pleasant generalized pins and needles.
2. Continuous electric shocks.
3. Electric vibrations.
4. Internal dynamo.
5. Internal *prickling*.
6. Magnetic currents.
7. Mild electricity.
8. The starting of an internal engine.

Paresthesia. In medicine, the sensation of *prickling* over the entire body is called “paresthesia.”

Prickling. In psychology, the term *prickling* refers to an unevenly distributed, intermittent or oscillating sensation, like an ambulatory pricking, giving the notion of a large number of ants running across the skin. It is produced by the action of a mild faradic current or of very strong mechanical vibrations that reach a sensitive group of nerves before reaching the pain threshold. This sensation greatly approximates certain occurrences of the vibrational state.

Mirmalgia. It is worth mentioning that a prickling sensation that becomes painful is a different occurrence and is termed *mirmalgia*.

Relaxation. Sometimes it is worth the effort of provoking the vibrational state, not with the singular intention of producing a full lucid consciential projection in the psychosoma, but with the objective of escaping the cold, coercive rigidity of the restriction of the physical body, or the prison of human forms, in a quick and positive psychological relaxation.

Sensations. When provoked intensely with psychological relaxation in mind, the vibrational state can predispose the appearance of diverse positive sensations, such as the following 3:

1. **Orgasm.** An extremely agreeable parapsychic *vibratory orgasm* that manifests throughout the body.

2. **Fire.** Immersion in an *energetic fire*, as though the entire organism were engulfed by rising crackling flames.

3. **Eyes.** Instantaneous appearance of *energetic eyes* – like minisprings or eyes of water – the small vibratory fires of which flow intensely with localized spouts seemingly in a circumscribed segment or area of the human body, such as the forearm, calf of the leg or solar plexus (umbilicochakra).

Catalepsy. Vibrational sensations and benign catalepsy often occur simultaneously and are not clearly distinguishable for some lucid consciential projectors.

Coronochakra. The positive rays of the *iridescent coronochakra*’s luminous human crest crown the vibrational state.

Unison. It seems theoretically safe to presume that vibrational state in unison – with synchronized vibrations – can occur through a greater auric coupling between an intraphysical sensitive and an extraphysical consciousness which has not yet passed through the second desoma. This junction results in the occurrence of different effects including an intense reciprocal exteriorization of energies, which predisposes the manifestation of varied phenomena. It is reasonable to suppose that this occurs in certain cases of ectoplasmy and the interconsciential transmission of bioenergies.

Takeoff. In the final stage of the vibrational state a sensation of intracranial pressure can occur, soon followed by the takeoff of the psychosoma transporting the consciousness. The consciousness may remain aware or unaware of the occurrence during takeoff.

Dematerialization. The more advanced vibrational state – or its climax – is the total ectoplasmic condition, or the complete dematerialization of the human body. This occurs in the phenomena of human parateleportation.

Migraine. Some migraine or hemicrania (psychopathology) sufferers report that, at times, after the onset of a severe headache, they feel as though the entire human body is vibrating and moving as if it were a fast-moving pendulum. These reported sensations are precisely reminiscent of the parapsychophysiological and *natural* sensations of the vibrational state.

Chair. The sensations of the vibrational state have been artificially created using a *vibratory chair* together with Ganzfeld stimulation. This makes the person feel vibrations, as though an electric current were passing throughout his/her human body. The purpose of the chair is to induce the consciousness to experience lucid projection. John Palmer is a researcher who observed that half of those persons tested with the vibratory chair were successful in inducing a lucid consciential projection.

Collective. *Collective auric coupling* can occur in a group of individuals who gather under the influence of a common factor that acts upon them (groupal holothosene), or even in a considerable

multitude. It can be fundamentally *unconscious* with regard to the occurrence and generated by the emotions (emotional contagion). From this, the vibrational state can occur, which is also *unconscious* with regard to the energies and is generated by the emotions of the promoter, or promoters of the gathering, as well as the majority of the components of the encounter.

Nature. The type of temporary auric coupling, as well as the type of transitory vibrational state, can both be of a positive (healthy) or negative (sick) nature.

Cause. The cause of the phenomenon here is the *interattraction* between each consciousness through the emotional body (psychosoma, psychosomatics).

Holochakrology. The main effects are generated by the energetic body (holochakra, holochakrology).

Quality. It should not be forgotten that the projected intraphysical consciencial projector may not only observe but also participate in these occurrences, whether in a conscious manner as an extraphysical paramedic (*leader*) or in an unconscious mode as “cannon fodder” (*victim*).

Homeostasis. In regard to the homeostatic nature (health of the holosomas), collective auric couplings can present themselves in 3 ways: positive, negative and ambivalent.

Positive. The following are 3 examples of collective auric couplings and joint, unisonous vibrational states of a crowd, which can be of a positive or healthy nature:

1. **Leader.** The constructive religious leader at the high point of his/her speech with an expectant crowd.

2. **Virtuoso.** The virtuoso at the end of a well-performed violin concert, for example, with a crowd that is aware and sensitive to what they have just heard.

3. **Valedictorian.** The end of a speech by an experienced valedictorian during the solemn act of a university graduation ceremony.

Assistance. When the emotional energy and the circumstances are positive, the helpers take advantage of the opportunity to extraphysically aid (interconsciencial assistance) the intraphysical and extraphysical beings which are in need or in lack.

Negative. The following are 2 examples of collective auric couplings and joint or unisonous vibrational states of a demented crowd that is hopelessly negative or sick or, in other words, manifestations of *mass poisoning*:

1. **Riot.** The political leader who instigates the crowd during a riot.

2. **Lynching.** The climax of intoxicated fury during a lynching.

Minimization. When the commotional energy and circumstances are negative, the helpers do what they can in order to reduce or minimize the misdeeds as much as possible. They assist those they are able to among the participants who are always in subhuman psychological conditions.

Ambivalent. The following are 5 examples of collective auric couplings and joint or unisonous vibrational states of a crowd which can simultaneously have an ambivalent, positive and negative nature:

1. **Fans.** The enthusiasm of fans at a decisive championship game (soccer, basketball, volleyball, baseball) in a filled to capacity stadium.

2. **Gamblers.** The vibration when the horses turn into the final stretch of the big race at the race track (horseracing fanatics).

3. **Samba dancers.** The climax of a samba school procession on the parade route during carnival.

4. **Artist.** The veteran artist who sings for his/her captive audience.

5. **Orator.** The orator upon psychologically involving his/her listeners (oratory, eloquence).

Bibliography: Alverga (18, p. 64), Blackmore (139, p. 101), Castaneda (258, p. 124), Crookall (343, p. 143), Greene (635, p. 92), Lippman (934, p. 347), Manning (993, p. 155), Monroe (1065, p. 210), Reis (1384, p. 54), Rogo (1444, p. 12), Salley (1496, p. 158), Sculthorp (1531, p. 17), Vieira (1762, p. 19), White (1831, p. 144).

245. HYPNAGOGY

Definitions. Hypnagogy (Greek: *hipnos*, sleep; and *agogos*, conductor): the transitional twilight condition of the consciousness (intrapysical consciousness) that characterizes the somnolent interval between the ordinary, physical waking state and the state of natural sleep; the altered state of consciousness introductory to natural sleep, characterized by oneiric images, hallucinatory visions and representations with visual and auditory effects, due to exacerbation of the imagination.

Synonymy: alpha rhythm; alpha state; alphagenic state; germinal substance of dreams; hypnagogy; hypnagogic activity; hypnagogic conditions; hypnagogic creations; hypnagogic episodes; hypnagogic events; hypnagogic experience; hypnagogic hallucinations; hypnagogic ideation; hypnagogic images; hypnagogic interval; hypnagogic mentation; hypnagogic paramnesia; hypnagogic period; hypnagogic phenomena; hypnagogic processes; hypnagogic state; hypnagogic thoughts; hypnagogic transition; hypnagogic visions; hypnoid state; lightninglike dreams; micro-dreams; pre-sleep state; quasi-sleep; semi-asleep state; semi-awake state; semi-dream state; semi-sleep images; semi-sleep state; semi-somnolent state; twilight state; twilight zone; waking-sleeping border state.

Term. The term *hypnagogic* was coined by A. Maury in 1848.

Material. There is currently more material on hypnagogy to be analyzed. Research is being developed and literature on hypnagogy can be encountered that is made up of reports where, for example, the following 13 consensual conditions are studied:

1. The pre-hypnagogic state.
2. Hypnagogic recall.
3. The subjects of hypnagogic experiments.
4. The training of hypnagogic *biofeedback*.
5. Hypnagogic content.
6. The hypnagogic electroencephalogram.
7. Hypnagogic oneiroid fantasies.
8. Hypnagogicoid phenomena.
9. Synesthetic hypnagogic imagination.
10. Receptivity to hypnagogic phenomena.
11. The aspects of the spontaneous emergence, quality and location of hypnagogic images.
12. The vividness, detail, novelty and grotesque appearance of hypnagogic *faces*.
13. The uncommon beauty and grandeur of hypnagogic *landscapes*.

Relations. Today, researchers endeavor to establish the relationship between hypnagogic *images* and other types of *imagination*, as the one induced by drugs and eidetics; as well as the relationship with déjà vu in general, the self-symbolic phenomenon, suggestibility, personality characteristics, correlated physiological data and rapid eye movements, in order to obtain better explanations for neurophysiological mechanisms of the phenomena and, in this way, formulate theories of greater consensus.

Phenomena. At least the following 4 occurrences have been observed in conjunction with the hypnagogic state in regard to these phenomena:

1. **EEG.** A drop in the frequency and a depression in the amplitude of an electroencephalogram (EEG).
2. **REM.** A tendency for slowness of eye movements.
3. **Musculature.** A decrease in the activity of the frontal muscles.
4. **Respiration.** Changes in respiratory patterns.

Obscurity. Little is still known about two other obscure occurrences:

1. **Mnemosomatics.** The nature of mnemonic storage and the processes involved in recuperating memories of the hypnagogic state.

2. **Hemispheres.** The relative contributions of the left and right cerebral hemispheres in hypnagogic mentation.

Hypnagog. The *hypnagog* generally acts in the passive role of a spectator of a theatrical piece or film, similar to an ordinary dream. This is why hypnagogic phenomena are called *microdreams*.

Polyopia. Cases of polyopia, dysmegalopsia and dysmorphia of the somato-sensory sphere occurring during the hypnagogic state have been verified.

Deprivation. Hypnagogic images seem to be a secondary component in experiences of sensory deprivation.

Tetrad. Hypnagogic images are part of the narcoleptic tetrad composed of:

1. Hypnagogy.
2. Dream paralysis.
3. Narcolepsy.
4. Cataplexy.

Methodology. Four processes have been used in hypnagogic state research methodology:

1. **Spontaneity.** Spontaneous self-observations.
2. **Self-systematization.** Method of systematic self-observation.
3. **Questionnaires.** Survey of questionnaire data sampling.
4. **Hetero-systematization.** Systematic experimental investigation.

Self-awareness. One of the criteria applied in order for an episode of personal experience to be considered hypnagogic is that the person presents the condition of continuous self-awareness of his/her environment.

Electroencephalograph. The loss of awareness of one's external situation can be gauged in a secure and reliable manner when *alpha* brain waves, from 12 to 14 Hertz or cycles per second, appear through electrodes placed on the cranium and are registered on the spindles of the electroencephalograph.

Children. Hypnagogic phenomena are relatively common and have always been more frequently reported by younger children.

Forms. Four basic hallucinatory forms or patterns have been identified as constants, or to frequently occur, in the hypnagogic state:

1. Hammocks, trellises, honeycombs (bees) and arabesques.
2. Spider webs.
3. Tunnel, funnel, grove, cone and vase.
4. Spiral.

Pharmacology. Many of these forms are also imagetic constants due to the use of light or heavy, licit or illicit drugs (pharmacology, criminology).

Recall. It has been consistently noted over time that hypnagogic phenomena are extremely difficult to recall if they are not registered immediately after they occur (mnemosomatics).

Forces. Hypnagogic phenomena seem to occur due to the struggle of two opposing forces in the consciousness:

1. **Brain.** Sleepiness (mental fatigue, somatics).
2. **Mind.** The effort of thinking (thosenization, thosenology).

Mythology. Spontaneous experiences with hypnagogic images looking like environments external to the individual may have played an important role in the development of folklore and mythology through the centuries.

Errors. There are many possibilities for the occurrence of visual errors.

Causes. Upon thinking that we see an external object, we can be mistaken for 3 basic reasons:

1. **Intraphysicality.** The external world, e.g.: the mirage, reflections and illusions or hallucinations (ecology or social influence).
2. **Somatics.** The human body (soma), e.g.: a stimulus to the eyes.
3. **Nightmare.** The brain, e.g.: the experience of a common physiological nightmare (neurology).

Criticism. Authors affirm that hypnagogic states cannot be compared with hallucinations, since they are criticized and censured, do not determine the acceptance of the individual and are fed by objects from the environment.

Characterizations. Any person can experience various types of sensations or visual images, which should be well-characterized, especially in terms of their specific origins, in order to better understand and distinguish the phenomena of hypnagogy from other visual or even animic-parapsychic occurrences, including all types of clairvoyance.

Categories. The following are 4 types or categories of images from which one can establish different characters:

1. **Secondary.** When people close their eyes after slowly and clearly observing an object for a few seconds, they see an image or a succession of images that reproduce the shape of the object which, as in photographs, can be positive or negative images, whether in a successive or alternating manner. These are common images, also called *complementary*, *consecutive*, *posterior* or *secondary* images, which are generated from commonplace external vision.

Recurrence. These visual images are inserted within the period of retinal oscillations or the recurring images and include: primary images, tertiary images and quartic images.

2. **Phosphene.** Other diverse luminous impressions can be experienced through *compression* or, in other words: pressing on the eyeball with the eyelids closed. In this case, the images are called *phosphenes*.

Mechanical. These effects can arise in the form of circles, colored flowers and more-or-less geometric figures, such as the designs of certain tapestries that are animated with the movement of a whirlwind. Nevertheless, they are merely the result of a mechanical action exercised upon the eyeball.

Sensations. Technically, phosphenes can be described as luminous sensations due to an inadequate electrical or mechanical (shocks to the eye, compression from an external or internal source, as in glaucoma) excitation of the retinal receptors.

Rotatory. There are also *rotatory* phosphenes that are produced by applying separate electrical stimuli, with very close frequencies, to each of the eyes.

3. **Entoptic.** Entoptic images are those visual images that occur in the interior of the eyeball. They are, therefore, of subjective origin, almost always cerebral, generally multiple, blurry, overlapping and have irregular shapes. They are visual stimulations originating in the eye itself: images of blood vessels and, sometimes, of blood cells, leukocytes that circulate in the vitreous humor (*floating flies*) and cell fragments. The vitreous humor is a gelatinous substance in the interior of the eyeball. These cell remnants, deposited in the bottom of the eye, dislocate when it moves.

Scotomas. Among these phenomena can be found retinal blue arcs, Maxwell spots and scotomas. These are manifested as more-or-less extensive, dark, immovable spots that cover a portion of the visual field or the object that is being observed. This results exclusively from the insensitivity of a corresponding portion of the *retina*. Often, in these cases, luminous, brilliant, flashing points or lines also appear. Scotoma is a type of temporary blindness, originating in the cerebral cortex. The images seen are sometimes described by persons of advanced age as *spider webs*, *floating flies*, *flashes*, *colored ribbons* and *stars*. These manifestations, when luminous or scintillating, move rapidly in a zigzag fashion.

Sleep. Scintillating scotomas awaken the sleeper and disturb his/her attempts to go back to sleep.

Migraine. Luminous scintillating scotoma appears in the ophthalmic migraine. Hemianoptic scotoma is due to a small lesion in the calcarine zone of the visual cortex, since it is found in symmetrical regions of the visual fields of the 2 eyes.

4. **Clairvoyance.** Other quite diverse precedential visions are incidences of *facial* clairvoyance (the transfigurations of Jesus of Nazareth) or the elementary animic-parapsychic phenomena of common clairvoyance that transcend the limits, atmosphere and characteristics of the physical forms seen at the moment, while the eyes are open.

Electrode. Upon electrical excitation of the visual region of the brain, what patients see is much more elementary than the things they see in normal life. They describe what they see as “flickering lights”, “colors”, “stars”, “wheels of fire”, “glauco-cerulean and reddish discs”, “pale blue lights”, “spinning colored balloons”, “stiletto-like sparkling grayish objects” and so on. All these visual reactions are elementary.

Models. An electrode that transmits 40, 60 or 80 impulses per second to the receptive surface of a field in the sensorial cortex is not able to imitate the diverse models of current impulses that normally arrive at this region, when a person sees or senses objects in his/her environment while in the ordinary, physical waking state.

Multidimensionality. If all of this occurs during the physical waking state, consider the far more sophisticated processes that occur when your consciousness perceives interdimensional or multidimensional realities through clairvoyance.

Occurrences. In the development of the images of facial clairvoyance, the following 10 occurrences can arise:

1. Clairvoyance by clairvoyant 1 of images superimposed on the face of clairvoyant 2, or vice-versa.
2. Simultaneous facial clairvoyance.
3. Images of landscapes.
4. Clairvoyance beyond the physical environment, the next room or the surrounding city block.
5. A parade of recognized and unfamiliar faces seen by both clairvoyants, sometimes totaling fifty or more personalities in 30 minutes of clairvoyance.
6. A variety of intercurrent physical effect phenomena with the first, more experienced clairvoyant, including alterations in respiration, stimulation of the chakras (notably the frontochakra and umbilicochakra) and a decrease in the body temperature of the clairvoyant.
7. The temporary disappearance of images, as though the scene had become blurry, with the appearance of new personalities.
8. The successive reappearance of some personalities many times in succession.
9. The instantaneous appearance and disappearance of a personality in the “screen” of the clairvoyance.
10. Caricatural alterations in the facial features of the clairvoyants.

Special. Neither the ambient light, nor the use of corrective lenses or glasses by both clairvoyants during the trance, nor the recent ingestion of food, still in the digestive process, alter the development of the phenomena of clairvoyance.

Preparation. The self-perceptible movement of the frontochakra of clairvoyant 1 announces the preparation of facial clairvoyance.

Beginning. The alterations in the facial characteristics of clairvoyant 2, as perceived by clairvoyant 1, generally represent the beginning of the clairvoyant manifestations.

Coupling. The auric coupling between the 2 aspiring clairvoyants, either over hours or even days of continued time together, facilitates the manifestations.

Eye. It is worth clarifying that – besides all the visual images already referred to – in complete darkness, without stimuli capable of provoking entoptic phenomena, an impression of a grayish light with irregular space-time distribution persists that seems to be due to the influx of the spontaneous discharges of the optical fibers. This would be the light of the human eye itself, the intra-ocular fluid or the self-luminosity of the retina.

Hypothesis. In this context, it is worth asking: Can we deduce from this occurrence that nerve impulses carry photons? What is the relationship of this to the luminosity of the psychosoma when it suddenly irrupts through the soma of the intraphysical consciousness (theory of irruption of the psychosoma) or, in other words, when the soma itself presents luminosity?

Appearance. On the other hand, hypnagogic images (*condensed hieroglyphs*) present themselves differently from the images referred to here, because they are the neighbors of natural sleep and more frequently appear as colored images, in which case the eyes are closed or the individual is in a completely dark environment, when the *human body* is inactive and *voluntary attention* remains active.

Somnolence. Hypnagogy is directly related to the state of somnolence or, in other words, the state of falling asleep, wherein voluntary control of activity and thought disappears, without the complete severing of sensory-motor relations with the external environment.

Hallucinations. The condition of somnolence can present hypnagogic hallucinations.

Predormitum. The initial phase of sleep receives the name of *predormitum*.

Prodromes. Hypnagogy is characterized by the prodromes of natural sleep and does not only constitute the doorway to sleep. This is because it also predisposes one toward lucid projection, and particularly projection with continuous self-awareness, as the dis coincidence of the vehicles of manifestation of the consciousness, in many cases, begins precisely during the hypnagogic period.

Demarcations. Hypnagogy is characterized by two very distinct lines:

1. **Consciousness.** The line of demarcation between *consciousness* and unconsciousness.
2. **Coincidence.** The line of demarcation between the states of coincidence and dis coincidence of the vehicles of manifestation of the intraphysical consciousness.

Takeoff. Hypnagogy is also an ideal opportunity for the intraphysical projector's consciousness to experience a fully lucid takeoff in the psychosoma.

Powers. The controlled hypnagogic state, as well as the hypnopompic state, have been recognized for approximately 3 centuries by many clairvoyants as being especially favorable for communication with extraphysical consciousnesses which have passed through first desoma. It is also advantageous for the development of animic-parapsychic powers, such as: telepathy, clairvoyance, precognition and cure (heteropalliative and parapsychic self-remission).

Myoclonuses. The hypnagogic state can be accompanied by abrupt and repeated involuntary muscular jerks or spasms in the form of more-or-less localized wrenching contractions or movements that occur either in a synchronized or irregular fashion, known as *myoclonuses*. There are other types of myoclonuses with a pathological etiology and nature.

Duration. The hypnagogic state, or the first phase in the sequence of natural sleep, can persist for a few seconds or can last for up to about 15 minutes, according to modern laboratory research on sleep and insomnia.

Pupils. Elevating the pupils toward the top of the head, brow line or sinciput, while concentrating one's consciousness on an imaginary point visualized at the top or center of the cranium, easily provokes the hypnagogic condition. This is an initial resource used in yoga practices, by practitioners of biofeedback and in the majority of mind expansion techniques, mind control, or alphasenics, namely the emission of small *alpha* type brain waves. Alpha waves range from 8 to 13 Hertz or cycles per second (cps) and can be detected by placing electrodes on the cranium, thus recording the *language of the brain*.

Waves. Currently, no less than 32 separate wires and channels are used to capture and register brain waves.

Potentials. The electroencephalograph (EEG) measures, registers and amplifies fluctuations in the voltage, or miniscule electrical potentials, occurring in the test-person's cerebral hemispheres. It then groups them into 4 categories or waves.

Electroencephalogram. Reading the resulting record, or electroencephalogram, allows one to know when large parts of the brain are actively working.

Hertz. One Hertz (Hz) is equivalent to 1 vibration per second.

Alpha. The alpha rhythm (Berger rhythm or alpha wave) refers to a state of passive alertness, or superficial (light) meditation. It does not generally occur when the eyes are open.

Frequencies. Three other small electrical pulsations, or frequencies, of brain waves also exist:

1. **Beta.** *Beta* waves, 14-30 cycles per second, correspond to the ordinary, physical waking state, which accompanies all types of intellectual activity as well as the individual's problem solving processes.

2. **Theta.** *Theta* waves, 4-7 cps, are related to deep meditation. They are believed to constitute the frequency of creative mental activity or when the person induces a deep altered state of consciousness.

3. **Delta.** *Delta* waves, 0.5-3 cps, appear during the state of deep sleep, wherein there are no rapid synchronous bi-ocular movements.

Pathology. When delta waves appear during the ordinary, physical waking state, it is indicative of a brain pathology.

Importance. All individuals who exhibit high amounts of *theta* waves while they are preparing to have a lucid projection invariably report having lucid experiences soon thereafter. This demonstrates that, of the 4 basic categories of electric brain pulsations, *theta* waves are more important, mysterious and exhibit the most intimate relationship with lucid projections, particularly those that present *consciential blackout*.

Control. As a general rule, those desiring to leave the human body who are able to generate and control *theta* waves produce impactful lucid projections.

Conditions. The alpha state appears under conditions of psychophysical relaxation, passivity, tranquility, inhibition of the outer world, assimilation, psychic well-being, abolition of the conscious, exalted sensitivity and during the production of phenomena occurring due to *psi capacities*.

Psychedelic. The alpha state is the best substitute for psychedelic drugs in general.

Hypnosis. In order to have an overall understanding of the consciential states studied in hetero-hypnosis, for example, we can divide the mind into 3 segments:

1. **Conscious.** The conscious mind, awake and attentive at the *beta* level.

2. **Subconscious.** The subconscious mind is at the *alpha* level.

3. **Unconscious.** The unconscious mind is manifested in light sleep, the *theta* level and deep sleep, the *delta* level, in which it is sometimes possible, in exceptional cases, to be conscious, according to inferences drawn from certain yoga techniques.

Language. Besides the brain waves referred to here, neuroscientists currently study other aspects of the intricate *language of the brain* and have already detected different waves, such as those of: expectation, surprise and reprocessing.

Mechanisms. It is hoped that a comprehension of the mechanisms of the brain will also afford a clearer understanding of the mechanisms in the innumerable aspects of projectiology in the near future.

Forearm. There is an effective, well-known technique for prolonging the hypnagogic state in order to allow the consciousness to *penetrate the images* of this state, which normally *behave* independently of the individual's voluntary control, initiating a lucid projection.

Technique. Lie down in the dorsal position, physically relax and extend the arms alongside the human body. When you feel yourself getting sleepy, raise one of the forearms into the vertical position

over the bed and keep it there, resting it on its elbow. Every time your consciousness begins to sleep, your forearm will fall onto the bed and you will awaken. This will prevent your falling asleep and will prolong your hypnagogy, thus predisposing you toward having a lucid projection.

Hypnopompy. The consciential condition contrary or antipodal to hypnagogy is hypnopompy.

Parasomnia. The set of presomnia, where hypnagogy is situated, and postsomnia, where hypnopompy is inserted, constitute *parasomnia*, or the 2 psychic states that precede and follow the ordinary or natural sleep state. Parasomnia can be pathological.

Differences. By their differential characteristics, altered states of consciousness exhibit their own diversified nuances that places them into a crescendo of manifestations, such as:

1. **Hypnagogy.** Hypnagogy represents an inner event, *without* the direct participation of the spectator-hypnagog.

2. **Paradream.** A dream constitutes an inner event *with* only the relative participation of the consciousness of the spectator-dreamer.

3. **Projection.** The lucid consciential projection is not an event that falls within either category. It is an authentic adventure of the intraphysical consciousness which is temporarily freed from the *bellows of the soma* and is active with the full decision-making powers of the projected projector.

246. TRANSITIONAL STATE

Definition. Transitional state: period of tenths of a second or, more rarely, of several seconds or minutes, that occurs between the beginning of the disincidence of the vehicles of manifestation of the intraphysical consciousness, or takeoff, and the full exteriorization of the psychosoma, occurring when the consciousness apparently finds itself in 2 vehicles – physical and extraphysical – or is passing quickly from one vehicle to another.

Synonymy: minidisincidence; semi-takeoff.

Dubiousness. During the transition stage, eccentric and dubious sensations often appear that are difficult for the projector to characterize and express, even when lucid during the entirety of the experiment.

Alarm clock. The common experience during lucid projection in which an intraphysical consciousness awakens extraphysically instead of waking up in the ordinary, physical waking state at the exact instant that an alarm clock rings, also incontrovertibly characterizes the condition of the transitional state.

Occurrences. Various events occur during the transition stage of consciential projection, especially the following 4:

1. Condition of instability of the psychosoma (psychosomatics).
2. Sinking takeoff (consciential projectability).
3. Double awareness.
4. Extraphysical double vision.

Bibliography: Crookall (343, p. 32), Muldoon (1105, p. 125), Vieira (1762, p. 44).

247. DOUBLE AWARENESS

Definition. Double awareness: the sensation of being in 2 centers of the consciousness at the same time or, in other words, in 2 vehicles of manifestation simultaneously, in this case almost always in the physical brain and the consciousness in the mentalsoma, which is bound in the parabrains of the psychosoma.

Synonymy: alternating consciousness; consciential cleavage; divided consciousness; double perceptions; dual consciousness; mental diplopia; sensation of 2 consciential pointers; sense of consciential duality; split consciousness.

Pointer. In order to further clarify the above definition it can be stated that the phenomenon of double awareness constitutes a transitional state of lucid projection in which part of the consciousness *seems to be* headquartered in the human body and the other part headquartered in the psychosoma. There is some lucidity simultaneously in each of the locations, sometimes predominating in one place and then in another, according to the focus of attention or the pointer of the consciousness.

Expansion. Actually, the consciousness does not divide itself, although it expands itself to currently unknown limits.

Integral. The integral consciousness seems to exist only in one body or vehicle of manifestation.

Mentalsoma. Nevertheless, mainly because of the extreme velocity or instantaneous nature of the process, the sensations *may appear to be* double, dubious, bifaceted or in 2 places at the same time, in an *apparent dichotomy* of the personality, as if the seat of intelligence – the mentalsoma – were unstable, transitional, shifting or moveable.

Semitakeoff. The phenomenon of double awareness has a direct relationship with the takeoff of the psychosoma from the human body or, in other words, constitutes an occurrence characteristic of the transition period of semitakeoff, semidisconnection, half-exteriorization or minidiscoincidence of the vehicles of consciential manifestation.

Pre-projective. Double awareness is more frequent as a pre-projective occurrence, although, more rarely, it can also arise after an interiorization of the consciousness in the psychosoma into the human body.

Bilocation. Physical bilocation should not be confused with 3 distinct and characteristic phenomena.

1. **Paravision.** Extraphysical double vision.
2. **Vision.** Duplication of the sense of vision.
3. **Consciousness.** Sensation of double awareness.

Electrode. In the same way, the sensations of double awareness, stemming from the discoincidence of the vehicles of manifestation of the ego, should not be confused with the sensations of being in 2 time periods and 2 different places. This occurs due to the stimulus of certain areas of the brain with a very fine electrode, which is an entirely chemical and electrical phenomenon of the organism. In this process, memories connected to a specific experience in the past, but from one's current human existence, can be reactivated (intrapysicology).

Hemispheres. As a working hypothesis, is it worth questioning whether the existence of the 2 cerebral hemispheres, left and right, might have some relationship with the sensation of double awareness in the same way that the *double ego* hypothesis exists?

Cord. The factor that seems to decisively influence the creation of the double awareness sensation is a reduction in the energetic link, namely the *caliber* of the silver cord, that does not transmit vigorous stimuli from one vehicle to the other, or from the human body to the psychosoma, and vice-versa.

Hypothesis. Could this occur in certain cases due to a parapsychic effect or to a survival instinct born of the fear of losing instantaneous control of the human body?

Omnipresence. In summary: according to observations it can be concluded that, due to more evolved consciential sensations and the lightning-fast velocity of the mentalsoma's still obscure

consciential processes in the mentalsomatic dimension, omnipresent consciousness sometimes seems to exist or, in other words, the attribute of omnipresence, which is a mere appearance.

Unipresence. Strictly speaking, therefore, the consciousness, whatever its consciential seat at a specific moment, is always a *unipresent* consciousness, having only a single presence.

248. EXTRAPHYSICAL DOUBLE VISION

Definition. Extraphysical double vision: the simultaneous visualization of 2 different environments or scenarios directly through the human eyes – in this case, through the brain (the eyes are just visual organs, therefore, it is *the brain that sees*) – as well as through the extraphysical vision (the para-eyes), in this case, through the psychosoma-mentalsoma relationship while outside the cellular organism, whether in the bedroom (energetically shielded chamber) or beyond.

Synonymy: ambivalent vision; animic-parapsychic vision; combined vision; extraphysical double vision; vision through 4 eyes.

Neurophysiology. According to neurophysiology, the following can exist: bi-ocular vision, the vision of colors, in-depth vision (stereoscopic vision) and three-dimensional vision. There is currently a greater development of the understanding of specific cerebral centers in order to interpret/organize the images that populate the micro-universe of the intraphysical consciousness of adults, children or youths.

Brain. It should be stressed that, physically speaking, it is the brain that sees. It can see even without the presence of external stimuli, as occurs in natural dreams (physiological), nightmares (physiological or pathological) and in hallucinatory phenomena (physiological or pathological).

Transition. In the manner of double awareness, extraphysical double vision is a similar phenomenon being the transition state of lucid projection in which part of the vision is simultaneously in the human body and part is in the psychosoma. It occurs through a two-way path of the sense of vision.

Pre-projective. Extraphysical double vision is more frequently a pre-projective occurrence, although it can also, but more rarely, occur after an interiorization of the consciousness that is preparing to awaken physically.

Clairvoyance. Extraphysical double vision should not be confused with clairvoyance, or second sight, as this only represents the second part of the latter.

Composition. In short, extraphysical double vision is normal physical vision plus the familiar clairvoyance, working simultaneously.

Audition. The phenomenon of double audition occurs with a certain frequency during the interiorization of the projected consciousness when returning to the human body. On these occasions, the projector's consciousness can extraphysically see the extraphysical consciousness which is speaking, sometimes calling its name. Due to the vision, or the *somehow perceptible* sound of the call, the consciousness ends up abruptly interiorizing while still hearing its name being insistently called.

Clapping. Often, the projected consciousness interiorizes because it hears a physical or extraphysical cracking or clapping noise of unknown origin.

Sensations. Evidently, according to the *eccentricity of the senses*, or the sensations that the consciousness experiences during the transition from one consciential state to another, besides *double* awareness, extraphysical *double* vision and *double* audition, *double* touch, *double* motricity and *double* sensitivity can occur.

Bibliography: Muldoon (1105, p. 107), Walker (1781, p. 70).

249. EXTRAPHYSICAL BRADYKINESIS

Definition. Extraphysical bradykinesis: the condition of abnormal slowness in the extraphysical movements of the intraphysical consciousness while projected in the psychosoma.

Synonymy: extraphysical slowness; slow extraphysical dislocation; slow-motion extraphysical movement; slow-motion.

Medicine. In medicine (neurology, psychiatry) the term *bradykinesis* denotes the slowness of the individual's movements due to a compromised nervous system, as occurs in Parkinson's disease and epilepsy, for example.

Net. Here we analyze the slow, laden, heavy extraphysical movement of the psychosoma of the projected consciousness. This generally occurs in the portion of the silver cord's intense activity, within the extraphysical sphere of energy. The psychosoma seems to be involved by a *net of energetic connections* that impedes it from moving in its condition of normal disentanglement, at full velocity.

Marionette. The psychosoma, in this case, seems transformed into a simple marionette. Any human lucid projector can have this experience regardless of his/her organic condition.

Causes. In projectiology, the *slow-motion* phenomenon seems to originate from the transitional or discontinuous state of the consciousness that occurs during the process of lucid projection, almost always when the exteriorized psychosoma is denser or carrying part of the holochakra.

Ballast. The greater density of this heavier and more voluminous ballast makes it difficult for the emotional vehicle of the consciousness to move with agility.

Coadjutants. The following are 2 other probable generating factors or coadjutants of extraphysical bradykinesis:

1. **Cord.** The difficulty and limitation of movements due to the direct action of the silver cord, when denser.

2. **Imponderability.** The insecurity of the movements of the projected intraphysical consciousness due to its psychosomatic or extraphysical imponderability, which is uncommon or unhabitual during the day-to-day existential routine.

Frustration. It is worth mentioning that sometimes, with the condition of extraphysical bradykinesis, the consciousness wants to move with greater agility but is not able to. It is locked in an indeterminate dragging slowness that makes the experience disagreeable and quite frustrating. It is similar to the common admonitory signals sent through the silver cord to the psychosoma of the projected intraphysical consciousness when he/she needs to return to the human body which remains inactive in the physical base.

Readjustment. In the phenomenon of traveling clairvoyance, produced by a clairvoyant through hetero-hypnosis, the hypnotist eliminates the condition of the clairvoyant's bradykinesis through energetic exteriorizations applied longitudinally or lengthwise onto his/her human body. Thus, the hypnotist applies his/her own consciential energy to readjust the equilibrium of the other consciousness.

VS. The same can be accomplished directly by the projected consciousness in an independent manner, which should install the VS or vibrational state (self-energization) and readjust the conditions of its consciential energies, thereby eliminating the *slow-motion* condition.

Energy. The instability of the projected human projector's psychosoma, as well as extraphysical bradykinesis, are conditions stemming from the energetic imbalance that arises during the transition period between the ordinary, physical waking state of the coincident intraphysical consciousness and its discoincidence or projection to the extraphysical dimension.

Will. Every energetic imbalance can be readjusted through the action of the will of the consciousness upon the manifestations of its consciential energies (holochakrology).

Bibliography: Noyes Jr. (1141, p. 20), Vieira (1762, p. 124).

250. PARAPSYCHOLEPSY

Definition. Parapsycholepsy: the brief lapse in the lucidity of the consciousness that frequently occurs in the transition of the focus of mental operations, headquartered in the brain of the human body, to the *paramental operations*, headquartered in the parabrains of the psychosoma, generally occurring at the precise moment at which the formation (recomposition, re-aggregation) of the humanoid structure of the exteriorized psychosoma is completed, being constituted in the extraphysical dimension, evidently outside the limits of the human body (soma).

Synonymy: consciential blackout; consciential short-circuit; extraphysical absence; extraphysical amnesic episode; extraphysical clouding of the consciousness; extraphysical consciential eclipse; extraphysical lapse of the consciousness; extraphysical loss of consciousness; extraphysical period of unconsciousness; hiatus of extraphysical awareness.

Brain. The brain is an electric apparatus with positive and negative polarity, and any interference with this polarity results in a loss of lucidity (*physical mind*) that can finally arrive at a transitory consciential blackout (*extraphysical consciousness*).

Parabrains. Consciential blackout occurs in the psychosoma – in the parabrains in which the mentalsoma or the consciousness is headquartered – and obviously directly affects the consciousness itself in the mentalsoma.

Takeoff. The physical-extraphysical blackout of the consciousness is situated at that point which is the most difficult or critical for maintaining lucidity. Blackout is the agent responsible for the difficulty of the consciential projector to experience the totally awake takeoff of the psychosoma, which is the rarest type of takeoff of all. Blackout demarcates the transition of the focalization of the thoughts of the consciousness – the pointer of the consciousness – from one vehicle of manifestation, the soma, to another, the psychosoma.

Emptying. This is the critical moment of basic discoincidence, the changing of the seat of the consciential pointer or the creation of the *empty brain condition*.

Tunnel. Temporary blackout is directly connected to the silver cord and the tunnel effect. This is because the projected consciousness seems to suddenly enter a dark tunnel, sometimes feeling a certain confusion, obnubilation or obfuscation in its extraphysical perceptions.

Bulb. Consciential blackout is reminiscent of an electric bulb that briefly diminishes in brightness and increases its luminous intensity soon thereafter to return to normal.

Change. Consciential blackout also appears like a profound and instantaneous change that arises during the changing of gears of consciential operations.

Incidence. According to the statistics of public surveys, the experience of parapsycholepsy affects approximately 30% of all individuals who report having consciential projections.

Time. Chronological time is always difficult to interpret, from an extraphysical point of view.

Duration. Although the duration of *consciential blackout* can vary within broad time limits, it seems to be generally very rapid, and at times lightning-fast, lasting a moment, an instant, tenths of a second or only a few seconds.

Vision. After a brief blackout, extraphysical illumination, or the first vision of the consciousness while outside of the body, arises. This vision appears nebulous, whitish and indistinct.

Sounds. Next, sounds that may perchance exist in the situation also arise.

Stars. A person suffering an injury to the head, e.g.: with cranioencephalic trauma in a brain concussion, has the sensation of *seeing stars* due to a momentary blow to the optic nerve. This is produced as a result of the momentary dislocation of the victim's psychosoma, just as with the consciential blackout which, nonetheless, is a normal, non-accidental or physiological occurrence.

Toll. Projective blackout represents the toll that the intraphysical consciousness pays in order to temporarily cross the border between the human dimension and the extraphysical dimension

(energetic dimension). The phenomenon energetically works like an electric or electromagnetic short circuit.

Self-awareness. Projection with continuous self-awareness somehow nullifies this toll. How does this happen? The answer seems to be beyond human understanding or at least beyond the current grasp of science. We still do not understand its mechanism. It is necessary to begin studying a little more holochakrology in a direct manner.

Will. The will, however, can eliminate the occurrence of conscial blackout.

Interiorization. Projective blackout may occur less frequently in the opposite direction, after the return of the projected consciousness and its interiorization into the human body, in the transition of the focus of conscial operations from the psychosoma to the dense body. Nonetheless, this does not take on the phenomenological magnitude and importance of the projective blackout which is specific to the takeoff stage of the psychosoma transporting the consciousness.

Translocation. Blackout of the lucidity of the projected consciousness may also occur when the psychosoma moves very rapidly from one extraphysical dimension or district to another.

Memory. The lucidity of the consciousness greatly depends on memory.

Unconsciousness. Strictly speaking, the state of total or absolute unconsciousness does not exist.

Subconscious. Our subconscious never sleeps.

Consciousness. The mind, in this case the consciousness, is always permanently conscious, even when in the states that we call unconscious and during projective blackouts. What more commonly occurs is that the consciousness does not remember what happened upon returning to the ordinary, physical waking state.

Inertia. It is interesting to note an analogy between the unconscious state of being (always relative and not absolute) and the concept of inertia, a property of matter (also always relative and not absolute), since it includes both the body at rest that tends to remain at rest, as well as the *body in movement* that tends to remain in movement, except when affected by a foreign or external force.

Movement. There is apparently nothing in the universe that remains at a *standstill*, such as the following 3 realities:

1. **Physics.** Atoms move themselves: see quantum physics.
2. **Somatics.** Bodies move themselves: see what happens to an inactive soma or a sedentary human life that destroy themselves.
3. **Conscientiology.** Intrapysical consciousnesses do not sleep even when the soma demands rest and physiological and periodical recomposition.

Images. The following, for example, are 11 images and expressions used by conscial projectors to characterize the projective blackout:

1. Conscial darkening.
2. Momentary darkness in awareness.
3. Personal state of complete unconsciousness.
4. Temporary lapse of lucidity.
5. Unexpected period of unconsciousness.
6. A second of *empty* unconsciousness.
7. Fogging of awareness.
8. “Everything became dark.”
9. “Everything became empty.”
10. “I underwent momentary unconsciousness.”
11. “I had a loss of lucidity.”

Absences. Finally, there are 4 basic types of psychic absence or conscial lapse. They are very distinct, with more or less ample blackouts occurring in the continued succession of the lucidity of the intraphysical consciousness and should be observed in order not to confuse them with each other:

1. **Epilepsy.** Pathological psychic absence or epileptic *petit mal*, generated by various causes.
2. **Psychophony.** Psychic absence due to benign parapsychic trance, characteristic of incorporation or semiconscious psychophony. Nevertheless, this type can also be pathological in those cases triggered due to intrusion by a pathological or *energivoros* extraphysical consciousness, blind guide, extraphysical intruder, or outright interconscial possession. At the beginning of the manifestation, one can have recollections that do not fit within one's personal memories or, in other words, pseudomemories or *para-amnesias*.
3. **Retrocognition.** Psychic absence due to an extremely intense retrocognition that occurred in the ordinary, physical waking state. In this situation, the intraphysical consciousness remembers experiences of the previous human existence, but perceives that they are real, are its own, pertaining to its holomemory or holobiographical integral memory.
4. **Projection.** Psychic absence due to a generally nonlucid or semilucid instantaneous conscial projection. This occurs due to the exit of the intraphysical consciousness from its seat in the human brain.

251. INTRACRANIAL SOUNDS OF TAKEOFF

Definition. Intracranial sounds of takeoff: the noises that are difficult to characterize, perceived only by the consciousness when projecting, almost always stemming from the cranium itself, whether intra or extracerebrally, at the exact moment of a lucid takeoff in the psychosoma.

Synonymy: encephalic echoes; extraphysical tinnitus (*acúfeno*); inexplicable intracranial sounds; internal clicks.

Tinnitus. According to psychology, the name tinnitus (*acúfeno*) is given to all auditory sensations that are not produced by a stimulus external to the organism.

Sanity. Tinnitus (*acúfeno*) does not always have a pathological origin.

Classification. Intracranial sounds occurring during the development of a lucid projection can be classified into two categories:

1. **Takeoff.** The sounds related to the takeoff of the psychosoma that was interiorized in the soma.
2. **Interiorization.** The sounds related to the interiorization of the psychosoma that was projected in the extraphysical dimension into the soma.

Cause. The main cause of the acoustical phenomena analyzed here – projective intracranial sounds – seems to be the abrupt or moderately traumatic takeoff of the extraphysical head of the psychosoma (parahead) from the human head, which produces the effect of intracranial energetic discharges.

Expressions. These energetic discharges are felt and heard by lucid conscial projectors and reported, for example, along the line of the following 6 categories of expressions:

1. Jingling.
2. Buzzing (loud jingling).
3. Tinkling (medium jingling).
4. Sibilations (sharp jingling).
5. Crackles (brief tinnitus (*acúfeno*) with an undeveloped tonal character).
6. Squeaks, chirps or twitters.

Action. During an abrupt takeoff, the silver cord acts decisively in the encephalic area.

Ductility. Hypothetically, these sounds can be provoked by the *ductile* movement of the silver cord that gradually changes from being a *layer*, distributed in the head, to being an actual *cord*.

Occurrences. Projective intracranial sounds occurring *simultaneously with* a lucid takeoff are less frequent and milder than intracranial sounds occurring *simultaneously with* the abrupt interiorization of the entire psychosoma (*inductility*).

Self-awareness. Sounds can occur consecutively in a single projection with continuous self-awareness or, in other words: *first* during a lucid takeoff; *afterwards* during a lucid interiorization.

Succession. Intracranial sounds can also occur during many successive or consecutive exits and reentries of the psychosoma out of and into the human body in a short period of time.

Types. With regard to their frequency and intensity, extraphysical tinnitus (*acúfenos*) occurring during the takeoff and interiorization of the psychosoma are generally described, for example, using the following 4 expressions:

1. **High frequency.** Loud noises and whistles or high frequency tinnitus (*acúfenos*) in the air.
2. **High intensity.** The sound of bells pealing violently or high intensity tinnitus (*acúfenos*).
3. **Low frequency.** Flapping wings or low frequency tinnitus (*acúfenos*).
4. **Low intensity.** Mild or low intensity tinnitus (*acúfenos*).

VS. These facts suggest that the intracranial sounds during the takeoff of the psychosoma are directly related to the vibrational state (VS).

Uniformity. In a consciential projection, whether during a lucid takeoff or a lucid interiorization – separately, with no relationship between one occurrence and the other – the sounds generally present patterns or are definitely uniform and independent, or are of high or low frequency and do not alternate from one frequency to another.

Psychosoma. The intensity of intracranial sounds during lucid takeoff is dependent upon the rapidity of the psychosoma or, more precisely, the velocity of the action of the holochakra between the soma and psychosoma.

Characteristics. Among the characteristics of intracranial sounds of takeoff we can point out the extremely personal internal sounds, whether they are heard inside the head, in the right or left ear.

Inoffensiveness. The sounds are always inoffensive.

Personality. The intensity and types vary according to the personality of the projector.

Analogies. Often, extraphysical tinnitus (*acúfenos*) are similar to the sounds stemming from small events in daily life, such as the following 5:

1. Metallic sounds.
2. Tearing of silk.
3. Falling grains.
4. A door slamming.
5. Vibration of a guitar string or another musical instrument.

Utilities. With time and repetition of the experiences, the intracranial sounds heard by the intraphysical consciousness present 3 categories of unquestionable holosomatic or self-persuasive evidence:

1. **Holochakra.** The existence of the holochakra.
2. **Cord.** The existence of the silver cord or cords (regional).
3. **Chakras.** The existence of chakras and consciential energy ducts.

Onomatopoeia. The following are 8 onomatopoeias sometimes used by consciential projectors to express types of intracranial sounds heard during interiorization and takeoff of the psychosoma: *bam; blam; chii; pap; sizz; tam; tirro; zing*.

Bibliography: Buther (227, p. 73), Castaneda (258, p. 202), Crookall (343, p. 94), Farrar (496, p. 198), Muldoon (1105, p. 34), Rogo (1444, p. 7), Salley (1496, p. 159), Walker (1781, p. 67).

252. TAKEOFF

Definition. Takeoff: the initial operation of the detachment of the psychosoma from the human body or soma.

Synonymy: act of detachment of the intraphysical consciousness; dis coincidence of the psychosoma; disjoining of the double; ejection of the psychosoma; physical-extraphysical *decorpage*; point of OOB detachment; rapid departure of the psychosoma.

Mentalsoma. Besides the takeoff of the psychosoma, the takeoff of the mentalsoma also occurs. However, this happens in subtle and diverse conditions that only reach the encephalic area of the human body, beginning with the extraphysical head of the psychosoma (the parahead or, in this case, the parabrains).

Impression. The takeoff of the psychosoma with the consciousness fully lucid is one of the most impressive steps in the experience of lucid projection (see fig. 252, p. 1,136).

Types. There are various types of takeoff, such as the following 9:

1. Lucid takeoff: the least frequent.
2. Semilucid takeoff.
3. Nonlucid takeoff: the most frequent.
4. Slow or discriminative takeoff.
5. Abrupt takeoff or takeoff by ejection: the *extraphysical escape*.
6. Complete, incomplete or partial takeoff.
7. Imperfect takeoff.
8. Voluntary or compulsory takeoff.
9. Totally unperceived takeoff, without any period of transition that is perceptible by the consciousness.

Positions. When projecting from the human body, the psychosoma – always transporting the mentalsoma and the consciousness – can assume the most different extraphysical positions, the following 12 being examples:

1. Vertical.
2. To the right or left side of the dense body.
3. Rolling.
4. With one, two or three somersaults over itself.
5. In spiral, whirl, or zigzag.
6. Backward.
7. Lengthwise.
8. Upward or vertical, classic.
9. Through the head, the most common.
10. Through the feet, the rarest.
11. Diving down or through the bed below.
12. Seated on one's own body.

Intercurrences. Besides that which has been presented, other sensations often occur during the takeoff of the psychosoma, such as the following 13:

1. Sensation of intracranial pressure, almost always in the center of the cranium or in the occipital base.
2. Sensation of pressure on the forehead or in the center of the frontal force (frontochakra).
3. Vibrational state (VS).
4. Sensation of a reduction in size (rare).
5. Successive attempts without achieving results.
6. Rhythm during takeoff.
7. A comfortable and impressive sensation of loss of respiration.

8. Extraphysical supine position.
9. Oscillations and undulations of the psychosoma.
10. Sensation of absolute freedom.
11. Takeoff in sequence.
12. Condition of physical anchoring of the projector.
13. Antiprojection or *anti-takeoff*.

Areas. The final part of the takeoff, or the exit of the psychosoma from the human body, usually occurs in the following organic areas, which are not always perceived: head, nuchal region; glabella or area between the eyebrows; center of the brain; medulla oblongata; epiphysis or pineal gland; top of the cranium (sinciput, bregma, brow line).

Solar. Less often, the projector can feel as if he/she were leaving the human body through the umbilical area, or solar plexus. Actually, however, the head of the psychosoma and, therefore, the seat of the consciousness does not frequently leave the physical body through this area (umbilicochakra).

Error. Most of the time, this fact constitutes a simple impression or an erroneous interpretation of the occurrences that repetitive experiences do not confirm.

Vision. This occurs because the consciousness does not see itself leaving from the head when, on the contrary, it can easily see the connections of the silver cord leaving the human body through the umbilicochakra, which corresponds to the first segment of the psychosoma to exteriorize itself.

Turns. When the projector is lying on his/her right or left side on the bed, it predisposes a lateral lucid takeoff of the consciousness in the psychosoma through rapid rolling turns made over the body. This does not cause any dizziness or confusion for the projector. Sometimes, this rolling allows the psychosoma to remain standing or erect in relation to the resting human body, after making two or more turns.

Projections. In projections of continuous self-awareness, the takeoff of the psychosoma with the consciousness fully lucid occurs more frequently when they are lateral. During these takeoffs, the psychosoma can be in a *horizontal position* or a *standing position*.

Lying down. The position of the psychosoma lying down predisposes the occurrence of a local projection, within the extraphysical sphere of energy, so that the consciousness has more difficulty in leaving the physical base due to the retractive power of the silver cord. Under these conditions, lucid projections are generally of short duration.

Standing. When the psychosoma is in an erect position, it gives the consciousness greater extraphysical agility. This allows it to leave the physical base and reach its distant mental target. Under these conditions, lucid projections are sometimes more prolonged.

Helpers. The helpers have certain energetic assistential resources that transcend our current understanding.

VS. The helpers' resources allow the intraphysical consciousness to leave the human body in an instantaneous takeoff through an increase or intensification of the vibrational state (VS), within the coincident individual, with or without his/her being aware of the fact and without disturbing him/her deeply or causing any harm.

Pulling. It is as if a pulling, suction or aspiration, performed by a special bundle of rays or a *vortex of energy*, is focused directly on the individual, regardless of whether it is an adult, child or animal. This explains various aspects of supposed abduction phenomena in UFO studies.

Exit. The intraphysical consciousness, when projecting to the extraphysical dimension in the psychosoma, generally does not perceive his/her exit from the physical base simply because his/her back is toward him/herself, endeavoring to look forward in the opposite direction, according to the usual conditioning imposed by the unidirectional vision of the human body.

Gradation. A backward exit allows one to *look behind oneself* and verify in detail the act of leaving the physical base. This can be performed little by little, with the body gradually *more distant*, until it disappears, losing its importance for the consciousness which is now engaged in extraphysical experiences.

Trendelenburg. During semidisconnection, or partial projection, it is common for the extraphysical Trendelenburg position (a type of imprisoning of the parahead) to occur. In other words: the psychosoma exteriorizes almost completely, becoming tilted downward, with only the extraphysical head (parahead) bound inside the physical brain, which maintains the waking state. Soon thereafter, the psychosoma may assume the extraphysical supine position, thus floating longitudinally above the human body.

Extremes. The experience of lucid takeoff, within the context of lucid projection phenomena, brings together the following 2 extremes of intense personal experience in a radical and singular manner:

1. **Micro-universe.** Firstly, the intraphysical consciousness microscopically and centripetally goes to the apex of his/her *interior state* or, in other words, to the intimacy of his/her consensual micro-universe. He/she feels more alive and awake than ever before, within his/her intraphysical, concrete and cellular micro-universe.

2. **Macro-universe.** Soon thereafter, instantaneously and without any lapse in lucidity, he/she leaves this coarse, material condition to centrifugally and telescopically go to the maximum of his/her exterior nature, or to the multidimensional macro-universe, manifesting in a subtle extraphysical vehicle, in another condition of expanded lucidity.

Stages. In some cases, 2 very distinct stages occur during the slow exteriorization of the psychosoma which, on the other hand, is confirmed by the phenomenon of exteriorization of sensitivity:

1. **Disaggregation.** *First*, the stage of disaggregation, decomposition or separation of the elements of the psychosoma, gradually leaving the human body.

2. **Reaggregation.** *Second*, the stage of re-agglomeration, reaggregation or reconstitution of the elements of the psychosoma, gradually reorganizing or reunifying the exact humanoid formation of the psychosoma while outside the human body, within the perimeter of the intense influence of the silver cord.

Common. The disaggregation of the elements of the psychosoma can occur in various ways. In the most common manner, the disconnection starts with the feet, legs, hands, arms, trunk, neck and, finally, the head, as if it were *steam* rising up from the pores, forming small balloons from the corporal segments.

Desoma. Biological death, final projection or the first desoma has already been described in exactly this way by countless communicant extraphysical consciousnesses through the phenomenon of psychography.

Observation. The disaggregation as well as the reaggregation of the psychosoma can be witnessed by the attentive observation of the projectionist. This signifies that both processes do not compromise the lucidity and the quality of the perceptions of the intraphysical consciousness. In rapid sideways exteriorization, for example, the *sensation of steam* does not occur.

Slow. The slow takeoff of the psychosoma, when entirely lucid, allows the intraphysical consciousness to *savor* extraphysical freedom little-by-little, bit-by-bit.

Happiness. The individual thus senses the *self* gradually rise from the bed to the ceiling, intensely experiencing the act of ascension. This provides an immense happiness as it brings the condition of being light and free, without the human body, the dense material or the heavy burden proceeding together. On the contrary, the latter remains bound to the bed, *deactivated* and *down there*, in the manner of a “dead weight from which I freed myself.”

Frustration. Often, on this occasion, our *uninvited warden*, the silver cord, unfortunately enters the scene and ends the party. Our consciousness then unwillingly *interiorizes* once more, bringing a sense of great frustration.

Rolling. During the lateral rolling takeoff of the psychosoma, projectors who are married (or form an evolutionary duo) and sleep in the same bed should dismiss the psychological connotation associated with the human body of the mate lying at his/her side, with the male on the left and the woman on the right, for example.

Inhibition. Strictly speaking, from a practical viewpoint, this fact is not of the least importance, due to the difference between life's dimensions and the psychosoma's extraphysical permeability. Therefore, psychologically speaking, this can inhibit the partner's projective performance, as well as causing energetic problems with the silver cord.

Psychology. As a general rule, all psychological influence is always important and should be considered in the techniques for lucid consciencial projection. This is because psychology studies precisely the reactions of the intraphysical consciousness (mind, brain, biomemory or the reactions of nerve cells), which the projector can sometimes not predict.

Cord. The most common lucid takeoff occurs wherein the projected consciousness is stuck within the perimeter of the silver cord's vigorous action, in the physical base. This can happen many times in a row, within a one-hour period of voluntary or involuntary experiences.

Research. These lucid projections allow the practitioner to specifically research two occurrences:

1. **Sounds.** The intracranial sounds during takeoff.
2. **Energies.** The vigorous consciencial energies of the silver cord when active.

Animic-parapsychic. The takeoff of the psychosoma leaving the human body can be animic-parapsychic when the semi-incorporated extraphysical mentor directly helps the projector leave the dense vehicle.

Bibliography: Brittain (206, p. 51), Castaneda (258, p. 117), Greenhouse (636, p. 257), Monroe (1065, p. 219), Reis (1384, p. 70), Ring (1406, p. 45), Salley (1496, p. 157), Vieira (1762, p. 147), Walker (1781, p. 67), Whiteman (1842, p. 250).

253. SINKING TAKEOFF

Definition. Sinking takeoff: exteriorization of the intraphysical consciousness manifesting through the psychosoma in which one has the parakinesthetic sensation of sinking or sliding downward through the members, articulations, tendons and muscles of the human body.

Synonymy: collisional takeoff; downward takeoff.

Sinking. In the sinking takeoff, the human body seems to move downward, sometimes appearing to have abruptly entered the mattress and the inside of the bed, going all the way to the bedroom floor, when the projector is lying on his/her back on the bed in his/her physical base.

Impression. The sinking or downward exit of the psychosoma from the physical body does not always occur. The opposite often occurs, the psychosoma elevates to one degree or another, either slowly or instantaneously from the human body. This gives the impression that the human body is sinking, due to the downward retraction of part of the energies of the silver cord. These energies obviously remain in connection with the physical body (the second connection of the holochakra).

Opposite. The best way to understand and improve your sensitivity regarding the sinking takeoff is by producing an instantaneous projection with continuous self-awareness, wherein the human body is lying on its front, inactive on the bed. In this way, the psychosoma will take off slowly, upward, in the opposite direction.

Nose. Thus, when leaving part of the silver cord's power behind, the downward sensation becomes clear and unquestionable, giving a real impression that the physical nose is sinking further into the mattress, the dense body seeming to become heavier, thus delicately liberating the psychosoma without any difficulties. This parakinesthetic sensation puzzles the individual who experiences it for the first time greatly.

Forms. Sinking represents the only mode of takeoff wherein the intraphysical consciousness in the psychosoma leaves in a direct encounter, or on a collision course, with forms, bodies or physical objects (the environment's decorative items) that are in the bedroom of the intraphysical projector's physical base along with or next to his/her own human body.

Rarity. This rare kind of sinking takeoff is only worthwhile for its exotic experience, as it almost always inhibits the appearance of profound extraphysical self-awareness. As well, it can provoke a trauma with the consequent abrupt interiorization of the consciousness, which is disturbed by its conditioned reflexes that are deeply rooted in human life, relative to the forms and structures of bodies and physical objects.

Bibliography: Muldoon (1105, p. 124).

254. INSTABILITY OF THE PSYCHOSOMA

Definition. Instability of the psychosoma: the state of brief extraphysical movement of the psychosoma that frequently occurs soon after lucid or nonlucid takeoff of the consciousness from the human body and which consists of the combination of a vertical oscillation and an oscillation around its transversal axis.

Synonymy: extraphysical rocking reaction; extraphysical rocking; floating of the psychosoma; oscillation of the psychosoma; the condition of extraphysical seesawing; turbulence of the psychosoma; undulation of the psychosoma.

First. In many projective experiences, the first immediate sensation of the intraphysical consciousness projected with lucidity – common to the majority of projectors having spontaneous experiences – in the physical base is, naturally, the movement of the psychosoma, which seems like a feather or a bubble floating in midair in its final stage of lucid takeoff.

Oscillations. This occurrence is characterized by the psychosoma oscillating and floating from one side to the other and, less often, by whirling, zigzagging, rocking, snaking or making small jumps. It does not provoke dizziness in the projected consciousness, which follows along in its seat, located in the parabrains.

Projectiophobia. As the oscillations of the psychosoma constitute the first direct experiences of the intraphysical consciousness projected in the extraphysical dimension, they represent the routine cause of the fear some people have of projecting themselves, or *projectiophobia*.

Evolution. This is the primary condition that should be combated and removed at all cost if the lucid projector wishes to evolve with his/her projective experiences.

Exit. During the psychosoma's state of instability, the lucid consciousness generally seeks to force an exit from the magnetic involvement of the human body, sometimes to one side, sometimes to the other, thus taking advantage of the undulations or even producing other movements within the undulations that are maintained by the silver cord or the energetic connections of the holochakra.

Duplicity. The state of instability of the psychosoma can also transmit the sensation of duplicity in which the consciousness feels as if it were two persons, one in space, swinging above the other which is lying on the bed or, in other words: 1 body *seesawing* just above the other.

Motricity. Oscillation of the projected psychosoma basically constitutes a phenomenon of exteriorization of motricity.

Rhythm. More rarely, the state of instability can develop a type of *oscillatory rhythm* in the psychosoma that begins in the human body, the source of the process, before concluding the operation of an either lucid or nonlucid takeoff, and liberating its segments little by little, as though it were bubbling until beginning to float, upon which extraphysical stability occurs.

Positions. The condition of dynamic instability is always relative. It can occur with the psychosoma in any extraphysical position, although it frequently occurs within the extraphysical sphere of energy or, in other words: only within the perimeter of the totipotency of the silver cord or the energetic connections of the holochakra.

Partial. Oscillations of the psychosoma can occur in a partial manner only with the paramembers (paralegs or para-arms) while the consciousness is entirely lucid in the ordinary, physical waking state during a partial projection of the psychosoma.

Rocking. When the human body is lying on its front, the consciousness can feel the psychosoma to be unstable, also lying on its front, facing downward, moving from side to side like a rocking ship. This provokes an extremely exotic or uncommon sensation.

Cord. Although the oscillations and fluctuations of the projected psychosoma sometimes present disagreeable impressions, as they evidence the vigorous and preponderant force of the silver cord upon the weak will of the inexperienced consciousness, they are completely inoffensive.

Frustration. In other words, the oscillations and fluctuations of the psychosoma do not ordinarily have any negative or lasting consequences, except for the occasional frustration of conscial interiorization that is considered premature or is against the wish of the intraphysical consciousness.

Occurrences. The following are 2 subsequent facts that occur more commonly after the condition of extraphysical instability of the psychosoma:

1. **Stability.** The stability of this conscial vehicle which, once it is standing up or erect, frees itself from the influence of the silver cord, beginning a lucid projection in the extraphysical dimension.

2. **Interiorization.** Conscial interiorization, almost always frustrating, occurring as a consequence of the mild or violent traction of the silver cord.

Readjustment. In the phenomenon of traveling clairvoyance produced by the clairvoyant through hetero-hypnosis, the hypnotist eliminates the condition of instability of the psychosoma of the clairvoyant through energetic exteriorizations applied longitudinally or lengthwise onto its human body. Thus, the hypnotist applies his/her own conscial energy to readjust the balance of the other consciousness.

VS. The same can be accomplished directly by the projected consciousness in an independent manner. It should install the VS or vibrational state (self-energization) and readjust the conditions of its conscial energy, thereby eliminating the instability of the psychosoma.

Energy. Both extraphysical bradykinesis or slow motion, as well as the instability of the psychosoma of the projected human projector, are conditions caused by the energetic imbalance that occurs in transition between the ordinary, physical waking state of the coincident consciousness and its disincidence, or projection to the extraphysical dimension, while still inside the physical base.

Will. Every energetic imbalance can be readjusted through the action of the will of the consciousness upon the manifestations of its conscial energies.

Distant. The state of instability of the psychosoma does not generally occur when an intraphysical consciousness, although projected, recovers its lucidity only when physically distant from the physical base.

Help. According to reports given by sundry projectors, this greatly helps those who lay in a hammock placed far from a wall, door or window. It also helps miniprojectors *swing playfully*, who nevertheless still have short legs whose feet are not able to reach the wall.

Bibliography: Muldoon (1105, p. 74), Reis (1384, p. 54), Vieira (1762, p. 174).

255. TRACE OF LIGHT

Definition. Trace of light: the vestiges, sparks, scintillations or luminous signals that the psychosoma of the intraphysical consciousness sometimes leaves behind when moving in the extraphysical dimension, notably when at high speed and carrying the conscial energies of the holochakra.

Synonymy: comet effect; extraphysical flash; luminous sparkles of the psychosoma; luminous trace of the psychosoma; phosphorescent tail; tail of light; trail of light; “wings of angels”.

Radiation. The psychosoma, also called the luminous body or radiant parabody, when disincidental from the conscial vehicles of manifestation, always has some unmanifested or even exuberant clarity.

Potency. Nevertheless, the tonality, gradation and intensity or, in other words, the irradiant energetic potency of the consciousness, varies according to its evolutionary level, the conditions of the vehicle of manifestation, the extraphysical environment and its personal actions on that occasion.

Characteristics. Among the essential characteristics of the trace of light, at least the following 7 can be pointed out:

1. **Emergence.** The sparks appear spontaneously, with or without the consciousness being aware of the occurrence.

2. **Origin.** The luminous effect comes directly from the energetic potency of the psychosoma of the projected intraphysical consciousness with extraphysical forms condensed by the energies of the holochakra.

3. **Volitation.** In the majority of occurrences, the trace of light occurs naturally from the process of extraphysical volitation.

4. **Direction.** The sparks appear in the direction of the movement of extraphysical translocation, although in the opposite direction of the movement (see fig. 255, p. 1,137).

5. **Extension.** The sparking can reach a distance of up to approximately 24” (60 cm) from the psychosoma.

6. **Intensity.** The intensity of the scintillation depends upon the velocity of the extraphysical translocation of the consciousness, when manifesting in the psychosoma.

7. **Coloration.** The colors and tonalities of the scintillations show the evolutionary level of the consciousness-psychosoma binomial, beyond the manifestations of the human aura.

Surprise. In the first consensual projections in the psychosoma, the intraphysical consciousness may notice that he/she is emitting sparks. This is often very surprising the first time it occurs.

Interpretation. From this, some disturbance regarding the interpretation of this occurrence can also arise as the intraphysical consciousness does not know if the sparks are his/her own unconscious creation or if they are emitted from some intangible personality (extraphysical consciousness) located in the area.

Paralle. The silver cord should not be confused with the trace of light. During the projection of the consciousness when distant from the human body, the silver cord remains connected at only 1 point of the free psychosoma, generally in the parahead at the extraphysical nucha (paranucha), for example. The trace of light almost always presents a sparkling over the entire dorsal area or the back of the humanoid form of the psychosoma.

Tail. The term “phosphorescent tail” refers to the scintillations of the silver cord. It nevertheless often refers to the trace of light of the psychosoma, that seems to be sparkling and leaving a trail of luminosity wherever the projected consciousness goes.

Wings. One hypothesis contends that the psychosoma’s trace of light is responsible for the ancient, imaginary, mythological idea that the angels (evolved spirits) fly (volitate) with luminous wings (traces of light) on the back of their body of light (psychosoma).

Mythology. As we can see in this case, mythology has a partly logical rationale, finding evident substrata for creation of the myth.

Hypotheses. The trace of light of the psychosoma of the projected intraphysical consciousness, arouses many important hypotheses and the following two might be the most appropriate ones:

1. **Exhaust.** Could these sparks be a means of outflow, an exhaust process, garbage discharge, burned refuse, emunctory system, or an excretory system of the psychosoma’s energies?

2. **Friction.** Or could the trace of light be a consequence of the psychosoma’s friction against the specific vibratory level of the extraphysical environment in which the projected consciousness moves?

Bibliography: Carrington (245, p. 278), Crookall (343, p. 49), Martin (1002, p. 27), Muldoon (1105, p. 59), Vieira (1762, p. 50).

256. RESPIRATION DURING TAKEOFF

Definition. Human respiration: the act of inhaling and exhaling, filling and emptying the 2 lungs, through which the human organism absorbs oxygen and expels carbon dioxide gas.

Synonymy: breath; human breathing; human respiration.

Nourishment. A healthy adult breathes between 17 and 25 times per minute. Respiration is automatic by nature and fundamental for the survival of all human beings. Without it, human life would be impossible on earth. It is the main source of nourishment only for the mass of matter comprising the cellular or physical body (soma).

Psychosoma. Despite being the auxiliary instrument of the human body's biological organizing system, a perfect replica of the soma, the psychosoma does not have hemoglobin, blood or active respiratory equipment. Similarly, the consciousness does not need cardiorespiratory processes while manifesting itself extraphysically.

Head. All indications are that the psychosoma has these instruments or systems only as a function of the human body, but does not need to use them when manifesting itself. As proof of this fact, the consciousness manifests itself extraphysically using only the head of the psychosoma or, in other words, partial projections in the form of a phantasm.

Simulacrum. If the will of the projected projector wishes to, it breathes. More precisely, it simulates the respiratory process in the same way that it can appear younger, create clothes for itself (self transfigurations) and perform other surprising extraphysical actions.

Takeoff. In lucid projection, during the phase of lucid takeoff, the projector may verify that respiration is the most intense and predominant organic sensation, the last to disappear when taking off and the first to be reacquired when interiorizing.

Physiology. More than the circulation of the blood and beating of the heart, the physiological phenomenon of respiration constitutes the vital factor of the projective process, being the most perceptible occurrence and the one that prevails over all others at the precise moment of leaving the human body.

Yoga. The analyzed facts are confirmation of the benefits of rhythmic respiratory exercises and yoga techniques, which can actually serve as *coadjutants* to the methods for efficient production of lucid projection.

Sensations. During the process of integral projection of the consciousness in the psychosoma, respiration of the human body does not change. The extraphysical sensations of the consciousness using the psychosoma are merely modified.

Facts. The sensation of not breathing is felt as a loss and corroborates the following 8 facts:

1. **Weak trait.** A person breathes 11,520 liters of air per day, from which his/her lungs filter 543 liters of oxygen necessary for the maintenance of life. The habitual function of respiration represents a heavy burden (*human physiological weak trait*) that individuals always carry. In daily life, nobody perceives this inconvenience (intrapysical restriction, temporary loss of cons) that is clearly discovered or evidenced through the phenomenon of lucid projection.

2. **Synchronism.** The extraphysical sensation of the synchronism of simultaneous human body-psychosoma respiration.

3. **Imponderability.** The loss of the respiratory function constitutes the first factor to establish the condition of weight loss, lightness or the psychosoma's extraphysical imponderability. This can scare unsuspecting individuals who feel it for the first time, for whom it seems to be a common symptom of asphyxia or a *lack of air* (dyspnea).

4. **Freedom.** The act of discontinuing respiration predisposes and establishes the condition of absolute freedom experienced by the projected intrapysical consciousness.

5. **Extraphysical euphoria.** The absence of respiration represents the beginning of the condition of extraphysical euphoria.

6. **Volitation.** Removal of the burden of respiration lays the foundation for extraphysical free flight, beginning with its *parapsychological* aspect.

7. **Sphere.** The halt in respiration constitutes the first step toward the liberation of the psychosoma from the extraphysical sphere of energy, or the act of becoming free from the totipotent operation of the silver cord.

8. **Nature.** Human respiration is a mechanical, coarse and heavy process compared with the lightness and subtle nature of the structure and manifestations of the psychosoma.

Interiorization. If the intraphysical consciousness thinks about or wishes to breathe while projected in the psychosoma in the proximity of the human body, especially while inside the extraphysical sphere of energy, this intention can provoke an abrupt interiorization imposed by the retraction of the silver cord.

Catalepsy. We can extract a valuable practical consequence from the process of respiration by utilizing it to neutralize the state of projective catalepsy. If the consciousness is in this state, it can exit it by firmly desiring to breathe. This act makes the psychosoma interact and engage more intimately with the human body, thereby promoting the coincidence of these vehicles. This breaks the immobility of the cataleptic condition with the perceptible sensation of the intensification of the process of natural respiration.

Parapsychotics. Only post-desomatic parapsychotics – those extraphysical consciousnesses which still think they are using the human body – suffer discomfort such as physical pain and heat, perceive the coarse sensations of corporal matter and breathe naturally as though they still had functioning lungs. This is because they are obnubilated and numb, do not feel any difference between the human body that they have already unwittingly discarded and the psychosoma through which they currently and continuously manifest.

Conclusion. This is the logical conclusion upon analysis of the facts: if, while projected, you always feel the need to breathe in the extraphysical dimension, it is because you still do not know how to utilize the vast possibilities of the free manifestation of your consciential vehicles. If you wish, you do not need to breathe in any circumstance outside the human body.

257. CONSCIENTIAL HIBERNATION

Definition. Consciential hibernation: the state of natural minimal discoincidence, with sometimes only a few centimeters between the human body and the psychosoma which becomes inactive or still, a fact that always occurs when someone enters into the state of natural sleep.

Synonymy: condition of the individual who is buried alive; consciential absolute zero; consciential period of inactivity; consciential semi-hibernation; neutral point; zero condition; zone of quietude of the consciousness.

Causes. The physiological causes of consciential hibernation seem to be cellular intoxication due to a lack of natural sleep, as well as the spontaneous relaxation of the entire organism, a fact that occurs when one begins to lose wakefulness.

Effects. Direct results that arise from this period of inactivity are the cellular detoxification of the organism and the absorption or replenishment of extraphysical energy by the psychosoma.

Absorption. This means that the psychosoma absorbs little or no extraphysical energy while coincident with the soma and needs to free itself, or return to its own dimension (the extraphysical dimension, *per se*) in order to fully absorb energy. Energetic absorption performed while in the ordinary, physical waking state is always less intense than that which is conducted directly with the psychosoma or when it is in a state of discoincidence of the vehicles of manifestation.

Occurrences. The hypnagogic state generally precedes consciential hibernation, discoincidence and movements of the psychosoma appearing slowly or instantaneously. Frequently, the consciousness does not notice the occurrence and, more rarely, it is aware of the fact through the lucid takeoff.

Oscillations. Soon thereafter, the psychosoma can undergo oscillations, undulations, turbulence, as well as physical repercussions.

Dream. Later on, the first dream during the sleep period occurs.

REM. The vegetative life of the human body related to oneiric states – including involuntary, rapid, synchronistic, bi-ocular movements (REM) – also occurs when the consciousness is in the *zone of quietude*.

Inertia. This signifies that consciential hibernation does not cause the absolute inertia of the intraphysical consciousness.

Holochakra. During consciential hibernation – a phenomenon peculiar to the extraphysical sphere of consciential energies – the discoincidence of the vehicles of manifestation is not only of the holochakra, but of the psychosoma transporting the consciousness.

Projectability. During projections with the holochakra alone, the consciousness does not project together with it.

Phenomenology. In some advanced pathological cases of interconsciential possession, it sometimes seems that the intraphysical consciousness remains in a state of hibernation while his/her human body remains under the command of the possessor.

Burials. This fact seems to occur temporarily in certain voluntary burials (yogis) without any extraphysical or pathological influence.

Repercussions. When there is any instability in the human body or the projected consciousness during consciential hibernation, the sudden abrupt return of the consciousness in the psychosoma to the human body produces some type of psychophysical repercussion, such as the well-known jerks, stretching and frightened physical awakening. These are common occurrences with children and adolescents, to which adults comment – mere folklore – that *these persons are simply growing up*.

Bibliography: Lilly (926, p. 48), Muldoon (1105, p. 123), Walker (1781, p. 77).

258. EXTRAPHYSICAL OPENING

Definition. Extraphysical opening: the condition outside the human body, or the impression that the projected intraphysical consciousness has, more often occurring soon after the takeoff of the psychosoma, of entering and passing – generally at high velocity – through a long, narrow, dark opening, until reaching the state of extraphysical illumination.

Synonymy: conductive tunnel; cosmic tunnel; extraphysical tube; interdimensional transmitter vein; spatial hole; spatial opening; spatial vacuum; tunnel effect.

Near-death. Reports of the tunnel effect, or an extraphysical opening, are very frequent during human lucid projections that occur during near-death experiences (NDE).

Descriptions. This long, narrow, dark tunnel is also generally described using some of the following 23 expressions:

1. Abyss.
2. Cave.
3. Cavern.
4. Channel.
5. Chasm or cosmic chasm.
6. Dark vacuum.
7. Deep valley.
8. Drain.
9. Enclosure.

10. Funnel of darkness.
11. Gutter.
12. Hole or hole in space.
13. Machine cylinder.
14. Narrow hallway.
15. Opening in space.
16. Pipe.
17. Pit.
18. Silent emptiness.
19. Tunnel in the cosmos.
20. Tunnel like a chimney with light at the top.
21. Well.
22. Whirlpool.
23. Wide tube.

Causes. The probable cause of most cases of tunnel effect, or the passage of the consciousness through an extraphysical opening, is the change of the condition of the projected consciousness from one level – sphere, frequency, parallel world, extraphysical plane or dimension – to another.

Time. It is for this reason that some compare the tunnel effect to a deformation of time or a black hole, a concern of physicists and astronomers.

Hypothesis. The following is a research hypothesis: could it be that the silver cord, a conductor of energy, is responsible for the impression of the tunnel effect in certain experiences when the intraphysical consciousness is projected in extraphysical paratropospheric environments and the circular part of this appendix (holochakra) exteriorizes *prior to* the extraphysical head of the psychosoma (parahead with parabrain), with the mentalsoma and the consciousness *inside*?

Frequency. The tunnel effect, or extraphysical opening, occurs with projected intraphysical consciousnesses not only in spontaneous lucid projections but also in voluntary lucid projections. The tunnel effect occurs more frequently during the exteriorization of the consciousness when in the psychosoma, but it can also occur during the interiorization of the psychosoma, namely when the intraphysical consciousness is returning to the physical base, human life or the dense physical dimension.

Exit. Descriptions show that the extraphysical opening, or the cosmic tunnel, is not only a departure but simultaneously an extraphysical exit, because it allows the return of the intraphysical consciousness from a parallel world to its temporary-headquarters-world or, in other words, its own native, physical, human *habitat*.

Passageway. This indicates that the extraphysical opening, cosmic tunnel, or any other denomination one wishes to give it, constitutes a *two-way* passageway of coming and going, of entrance and exit.

Currents. The tunnel effect should not be confused with the phenomenon of extraphysical currents of energy, or currents of force and can occur in other altered states of consciousness, aside from lucid consensual projection. It can even be induced by drugs.

Birth. The hypothesis has been posed that the tunnel effect might be a reprise (playback) of the consciousness' experience of traveling through the birth canal of natural childbirth. Nevertheless, research shows that lucid consensual projections often occur with persons delivered through Cesarean section – a condition in which the individual did not pass through the natural birth canal – which definitively eliminates that supposition.

259. EXTRAPHYSICAL ELONGATION

Definition. Extraphysical elongation: partial projection characterized by a sensed and observable greater elongation or alteration in the length, dimension or volume of the parts of the psychosoma, notably the paramembers or extraphysical members.

Synonymy: extraphysical elongation; extraphysical stretching of the psychosoma.

Elasticity. The phenomenon of elongation in general is a consequence of elasticity, which is an essential attribute of the psychosoma and should not be cause for concern or fear on the part of the lucid projection practitioner.

Paramembers. The more common elongations with projectors occur with the para-arms and paralegs of the psychosoma being partially projected from the human body.

Self-kinesis. The elongation of the projector still represents a type of *self-kinesis* or, in other words, the movement of the psychosoma produced by the consciousness itself, in a manner of extraphysical translocation, through the action of the consciencial energies.

Elongater. The individual who produces elongation is called an *elongater*.

Sensitive. The sensitive responsible for elongation receives the name of *elongater sensitive*.

Technique. An exercise that any practitioner of lucid projection can apply is to lay down on the back, close the eyes, stretch the arms and hands alongside the body, physically relax and use the will to bring the two parahands together above the thorax.

Effects. The effects of this partial projection are impressive because the practitioner does not lose lucidity. From this point, you can stretch the para-arms and provoke extraphysical elongation.

Itching. Some lucid projection practitioners experience partial projections and spontaneous extraphysical elongations due to an itching of the skin or ear during the period in which they are endeavoring to produce a lucid projection.

Ear. When a person is physically relaxed he/she can, for example, feel the intense itching of one of his/her ears due to an allergic reaction. This makes him/her *instinctively* raise the extraphysical index finger to the ear with the intention of scratching it.

Translocation. Some lucid consciencial projectors apply the elongation of the psychosoma to translocate extraphysically from one district to another.

Shortening. In the same way that extraphysical elongation occurs, the opposite – extraphysical shortening – can also take place. This is reminiscent of the cases of physical shortening registered in ectoplasmy experiments and in reports of hagiography.

Case study. The phenomenon of elongation of the psychosoma has somehow continued to be reported throughout time in 4 very diverse human areas:

1. **Art.** The supposition of extraphysical elongation arose in order to explain the artistic virtuosity of certain people such as the Spanish musical prodigy Pepito Rodriguez Ariola. He was born in La Coruña, a small town near Ferrol on December 14, 1896. In 1900, at the physical age of 3-and-a-half, he could play octaves on the piano through the increase of his hands, although they could actually only span 5-note intervals. In this case, the semiprojection of the *parafingers*, or a partial projection of the *parahands* of the psychosoma, would have been occurring in a spontaneous and unconscious manner.

2. **Ectoplasmy.** Aside from ancient references made to the phenomenon of ectoplasmy in human history, cases of elongation of the physical members with corporal prolongation or distension of the cellular body of the ectoplasmic sensitive have been registered. Often, these would reach up to 10” (25 cm) through the transfiguration of the psychosoma, bringing about ectoplasm, on this occasion, and the consequent partial dematerialization of the ectoplasmic sensitive’s human body.

3. **Hypnology.** There is also the case registered by the French school of hypnosis of a sensitive – who was not pregnant – portraying the scene of a childbirth with impressive realism wherein she felt pain, cried, writhed and clenched her hands. Moreover, all those persons present verified that her

breasts actually became fuller than usual. The increased volume of her breasts is a phenomenon of *hypnotic elongation*. This is, nevertheless, a complex occurrence of dematerialization-materialization-rematerialization.

4. Neurology. In registered neurology experiments, the posterior zones of the parietal lobes were stimulated, producing *sensations* of elongation of the human body's image.

Elasticity. Extraphysical elongation is reminiscent of occurrences of elasticity in certain organs of the soma: penis (androsoma), uterus (gynosoma), vagina (gynosoma) and clitoris (gynosoma).

Bibliography: Andreas (36, p. 92), Blunsdon (157, p. 72), Bonin (168, p. 157), Bozzano (192, p. 19), Cavendish (266, p. 83), Digest (401, p. 353), Eysenck (493, p. 28), Fodor (528, p. 124), Gauld (575, p. 213), Gaynor (577, p. 56), Holt (741, p. 210), Monroe (1065, p. 170), Randall (1369, p. 42), Reis (1384, p. 53), Riland (1403, p. 87), Shepard (1548, p. 294), Somerlott (1582, p. 110), Spence (1588, p. 141), Todd (1689, p. 52), Tourinho (1693, p. 38), Thurston (1700, p. 285), Underwood (1721, p. 23), Wedeck (1807, p. 128).

260. EXTRAPHYSICAL AWAKENING

Definition. Extraphysical awakening: the act of the intraphysical consciousness waking up with full lucidity somewhere outside the human body.

Synonymy: act of waking up outside the human body; beginning of extraphysical self-awareness; extracorporeal awakening.

Types. There are various types of extraphysical awakening, such as the following 6:

1. Slow.
2. Abrupt (extraphysical escape).
3. Oneiric (pertaining to a dream).
4. Voluntary.
5. Solitary.
6. Assisted by an energetic shower from a helper.

Characteristics. The extraphysical awakening of the intraphysical consciousness presents at least the following 11 distinct characteristics:

1. Level of immediate awareness.
2. Darkness, illumination or penumbra in regard to the paravisual perception of the extraphysical environment or dimension.
3. *Open eyes*.
4. Closed para-eyes.
5. Self-awareness in regard to the vehicle of manifestation, whether in the physical base, a nearby or distant place.
6. In a condition of extraphysical disorientation.
7. With oscillations and undulations of the projected psychosoma.
8. In a position of extraphysical equilibrium.
9. In a position of extraphysical disequilibrium.
10. In the condition of a *blind*, *deaf* and *mute* consciousness.
11. With mental perspectives that may be healthy or pathological.

Continuous. In the experiences of projections with continuous awareness, it is obvious that neither extraphysical nor physical awakenings occur.

Resurrection. The occurrence denominated *spiritual resurrection*, a much used expression in religious environments, represents nothing more than the extraphysical awakening of the consciousness after going through unconscious final projection (desoma).

261. EXTRAPHYSICAL SELF-AWAKENING TECHNIQUE

Liberation. In the production of lucid projection, what is important is that you see yourself in the extraphysical dimension free from the consciential state you were in before – whether it was sleep, a dream, a nightmare, a daydream, hypnagogy or the ordinary, physical waking state – and acquire full lucidity outside the human body. This is because, as a general rule, your consciousness does not perceive it has temporarily left the human body.

Autosuggestion. The most common provision for predisposing extraphysical awakening is repeating the following phrase to yourself many times before going to bed to sleep: “I am going to wake up lying over the bed above my body.”

Test. You can employ the positive resource of the *coherence test* in order to remove the interference of all oneiric images or gravitating morphothosenes, thus refining your extraphysical perceptions and *denuding* your consciousness. This test consists of a judicious observation of aberrations in the scenes that you are perceiving or experiencing. For example, if you see a cat clucking like a chicken; if you ascertain that every stone in a wall takes on a different color; if the humanoid beings you see are blurry and superimposed; these visions clearly show incoherences or oneiric alterations that disappear as soon as you become aware that you are dreaming. This will initiate a more lucid projection.

Faculties. You can utilize all extraphysical *natural* resources that often spontaneously provoke extraphysical awakening, such as: the characteristic faculties of the psychosoma, self-luminosity, the acuity of extraphysical vision, permeability, lightness, volitation, invulnerability to physical agents, invisibility or intangibility to human beings.

Awareness. While in the ordinary, physical waking state, you must saturate your mind with the idea and determination of extraphysically awakening yourself when one or more of the following 18 conditions come to your attention:

1. **Psychosoma.** Find yourself suspended in empty space, stopped or in movement above the floor (instability of the psychosoma).
2. **Respiration.** Notice that you do not need to breathe (departure from intraphysical restriction).
3. **Elasticity.** Observe that your arm stretches easily (extraphysical elasticity).
4. **Invisibility.** Perceive that an ordinary mirror does not reflect your image (extraphysical invisibility).
5. **Imperceptibility.** Observe that other beings are not aware of the presence of your consciousness projected in the environment (extraphysical invisibility).
6. **Inaudibility.** Verify that those beings present do not hear your words (extraphysical inaudibility).
7. **Self-luminosity.** Discover that you are somehow emitting your own light (extraphysical self-luminosity).
8. **Imponderability.** Discover that you are lighter or discover that your *body* does not cast a shadow when in the sun (extraphysical imponderability).
9. **Translocation.** Perceive that you are somehow moving from one district to another, either by gliding or flying, and that this is different from the state of inactivity in which you left your human body on the bed (extraphysical translocation).
10. **Freedom.** Experience yourself having greater freedom, being capable of going wherever you wish (sense of freedom).
11. **Paravision.** Recognize that your vision manifests characteristics superior to physical vision (paravision), such as: endoscopy or depth, microscopy, magnification, retrovision and vision with no perspective.
12. **Transparency.** Verify the transparency of all objects and constructions that you see.

13. **Copy.** Identify that all things have a double form, or luminous copy (second universe).
14. **Rejuvenation.** Find yourself suddenly rejuvenated (unconscious self-transfiguration).
15. **Invulnerability.** Clearly experience a person or moving vehicle pass right through you in any public place (extraphysical invulnerability).
16. **Self-permeability.** Pass a hand freely through physical objects (extraphysical self-permeability).
17. **Projectability.** Observe yourself and verify that you do not have a body or vehicle of manifestation (projection in the mentalsoma).
18. **Ideoplasty.** Notice that you redo or undo the scenes that you visualize with a simple act of will (ideoplasty).

Stimulus. It is recommended that the veteran projector read and reflect upon the above listed 18 extraphysical conditions, as they can actually stimulate the production of *spontaneous* lucid projections, as well as amplifying extraphysical self-lucidity. This has already occurred on a number of occasions with the author.

Bibliography: Vieira (1762, p. 67).

X - Extraphysical Period of the Consciousness

262. EXTRAPHYSICAL SELF-AWARENESS

Definition. Extraphysical self-awareness: the state of consciential lucidity while outside the human body that allows the intraphysical consciousness to have absolute certainty that he/she is neither dreaming nor in the normal waking state.

Synonymy: astral awareness; astral lucidity; connection of awareness; extracorporeal lucidity; extraphysical lucidity; extraphysical self-awareness; extraphysical wakefulness; second attention.

Awakening. The majority of intraphysical consciousnesses, when projected from the human body, remain aware *in* the extraphysical dimension but, nonetheless, are unfortunately unaware *of* the selfsame extraphysical dimension.

Challenge. The majority of projected projectors encounter extraphysical situations that cannot be categorized in terms with which they are already familiar. In these cases, they need to *adapt*, create new strategies and modify or combine old strategies in order to deal with the challenge of the *new world*.

Thought. Creating the habit of maintaining sustained and concentrated thoughts during daily life, in the ordinary waking state, results in having absolute control of the thoughts of the consciousness projected in the extraphysical dimension.

Objective. The entire technical endeavor of this book is directed toward the processes for obtaining extraphysical self-awareness, the greatest condition or the most difficult objective to achieve in the experience of lucid projection.

Bottleneck. Having *overcome the bottleneck* or having obtained extraphysical self-awareness, everything else will come naturally to the consciential projection practitioner due to the following 3 facts:

1. **Departure.** All intraphysical consciousnesses leave the human body every night.
2. **Interiorization.** Returning to the body is always easy and does not involve any major difficulties.
3. **Recall.** Recall is a simple consequence of extraphysical lucidity, in most cases.

Horizontality. While in the extraphysical horizontal position, the psychosoma remains passive and inactive.

Verticality. While in the vertical or erect position, this vehicle generally allows the projected intraphysical consciousness to recuperate lucidity. This fact is perhaps due to the physical and psychic conditioning of individuals who spend most of their life in the erect position, in the ordinary, physical waking state.

Extension. At least the following 7 facets should be analyzed regarding the extent or degree of the lucidity of the consciousness:

1. **Ordinary.** Ordinary, superficial or profound awareness.
2. **Semi-awareness.** Semi-awareness per se.
3. **Superawareness.** Cosmic superawareness.
4. **Uniform.** Uniform awareness.
5. **Discontinuous.** Discontinuous awareness.
6. **Self-awareness.** Awareness of oneself, although without form.
7. **Appearance.** The sensation of apparent omniscience (mentalsoma).

Attributes. Among the attributes of extraphysical self-awareness, at least the following 14 can be singled out:

1. **Thosenology.** Thought (or thosenization).
2. **Concentration.** Mental elaboration.
3. **Reason.** Reasoning (or reason).
4. **Attention.** Long or short attention span.
5. **Mnemosomatics.** Memory (mnemosomatics).

6. **Holomemory.** Compound pluriexistential or holobiographical memory of the integral memory bank (holomemory, personal holobiography, holoresomatics).

7. **Imagistic.** Imagination or imagistic capacity.

8. **Comprehension.** Comprehension or understanding, comprehensive understanding.

9. **Self-discernment.** Discernment (distinction between better and worse, outdated and ideal, cosmoethical and anticosmoethical).

10. **Globalization.** Association of ideas (the panoramic vision of universalism).

11. **Critiquing.** Critical judgment (self-critiquing and heterocritiquing).

12. **Comparison.** Comparison or the habit of establishing relationships (association of ideas).

13. **Abstraction.** Abstraction or *alienation without becoming alienated*.

14. **Generalization.** Generalization or broader conclusions (multidimensionality; generalism; polyglotism; formal education and self-education; culture and multiculturalism; encyclopedism; polymathy).

Aspects. The following are 13 important aspects in the world of extraphysical self-awareness:

1. **Maintenance.** Maintenance of extraphysical self-awareness.

2. **Paramind.** An open mind or open *paramind*.

3. **Paratachypsychism.** *Extraphysical presence of mind*.

4. **Coherence.** Coherence in the progression of extraphysical experiences or events.

5. **Paraperceptiology.** Gradation of perceptions according to consciential projection.

6. **Shock.** Intraconsciential shock.

7. **Somnambulism.** Extraphysical somnambulism.

8. **Oneirism.** Pre-projective dream.

9. **Lapses.** Consciential lapses.

10. **Volition.** The action of will upon the forms of the psychosoma.

11. **Psychosomatics.** The consciousness in the partially configured psychosoma as well as in the integral psychosoma.

12. **Mentalsomatics.** The consciousness in the isolated mentalsoma.

13. **Awareness.** The difference of awareness (cognitive capacity) in one vehicle of manifestation and another.

Lucidity. An elevated level of extraphysical lucidity favors recall subsequent to the projection.

Discontinuity. The state of discontinuous extraphysical lucidity sometimes causes fragmented recall.

Faculty. Ordinary, physical self-awareness is the faculty of being aware of your own behavior, which involves the capacity to reflect upon it and, using reason, to maintain or modify it.

Initiatives. Extraphysical self-awareness allows the projected projector at least the following 5 well-defined initiatives:

1. **Control.** Deliberately control your condition or extraphysical situation.

2. **Paravisual.** Have a nude or clothed appearance (para-appearance).

3. **Direction.** Determine the direction and the destination to which you transfer yourself.

4. **Encounters.** Encounter other consciousnesses or extraphysical consciousnesses.

5. **Learning.** Learn new ideas in the extraphysical dimension.

Perceptions. While projected in the extraphysical dimension, the consciousness – when in the psychosoma and, more intensely, in the mentalsoma, in the mentalsomatic dimension – can achieve an elevated state of self-awareness that allows it to perceive everything *en bloc*, at once, instantaneously and in detail, regardless of the amount of minutiae in the concepts that are perceived.

Factors. One of the first factors among those that call the attention of the intraphysical consciousness projected for the first time is the hitherto unknown relationship between the sensation of the human body's heaviness and the psychosoma's lightness. This fact implies the notion of the inertia of the bodies and the action of gravity upon them, which are diminished or temporarily extinguished.

Mysticism. From an extraphysical standpoint, mysticism – in this context understood to be emotionality without rationality – impairs consciential lucidity, a fact that illustrates 2 principles:

1. **Obnubilation.** The greater the mysticism in the *dominant* emotions of the projected intraphysical consciousness, the more obnubilated his/her lucidity will be.

2. **Serenity.** The greater the serenity, or the greater the elevated sentiments (rational and *tamed* emotions), the more lucid the projected intraphysical consciousness will be.

Ballast. The consciousness of the projected projector being assisted by helper(s) in extraphysical assistential activities tends to remain clouded, obfuscated or eclipsed. This is not only because it is ballasted by the holochakra, or manifesting through the dense psychosoma, but also due to the presence of the helper(s).

Obscurity. There are some more obscure aspects related to these events that require further research and clarification.

Relation. Something occurs in this contiguous relationship that sometimes impedes the full lucidity of the projected consciousness, as occurs with 3 other similar events:

1. **Satellite.** The satellite (moon) being dependent upon the star (planet, sun).
2. **Clairvoyant.** The clairvoyant being dependent upon the nagual.
3. **Sensitive.** The sensitive being dependent upon the extraphysical mentor.

Errors. Probably 90% of all lucid projections of the consciousness experienced by intraphysical projectors, even when prolonged and important, are no more than semilucid projections or mere lucid dreams. Hence it is necessary to insist that the act of obtaining advanced extraphysical self-awareness is the greatest basic conquest for any lucid projector.

Doubts. Only with an elevated level of extraphysical self-awareness can the intraphysical consciousness liberate him/herself from the errors of interpretation in experiences outside his/her human body. Thus, a single lucid projection does not always resolve the intraphysical consciousness' issues of the essential doubts regarding the real extraphysical world.

Exception. The above-mentioned fact also shows that lucid projection – although being a *natural*, physiological *occurrence* and common to all of humanity, and being an advanced condition of extraphysical self-awareness – is paradoxically an occurrence which is unfortunately still the *exception* for the intraphysical consciousness. In other words, it is still subordinated to the prison or *funnel* of the condition of terrestrial physical restriction and to the *bellows* (the lungs in the maintenance of the soma).

Immaturity. Persons who are excessively *locked* when their vehicles of consciential manifestation are in the coincident state are much more prone to be immature extraphysical consciousnesses. In other words, they fall into the same post-desomatic extraphysical conditions as certain children who, upon undergoing desoma, remain in the intermissive period, sometimes for an extended period of time, presenting only an infantile lucidity, mentality and, frequently, paraform of the psychosoma. They take a long time to recuperate the conditions and forms of the natural adulthood (somatic adulthood or maturity) from their *next-to-last* human life (next-to-last retrosoma).

Development. Despite everything, the parapsychically developed intraphysical consciousness can enjoy perfect lucidity when projected from the human body.

Analogy. The following is a pertinent comparison of two experiences in different consciential dimensions:

1. **Intraphysiology.** Human life is like a *movie*, produced far from the public, where one can employ all the tricks of the trade and spectacular special effects.

2. **Extraphysiology.** Temporary, extraphysical life, during the experience of lucid projection is like a *play* in which one has direct, raw, face-to-face contact with the audience, in which crude camera tricks are not allowed.

263. SCALE OF LUCIDITY OF THE PROJECTED CONSCIOUSNESS

Definition. Scale of lucidity of the projected consciousness: the ordered sequence of factors for establishing the development of the magnificence of the phenomenon of extraphysical lucidity.

Synonymy: table of extraphysical lucidity.

Awareness. The normal or unaltered mental state of the waking, adult intraphysical consciousness – or that in which the individual spends the greater part of his/her time in the ordinary, physical waking state – was arbitrarily chosen as the conventional pattern for characterizing the condition of full, total, complete, rational or lucid awareness.

Exclusions. This state of lucidity of the intraphysical consciousness excludes various factors or conditions, such as the following 9:

1. **Sleep.** Sleep or somatic renewal.
2. **Sleepiness.** Nap (sleepiness, hypnagogy).
3. **Absence.** Small abstraction (absence).
4. **Daydream.** Daydream or deep waking dream.
5. **Pharmacology.** Drugged organic state (pharmacological).
6. **Psychopathology.** Permanent mental insanity or a psychotic episode.
7. **Pathology.** Serious or chronic illness (organic disturbance).
8. **Self-lucidity.** Prenatal, infantile and senile mental conditions.
9. **Incapacitation.** All other psychological situations in which the intraphysical consciousness (mind) is incapable of acting efficiently when faced with the practical, prosaic or trivial everyday problems of human existence.

Variations. According to the above-cited characterization of the waking state, it can clearly be seen that human awareness, in everyday life, varies in layers, stages, percentages, degrees or levels, according to the individual conditions and circumstances of the moment, which provoke bursts of exacerbation or reductions of obfuscation in the individual's lucidity.

Extraphysicality. Those who project with some frequency or, in other words, after having approximately 10 lucid projections in succession, without great gaps of time between them, end up easily verifying that the *degree of lucidity* of their consciousness, while in the extraphysical dimension, also varies from experience to experience, in the same manner as occurs in the ordinary, physical waking state.

Change. There is a close relationship between change of consciential dimension and consciential lucidity. As a rule, every change from one extraphysical dimension to another, as small as it may be, disturbs or reduces the degree of the projected intraphysical consciousness' extraphysical lucidity.

Oneirism. In the new extraphysical dimension, the projected intraphysical consciousness' lucidity may be clearer than before (rarer), or he/she may mix the images that he/she visualizes (more frequent), thereby ending up in a condition of semilucidity or in an oneiric state (oneirism).

Relationship. The relationship between awareness, wakefulness regarding the environment and extraphysical self-permeability is intense and profound for the intraphysical consciousness projected in the extraphysical tropospheric dimension.

Perception. For example, upon returning to the physical base, the projected intraphysical consciousness can pass through countless physical obstacles without noticing it and only become aware of the environment when in the bedroom or *inside* the soma. The building where his/her physical body resides, the ceilings, outer walls, inner walls, furniture or interior decoration of the human environments were neither seen nor *perceived* by the intraphysical consciousness. This shows that, in the same extraphysical dimension, in a single lucid projection, the vehicles of consciential manifestation can go through diverse vibratory frequencies in their energies and densities.

Functioning. In order for the lucidity of the projected intraphysical consciousness (*paramind*) to be full and function adequately both *sensorial*, or paraphysiological, perceptions and *intellectual* abilities need to manifest simultaneously. It is therefore necessary – in the case of the psychosoma, for example – that the vehicle be completely projected, or at least with all its essential attributes, in order for the consciousness to operate efficiently in an extraphysical dimension.

Recall. Furthermore, *lucidity* has to be accompanied by *recall* subsequent to the extraphysical experiences in order for these two conditions to be efficiently registered and accompanied by accurate observation.

Classification. There are still no standard units for measuring, or known elements for gauging, levels of awareness in the ordinary, physical waking state. Thus, in an attempt to quantify the subject, certain parameters or characteristics can be established according to the quality of the projected projector's perceptions, in a scale of qualities and values or subjective classification – obviously the most precise possible – within the current circumstances, which are composed of 5 basic degrees or percentages:

1. **20%.** The extraphysical experience with 20% lucidity constitutes *semi-awareness*: discontinuity of extraphysical wakefulness; oneiric interferences in incoming perceptions; hallucinogenic aberrations; factors which definitively characterize the state of semilucid projection or, in other words, that state which is mixed with dreams, nightmares and conscial projection (somatics).

2. **40%.** The extraphysical experience with 40% lucidity shows the elements of *doubt*: constant positive (exaltation) or negative (fear, projectiophobia) emotional influence during the entire period of extraphysical exteriorization; doubt, or unawareness, on that occasion, regarding the fact of being projected; continuous insecurity during the entire course of extraphysical actions.

3. **60%.** The extraphysical experience with 60% lucidity shows the characteristics of *certainty*: full conviction of being projected; the beginning of the association of ideas and rational comparisons between the physical and extraphysical dimension, which are spontaneously elaborated with defined critical judgment (holosomatics).

4. **80%.** The extraphysical experience with 80% lucidity shows *self-awareness*: lucidity equal to that of the ordinary, physical waking state; unalterable uniformity of clear perceptions; a complete absence of immature or irrational emotionality; the maturity of the undisputed knowledge of being projected, or extraphysical self-awareness; maximum critical judgment, with the ordinary possibilities of the projector's self-critique (projectiology).

5. **100%.** The extraphysical experience with 100% lucidity is characterized by *superawareness*: lucidity superior to the maximum available in the ordinary, physical waking state and which incontrovertibly identifies the state of cosmoconsciousness typical of magnificent conscial projections in the isolated mentalsoma (cosmoconscientiology).

Comparison. Evidently, the state of 100% of extraphysical awareness is equivalent to the impossible 150% of lucidity in the standard ordinary, waking state.

Average. The majority of conscial projections characterized as being lucid – by all conscial projectors, over the course of *time, everywhere*, in all *conditions* – varies between the average range of 40% and 60% of extraphysical lucidity or, in other words, between the states of *vacillation-doubt* and *confidence-certainty* in manifestations outside the human body.
